3. For the aforeſaid reaſons alſo, this Fever being a long while protracted, was wont ſcarce ever to be critically helped, and difficultly cured, by the help of almoſt any Medicines: For the feveriſh matter creeping preſently from the beginning of the Diſeaſe into the nervous liquor, could hardly afterwards, and not but of a long time, be exterminated from its boſome: for that this water, with a ſlow motion, and flowing leaſurely in the ſtraight veſſels, does not as the blood, conceive of its own accord a purifying efferveſcency or fermentation; neither can the forces of Medicines reach to it ſo eaſily and unmixed: but either they are firſt hindred by other parts, or becauſe they are heterogeneous, they are wholly excluded from the brain, caſting back whatever is incongruous. In truth for this reaſon, all diſtempers of the brain and nerves, as it were making a mock at Medicines, are moſt difficultly cured. Therefore in this Fever, if the evil impreſſed on the brain and nervous ſtock was taken away, either a cruel cough with plentiful ſpitting, or tumors, or an impoſthume in the neck did follow: to wit, the morbific matter being ſupped back by the blood, and again depoſited, ſetled either in the *Thorax*, or in the Glandula's and Emunctories, nigh the hinder part of the neck. But this Diſeaſe was the more contumacious, becauſe the diſcraſie or evil conſtitution of the blood, was not eaſily mended: for altho from the beginning, its *Latex*, the recrements being poured forth, even into the nervous Liquor, grew but little and ſluggiſhly hot; yet afterwards, theſe receptacles being filled, and the morbific feculencies, and beſides the nutritious matter, not imployed in nouriſhing the parts, being reſident even in the blood, did aggravate it, and for the excluſion of this trouble, not to be immixed with it, did induce an efferveſcency, ſuch as is wont to be in an hectict Fever, either almoſt continual, or preſently apt to come again. For I have often obſerved in this Fever, from Grewel, Barley broth, and other ſlender diet, no leſs ebullition of the blood to be ſtirred up, than from broth made of fleſh: whether indeed the nouriſhing juice ſupplying the blood from the chyle, becauſe it was not imployed in the work of nutrition, carried ſomething heterogeneous, and not rightly miſcible, as a trouble to the blood; and by reaſon of the particles of this ſuperfluous juice, being copiouſly ſent away with the *ſerum*, the Urine became very thick, red, and very full of contents: Alſo, for the ſame reaſon, the belly was for the moſt part looſe, foraſmuch as the blood, filled full of the nutritious juice, did ſuck forth a leſſer portion of the chile from the bowels, and did pour back again part of that which had been brought to it on the inteſtines; the feveriſh Diſtemper did likewiſe ſtick ſo long in the blood, becauſe, till the animal regiment being reſtored, nutrition was rightly performed, that ſuperfluous matter was carried into the maſs of blood.

We deliver the example, and the *Ætiology*, or rational account of this aforeſaid Fever, more largely for this reaſon, becauſe the ſame Diſeaſe did fall upon our Country-men, here and there alſo at other times: for that of late, in this City, all the younger people of a certain Family, were ſick of it: yea, I remember, that ſome time paſt, very many laboured with ſuch a Fever. Out of the many Hiſtories and Examples of ſick people, which it rendred when it was epidemical, I will here propoſe one or two.

1. Obſervation.

A ſtrong and lively young man, about the beginning of the ſpring, 1661, falling ſick, without any evident cauſe, without any great heat or thirſt, he became ſuddenly weak, and as if enervated, with a dejected appetite, and languor of ſpirits. *Cathartick Remedies*, *Antipyretics* or allaying of heat, digeſtives, and alſo antiſcorbutics, and others of various kinds, adminiſtred by the preſcriptions of the moſt famous Phyſicians, availed nothing: But, notwithſtanding, the ſick man hitherto languiſhing with a

ſlow and wandring fever, with a quick and feeble pulſe, a deep-coloured urine, had kept his bed a fortnight; beſides being reduced to the greateſt leanneſs, he complained of a giddineſs, and as it were the fluctuation of a ſound in his head, and a tingling noiſe in his ears. Altho he was troubled with a great ſtupor, yet his ſleeps were mightily troubled with delirious fables. After four days, when the fever was not yet declined, it was thought good to take away four or five ounces of blood by Leeches, from the ſedal veins; from hence the fever began to be much exaſperated, for a great intenſe heat, with thirſt, watchings, and almoſt continual toſſing of the body, alſo the tongue dry, and ſcurfy, appeared; then quickly a troubleſome cough, with abundance of diſcoloured ſpittle followed; to him were adminiſtred, *almond*, and *barly-drinks*, with temperate bechicks (or things to ſtop coughing) boiled in them: water of milk diſtilled with ſnails, and pectoral herbs, the ſhelly powders, prepared nitre, and often Cordial Opiats; which notwithſtanding ſcarce giving any help, the ſick man ſtill became more weak; when in this manner being ſick above two months ſpace, the feveriſh diſtemperature, and cough alſo, daily growing worſe, he ſeemed near death, at length a voluntary ſweating ariſing, ſo that every night, or every other night, he ſweat abundantly, and from thence finding himſelf better, uſing then the foreſaid Remedies, he grew well within ſix weeks.

The reaſon of it.

Till I had ſeen many ſick people after the ſame manner, I ſuſpected this diſeaſe to be altogether an hectick fever with a conſumptive diſpoſition of the Lungs; but when I ſaw many others at that time fall ſick ordinarily, after the like manner, I eaſily inſtituted the *Ætiologie* or national account of this feavour, ſuch as I have already deſcribed: to wit, that the blood, becauſe of the intemperature of the year, and perhaps from errors in diet, had contracted a vitious *procatarxis* or remote cauſe: Then it growing feveriſhly hot, and preſently carrying its impurities to the brain, and ſo depraving the juice, watering it, and the nervous ſtock, induced the vertigineous diſtempers, with a *ſtupor*, a languiſhing of ſpirits, and an *atrophy* of the whole body: but ſo long as the blood did transfer its recrements, from its own boſom, into the brain and nervous *appendix*, the feveriſh heat continued more gentle and mild; but afterwards, when the tending downwards of the morbific matter, by the opening of the hemorhoid veins, was drawn away from the brain, the ſame being firſt retained within the bloody maſs, increaſed the fever; then being poured on the Lungs, excited the cruel cough, with plentiful ſpittle: but foraſmuch as the fleſh of the Lungs remained free from putrefaction, as ſoon as the ſerous water was ſent away by a more plentiful ſweating, the ſick man became free, both from the fever and *phthiſis* or Conſumption, that ſeemed ſo deplorable.

2. *Obſervation.* In the mean time, whilſt he lay ſick, I viſited another, about 12. years of age, after the like manner affected. But this when I was firſt ſent for, having been ſick above a month, was reduced to the leanneſs of a Skelliton: beſides he was troubled with a *vertigo*, with a noiſe in his ears, and deafneſs, and alſo with a violent cough with yellow, and as it were conſumptive ſpittle: his pulſe was quick and feeble, his urine red and thick, his appetite much dejected, his ſpirits ſo languid, and his ſtrength ſo caſt down, that he could not keep out of his bed: I gave this Youth to drink often in a day, water diſtilled from milk, with ſnails and temperate herbs: beſides I ordered him an open decoction, ſuch as is in uſe for the Rickets, to be daily taken inſtead of his ordinary drink; by the help of which Remedies, he was reſtored to his health in a months ſpace. At this time I was ſent for to many other people, of every age and ſex, diſtempered by the ſame diſeaſe, now clearly Epidemical; for it running thorow whole families not only in this City and the neighbouring parts, but in the Countries at a great diſtance, as I heard from Phyſitians dwelling in other places, increaſed very much. Thoſe for the moſt part labouring with this fever, ſo be they were otherwiſe whole, grew well by the fit uſe, and order of medicine and dyet: but it hapned very often but ill to thoſe who were indued with a weakly conſtitution of brain and nervous ſtock, or broken with age; but not ſeldom the caſe of the ſick became dangerous becauſe the Phyſitians were not wont to be ſent for preſently after the beginning of the diſeaſe, yea, ſcarcely before it had more deeply ſpread abroad it roots, and the opportunity of healing was paſt.

3. *Obſervation.* For that reaſon, this fever became very deadly, in the family of a certain Noble man among his children, originally obnoxious to Cephalic diſtempers. About the vernal Æquinox, a Boy of about eleven years of Age, began to be ſick: At firſt without any vehement heat, or thirſt, a dejection of appetite, and want of ſtrength came upon him: Beſides, an almoſt continual giddineſs did trouble him, with a frequent danger of fainting, that he often thought he was juſt dying. By the advice of a certain woman at-

attending him, they daily gave him Clisters: then, when from the foulness of the Mouth and Tongue, manifest signs of a Fever appeared, this Emperick on the fifth day, gave him a vomit of the infusion of *Crocus metallorum*, and on the seventh day a Cordial Powder being administred, she incited the sick Youth covered with blankets to sweat: but presently he began to talk idly, complained that his Cap was fallen into the water, by and by becoming speechless, within four hours, whilst I was sent for, he expired before I came.

A little while after, the same disease fell upon his younger Sister: whose sickness however because it was accompanied with a frequent and humid Cough, was thought at first to be only a taking of Cold; but within a few days, this Cough became plainly Convulsive: so that, whilst she coughed, the *Diaphragma* being carried upward, and with a renewed *Sistole*, held so a long time, she made a great noise as if about to be suffocated: then this little maid growing more apparently feverish, complained of thirst and heat, and lay all night without sleep with a mighty agitation of her body, and begau to talk idly, after the same manner as her brother, of her coat being fallen into the water; and when all things grew worse, she began to be tormented with Convulsive motions, first in her Limbs, by and by in her face, and then in her whole body: the *Paroxysms* coming by often turns, twice or thrice in an hour, did most grievously trouble her, so that this little wretch, within the space of 24. hours, after the Convulsive Distempers began to grow more grievous, her animal spirits being almost quite spent, she died; whilst the Convulsive fits tormented her, her pulse was very much disordered, and often intermitting, also a frequent vomiting molested her. Being sent for to visit this maid, also too late, a little before her death; when I could contribute nothing to the proroguing of Life, I endeavoured what I could, to find out from her death, the knowledg of the aforesaid disease, therefore having got leave to dissect her body, the reasons and marks of the Symptoms chiefly urging in this fever, more clearly appeared.

The knowledg of the disease found out by dissecting the Carcase.

Opening therefore first the lower belly, I found all the bowels in it sound enough and well furnisht: The *Ventricle* altho tired with empty vomiting, contained nothing besides the Liquor, lately taken in at the mouth: for neither in it, nor in its *Appendix*, were worms, or sharp humors found which are wont oftentimes to give a cause to these kind of Convulsions: the small guts, were in many places involved: to wit, the *Convex superficies* of one part, was thrust into the concave of another, as into a sheath, and hid far in it, which indeed I judg to have hapned wholly from the convulsive motions of those bowels: for whilst by vehement Convulsion, excited from the nervous *origine*, the opposite *fibres* being drawn together, did work the same Intestine into contrary motions, it easily hapned that a part of the Intestine of the *Ilion*, being carried upward, might run into the hollowness of the other, being snatched downward.

The *Thorax* being opened, the flesh of the Lungs appeared very red, and as it were sprinkled with blood, yea in some places as it were livid, and almost black: out of the same wherever it was cut, there flow'd forth a thin and frothy matter. Certainly this shew'd, that the feverish matter, or the serous impurities of the boiling blood, being soon impacted in the Lungs, did so stuff up their pores and passagss, that the blood it self, being in its wonted and free Circulation, there stagnating, and being extravasated, did excite a certain Inflamation.

We found a no less clear tract of this so deadly disease in the head: for the shell of the skull being removed, presently the vessels, creeping through the *meningæ*, were seen to swell very much with blood, as if almost the whole mass of blood were gathered together in the head: for the veins being cut or broken, about the inwards of the lower and middle belly, little blood flowed forth: Besides, those membranes where they cloath the *Cerebel*, and being higher spread, divide it from the brain, being sprinkled in very many places with extravasated blood, were noted to be of a black purple colour; that it was not to be doubted, but the *Phlegosis* or Inflamation round about excited, was the cause of the so cruelly infesting Convulsions. These coverings being taken away, the substance of the brain was seen to be altogether moist and watered above measure with a watery humor: yea, its rine or bark being taken off, all the *ventricles* were full of a limpid or clear water, of which kind of very clear Liquor, there was judged to be more than half a pint.

The Pathologie of the aforesaid Fever.

From these appearances, the *Pathologie* of the aforesaid fever is easily collected: to wit, in this sickness, as also in many others, the blood severishly growing hot, presently depose its recrements, both into the Lungs, and into the brain; wherefore a serous Colluvies, or watry heap, did presently overflow the constitirution of either; then, because the blood being hindred, both here and there, from its due circulation, it

began to grow into a very great heap, about the conſines of the affected parts, and at length to ſtagnate, and to cauſe as it were a *Phlegoſis* or Inflamation: hence by reaſon of the *Serum* being plentifully heaped up in the Lungs, and baked by the heat, the troubleſome cough, with the thick and diſcoloured ſpittle, for the moſt part came in this diſeaſe; and by reaſon of the like affection, excited within the head, the *vertigo*, ſwimming, ſtupifaction, and other *Cephalic* paſſions, conſtantly ſeiſed on the ſick: which kind of Diſtempers in this little Maid, and in her Brother, by reaſon of the infirm conſtitution of the brain, before in either of them, being made more grievous, terminated in an *Apoplexy*. I might eaſily here propoſe many other Hiſtories of perſons ſick of this fever at that time, but from theſe but now recited, the Type of the aforeſaid Diſeaſe may be ſufficiently known: But becauſe the ſame fever happens almoſt every year, on ſome prediſpoſed; and perhaps by reaſon of an evil conſtitution of the year, may hereafter at ſometime become *Epidemical*, it will be worth the while to repreſent ſome Method about its Cure.

The Curatory Method.

Concerning which, firſt of all take notice, that in this fever no Critical days were to be obſerved, as in the vulgar continual fevers: for the blood as ſoon as it began to grow hot, poured out a part of the morbifick matter, as yet crude, and not overcome, from its embrace to the head, or breaſt: wherefore it were vain to expect that the blood ſhould ſuffer the heterogeneous particles to be heaped together, in its maſs to a fulneſs, that from thence a flowring or putting forth ariſing, at the ſet intervals of times, it might thruſt the ſame ſubtilties out of doors: yea rather this growing hot glows not with a great and open burning: but like a fire covered with chips, ſends forth a moiſt ſmoke or breath, rather than a flame: But ſo that from thence by reaſon of the nervous juice being depraved ſoon in its diſpoſition, and not rarely, becauſe of the lungs being ſtuffed with the conſumptive matter, the convulſive or phthiſical or conſumptive ſymptoms, did moleſt chiefly in the whole courſe of the diſeaſe.

Bleod to be taken away at the beginning of the diſeaſe.

It behoves us to deſign the curative Intentions according to the various times of the diſeaſe, and the diverſities of the ſymptoms chiefly urging. About the beginning of this fever the taking away of blood ſeemed convenient almoſt to all. This kind of Remedy I often experienced with ſucceſs in little Children: for that by the means as it were another breathing place is opened to the maſs of blood, ſilently and covertly growing hot, and obtruding its ſoot or ſmoak on the more noble parts; and for that reaſon its impure effloreſcencies or puttings forth are drawn away from the brain and lungs. Therefore altho this fever of an ill Condition may be accounted as it were malignant, yet foraſmuch as the blood is not preſently apt to be coagulated, but to be too much poured forth, and to beſtow its ſeroſities on the nobler parts, to wit, the brain and lungs; therefore *Phlebotomy*, ſo it be adminiſtred in the beginning of the diſeaſe, is convenient almoſt to all.

For the ſame reaſon, *Cathartick* Medicines, and chiefly vomitory, are adminiſtred at the very beginning of the diſeaſe; for theſe do not only evacuate the *viſcera* of concoction, and ſo draw away the chief fomenting of the diſeaſe, and as it were its original, but beſides, they draw forth the ſeroſities from the blood, and ſo effect its cleanſing rather in the ſtomack and inteſtines, than in the head and lungs. Further by Emeticks, for that the receiving *Glandulaes* of the *Lympheducts*, are pulled with a great ſhaking, the ſuperfluities of the nervous juice, leſt they ſhould evilly affect the brain, and its dependencies, are expreſſed forth into the lower bowels: alſo for this end the belly is to be kept continually looſe by the uſe of Clyſters. But in the mean time, whilſt the blood being infected with the taint of this diſeaſe threatens the brain or *præcordia*, with the evil, it will not be faſe to attempt any thing with *Diaphoreticks*, or ſweating medicines, or *Diureticks*, or ſuch as evacuate by urine, or alſo with *Cathartick*s, vomiting and purging medicines: For theſe kind of medicines, foraſmuch as they greatly pour out the blood, and compel its ſeroſities into more open iſſuings forth, all the recrements being apt to fall away from the maſs of the blood are eaſily obtruded on the brain, or lungs, when they are of a more feeble conſtitution: So in the youth abovementioned, a loſs of ſpeech, came upon the raiſing of an untimely ſweat: Alſo I have known that *Sudorificks*, no other than chaley beats in the morbid diſpoſition of the lungs, have brought on a waſting or Conſumption.

Vomits and Purges are to be adminiſtred.

Phlebotomy therefore, and if need be, vomiting or purging either one or other, or both, being to be made uſe of at the beginning of the diſeaſe, the other intentions ſhall be to draw away the morbific ſeroſities of the blood, apt to flow forth on the head or breaſt, and to derive them gently by other ways of evacuation, and to put them forth of doors. To this end *Veſicatories* or bliſtering plaiſters ought to be applyed to the nape of the neck, or *Parotida* or *jugular Arteries*, or to the Arm-pits, or the Groin, or about the Thighs or Calves of the legs, ſometimes in this part, ſometimes in that;

Bliſtering plaſters.

to

to wit, that the little Ulcers being here and there excited, and continually running, might plentifully pour forth the *ſerum*, imbued with the morbid and heterogeneous particles.

Diureticks. But Remedies gently carrying the *ſerum* into the Reins and urinary paſſages, are moſt often adminiſtred with ſucceſs: For this buſineſs, *diuretical Apozems* and *Julups* are to be ordained after the following forms.

A diuretick Apozem. Take of the Roots of *Scorzonera*, *Cherfoil*, *Graſs*, and of *Eryngoes* candied, each ſix Drams, one *Apple* cut, of the leaves of *pimpinel*, *meadow-ſweet*, each one handful; of *Raiſins of the Sun*, an Ounce and a half, of *Harts-horn* burnt two Drams; being cut and bruiſed, let them be boiled on a clear fire, in four pints of ſpring water to the conſumption of the third part; to the ſtraining being cleared two pints, add of the *Syrrup* of *green Cytorns*, or *Violets*, two Ounces, of *Sal prunella* one Dram and a half, make an *Apozem*. The Doſe four to ſix Ounces, thrice in a day.

An Emulſion. Or into that ſtraining, put 15 *blanched ſweet Almonds*, and of the four cold ſeeds, each one Dram; being bruiſed, make an Emulſion according to Art.

Julup. Take water of *Dragons*, and of *black-Cherries*, each four Ounces, of *ſcordium* compound two Drams, of *Threacle* water an Ounce and a half, of *Syrrop of Clove-gilliflowers* two Ounces, of the *ſpirit of Vitriol* twelve drops, make a Julnp.

A Powder. Take oftentimes in a day, in ſmall Beer or Poſſet-drink, half a Dram, or two Scruples of *Sal prunella*.

Gentle Diaphoreticks. Beſides in this Fever, medicines gently ſweating, of that ſort chiefly which reſtores the animal ſpirits, and defends them from any heterogeneous *Copula*, are of very great uſe: wherefore, either the *powder of Pearls*, or the *ſpirit of Harts-horn*, or of *Blood*, in a moderate Doſe, are adminiſtred twice in a day, *viz.* Morning and Evening.

Cliſters. *Cliſters* are to be given almoſt every day; and if it be thought fit, a gently looſning *purge* may be taken once or twice in a week.

Diet. The diet preſcribed ought to be ſlender, as in other Fevers, let them be wholly interdicted from fleſh, or broth made thereof, only let the ſick feed on Grewel, or Barley-broth, and let their drink be ſmall Beer or Poſſet-drink.

If that, notwithſtanding, any preventive Phyſick, the Morbific matter ſhould lodge in the Brain, or Lungs, or both together, ſo that a diſſolution, or inordination of the animal function, or alſo a violent Cough ſhould aſſault them; it muſt be conſider'd, what is to be done in either ſtate of the Diſeaſe, carried forth after this manner into an evil condition; but then the curative Indications ought to reſpect the ſtupor, or madneſs, or cough: and laſtly, if in the declination of the Diſeaſe, theſe ſymptoms do remit, proper Remedies are to be adhibited againſt the *Atrophie*, as it were the laſt fortreſs of this Fever.

The Curatory method in the unſenſibleneſs and madneſs. Firſt, Therefore if the morbific matter, as it is often wont, being brought to the brain, ſhould bring in an inſenſibleneſs, or a ſoporiferous or ſleepy diſtemper, remedies drawing it another way, and deriving it ſome way from the head; and beſides, ſuch as ſtir up the animal ſpirits, and take away the impure *Copula*, ought carefully to be adminiſtred; wherefore in this caſe, the uſe of Epiſpaſticks or ſuch things that draw the water outwardly, ſhould be much increaſed, and let the *ſpirit of Harts-horn* be exhibited almoſt every ſixth hour, in a little bigger Doſe; let blood be alſo taken by the ſucking of Leeches, more largely from the jugular veins, the *Salvatella*, or the ſedal veins. If the Diſtemper remits not, the head being ſhaven, let *Emollient fomentations* be often applied thereto: Further, let *Cupping-Glaſſes*, *Plaiſters* and *Cataplaſms* be laid to the ſoals of the feet, and other means of adminiſtrations, ſuch as are commonly preſcribed for the curing of the ſtupor, or inſenſibleneſs, ought to be uſed: in like manner, if on the evil, or no *Criſis* of this Fever, a Phrenſie, or madneſs ſhould come, Remedies appropriate to thoſe Diſtempers are made uſe of.

In the Cough. Secondly, But if either with, or without this ſort of diſpleaſure brought to the head, the Lungs alſo have taken the evil of this Diſeaſe, ſo that the ſick, not yet free from the Fever, ſeem to fall into a waſting, or Conſumption, with a troubleſome Cough, with abundance of thick, and often diſcoloured ſpittle; Medicines commonly preſcribed for ſuch kind of Diſtempers are convenient enough; wherefore pectoral Decoctions, Electuaries, Syrrops, diſtill'd waters of Milk and Snails, and other Remedies of the like nature, ought diligently to be made uſe of; the forms of which may be found in the before-deſcribed Caſes.

Thus far we have deſcribed the continual Fever, for the moſt part Convulſive, and ariſing no leſs from the fault of the nervous juice, than of the blood: I will here further propoſe an example of a Diſeaſe, having the likeneſs of an intermitting Fever, but radicated chiefly in the nervous juice; the nature of which kind of Diſtemper, for that it is very rare, and truly pertinent to our convulſive *Pathologie*, will appear from the following Hiſtory.

A noted

A very rare Observation.

A noted Woman very young, and indued with a more weak constitution of brain and nervous stock, and for that cause very obnoxious to Convulsive Distempers, after she had conceived with Child, about the fourth month of her being big, from cold being taken, she was grievously afflicted with Astmatical fits; and besides, with a frequent sinking down of her spirits: but by the use of Remedies, indued with a volatile Salt, she grew well within a fortnights space; but after that, about fourteen days, an unwonted and truly admirable Distemper fell upon this Gentlewoman.

One morning, awaking after an unquiet sleep that night, she felt a light shivering in all her body, as if she had had the fit of an Ague: frequent yaunings and reachings, with an endeavour to vomit followed thereupon: then her Urine, which was but now of a citron colour, and of a laudable substance, became pale and wateriſh, and was rendred at every turn, to wit, almost every minute of an hour: moreover, about her loins, and *hypochondria*, and in other places, pains with light Convulsions running about here and there, were excited: which kind of symptoms plainly Convulsive, with her frequent making of a lympid Urine, continued in the Morning almost to the Evening, in which space of time, a great quantity of water, at least three times more than the liquor she had taken, was rendred; in the mean time, neither was the heat great, nor did thirst trouble her, nor was her pulse encreased: In the evening the aforesaid Distempers ceased, and her Urine became citron colour and moderate; and besides, all night she enjoy'd a moderate sleep; then the morning following, about the same hour, the fit returned, accompanied altogether with the like symptoms, and so daily acted the same Tragedy.

The reason of it.

Visiting this Gentlewoman, after she had been sick in this manner for twelve days, I framed the Ætiologie of the aforesaid case, to wit, That this Disease, chiefly radical in the nervous stock, did depend upon the effervescency and flux of the humour, watering the nervous parts: For it might be suspected, that this water being diffused from the blood, made degenerate by reason of the suppression of her Terms, upon the brain and nervous stock, became more sharp and serous than it ought to be, and for that cause incongruous to the containing parts: wherefore, being gathered together to a plenitude, by the nights sleep, it did stir them up or provoke them, for the expulsion of it, every where into wrinklings and contractions: hence shiverings, yaunings, stretchings, and wandring pains were excited in the whole body: Furthermore, from the solid parts, after this manner contracted and shaken, not only the nervous liquor, but also the nutricious every where laid up in the solid parts, but not truly assimilated, were shaken off: and then, either *Latex*, being exterminated from its receptacles, and received by the Veins, or Lymphaducts, or water carrying Vessels, was render'd to the mass of blood: from whose bosome, before it had acquired a lixivial tincture from it, being at last cast forth by the reins, constituted a clear and copious Urine: But that this Distemper observed such exact periods, the reason is, because the nervous water being supplied with an equal dimension, did arise to a fulness of running over, daily at the set time: Therefore also, the Urine appeared concocted and yellow, before and after the fit, because then its matter consisted only from the *serum* of the blood: Afterwards, during the Convulsive fit, the limpid humour being shaken off from the solid and nervous parts, and passing quickly thorow the blood, adulterated the colour and the quantity of the Urine. I prescribed to this big-bellied Woman, Phlebotomie, and besides, a Powder composed out of *Coral*, *Pearls*, *Ivory*, and other *Cardiacks*, to be taken thrice in a day in a proper liquor; morning and evening she took of the *tincture of Antimony* twelve drops (whose singular effect in the too great flux of Urine, I have many times experienced:) By the use of these, all the symptoms ceased in a short time.

CHAP.

CHAPTER IX.

Of Universal Convulsions, which are wont to be excited, because of the Scorbutic disposition of the Nervous juice.

THus much concerning universal Convulsions, diffused thorow the whole nervous kind, which come upon Fevers; and especially concerning the Convulsions which are wont to be excited in the commonly called *malignant hectick Fever*. There yet remains (which was proposed in the third place) for us to shew, by what means, and from what causes, universal Convulsions are induced, without Poyson or Feverish infection, by reason of the scorbutick, or otherwise vitious dyscrasie or evil disposition of the nervous juice. For indeed, the liquor watering both the nerves and the nervous parts, sometimes descending from its natural disposition, is so much stuffed with heterogeneous and explosive Particles, that the animal spirits admitting an incongruous *Copula*, every where growing to themselves, are irritated into continual, as it were, cracklings, or convulsive explosions: These kind of affections of the spirits are either divided or separated, between which no communication or dependency intercedes, *viz.* When many parts of the body are troubled at once with so many Convulsions proper to themselves, which do not come successively one from another, but are terminated in the same muscle or member where they begin: After which manner, I have known some sick people, who have had their Muscles and Tendons all at once in their whole body, perpetually to leap forth with so many distinct Convulsions. Or, Secondly, the Convulsive Distempers, which are excited in the whole nervous kind together, are continued or connex, which succeed one another with a certain perpetual vicissitude continued between themselves: Forasmrch as inordinate motions, almost of all the members, mutually relieving themselves, being risen in one part, presently pass over to others. For so *Horstius* relates of a Maid obnoxious to Convulsive motions, whose Members and Limbs not only were forced into divers manner of flections and distortions; but besides, as if agitated by an evil spirit, not being able to stand in a place, she was necessitated to run up and down here and there, and to dance and leap in the Hot-house; nor could be hindred from it by any force or chiding, but that she would run here and there; now she would cast her self on her feet, now impetuously fling her self after another manner; for if she did endeavour never so little to be quiet, presently her *Præcordia* was most grievously afflicted. Wherefore, the business of our present task is, to enquire a little more exactly into the nature and causes of either Convulsive affection, to wit, both of that which is affected through the very much leaping of the Tendons and Muscles together; and of this, which is caused through the madness and inquietudes of the members of the whole body: that from thence it may appear, what method of healing ought to be administred in either case.

Universal Convulsions by reason of the Scorbutic disposition of the nervous juice.

Two kinds of these, viz. Separate, and connex or joyned together.

As to the former kind, it easily appears, that these kind of Distempers are not simple, but complicated, to wit, of a Convulsion and Palsie. For the Muscles and Tendons are perpetually urged with Convulsive motions, notwithstanding, the sick being made weak, they are not able strongly to move any of their members, or their whole body: yea, to these Distempers, pains equally diffused thorow all their Limbs are adjoyned. Hence we may infer, that the animal spirits are imbued with a manifold *Copula*, *viz.* both with explosive, and also narcotick or stupifying, and in some sort irritative or provoking Particles: so that, although being alway burthened, they enter into explosions, yet, not many together, nor indeed any hastily or strongly are exploded, by reason of the other interjected Particles of another kind; wherefore the motive force does not long continue, but is short, and as it were interrupted: just as if Gun-powder being kneeded with some muddy substance, should be fired: for then the whole mass is not let off at once, with a noise, nor does one heap presently fire another, but a few grains only, and those successively, to wit, one a little while after another, with small crackling noises, are let off or exploded: In like manner the nervous liquor is stuffed thorowout with Convulsive particles, which even cleave to the spirits: but forasmuch, as some narcotick, and other painful ones are mingled with them, the elastick force of the former, however lasting, and greatly diffused, is yet much broken, and every where cut off.

The nature of the broken Convulsive distemper.

For

An Observation. For the illustrating this kind of broken convulsive Distemper, I will here describe a very notable case of a certain Gentleman lately living in this neighbourhood: which being truly admirable, not any writings or observations of Physitians have scarce shewed the like. An honourable Gentleman, whom I knew, sprung from Parents and Grand fathers obnoxious to a someways morbid dispostion, either of the brain or nerves, about the hight or beyond the strength of his Age, the fruit of this diseased race began to punish him: for first of all, he was wont to be tormented with a debility and numbness of his Limbs, and with light Convulsions; with which kind of Distempers, when he had a while laboured, at length for cure sake going to the Bath, having used too much the hot Baths, instead of a remedy, he brought back only an exasperation of the Disease, that from that time the aforesaid symptoms did not any more torment him by fits, but almost continually, to wit, the Convulsive motions, and painful extensions, did incessantly exercise every Limb, yea, every part of his Body, so that all the muscles were perpetually drawn together, with repeated leapings all at once, and that not without great torment: The only means he had for quieting them, was to exercise his whole body, sometimes some of his members, perpetually with a local motion: for so long as he was awake, he was necessitated to be rock'd in his Bed, or on his Couch, or to be carried in a Coach, or to have his members press'd or rubb'd; for which end they had made for him a Bed, and a Chair set upon bow-fashion'd feet, such as are on Childrens Cradles, in which, when he lay down or sat upright, he was moved up and down continually, with a tottering or rocking motion; which unless he did, he was infested with most cruel pain, and horrid extensions of his muscles: This kind of daily trouble of the Convulsive Distemper, in the night-time, and presently after sleep, entertain'd much more grievous symptoms: for being newly awaked, his whole body presently was wont to quake, his muscles to be exercised with painful stretchings, every Limb to be wetted with a squalid or ill-favour'd sweat, as if in the agony of death, which was so very Corrosive, that, like *aqua fortis*, unless they presently wiped it off, it quickly eat and rotted the Linen. The sick man, during this conflict, was tormented for many hours, between the sweats and shiverings, until being quite tired out, sleep creeping upon him, brought him some ease; but if at the approach of the fit, he was presently taken out of his Bed, he was better, and so prevented the wonted cruelty of the Distemper: Therefore, as soon as he was awaked from sleep, though it hapned within half an hour, immediately to avoid the torture, his servants being called, they took him out of his Bed: As to his Appetite he was well enough, he eat without loathing, nor was his stomach disturb'd with what he eat: But he did often complain of the pain of the heart, and sometimes a troublesome spitting, with a stink in his mouth, as if he had taken *Mercury*, molested him for many days. All hot things, whether Food or Physick, did not agree with his constitution; he did not dare to taste, either Wine, or strong Beer. In the first years of his sickness he abhor'd the very sight of the fire, afterwards becoming weaker, though the winter was sharp he would not sit near the Chimney; his Urine was always of a citron colour, which if it were evaporated in an earthen vessel, over hot coals, saltish fæculencies remained in the bottom, to above half the liquor; his belly was continually bound, and never put forth its load, unless provoked by a Purge or Clister: Yea, besides the Convulsive motions, a spurious Palsie possessed every member of hiswhole Body; for he could not lift up his hand, nor step a foot forward; his tongue shaking, brought forth his words but imperfect; but sometimes, when his mind was carried forth by some sudden occasion of joy, he would be able, his spirits being raised with a wonderful strength, suddenly to rise out of his Chair, and without the help of another, to stand upright, and to jump, which interval however lasted scarce a minute of an hour, but that his members flagg'd, and were affected with their wonted languor and trembling. When this worthy Gentleman had been sick after this manner above twelve years, and had consulted the most famous Physitians in all *England*, and had tried very many Remedies, and almost of every kind, *viz.* Antiparalytick, Antiscorbutick, drying Diets, sweating Medicines, Purges, Causticks, Baths, Liniments, yea, and had twice tried Salivation, could find no cure by any method of healing; wherefore, all hope of cure being wholly laid aside, for the latter seven years of his life, he made use of only Remedies, chiefly respecting some symptoms, *viz.* he took thrice in a week a solutive Medicine of *Senna* and *Rubarb* with correctives, now in form of a Syrrop, or of an extract another time; every night he was wont to take a Dose of an opiate, out of conserves, and temperate *Species*: Besides, as occasions served, he had ready a Julup, to be taken when his spirits fainted: moreover, he continually drank Beer made of Oaten Mault, altered with temperate and diurerical herbs. By the use of these he pass'd over at least seven years, without any great alteration for the worse; at length, old age coming on him,

together

together with the Diſeaſe, more cruel fits of Convulſions, not as at firſt after ſleep, but as ſoon as he was warm in his bed, invaded him, that he was forced to abſtain altogether from his Bed, and rarely put off his clothes, unleſs to ſhift his Linen: from hence tranſpiration being hindred, the ſerous recrements, and others wont to be evaporated; were fixed on the Lungs, which at firſt brought in a frequent or ſhort breathing, afterwards an Aſthmatical Diſtemper; and laſtly, a deadly conſumption or waſting.

The reaſons of the ſymptoms chiefly tormenting.

If the reaſons of the aforeſaid ſymptoms be ſought after, it will be eaſie to deduce all theſe evils from a depraved conſtitution of the Brain and Nervous ſtock, and more immediately from the diſcraſie, and fault of the juice watering thoſe parts. For when that Liquor, in which the animal ſpirits do abound, was, as to its temper, highly ſharp and corroſive, like *Stygian* water; and as to its mixion, was ſtuffed full of both narcotick and exploſive Particles, it is no wonder, becauſe the ſpirits being very much burthened, and for that cauſe reſtrained from their due expanſion, that they ſhould be forced every where into ſmall exploſions, as it were cracklings; and that the containing bodies, being looſed from their due extenſion and ſtrength, ſhould be alſo continually irritated into painful corrugations or ſhrinkings up.

The growing worſe preſently after ſleep, whence it proceeded.

Thoſe Convulſive Diſtempers did more ſharply infeſt after ſleep, becauſe the heat of the Bed, did exuſcitate or ſtir up the heterogeneous Particles of the nervous juice, and rarifying them, as it were, compell'd them into exploſions; then alſo, becauſe the nervous parts did imbibe its juice in ſleep, and a more plentiful proviſion of the morbific matter, brought together with it; which being filled to a plenitude, at the firſt inſtant of waking, they immediately endeavour to ſhake off what is troubleſome. For this reaſon it is obſerved, that the pains of Scorbutical people, and the fits of Aſthmatical, are made worſe by the heat of the Bed, and by ſleep; therefore as in theſe, preſently to leave the bed, was wont to give eaſe, ſo likewiſe it did in our ſick man: But that the trouble, excited by the continual leapings, and painful extentions of the muſcles, was ſomewhat allayed by the local motion, or moving from one place to another of the body, or members; the reaſon is, becauſe the animal ſpirits, whilſt they are compelled to divers actions from without, they remit whatſoever inordinations are excited from within: for as in pain, and itching, which are lighter Convulſions, it helps, to preſs, rub, or ſcratch the affected part; ſo the Convulſive motions of the muſcles and tendons, are ſomewhat pleaſed, by the inordinate agitation of the whole body, or the members.

Why allayed by motion.

The ſpitting.

As to the *Ptyaliſmus*, or copious ſpitting, with the ſtinking breath, which was wont to return at uncertain intervals, we do ſuppoſe that might perchance proceed from *Mercury* ſometime ſecretly given, although I have ſeen many labouring both with Convulſive, and alſo Scorbutick Diſtempers, in whom this kind of perpetual defluxion of ſpittle from the mouth was very troubleſome, without any ſuſpition of *Mercury*; alſo ſome (as ſhall be told hereafter) on whom a ſalivation coming (the exploſive matter being after this manner critically evacuated) help'd the Diſeaſe: moreover, it is likely that this Diſtemper was produced from the meer recrements of the nervous juice; and that the ſalival paſſages, when many, and enough were open, did receive, and convey forth of doors, the ſuperfluities plentifully depoſited in the *Glandula's*, from the Nerves, and alſo from the Arteries.

Why this ſick man obtained ſome truce from pains.

As to the lucid intervals, whereby the ſick man us'd to obtain ſome truces, though ſhort, the cruelties as it were of the Diſeaſe being mitigated, as when but now his ſickneſs had bound him to his chair, he was able on a ſudden to leap up, and walk about; but yet, this unlook'd-for ſtrength being vaniſh'd, by and by falling again into his wonted languiſhment: I ſay, theſe kind of motions of labouring Nature, proſtrate under a great burthen, are its utmoſt endeavours, and ſome more ſtrong inforcements, to wit, whereby for a moment of time ſhe recollects her ſelf, and attempts as it were to ſhake off the yoak of the Diſeaſe; but becauſe ſhe is not able to ſuſtain long this ſtrife, ſhe quickly relapſes, and lies down under her former burthen. Truly it is a wonder, how much above the ſtrength of Nature, Anger, and Fear, and ſome other Paſſions of the mind, do ſtretch the nervous kind, and compel them to ſhew a force plainly ſtupendious: But theſe prodigies of her attempts, are only of a ſmall duration.

The ſecret leading cauſe of the aforeſaid diſtemper.

The conjunct cauſe of the aforeſaid Diſeaſe being after this manner deſigned, and the reaſons of the ſymptoms chiefly tormenting, being ſhown, it remains yet for us to inquire into the leading cauſe; to wit, by what occaſions the nervous juice being become ſo degenerate, at firſt brings in the Palſie, and then leapings, or inteſtine Convulſions of all the muſcles: further, we ought to explain wherefore the fruits of this Diſeaſe, increaſing by little and little, came ſuddenly to maturity, by the uſe of the Baths; alſo wherefore this ſickneſs yielding to no Remedies, became uncurable.

As to the firſt, it may be ſaid, that the ſick Perſon, being ſprung from Parents who were obnoxious greatly to Cephalic Diſeaſes, had contracted originally an evil Conſtitution of the brain and nervous ſtock, ſo that within the 6th luſtre (*i. e.* about the 36th year) of his Age, he began to be ſick of a ſpurious Palſie, then, when the evident cauſes daily fixing the infection more on the blood and humors, did happen upon this remote hereditary cauſe (for there were many chances and unfortunate accidents, which continiually brought ſadneſs, and melancholly upon this Gentleman) indeed therefore, the nervous Liquor being imbued above meaſure, with a fixed and Scorbutic ſalt, became highly ſharp and irritative, like *aqua fortis*, or the Stagma's of *Vitriol*; and ſo continually incited the Spirits, and the bodies containing them into corrugations and contractions, juſt as the aforeſaid Liquors when poured upon worms do the ſame thing.

Why this Diſtemper grew worſe by the uſe of the Baths.

But that this diſeaſe, leaſurely at firſt increaſing, was quickly brought into a much worſe condition, by the uſe of the hot baths, the reaſon eaſily appears: It is known by experience, that the hot Baths do very much exalt and quickly bring to the height, the Sulphureous-ſaline particles in the humane body, and otherwiſe morbid, which abound in the bowels and humors, *viz.* do render them more fierce by agitating them throughly, and force them from their firſt paſſages into the blood, and from thence into the brain and nervous ſtock, yea, and joyn together thoſe that were before ſeperate, and idle, and incite them into a certain fermentation: wherefore, thoſe who are hereditarily obnoxious to the *Gout* or *Stone*, and have not as yet ſuffered any fits of thoſe diſtempers, very often feel the fruit of either diſeaſe in themſelves to grow ripe ſoon by the uſe of the Baths: when therefore in this ſick perſon, both the blood and Liquor watering the Brain and Nerves, were imbued both with narcotick or ſtupifying, and convulſive particles; and alſo when they did degenerate from their ſweet and Balſamy Diſpoſition that towards a ſaltiſh, and this into a ſour, *Ciæmul* of a *Stagma* of *Vitriol*, the uſe of the hot mineral waters was ſo far from bringing help, that on the contrary, theſe evils, for that very cauſe, preſently grew all very much worſe: and the Diſeaſe, proceeding from the humors being ſo depraved, as to their temper and mixture, could never be cured by any medicines, no eaſier than vinegar may be reduced into wine.

When this Gentlemans body, being at laſt dead of the *Phthiſis* or *Conſumption*, was opened by me, we could find but very few foot-ſteps of theſe kind of moſt grievous Symptoms. Hence, as it appeared, the *Palſie* and *Convulſion*, did not depend ſo much on a thick and copious matter, heaped together ſomewhere in mines, as of an evil affection of the animal Spirits, who are ſubtle and inviſible. I will lay forth, what was worthy taking notice of in the Anatomy of this Perſon.

Things worthy to be noted in the body being diſſected.

The *Abdomen* being opened, the *Caule* (as is wont to be in moſt who die of a Conſumption, and other Chronical Diſeaſes) was putrified and almoſt conſumed. In the mean time, the *Ventricle*, *Inteſtines*, *Pancreas*, *and Meſentery*, were well enough, to wit, the membranes were firm, well-coloured, and free from any ulcer, or hard ſwelling: There grew to the greater inteſtines certain excreſcencies, like to the ears of a mouſe; for that there were very many of theſe kind of things out of either ſide of the *Colon*, and right inteſtine, they ſhewed like twins at certain diſtances, like the branches of trees: The like I formerly found in a conſumptive Perſon: The Reaſon of this ſeems to be, that the nouriſhment in Conſumptive people, (tho it be deficient about the more ſolid, and outward parts, yet ſometimes) within near the fountains of the nouriſhing juice, performs more than it ought, and for that cauſe, ſuperfluous and unnatural additions grow forth.

The milt or ſpleen, which always is thought ill of, and of moſt Phyſitians condemned, for being the principal cauſe of the Scurvy, and of all other diſtempers, appear altogether blameleſs, and free from any fault: For, as in moſt ſound people, we obſerved, it was of a darkiſh Colour, ſoft, and of an equal *ſuperficies*, free from any obſtruction, or ſwelling, indued with veſſels, and fibres, diſtinct, and firm enough: out of its ſubſtance, flowed black blood when it was cut.

The Liver, (which indeed might be wondred at) was indifferently well, neither was it, from ſo long and grievous a ſickneſs, become harder than uſual, or ſcirrhous, or planted with little whelks, but it was ſomewhat big, and of a darkiſh colour.

The Kidneys, tho free from any ulcer, or gravel, were not however free from fault: for in the middle of the right Kidney, was ſeen a great cavity, diſtinct from the Tunnel, and much greater than it, full of clear water; the like I have very often found in hydropical people: But indeed, this perhaps aroſe from the *ſerum* depoſited in that kidney, that could not eaſily be ſtrained thorow its paſſages and pores; for that the *ſerum* ſubſiſting therein, had in the beginning made for it ſelf a little den, which afterwards

by

by degres was inlarged; and when for this reaſon, the ſecretion of the *ſerum*, and its paſſing forth by the *ureter* were ſomething hindred, its *Latex* reſtagnating into the blood, brought in the grievous trouble to the head; which indeed, was the rather to be ſuſpected, becauſe alſo the left Kidney being mightily extenuated and conſumed, contained many ciſterns and cavities full of clear water.

The Lungs growing on every ſide to the *Sternum*, (or part of the breaſt where the ribs meet) ſides, and *Diaphragma*, ſeem'd without any diſtinction of *Lobes*, of one ſubſtance only of putrid ſpongy fleſh, ſtuffed throughout with a frothy or ichorous matter: without doubt, the ſick man had not contracted this evil ſo long before, to wit, when he was not able to perform any exerciſe of the body, nor ſtay in bed that it might breathe out any thing more freely; the feculencies and recrements of the blood, which were wont to evaporate thorow the skin, being laid up in the Lungs, were the cauſe that they grew together among themſelves, and with other parts, and did vitiate their tone and conformation wholly, ſo that a Conſumption being at laſt ariſen, was the effect and product, and not the cauſe of the reſt of the Diſtempers wherewith he had been a long while miſerably afflicted.

In either ventricle of the heart, blood was concreted into a ſolid whitiſh ſubſtance, and baked like fleſh; which being formed near the cavities and proceſſes of the veſſels of the heart, reſembled the figure of a Serpent, with a manifold divided tail: than which indeed nothing is more uſual, in many dead People after long ſickneſs: The reaſon of which is, that the blood being without life, from long ſickneſs, and from thence circulated ſlowly about the *Præcordia*, begins to ſtand or ſtagnate in the heart, and depending veſſels, and by that means is congealed leaſurely into this kind of fleſhy concrete.

When the Skull was opened, we ſought among its contents, the chief cauſe of the Diſeaſe: The firſt thing that occurr'd was, the bulk of the brain was leſs than it ſhould be, and folded into fewer folds, from whence we ſuſpected, that the animal ſpirits were not plentifully enough brought forth: Further, the whole ſubſtance of the head was more moiſt than it ought to be, and wholly immerſed in a wet watery humor; that its covering, *viz.* the whole meninges were pulled aſunder, and the compaſſing or crevices, and all the ventricles run over with clear water. 'Tis probable, that this deluge of the brain had lately happned, to wit, foraſmuch, as by reaſon perſpiration being hindred, and the ſecretion of Urine being but little, the ſeroſities gathered together in the bloody maſs, were carried to the head, and therefore the ſubſtance of the brain, and eſpecially the chancelled or chequer'd bodies were ſo wholly wetted and ſoked, that being cut, their ſubſtance could ſcarce remain compacted, but that it would flow away, ſomewhat after the manner of thick liquids: within the boſoms overlying and inſerted to the brain and its *appendix*, and the veſſels coming from them, the blood had concreted into little, round, hard, and as it were fleſhy balls, juſt like thoſe within the ventricles of the heart, and the veſſels hanging to them, which alſo lately, when the blood circulated ſlowly, we thought might happen for the ſame reaſon, for which the blood was coagulated within the *Præcordia*.

The trunk of the ſpinal marrow being drowned in clear water, was very much extenuated, that it could ſcarce fill half of the bony cavity or hollowneſs: which we thought to be effected by the deluge of ſalt *Serum*, in which it was as it were boiled.

The nature and the manner of the continued convulſive diſtemper being made.

So much concerning univerſal Convulſions, which being very much conjoyned with the Paralitick Diſtemper, are excited dividedly in many parts at once: There remains others which we call'd continued, becauſe being ſuddenly tranſlated from ſome parts to others, they mutually relieve one another, and compel the members, now theſe, now thoſe, and often the whole body, to be involuntarily moved, and diverſly bended or agitated. In theſe caſes the animal ſpirits, not only thoſe implanted in private corners, and mines, get to themſelves an exploſive *Copula*; and being ſome how ſatisfied or irritated, ſtrike it off by certain turns; but when the whole maſs of the nervous Liquor, abundantly abounds with elaſtick particles, they then every where cleaving to both the ſpirits implanted and flowing in, for that reaſon ſtir them up into continual Convulſions: But foraſmuch, as not all the ſpirits at once are not able, however prediſpoſed, to be exploded, (becauſe within the nervous paſſages there is not room large enough for their ſo great agitations) therefore the exploſive force ariſing in theſe, or thoſe parts, is by and by tranſfer'd from thence unto others, and ſo to others, and ſo like fire-drakes, or wild-fire, it runs wandringly here and there, moſt ſwiftly creeping from theſe Limbs to thoſe, and then preſently from all into the *Præcordia* or *Viſcera*, and back again. That the Image of thoſe kind of Diſtempers may be known, we will here propoſe ſome more rare caſes, of ſick perſons, whom ſometime paſt I endeavoured to cure.

1. *Obſervation* A very fine and religious maid, tall and ſlender, begot of a Father ſickly and obnoxious to moſt grievous Diſtempers of the nervous kind, about the 20th year of her Age, was afflicted for many days with an head-aeh, very cruel and periodical; at length, at that time of the winter ſolſtice, 1656. the pain of her head ceaſed, but inſtead of it, a mighty Catarrh followed, with a thin and copious ſpitting, alſo an ulcerous diſtemper of the noſe and throat; when ſhe had for ſome time endured this trouble, at length, by the preſcript of a certain Woman, receiving the fume of *Amber* by a tunnel into her mouth, ſhe was ſuddenly cured, to wit, the Catarrh, or violent Rhume ceaſed ſuddenly, but from thence ſhe complained of a notable *Virtego*, with a pain in the head, and of the tingling noiſe of the ears: on the Third Day, the tendons of the hinder part of her neck, were pulled together, that her head was bended now forward, now backward, and now of one ſide, ſometime it continued ſtiff and unmovable; a little after this, the ſame kind of Convulſive Diſtemper invaded the outward members and Limbs of the whole body, her arms and hands were wonderfully turned about, that no jugler or tumbler could imitate their bendings, and rollings about; ſhe was neceſſitated to ſpread abroad her leggs, and feet, here and there, to ſtrike them againſt one another, and to tranſpoſe or croſs them by turns: After this manner either ſitting in a Chair, or lying in a Bed ſhe was perpetually afflicted with theſe Convulſive motions, unleſs when overwhelmed with ſleep; and when ſhe did a little reſtrain her members from the great labour of the Muſcles, preſently ſhe was taken with a difficult and ſhort-breathing with a ſenſe of Choaking; but in the mean time, her eyes, jaws, mouth, and lower bowels, remained free from any Convulſion; neither was ſhe troubled with vomiting, belching, nor any inflation of the belly and *hypochondria*: Beſides ſhe was ſtill her ſelf, and had truly the uſe of her memory, underſtanding, and phantaſie, ſhe did, nor ſaid any thing madly or fooliſhly: but in theſe wonderful evils ſhe ſhewed an admirable example of Chriſtian fortitude and patience, even with godly and diſcreet ſpeeches; her appetite was ſoon loſt, ſo that ſhe took any meat or aliment very unwillingly; thirſt continually troubled her, and her ſtrength was grown ſo feeble, that ſhe could not ſtand or walk, her urine was of a Citron colour, very full of ſaltneſs, on whoſe *ſuperficies* grew little tararous skins.

When I was ſent for to this Gentlewoman, on the Sixth Day of her Sickneſs, I framed the Ætiology of this kind of admirable diſtemper: For the conſideration of her father, who at that time was ſick in the ſame houſe, with moſt grievous Convulſive paſſions, kept me, that I did not with many others, refer all things to the deluſions of witches: wherefore, that I might ſeek out the natural cauſes of theſe Symptoms, it was in the firſt place plainly to be ſuſpected that this Gentlewoman had contracted hereditar-i ly the ſeeds of Convulſive Diſtempers, which at length, about the flower of her age, broke forth into this kind of fruit: for when her blood was very much imbued with heterogeneous exploſive particles, they at length (as is wont in ſuch a diſpoſition) began to be poured into the head, and there to be fixed: being therefore firſt depoſited in the *Meningæ*, they induced the huge periodical head-ach; then afterwards, the ſame matter having accidentally ſhifted its place, falling down into the ſinks of the throat and mouth, changed the *Cephalage* or head-ach, into a *Catarrh* or *Rhume*: and when laſtly by an untimely uſe of the adminiſtred remedy, the defluxion ſtopped, the morbifick matter flowing back into the brain, brought the *Vertigo*, and then, being thruſt forth on the nervous ſtock, it excited the aforeſaid Convulſive Affections.

The reaſon of the aforeſaid cauſe. As to the formal Reaſon, or the means of generation, whereby the Convulſive matter, falling down into the nervous ſtock, did produce theſe admirable Symptoms, we may lawfully ſuppoſe, that the ſame being thruſt forth from the Confines of the head, being yet more firm, into the ſpinal marrow, and its *Appendix*; and being like a malignant ferment, it firſt infected with heterogeneous and highly exploſive particles, theſe parts of the juice watering the whole maſs; which cleaving to the ſpirits, every where diſpoſed thorow their whole *ſeries*, and agitating them, as it were with a certain fury, did ſtir them up into continual exploſions: When in truth, the nervous juice, as is ſaid, was ſo fermented by the inflowing of the Convulſive matter, that which did otherways water the containing parts, with a gentle falling on them, and through the ſame did paſs over the animal ſpirits, with an equal expanſion; now the ſame did torment the nervous fibres, with various contractions and corrugations or ſhrinkings up, and did hinder both the ſpirits flowing in, being too much burthened with an heterogeneous *Copula*, from their due irradiation, and alſo variouſly moving thoſe implanted in every part, did incite them, as it were with a diabolical Inſpiration, ſo that no more obeying the Empire of the will, they ran into inordinate motions, and did renew them, tranſlated rapidly here and there, with a perpetual reciprocation.

But, altho the heterogeneous particles, being poured forth with the blood into the brain, and thence thruſt forth into the nervous ſtock, did not enter rightly the beginnings of all the Nerves, but chiefly, and almoſt only, the ſpinal marrow, and its nervous ſhoots; ſo that the internal *Viſcera*, alſo the parts of the eyes, mouth, and face, remained free from any Convulſion: yet, that ſame explofive force being hindred by ſome violence, whereby it entred leſs in the outward members, preſently like wild-fire, a way being found, it was wont to run into the *Præcordia*, and bowels of the lower belly, *viz.* becauſe the inflowing ſpirits being ſtruck with a certain fury, and requiring a larger ſpace, in which they might exerciſe their madneſs; being excluded from one place, preſently enter another ſomewhere open: wherefore, if that fury had been repulſed both from the members, and the *Viſcera*, no doubt but it would have flown back on the brain, and brought thither madneſs, or as it were an epileptical inſenſibleneſs: which ſymptoms indeed hapned to be wanting, for that the brain of this moſt ingenious Gentlewoman, being indued with a more firm conſtitution, did take from the nervous liquor freſhly inſtilled, whatſoever was congruous and ſpiritous, for its proper food, and enjoy'd it: in the mean time, it did depreſs all the morbific particles, into the ſpinal marrow, by which the involuntary motions of the members were excited, after that manner as we ſaid but now.

The Curatory Method Obſerved in this caſe.

Being requeſted to undertake the cure of this worthy Virgin; firſt, a light preparation of her body being made, I gave her a ſolutive potion of the infuſion of *Senna* and *Rhubarb*, with *yellow Sanders* and *ſalt of Wormwood* added to it, by which ſhe was purged twelve times with great eaſe; the next day I took eight Ounces of blood from her left Arm, every evening I gave her an opiate of the water, and Syrrop of the *flowers of Lungwort*, with the *powder of Pearls*: beſides, once within ſix hours, I preſcribed her to take a doſe of the *ſpirits of Harts-horn*, in a draught of the following Julup: Take of the *waters of black-Cherries*, *Walnuts*, and the *flowers of Pæony*, each three Ounces, of the Antipeleptic of *Langius* two Ounces, of the *Syrrop of the flowers of the Male-Pæony* two ounces, of the *powder of Pearls* one Scruple, mix it, and make a Julup: becauſe ſhe could not endure much purging, *Cliſters* with Sugar'd milk were made uſe of frequently: beſides antiſpaſmodic Ointments being applied to the hinder part of her neck, and the back-bone, we ordered often rubbing of the diſtempered members, with warm Wollen cloths wetted in proper Oil.

By the uſe of theſe the ſick perſon within ſix days ſeemed to be very much helped; for the Convulſive motions almoſt wholly ceaſed, and ſhe could contain her members quietly in their due poſition, only her head ſometimes by a lighter contraction was compelled to bend gently this way and that way; further ſhe was able to ſtand a little, and riſe out of her Chair; but when ſhe went to ſtep forward, ſhe went not rightly, but obliquely on one ſide: At this time going away, I left her much better, and in a manifeſt ſtate of growing well: But after another week, when the North-wind being high, and ariſen in night-time, the Window not being faſt ſhut, blew very much upon the ſick perſon being in Bed, ſhe preſently taking cold, relapſed into that kind of condition, that ſhe became obnoxious not only to Convulſive paſſions, but to an uniuerſal periodical Palſie: for after that ſhe was forced to move about, turn, and wind variouſly, all her Limbs ſucceſſively, with her head, and members by turns, bent, and thrown about here and there (as before) from morning to night; till at night theſe kind of motions wholly ceaſing, a reſolution of her members, or palſie ſucceeded, ſo that ſhe was not able to ſtir either hand or foot, or any other part of her body beſides, or to exerciſe any motive bending of the body, lying in her bed almoſt immovable like a ſtone; but being a little refreſhed with ſleep, about morning, as ſhe recovered ſome little ſtrength or virtue of the regular motive faculty, by bending, tho but weakly here and there, her arms, and legs, ſo alſo the involuntary and convulſive motions did conſtantly return, enduring from that time all the day, which again at the evening were changed into theſe reſolutions of the Limbs.

By theſe it appears clearly, that the ſick Gentlewoman laboured with a twofold Diſeaſe, *viz.* a Palſie, and Convulſion, and that the material cauſe of either, was ſomewhat diſtinct: For it ſeems, that the animal ſpirits every where abounding, being burdened with narcotick particles, were almoſt continually bound: beſides that, in the time of ſleeping, together with the nervous juice, the Convulſive particles plentifully flowing in, clove alſo to the ſpirits: for the explofions of which, the ſpirits being incited, produced the involuntary motions: but alſo at that time, the narcotic *Copula* being ſomewhat ſhaken off, they were then able in ſome ſort to perform the voluntary or regular alſo: Beſides the Remedies but now recited, they did carefully adminiſter very many others, almoſt of every kind, *viz.* Antiſcorbuticks, Antiparaleticks, Decoctions, Sudorificks, or ſweating Medicines, diſtilled Waters, Spirits, Elixirs, Tincture, Baths, Liniments,

Liniments, with many others; by the uſe of which, the ſymptoms were ſomething remitted, but yet the Diſeaſe was not wholly cured, the univerſal Palſie ſoon ceaſed, that ſhe was able at any time to move her Limbs, and to bend them here and there; and alſo the involuntary motions did trouble her but rarely, yet ſhe continued languiſhing and weak; and when ſhe being of a more fine temper, and prone to a Conſumption, by reaſon tranſpiration was hindred, the recrements of the bloods being laid up in the Lungs, brought in a Cough, which every day growing worſe, ſhe at length died of a *Phthiſis* or waſting.

2. *Obſervation.* Some years ſince, I was ſent for to a Noble Virgin, ſick almoſt after the ſame manner, and ſometimes worſe: For this ſuffer'd almoſt perpetually, coming by turns, involuntary motions, to wit, ſhakings of the head and members, or deflections or movings about here and there: beſides, ſhe was afflicted with an exceeding troubleſome and plainly wonderful Convulſion of the *Diaphragma* and muſcles ſerving for breathing: for every minute of an hour, and oftner, her back-bone was ſuddenly bent in about its middle, and together her breaſt ſhooting out forward, and her *hypochondria* being drawn inwards, ſhe made a noiſie ſobbing, now double, now threefold, but ſtill with a leſs and leſs noiſe: this kind of motion, and ebbing of a craſhing noiſe, was wont to come for many hours, and ſo that ſhe might be heard through the whole houſe; and when any ſhort interval of this hapned, ſhe was compelled preſently to ſhake, or writhe together extreamly her arms and hands, and ſometimes her legs and feet, and alſo to fling about moſt furiouſly her head, and by and by to hold her neck, as it were ſtiff, and immovoble: and then in ſpeaking, her tongue would be taken after that manner that ſhe would repeat the ſame word very often, yea ſometimes twenty times at leaſt: when the Convulſive motions tormented her ſtrongly in her outward members, ſhe was free for a little while from that throatling and noiſie Diſtemper; and this ſpace of intermiſſion ſhe called her time of eaſe; tho in the mean time her head and members were carried violently here and there, with Convulſive motions: if at any time ſhe lay on her left ſide, preſently a contraction of her right *hypochondrium* inwards, with a ſobbing or throatling, vexed her. Within a few day, her ſtrength being very much loſt by the aſſiduity of the paſſions, ſhe contracted ſo great an imbecility in her loins and joynts of her legs, that ſhe could not ſtand, nor lean on her feet: her ſtomach, diſtempered either with weakneſs or the convulſion, returned back whatever was put into it, by vomit.

The nature and cauſe of the deſcribed caſe. In this caſe, as in the former, it appears clearly, that the animal ſpirits, not only thoſe implanted in this or that part or region, had contracted an heterogeneous *Copula* to be ſhaken off by ſome turns, but alſo the ſpirits influencing ſome nerves, being imbued with exploſive particles, had brought in the perpetual and wandring Convulſive motions. And when at firſt it hapned that the ſpirits ſo afflicted did aſſault not all the nerves together, nor any indifferently, but for the moſt part only thoſe belonging to the *Diaphragma*, and the *Appendixes* of the ſpinal marrow, ſo that within thoſe ſpaces the fury of the ſpirits, perpetually exploſing, was limitted; for this reaſon it hapned that the Convulſive affections being reſtrained in any one of thoſe parts, did break forth more furiouſly ſtraight in another; and when by their proper inſtinct, their motive force was implyoed in one region, the ſame was in the mean time wont to be remitted in another. Moreover, in this ſick perſon, the morbific matter conſiſting both of narcotick and convulſive particles, cauſed together the paralitick and convulſive Diſtemper.

Coming to her on the fourth day, I gave her an Emetick potion, by which ſhe vomited ſeven times abundance of ropy phlegm, with yellow choller, yet without any eaſe: on the next day I took ſix Ounces of blood from her left Arm, preſently from thence the blood being more impetuouſly carried towards the head, ſhe complained mightily of an headach, and giddineſs; But within three days, ſhe being let blood in the foot, found her ſelf better: ſhe afterwards took Remedies for the Diſtempers of the nerves, to wit, *ſpirits of Harts-horn*, and of *Blood*, *Bezoartick* and *ſhelly Powders*, *Julups*, and *Electuaries*, Antiſpaſmodical: by the uſe of theſe the ſymptoms ſeemed to be ſomething remitted, but yet they remained ſomewhat after the manner but now deſcribed: After a fortnight, by the preſcription of a certain Country-Woman, ſhe took in a draught of Beer, ſix ſpoonfuls of *blood* taken from the ear of an Aſſe, by which ſhe ſeem'd on a ſudden to be cured: for forthwith all the Convulſive motions did leave, and ſhe remained free from them 24 hours; but yet the Diſeaſe returning the next day, with its wonted fierceneſs, would not give place neither to that Remedy, nor indeed eaſily to any others: ſhe therefore for the future, took Medicines methodically preſcribed: Once within ſix days ſhe was gently purged, beſides ſhe took the Powder compoſed of *Bezoar*, *Pearls*, and *Coral*, with the roots and ſeeds of *Pæony*, alſo an Electuary,

ctuary, prescribed by *Horstius* for these kind of admirable Convulsions; also *Julup*, and *decoctions*, proper in convulsive Distempers: *Clisters* were often used, frictious ointments, and vesicatories were administred with success: within another week the sobbing affection wholly ceased, and likewise the other Convulsive motions being grown more gentle by degrees, very much remitted: growing well of these Distempers, a *Cathar* falling down in her throat, she was so much troubled, that she almost continually spit forth a sharp, and as it were corrosive spittle, as if she had had a salivation by taking *Mercury*: which kind of Remedy, indeed, hath been found to have been the last event in this case: but I wholly abstained from administring it, because both the sick, and her friends, would not give me leave.

After this plentiful and troublesome spitting had continued for many days, the Disease seem'd almost to be wholly cured: so that this noble Gentlewoman being free of her Convulsive motions, went abroad, and was well, both in strength and stomach. Only she complained, that oftentimes in a day, she was suddenly afflicted for about a minute of an hour with a shivering of her whole body; which kind of Distemper coming upon her sometimes in the night, broke her sleep: within the space of a month this symptom also, and likewise her Catarrh wholly ceased: But from thence she was sometimes afflicted with an extream sourness in her ventricle, and the passage of the *Oesophagus*, and sometimes also in her mouth, and pallate, that it was feared lest the inward skin being fretted, those parts should contract an ulcerous dispostion; besides she was wont to be tormented often in her sleep, sometimes also being awake, with the night-mare or *Incubus*. For this I prescribed *spring* and *fall*, a gentle purge to be administred, with the use of antiscorbutick Remedies, and sometimes *Chalibiates*, or Medicines of *prepared steel*, which kind of method she observed so much to her benefit, that she was well in health for many years, and is as yet well.

Among the many Remedies which were taken against that sourness, and as it were ulcerous disposition of the pallat and *Oesophagus*, I prescribed that she should drink every morning her own Urine fresh made; this, whilst it was very saltish, was wont to give her great ease; but at sometimes her Urine flow'd from her thin and plentifully, which being nothing salt, but like to sour Vinegar, from the drinking of that she received little or no benefit.

The reason of the case but now described, seems not much unlike the former, unless that in this sick Gentlewoman the explosive particles had entered into more passages of the nerves, to wit, besides the *appendixes* of the spinal marrow, into those dedicated for the office of breathing, and also by fits, into those designed for the motion of the Tongue, and almost perpetually tormented the spirits, abounding in them with rage or fury.

But that the cure of this Disease happen'd by the falling down of the sharp humor into the emunctories of the mouth and throat, we may from thence gather that the material cause of this, was the heterogeneous particles, and as it were nitrous, begotten in the blood; which, when from thence, being passed thorow from the brain, they were carried into the nervous stock, caused the aforesaid Distempers: But assoon as by the help of Remedies the more plentiful provision of that matter was hindered, and the morbific particles already produced both from the blood, and the brain, and nervous stock, were derived into those emunctories of the head, the Convulsive Distemper presently ceased, and within a short time, such a Crisis or Secretion still remaining, the perfect cure of the Disease followed.

Forasmuch as the Urine being of it self very salt, and as it were lixivial, became at some times sourish, which did not give any help, as the former, to the sourness of the throat: it may hence be gathered, that the salt particles of the blood and humors coming away by the Urine, had a twofold state or condition, to wit, of fixedness and fluedness; wherefore the Serum, imbued by them, became now of this, now of that nature: for it seems, that the Saline particles being degenerate within the mass of the blood, remained fixed, and rendred the Urine for the most part Lixivial: but those which flowed without the blood in the nervous juice, or were laid up about the solid parts, did degenerate into a flux or acetousness: and therefore from these, being derived into the emunctuaries of the mouth, that noted sourness of the mouth, and *Oesophagus* proceeded: moreover, when these kind of particles being gathered to a fulness in the nervous juice and solid parts, did swell up, and arising to a fluxion, boiled up into the blood: presently these being sent away from thence in heaps, thorow the Reins, rendred the Urine increased in quantity, sourish. But forasmuch, as the Saline particles, being of a divers condition, and that those of the same kind could not be mingled together, they mutually moved against one another, and break their forces; therefore the salt Urine, and not the sour, healed the sourness of the throat. It appears

pears by a vulgar experiment, that the most sharp *spirit of Vitriol*, by the mixture of the *Salt of Tartar*, or any other Lixivial, grows very mild: yea, and yet from thence appears, that the acid humor sweating out into the parts of the mouth and throat of this Gentlewoman, came near the nature of sharp *Vitriol*; because the fume of Tobacco, being taken at the mouth of the sick person, was wonderfully sweet, as it happens to such who have beforehand tasted *Vitriol*.

Because we treat here of admirable Convulsions, which do not ordinarily happen, and whose nature and causes lie deeply hid; for the better illustration of these kind of Distempers we will yet shew one or two more cases no less wonderful than the former.

3. Observation. About ten years since, I visited the daughter of a certain Noble man, troubled after that manner with Convulsive motions, that some thought her possessed with an evil spirit: This virgin about sixteen years of age, fair, and well-made, yet begotten of a paralitick Father, without any evident cause, about the Winter-solstice began to fall ill. At first she was troubled, though not in any grievous manner, with an head-ach, and giddiness for many days; then she felt, now in one of her arms, and then in another, a trembling and sudden contraction; which kind of Convulsions returning often that day, endured scarce a moment; the next day sitting nigh her Sister in a Chair, suddenly leaping out, she fetch'd one or two jumps, and many others successively, with wonderful agility, at the distance of many feet; then, when she was come to the farther part of the Chamber, she stood leaping a great while in the same place, and every time to a great height; when her legs were quite tired with leaping, she fell on the floor, and presently she flung her head here and there with wonderful violence, as if she would shake it from her neck: As soon as she ceased from this motion for weariness, presently the same fury invaded her hands and feet, so that she was forced strongly to exercise these members, by striking the walls or posts, or by beating the pavement: when by reason of shame or modesty, due to her friends, and by-standers, she did hinder her self with great violence from these motions (for all the while she was her self, and spake soberly) the Distemper being sent inwardly, she was very much infested with a mighty oppression of the heart, with a bemoaning and very noiseful sobbing; when she would ease her self, she was forced presently, the fury being transmitted to the muscles of the outward Limbs, either to leap about, or to fling here and there cruelly her head, or arms, or also to run about the Chamber most swiftly, or to beat the ground with her feet: because these kind of vehement motions of her Limbs or *Viscera*, in the Tragedy of the Distemper, did mutually relieve themselves, returning as it were in a round.

The Curatory Method. Coming the 5th day after this Lady had been sick, I gave her a Vomit of the fusion of *Crocus Metallorum*, *wine of Squills*, and *salt of Vitriol*, by which she vomited seven times cancker'd oil or choller in a great plenty, with the mixture of a sharp, and as it were vitriolic humor: The next day ten Ounces of blood was taken from the *Saphana* vein; besides, she took twice in day, Antidotes of the *powders* of precious Stones, of *human Skull*, and the *root of the Male-Pæony*. By the use of these, within a week, she seem'd to be cured; she continued for many days afterwards free from the aforesaid Distempers: But after two weeks, at the time of the full Moon, she fell into a relapse of the same Disease more cruel than before; for besides those wonderful leapings, and vehement conversions and roulings about of her head and members, she was forced besides to fetch often a most rapid course round about the Chamber: she began at this time, from the Prescripts of others, to take anti-hysterical Remedies, and Purges at certain set intervals, but without any help: At last, I being sent for, because she seemed indued with a strong habit of body, and with a notable fierceness of spirits, I gave her a stronger Emetick, by which she vomited forth ten times, greenish choller, like to rust, with phlegm, sharp like stygian water, and she was suddenly eased: After this, I gave her every morning a draught of white-wine, dilated with the *water of black-Cherries*, with sows or hog-lice bruised and infused therein, and strongly pressed forth. By the use of these, she seem'd presently to be cured, and was well above a Month: And when afterwards, the Distempers being about to return, she felt at any time some fore-runners, presently by the use of a Vomit, and the expression of the *Millepedes* or *Cheslogs*, she averted the approach of the Disease: within three months, she so far recovered her former health, that she has now liv'd for many years free from those kind of Convulsive Distempers: But from the time the Convulsive passions wholly ceased, she was sometimes troubled about the parts of her mouth, and throat, with a defluxion of a most sour humor, like the vitriolick *Stagma*; besides, sometimes she was obnoxious to the *Pica* or longing of Women, and at sometimes also to the Cough, with a discoloured spittle, threatning a Consumption,

not-

notwithſtanding which, by Remedies uſed in theſe kind of Caſes, ſhe was eaſily cured.

As to the Ætiologie, or rational account of the aforeſaid caſe, there is no reaſon that we ſhould fear to refer both the Cauſes and Symptoms of this Diſeaſe, to the exploſive Particles (the Brain being paſs'd thorow without hurt) ſent as a ſupply continually from the Blood into the Nervous Stock; which, foraſmuch as they being poured forth in great plenty, were not reſtrained within private Mines, to be ſtruck off onely by turns, cleaving every where, both to the implanted and flowing Spirits, forced them, as it were inſpired with a Madneſs, to be perpetually exploded, and to grow raging here and there, by bands: ſo that indeed, they were not able at all to be ruled, within the containing parts; but there was need to overthrow, and to tame them; impetuouſly tumultuating, and apt to be carried here and there, like a Whirlwind, by ſome very violent and ſtrong exerciſe. In truth, it was in this ſick perſon, as it is in muſical Organs, which if filled above meaſure, by too great a blaſt of wind, unleſs preſently the paſſage of more Pipes be opened, the whole frame of the Organ is quickly ſhaken, and in danger to be broken to pieces: In like manner in this Lady, when the Animal Spirits actuating the pipes, and the depending *Fibres* of ſome of the Nerves, were moved beyond their due Tenour, there was a neceſſity that their force ſhould be beſtowed on many vehement local Motions together, whilſt they inflated above meaſure the Nervous Bodies: wherefore, when their Madneſs was hindred in one part, by and by, like Wind pent up, creeping ſomewhere elſe, it broke forth more violently in ſome other part. *The reaſons of aforeſaid caſe.*

In this ſick Perſon, the uſe of one or two Vomits, brought help once or twice, becauſe that by it, what was lodged in the gallie-Veſſel; yea the *Glandula's* and *Emunctuaries*, and alſo about the *Viſcera* of Concoction, being by this means emptied, the purging of the Blood and Nervous Juice, were more copiouſly drawn into the ſame place; therefore indeed, that the Animal Spirits flowing within the Pipes of the diſtempered Nerves, might be leſs infected by them: By this reaſon alſo, the juice of the Sows, or Hog-lice, was beneficial; foraſmuch as it derived the Morbifick Matter, from the Nervous kind to the Urinary paſſages: Beſides theſe Remedies, the Root, and in a great part the Branches of the Morbifick Matter being cut off, and when others, as it were antidotes, and as it were carefully Adminiſtred whatſoever was left of it; Nature at length becoming ſuperior (as ſhe is wont in theſe critical caſes) ſent away to the ſinks of the Mouth and Throat.

Whilſt I was writing theſe things, I viſited an illuſtrious Virgin, who was troubled with other kind of Convulſive motions, and thoſe univerſal, and no leſs to be admired: ſhe was about Eighteen years of Age, handſome, and well made, and before this time, healthful; when the Peſtilence raging in this Neighbourhood, ſhe had come within the danger of its Contagion, ſhe fell into a panick fear, with frequent ſwouning; the Night following, ſhe ſuffer'd ſo great a *deliquium*, or ſinking down of her Spirits, and Inſenſibility, that ſhe ſeem'd juſt a dying; hardly ſtrugling with ſo great an evil: afterwards, ſhe had every day Convulſive fits, though at firſt, at uncertain hours, and returning after a manifold kind; But within a ſhort time, its comings being made regular, twice in a day; to wit, they conſtantly returned at Eleven of the Clock, and before Five in the Afternoon, that no intermitting Fever kept more exactly its periods; yea, alſo the ſame accidents of the fit daily chanced after the ſame manner. 4. *Obſervation.*

When ſhe had thus been ſick for three Weeks, one day I was ſent for, that I might take notice of all the Symptoms, and the whole figure of the Diſeaſe; ſhe being up about Ten in the Morning, was well in her countenance, going, and ſpeech; ſhe behaved her ſelf exceeding well, ſo that none would ever ſuſpect her to be ſick: at Eleven of the Clock, ſhe began to complain of a fullneſs of her Head, and numbneſs of Spirits, with a light ſwimming; by and by ſhe felt a great Pulſation, and as it were the leaping of ſome live Animal in her left *Hypochondrium:* putting my hand on her ſide, I plainly perceived this Motion; then a ſtretching, and belching followed; which done, ſhe was preſently put to bed, and a Maid ſitting upon a Pillow held her down; who during the fit, moſt ſtrictly graſpt the ſick Perſon, holding her to her boſom, with her arms folded about her waſt: beſides, ſervants were ready, and her Relations ſtanding by, who now preſs'd down her Belly, and *Hypochondria* riſing up, and ſwelling to a great bulk, now held her hands and arms. The chief Symptoms of the Diſeaſe, which being excited by turns, almoſt divided the whole fit, were theſe two, *viz.* One while cruel Convulſions of the Bowels did infeſt her, ſo that the *Abdomen* riſing up into a mighty bulk, ſtrove againſt the hands of the by-ſtanders, held upon it, that it could not be preſſed down; and at the ſame time, her *Præcordia* being contracted upwards, the motions of her blood and heart were almoſt ſtopt: in which ſpace of time, this Virgin, her Head falling down, with a ſmall pulſe, and almoſt without voice, lay nigh

ſenſleſs; after two or three minutes of an hour, theſe Convulſions ceaſed: and then the ſick perſon ſetting her ſelf upright, look'd about chearfully, and for a while the force of the Diſeaſe changed into talking, and ſinging; both of which, ſhe without ceaſing performed moſt pleaſantly, and moſt elegantly, beyond her proper capacity: with theſe kind of ſpeeches, and pleaſant jeſts, ſhe fell upon all the ſtanders by, that nothing in a Comedy could be more pleaſant; then ſhe uttered moſt ſweet tunes of Muſick, and more pleaſant than any other could, or her ſelf at any other time: After ſhe had paſt ſix or ſeven minutes of an hour, thus jeſting and ſinging, the Convulſions of her Bowels and *Præcordia*, and the want of ſpeech, came upon her as before: and theſe ſoon remitting, the force of the Spirits leaping back from the inferior Nerves on the Brain, it was laſtly imployed in the pleaſantneſs of Speech, and Songs; as often (when ſhe talkt to the by-ſtanders) as any of them replyed any thing bitterly, or reproachfully, ſhe fell into thoſe moſt grievous, and longer continuing Convulſions of the *Viſcera*. After this manner ſhe was wont to be moleſted with an alternate Diſtemper of the Bowels, and Brain, about the ſpace of an hour; then towards the end of the *Viſcera*, the fit declining, more light Convulſions being made, they repeated three or four times, without any intermiſſion; then theſe wholly ceaſing, the force of the Diſeaſe brake forth into her outward Members, from whence it quickly vaniſhed; for her Arms and Legs, for a minute of an hour, ſuffered leapings forth, and contractions; preſently after, the ſick perſon being taken up, left her Bed, free from all Convulſions, till a new fit returned; yea, indifferently well in ſtrength ſhe walk'd about the Houſe, and during the interval of her Diſtemper, ſhe chearfully performed the accuſtomed Offices of Life, excepting that her Stomach-languiſhings, all day ſhe loathed food; in the evening, after the ſecond fit, ſhe ſupp'd moderately.

This was the preſent ſtate of the Diſeaſe, in whoſe fits, the more clear uſe of ſome faculties, ſeem'd in a manner to compenſate the irregularity of others: But about the beginning of her ſickneſs, it was ſomewhat otherwiſe; for the Convulſions of her Bowels were far more grievous, and an inſenſibility was joyned to them; beſides, in their interval, talking idly, an incongruous ſinging; yea, both laughter and weeping, without any known reaſon breaking forth, were wont to follow one another; but now the Animal Spirits being forced into longer Exploſions, performed them ſo regularly, now this, now that, as a more commodious way was made, that they ſeemed after a manner to be done by the command of the Will, and of Reaſon.

The reaſons of the aforeſaid Diſtemper.

That we may therefore, according to our *Hypotheſis*, frame an *Aitiology* or Rational Account of this Diſtemper: In the firſt place it ſeems, that a vehement fear did drive the Spirits inhabiting the Brain and *Præcordia*, into great diſorders: ſo that they being diſturb'd out of their ranks, both the kind of Madneſs or Fooliſhneſs, and the frequent ſwooning ſucceeded: Further, it may be ſuſpected, that from the ſame impreſſion the hurt was carried to the Brain it ſelf, ſo that its conformation being ſomewhat vitiated, the Heterogeneous and Morbific Particles were admitted, together with the Nervous Juice: then, although the ſpirits at the beginning, being confuſed and troubled, after their ſhort inordinations, at laſt recovered themſelves, and performed the wonted offices both of the animal and vital Function; yet by reaſon of the taint, impreſſed on the Brain, the Heterogeneous Particles being conſtantly admitted, cleaving to thoſe Spirits, induced exploſive endeavours, as ſoon as the ſpirits were filled to a plentitude with the extraneous *Copula*, they being irritated, entred into Convulſive exploſions for the ſhaking, or ſtriking it off.

About the beginning of the Diſeaſe, when both the diſpoſition of the Brain, and the Spirits inhabiting it, was more perverſe and vitious from the freſh received hurt, a fullneſs of the Heterogeneous *Copula* ſooner happened, and ſo its exploſion following more often, and more inordinately, was diſpatched with greater Tumult; but afterwards, when the hurt of the Animal Regiment abating, the ſupplements of that *Copula*, even as the Nervous Liquor, were daily brought in with an equal dimention, the exploſions of the Spirits being made regular and more mild, obſerved their juſt periods or ſet times.

That ſhe felt upon the approach of the Fit a fullneſs, and as it were an Inflation in her Head, with an heavineſs, and dullneſs of the Spirits; the reaſon is, becauſe at this time, the Spirits Inhabiting the Brain, being now prepared for Exploſions, were wont firſt of all to be moved, and as it were to ſwell up; then that Pulſation in her left *Hypochondria* ſucceeded; for that the Spirits inhabiting the Nervous foldings and *Fibres*, thickly planted about the Spleen, began to be Exploded: afterwards, when the Spirits flowing, both within the Meſenterick and Cardiac Enfoldings were Exploded together, thoſe elevations, and as it were leapings up of the *Abdomen*, and *Thorax*, were induced: and when in this Diſtemper the Motions

tions of the Blood and Heart were almoſt wholly ſtopped, therefore there was a ſmall, and almoſt no Pulſe, and ſhe became ſpeechleſs, and in a manner ſenſleſs.

The Convulſion of the *Viſcera* and *Præcordia* remitting, a Prattling and Singing ſucceeded; becauſe a falling down, or removal of the Spirits as yet exploded, being made from the Nervous Stock into the Brain, it changed the Convulſions into an exaltation of the fancy, and more ready exerciſe of the Phantaſm, or Repreſentation of the Imagination: So long as the Spirits within the middle of the Brain, are regularly and orderly Exploded, they bring forth the Acts of the Habits and Faculties ſo much more noble, and as it were above the ſtrength and tenour of Nature, as in this ſick Gentlewoman: but on the contrary, when the Exploſions of the Spirits in that Region happen to be inordinate, they cauſe for the moſt part fooliſhneſs; or at leaſt, the exerciſe of their powers are incongruous and abſurd.

The Convulſions of the Bowels, and the phantaſtick Actions, reliev'd one another mutually, and by turns; becauſe plenty of Spirits being diſpoſed to be ſtruck off, made their tendency, as it were, with a direct and reflected waving or undulation, now on this part, now on that, by turns: then laſtly, when they were almoſt all Exploded, the more often Convulſions of the *Viſcera* were ſtir'd up; and when a ſmall handful onely remained to be Exploded, that being at laſt excluded both from the Head and Bowels, it ran forth into the ſpinal Marrow, and employed the laſt aſſault of the Diſeaſe in the Convulſions of the Arms and Legs.

There yet remains one great difficulty in this Caſe, why the Fits of this Diſeaſe were always repeated exactly at ſet hours, and yet had ſo unequal Periods; to wit, that the coming of the firſt, was onely but ſix hours before the ſecond; and then the return of the next, did not happen but in Eighteen hours ſpace. For the ſolving of this, it is to be ſuppoſed, that theſe Fits did depend upon the Nervous Juice being ſtuffed to a Plenitude with Heterogeneous Particles; which Particles were altogether conveyed thither from the bloody Maſs, and the blood did drink up the ſame from the nouriſhing juice, ſent as a ſupply from the Bowels: Theſe being thus ſuppoſed, we muſt conſider, in what ſpace of time the Bloody Maſs is filled with thoſe Morbific Particles, and then in what meaſure it pours them forth into the Nervous Liquor. As to theſe, that it may the better appear, after what manner it was done in the caſe of this ſick Perſon, you muſt know, that ſhe took in Twenty four hours ſpace onely at one time a full Meal: to wit, after the ſecond Fit was ended ſhe Supped moderately about Seven of the Clock; the reſt of the day wanting an Appetite, ſhe hardly took any Food: therefore it is probable, that the Morbific Matter was poured forth, together with the Nutricious Proviſion, into the Bloody Maſs; chiefly in the Night time, and that more plentifully, than that all could preſently be derived into the Nervous Liquor: The Heterogeneous Particles which are firſt conveyed from the Blood, newly ſatisfied, into the Nervous Liquor, being heaped up to the fulneſs, did excite the firſt Fit, the coming of which therefore was longer delayed, becauſe both one ſpace is required wherein the Blood, and then another, wherein the Brain and Nerves are to be filled: after this Fit was over, becauſe the Blood yet full, containing in it ſelf more Particles of the ſame kind, pours them ſuddenly on the Nervous Juice, therefore the other Fit is induced within thrice the ſpace of the former: but this being ended, becauſe both the Bloody Maſs, and the Nervous Juice, are wholly freed from their burthen, the ſick Perſon finding her ſelf better than at any other time, took her food greedily enough; but after that when to the next following Fit, firſt the Bloody Maſs, and then the Nervous Juice ought to be filled with the Morbific Matter, therefore Ten hours are required for this double task; but foraſmuch as there is onely need for the ſecond Fit, that the other Particles ſhould be derived from the Bloody Maſs yet full, into the Nervous juice, therefore for this Effect, a much leſs ſpace doth ſuffice, *viz.* of Six hours,

The Curatory Method.

After I had ſeen this Lady, who had laboured for many Weeks with theſe kind of Periodical Fits, I order'd, that Three hours before the ſecond Fit, Ten Ounces of Blood ſhould be taken out of the Vein on the Foot; which being done, the coming of the Fit in the Evening being expected, quite left her, neither did it return at all afterwards; but the other Fit obſerving its former time, daily returned till the Patient being let Blood a little before its coming, remained that day free from the Diſeaſe, which however returning the day after, according to the ſame manner, exerciſed her for many Months: In the mean time, becauſe the cold of the Winter was very great, ſhe forbore for ſome time the uſe of Remedies: but the Spring coming on, this honourable Lady being brought to *Oxford*, was Cured by the following Method.

Firſt I gave her this Cathartick, and I took care, that it was repeated every ſixth or ſeventh day. Take of the *Sulphur of Antimony* ſix grains, of *Mercurius dulcis* one ſcruple, of the *Reſine of Julup* gr. iv. of *Ginger* gr. vi. let them be beaten together in a morter, then add of the *Conſerves of Violets* i. dram, make a *Bolus*: It was wont to provoke two or three Vomits, and three or four ſtools. The flux of her Terms came conſtantly in great abundance, at the ſet times: wherefore, when the blood ſeem'd very plentiful, and hot, I order'd *Phlebotomy* twice or thrice in the midſt betwixt the times of her Terms: Beſides, every day that ſhe did not Purge, ſhe took twice in a day 4 Pills of the following maſs, drinking after them a little draught of the Julup below preſcribed. Take of the *Roots of the Male-Pæony* half an Ounce, of *Virginian Snakeweed*, *Contraerva*, *Cretic*, *Dittany*, each two Drams, of *human skull* prepared, one Dram and a half, of an *Elks claw* one Dram, of *red Coral* prepared, of the *Powder of Pearls*, each one Dram, of the *ſalt of Wormwood* two Drams, of the *ſalt of Corral* one Dram, with what will ſuffice of the *Syrrop of the flowers* of the *Male-Pæony*, make a maſs.

Take of the water of the *flowers* of the *Male-Pæony*, of *black-Cherries*, and of *Wall-nuts*, each four Ounces, of the Antiepileptic of *Langius* two Ounces, of the *Syrrop* of the *flowers of Pæony* an Ounce and a half, of *Caſtor* tied in a knot, and hung in the glaſs, one Dram, mix them, and make a Julup.

When ſhe began to loath the Pills, they being omitted, ſhe took twice a day, to wit, in the Morning and the Evening, about one Scruple of the following Powder, in a ſpoonful of Julup, drinking after it four or five ſpoonfuls of the ſame. Take of *Bezar-ſtone*, of either *white Amber*, of *Pearls* prepared, of *red Corral*, each one Scruple, of *human skull* two Scruples, of the root of *Virginian Snakeweed*, and the *Seeds* of *Rue*, each half a Dram, mingle them, and make a Powder, let her take one Scruple Morning and Evening, with a Doſe of the above-preſcribed Julup.

Then, when alſo this Medicine began to be tedious to her, ſhe uſed the Pills, or the *Elixir proprietatis*, and alſo, ſometimes for many days, the *ſpirits of Harts-horn*: At laſt, ſhe began to be helped by that Powder, being daily taken, for ſome ſpace.

In the mean time, whilſt this method of healing was ordained, her hair being ſhaven from her head, it was covered only with a thin covering: ſhe wore upon her Belly an Hyſterical Plaiſter mixed with *Galbanum*: for her ordinary drink, ſhe took a *Bochet* of *Sarſa* and *China*, the *roots* of the *Male-Pæony*, and other proper things, infuſed in *Spring-water* and boiled. Within a month the fits were ſomething remitted: then, being by degrees made gentler and leſſer, at length they almoſt quite ceaſed: unleſs that at the time of her Terms, one or two fits of the Diſeaſe was wont to trouble her: Further ſhe labour'd with an almoſt conſtant giddineſs, and queaſineſs of ſtomach; in the middle of the Summer ſhe drank *Aſtrop-waters* for a fortnight, and was perfectly well.

But as for the means in general, to be ſhown for the Cure of theſe admirable Convulſions, it will not be eaſie to aſſign, either fit Remedies for this Herculean Diſeaſe, or a certain method of Cure, approved by often experience: for beſides, that theſe like caſes are ſeldom met with; it is likewiſe obſerved, that the ſame Medicines which at this time were helpful to this ſick perſon, being given to another, or to the ſame, helpt nothing at another time: The reaſon of which ſeems to be, becauſe the cauſe of the Diſeaſe conſiſts in the diſcraſie, or evil diſpoſition of the nervous juice, which Liquor is not always perverted after one and the ſame manner: But by the manifold combination of the Salts and Sulphurs, it gets a morbid nature of a various manner and kind, and oftentimes changes it: wherefore, in the moſt grievous Diſtempers of this kind, not the vulgar Medicines, taken from the Shops or Diſpenſatory, are to be preſcribed, but magiſtrals, as cauſe ariſes, according to the appearances of the admirable ſymptoms. A gentle Vomit, Purge, Blood-letting, ought in the firſt place to be ordained, and to be repeated, as often as ſhall ſeem fit. As to ſpecifick Medicines alſo, and appropriate in theſe caſes, when the chief Indication ſhall be, to mend the temper of the Nervous juice, you may try many, and by their effect judge of their virtues: Therefore it may be lawful to try what the Remedies indued with a Volatile or Armoniac Salt may effect. For this end, the ſpirits and ſalts of Harts-horn, Blood, Soot, and the Flowers and ſpirits of *Sal-Armoniac*, are taken: Theſe helping nothing, you muſt come to Chalybiats or Steel Medicines; the tinctures and ſolutions of Coral and Antimony are given: which kind of Medicines are exhibited in ſuch a doſe, and form, and ſo often, that ſome alteration may be made by them, on the whole blood or nervous juice: Further, if ſucceſs ſhall fail in ſuch like, you muſt then proceed to *Alexipharmaca*, which help againſt Poyſons, and the maligniancy impreſſed on the humors, to wit, to inſtitute from theſe, decoctions, and diſtilled waters of vegitables, powders, conſerves, and other preparations: and to compound variouſly ſome with others, and

to

to administer them diversly. It is likely, that those kind of Medicines which are wont to be helpful to such as are bitten by a Viper, or a mad Dog, or that have taken Wolfs bane, or Poyson, may be useful also in the aforesaid Convulsions. It may be lawful here, according to the example of *Gregory Horstius*, in his tract of the malignant Convulsive Disease, and also of wonderful Convulsions, to prescribe magisterial Remedies in the form of a Purging Electuary, and also of a Powder, and Convulsive Antidote, and to compound them variously, partly of simple *Alexipharmicks*, or poyson resisters, and partly of *Antiepilepticks*, or things good against the falling Evil.

CHAPTER X.

Of the Passions commonly called Hysterical, or Fits of the Mother.

THE hysterical passion is of so ill fame among the Diseases belonging to Women, that like one half damn'd, it bears the faults of many other Distempers: For when at any time a sickness happens in a Womans Body, of an unusual manner, or more occult original, so that its cause lies hid, and the Curatory indication is altogether uncertain, presently we accuse the evil influence of the Womb (which for the most part is innocent) and in every unusual symptom, we declare it to be something Hysterical, and so to this scope, which oftentimes is only the subterfuge of ignorance, the medical intentions and use of Remedies are directed.

A description of the Hysterical Passion.

The Passions, which are wont to be referred to this sense or order, are found to be various and manifold; which rarely happen in divers Women, or which come wholly after the same manner: The most common, and which commonly are said to constitute the formal reason of the Hysterical Distemper, are these, *viz.* A motion in the bottom of the Belly, and an ascention of the same, as it were a certain round thing, then a belching, or a striving to Vomit, a distention, and murmur of the *Hypochondria*, with a breaking forth of blasts of wind, an unequal breathing, and very much hindred, a choaking in the throat, a *Vertigo*, an inversion, or rolling about of the eyes, oftentimes laughing, or weeping, absurd talking, sometimes want of speech, and motionless, with an obscure or no pulse, and deadish aspect, sometime Convulsive motions in the Face and Limbs, and sometimes in the whole Body, are excited: But universal Convulsions rarely happen, and not unless this Disease be in the very worst state: because, for the most part, the Tragedy of the Fit is acted without contraction of the members, only in the inferior Belly, *Thorax*, and Head, to wit, in some of them, or successively in all: Women of every age, and condition, are obnoxious to these kind of Distempers, to wit, Rich and Poor, Virgins, Wives, and Widows: I have observed those symptoms in Maids before ripe age, also in old Women after their flowers have left them; yea, sometimes the same kind of Passions infest Men; as plainly appeared by the example already shewed.

The cause of the symptoms inquired into

As to the causes of those symptoms, most ancient, and indeed modern Physitians, refer them to the ascent of the Womb, and vapours elevated from it: The former opinion, although it plead antiquity, seems the less probable, for that the body of the Womb is of so small bulk in Virgins, and Widows, and is so strictly tied by the neighbouring parts round about, that it cannot of it self be moved, or ascend from its place; nor could its motion be felt, if there were any: as to that vulgar opinion, or reason taken from the vapours, we have often rejected it as wholly vain, and light, for just reasons elsewhere: But we judg, the Passions but now described, do neither always, nor at all proceed from the ascent or the vapours of the Womb: and that indeed, other very famous Physitians have already determined: For in times past, *Charles Piso*, and of late the most learned *Highmore*, have vindicated the Womb from all fault; and the Passions, which are commonly call'd Hysterical, are thought by this latter to arise from the blood, most impetuously rushing on the Lungs; and by the other, from a serous colluvives heaped together near the *origin* of the Nerves. How probable this latter opinion doth seem, shall appear from what follows: But as to the opinion deliver'd by Doctor *Highmore*, concerning this thing, though it be far from our custom to contradict any ones opinion, and that it is almost unlawful for me

to

to dissent from this famous man: yet, because our Pathologie standing on a contrary *basis*, (viz. the cause of the Hysterical Distemper being imputed more immediately to the nervous stock, than to the blood) will seem to be only asserted, unless we shew the reasons which combat against that *hypothesis*; and for ours, therefore taking leave, here we will try more exactly either opinion, put as it were in a ballance.

Doctor Highmores *Opinion Examined.*

In the fit therefore commonly called Hysterical, this famous man supposes the blood, for that it is thin, flatulent, and with a certain effervescency, to rush too much in heaps, into the pneumonic vessels, and the vessels of the heart, and in them to broil up impetuously, and so to stuff up the Lungs, and very much to aggravate them, that neither they can exercise their motion, nor that the blood can be drained from the bosom of the heart: Hence, from the blood stagnating in the *Præcordia*, a great oppression, difficult breathing, and often none, with a melting of the vital spirits, were wont to be inferred: then the *diaphragma*, that it might give place to the Lungs, more and more distended; and that breathing at least might be some way made, is carried downward, with a mighty and long continued *Diastole*, and so by pressing down the Intestines, it lifts up the *abdomen*, and *hypochondria*, and feigns a motion as it were the arising of a Globe: But afterwards, the vital function labouring after this manner, the animal faculty arises in its aid; wherefore, a necessity of motions in various parts urging the animal spirits, being driven impetuously into the beginnings of the nerves, produce divers manners of Convulsions, running here and there. The Author endeavours to confirm this Opinion, by the great help in this Disease had by taking away the bloody excretion, both from things helpful, and things hurtful in this Passion.

But though I cannot but praise this Doctrine of the suffocation of the Womb, as very ingenious and cunningly wrought; yet that I do not consent to it in all things, some reasons of great moment clearly hinder me. Truly I confess, that I do not understand, how in some Hysterical persons, to wit, who are of a more frigid temperament, and are often troubled with the Pica, and longing Disease, the blood should so immoderately boil up in the Lungs, without any conspicuous notes of its growing hot, in some other place. I have known young maids, by reason of the green sickness, as it were without blood, to wit, whose blood indeed being without life, did remain without any exercise in the heart, and was from thence difficultly enough drawn forth into the Lungs, who yet were grievously obnoxious to the Passions called Hysterical: Certainly it is not probable, that the blood of these persons growing immoderately hot, should rush impetuously into the Pneumonick vessels, and should stuff up their pores and passages very thickly, when in the mean time such become short-breath'd, by reason of the absence of the blood from the Lungs, or its difficult admission to them: Besides, by what means comes it to pass, that this violent course of the blood into the Lungs, which is supposed to be made in this Fit, brings forth no Inflamation in them? For that the blood, being too much heaped, or rapidly put into any part, is easily extravasated, and is wont to excite an Inflammation hardly to be shaken off. From whence is it therefore, in the Hysterical Distemper, the blood entring violently into the Lungs, and distending them, does not cause a peripneumonie or Impostume of the Lungs? Or wherefore the Distempers, as it were Hysterical, come not on an inflammation of the Lungs, otherwise caused? Wherefore it seems improbable, that the blood swelling up, with its proper anger or heat, should rush into the Lungs, and by stuffing them, renders them too immovable, and so secondarily and consequently induce Convulsions of the *Diaphragma*, and other parts: but it may rather seem, that by reason of the *Diaphragma*, and other organs of breathing, being first affected with a Convulsion, the blood should be forced to stagnate in the *Præcordia*: Besides, it may be observ'd, that the Lungs are not always afflicted before other parts; for oftentimes the Convulsive symptoms begin elsewhere, and not rarely bear the region of the breast wholly untouch'd: Because in some, the *Vertigo*, and Corruscations or sparklings of the eyes, begin the fit; to which succeed either weeping, or laughing, or convulsive motions of the Limbs, without any straitness of the breath, or oppression of the heart: In others, before respiration troubles them any way, a swelling in the bottom of the belly, with a vomiting and rumbling of the belly, begins and often ends the fit; so that the difficulty of breathing oftentimes follows these symptoms at a great distance, and is wont to be prevented by the tying strictly of swathing-bands about the *Hypochondria*. Moreover, it seems, that this ascent as it were of a certain round thing, from the *Hypogastrium* or lower part of the belly, can never proceed from the depression of the *Diaphragma*; because in the Hysterical fit, this part is not always pressed down towards the lower parts, but oftentimes drawn up to the higher parts, and drives the Lungs upwards, so that the spirit or breath being almost shut forth, threatens the danger of Choaking. By these, and other reasons, we are at length

per-

perſwaded to that opinion, that the Diſtemper named from the Womb, is chiefly and primarily Convulſive, and chiefly depends on the brain and the nervous ſtock being affected, and whatever inordination, or irregularity from thence happens, about the motion of the blood, is only ſecondary, and is made dependingly by the Convulſions of the Bowels. *The Hyſterical Diſtemper chiefly belongs to the Brain and nervous ſtock.*

But that this doth conſiſt within the bounds of the head, both the comparing of the ſymptoms, which happen in the living, and the Anatomical obſervations of the dead, clearly ſhew; becauſe we may obſerve, that this Diſtemper often takes its riſe from a ſudden fear, great ſadneſs, or anger, or other violent Paſſion, in which the ſpirits inhabiting the brain are chiefly affected beſides, to ſome an ill manner of Diet, and various accidents whereby the humors being vitiated, are headed more plentifully within the head, at firſt brings this evil. Yea, the manner of the fits clearly evinces the ſame, foraſmuch, as a fulneſs of the head, a *Vertigo*, a ſparkling of the eyes, a ringing noiſe of the ears, begin in many the Hyſterical fit, and often conclude it; Beſides I have opened ſome Women dead of other Diſeaſes, tho while they were ſick, very obnoxious to Hyſterical Paſſions, in whom the Womb being very well, I have found in the hinder part of the head, the beginnings of the nerves, moiſtned and wholly drowned with a ſharp *ſerum*, as ſhall be more largely declared anon.

Having weighed theſe, and other reaſons, we doubt not to aſſert the Paſſions commonly called Hyſterical, to ariſe moſt often, for that the animal ſpirits poſſeſſing the beginning of the Nerves within the head, are infected with ſome taint; to wit, they being either acted or brought into Confuſion, or being tincted with vitious humors, get to themſelves an heterogeneous and exploſive *Copula*, which they carry far away with themſelves, into the Channels of the Nerves: and when the ſame ſpirits are filled to a plenitude, with that *Copula*, thorow all their *ſeries* or orders, either of their own accord, or being occaſionally moved, they enter into exploſions, and ſo ſtir up Convulſive motions: But that ſuch a *Copula* adhering to the ſpirits, is chiefly derived together with them into the interior nerves; the reaſon is, becauſe in this paſſage towards the *Præcordia* and *Viſcera*, the animal ſpirits, by reaſon of the Diſtemper of the mind, are very much diſturbed: wherefore, they more eaſily admit any evils brought from another place, and more readily conceive irregularities. For the animal ſpirits, chiefly for this occaſion, contract a Convulſive diſpoſition: foraſmuch as they, from a violent impreſſion, are perverted out of their courſes, and their wonted manner of influence, and acting; hence they not only repeat their inordinations, but alſo receive the heterogeneou particles into their embraces, and more eaſily combine with them: Wherefore, foraſmuch as the animal ſpirits, running thorow the nerves of the wandring pair, and intercoſtals, are continually entangled with all perturbations both of the concupiſcible, and iraſcible Appetite, it is no wonder, if they acquire a Convulſive diſpoſition before the reſt. *The cauſe of the Diſeaſe moſt often begins about the beginnings of the nerves.*

It being ſuppoſed (which indeed ought to be ſuppoſed) that the animal ſpirits have contracted an heterogeneous and exploſive *Copula*, now the nervous *origines*, and carried it together with it ſelf into the interior nerves, and ſpread it thorow all their paſſages, it will not be hard to aſſign the reaſons of the hyſterical fit, and of all its ſymptoms. For firſt of all, the Diſeaſe being ready to fall upon one, oftentimes the *Vertigo*, a rolling about the eyes, and a certain inflation of the brain, as it were previous skirmiſhing are ſtirred up, becauſe the whole band of the ſpirits, being in readineſs for exploſions, the more light companies of them leaping back towards the brain, are firſt ſtruck off; then preſently a perturbation ſucceeds in the bottom of the belly or *hypochondria*, for that the ſpirits within the enfoldings here and there, are next diſturbed: For we have elſewhere ſhown, if at any time the animal ſpirits are exploded, in a certain whole *Series*, thoſe which abode in the extream parts, firſt of all enter into that aſſertion: Wherefore the beginnings of this Diſeaſe, are found to be, for the moſt part, in the Head and Bowels: but that the Convulſions are firſt perceived, now in the bottom of the Belly, now in the *Hypochondria*, the reaſon is, becauſe the morbific matter is ſometimes carried by the paſſage of the intercoſtal nerve, into the utmoſt meſenteric enfoldings; but ſometimes the ſame, being ſlid down, not beyond the ends of the wandring pair, ſubſiſts much nearer, to wit, about the enfoldings of the ſpleen or ſtomach. *The ſame cauſe afterwards diſpoſed, thorow the whole paſſage of the Nerves.*

When therefore the animal ſpirits (as hath been ſhown) within the nerves of the wandring pair, and intercoſtals, are imbued from their *origine*, even to their utmoſt ends, with an heterogeneous and exploſive *Copula*; they at length, either from meer fulneſs, or by an irritation ſomewhere made, are ſtirred up to exploſions; in which affection, if any ſpirits leap forth towards the middle of the brain, they induce the *Vertigo*, the Inflation and other prævious Accidents of the Head: but the Spirits inhabiting the *The reaſon of the Hyſterical ſymptoms unfolded.*

other

other Extremity of the Nervous Trunk, *viz.* the Mesenteric Enfoldings begin chiefly to be Exploded, which presently by their letting off, compel the lower parts of the *Hypogastrum* to be lifted up, and contracted upwards, and so induce the Ascention of a certain bulk, as it were of the Womb: then, when the upper parts of the Enfoldings of the Mesentory, are by degrees intangled with the same Distemper, and the Bowels annexed to the same are Elevated, and drawn forcibly towards the upper parts, the violent swelling of the *Abdomen*, as it were with a certain leaping forth, succeeds: Further, the Ventricle is not onely Elevated, by changing its place; all its *Fibers*, to wit, the Direct, Oblique, and Transverse, being affected at once with the Convulsion, is often distended like a blown Bladder: hence very often Vomiting, or at least a rumbling and murmur of the *Hypochondria*, are excited: but as soon as the Spirits being Exploded with a certain *series*, it comes to the Region of the *Thorax*, the *Diaphragma* being drawn together, with an huge Diastole is sometimes depressed, and so meeting with the Ascention of the *Viscera*, causes an Inflation, and high Intumescency or swelling up, with a mighty strugling: so that the laces of those in this Distemper must be forthwith loosned, or else they are in danger of falling into a Trance: In the mean time, the *Diaphragma* being so depressed, and its Diastole continued, the Blood remains almost immovable in the *Præcordia*; and so by its Stagnation, causes a great Oppression, and very often a failing of the Vital Function: Further, the Convulsion of the *Diaphragma* happens sometimes towards the upper parts, and so that driving the Lungs upwards, induces a violent Systole, and protracted longer than it should be; and when by this means the Blood is driven forward into the Pneumonic Vessels, and is not at last received from the bosom of the Heart, it Stagnates there, and besides in the whole Body; from whence the oppression of the Heart, and oftentimes a swooning, yea sometimes a want of Speech, and Motion, now with a blewness of the Face, and now with a dead Aspect follow: After these things are acted in the lower, and middle Region, at length the Distemper reaches to the Head, by the Passage of the Nerves, as it were a fiery inkindling, and the Spirits being there Exploded, leaping now towards the middle of the Brain, produce a swimming in the Head, and often symptoms very like the *Epilepsy*; sometimes the Spirits there Exploded rush into the beginnings of the other Nerves, and there stir up the like Explosions; wherefore Hysterical people, towards the end of the Fit often Laugh, or Weep, or talk idly; sometimes the parts of the Face and Mouth, yea sometimes the Arms, and other Members are troubled with Convulsive Motions; and so when at length all the Spirits which had contracted an Heterogeneous *Copula* are Exploded, the Fit ends; but presently after, matter for another Fit begins to be gathered together.

From whence the diversity of the Symptoms happens.

It sometimes happens, that the Convulsive Disposition is not drawn out so long and largely; for besides that, oftentimes the Nerves onely of the wandring Pair, and the Intercostals are troubled with it, that neither the Brain, nor the outward Members are at all molested; yea sometime, neither the Interior Nerves themselves are possessed with the Morbific Cause thorow their whole Processes: for the Convulsive Disposition (as we but now intimated) oftentimes arrives not beyond the Enfoldings of the Spleen or Stomach, and then the Fit beginning from the Inflation of the *Ventricle*, or left *Hypochondrium*, is thought to arise not from the fault of the Womb, but of the Spleen: which kind of Distemper by and by being brought to the *Thorax*, and there involving the *Diaphragma* and Lungs with a Convulsion, stops Respiration, and the motion of the Heart, or in some manner preverts it: but then from thence the Fit passes over; now with, and now without a great Perturbation of the Head. These things happen indeed after a various manner, according as it happens that the Morbific Matter, or Explosive *Copula* descending from the Head is gathered together, as it were heaps of Gunpowder, more or less, now in this, now in that part. But concerning which matter, by what means the same being brought forth in the Head, first Affects the beginnings of the Nerves and so constitutes the Procatartick, or more remote cause of the passion called Hysterical, now remains next to be inquired into.

The more remote cause of the disease, subsists, either nigh the beginnings of the Nerves.

As to the Morbific Matter, or Explosive *Copula* which cleaving to the Spirits, flowing within the Head, and with them derived into the Nervous Passages, is often the cause of the Distempers commonly termed of the Womb; we say, that this, as in other kinds of Convulsions, is the Heterogeneous Particles poured forth from the Blood, which yet are wont to be affixed to the Spirits, flowing into the beginnings of the Nerves, chiefly for two Causes: to wit, either by the fault of the Spirits themselves, or by the force of the matter it self, instances of either kind are ordinarily met with. It sometimes happens, that the Animal Spirits, planted within the Brain, and in the passage leading from it, to the *præcordia*, are very much disturbed by a sudden Passion, as of Fear, Anger, Sadness, *&c.* and forced into disorders, and that by that means they being driven out of their orders, do acquire to themselves Heterogeneous Particles, where ever met with;

and

and combine with theſe, that by and by for that reaſon, they acquire an exploſive diſpoſition, as we have already declared. Further, in the Second place, ſometimes the Morbific matter it ſelf, being made more fierce and ſtrong, in ſpite of the ſuccour of the Animal *Æconomie* or rule, is poured forth into the Brain, and its Appendix, from the Bloody Maſs, which cleaving faſt to the Spirits, preſently diſpoſes them into Exploſions: This is ordinarily diſcerned in the Evil Criſes of Fevers, alſo in ſome Malignant Diſtempers; alſo in Scorbutic and other Cronical Diſeaſes ill cured. An ill or weak Conſtitution of the Brain, or Nervous Stock, whether it be Hereditary, or acquired, by reaſon of an ill manner of living, very much cheriſhes theſe cauſes. For in bodies ſo diſpoſed, both the Animal Spirits, from every light occaſion, are moved in Confuſion; and the paſſages of the Brain and Nervous *Syſtem*, more eaſily lye open, for the running in of the Heterogeneous and Exploſive Matter. In truth, for this reaſon Women are more obnoxious to Convulſive Diſtempers than Men, and ſome Women than others, as we will ſhew more largely hereafter.

But although theſe kind of Paſſions of Women, called Hyſterical, moſt often proceed from the fault of the Head, or from the Morbific Cauſe ariſing within the *Encephalon*; yet ſometimes ſuch Diſtempers are ſtirred up by reaſon of a Cauſe beginning ſomewhere elſe, *viz.* Now in the Womb, now in the other Bowels: and of this Convulſive Pathologie, there are chiefly Two Heads, *viz.* *Or near the Womb, or other Inwards.*

1*ſt.* Sometimes it happens, that a Tumour, or an Ulcer, or a Congeſtion of ſharp Humours, ariſes in the Membranous parts about the Womb, or planted about the other *Viſcera*, and often irritates the parts ſo Diſtemper'd, by reaſon of the breaking of the Union into painful Convulſions: then foraſmuch as the Animal Spirits placed round about, and thoſe inflowing are moved into frequent diſorders, they at length getting to themſelves Heterogeneous Particles, ſent either from the Diſtemper'd part, or from ſome other place, are diſpoſed to Convulſive Aſſaults; and when firſt of all the Convulſive Motions happen onely in the Neighbourhood of the Affected Place, to wit. that the Bulk aſcending in the lower part of the Belly, or its ſwelling up be onely perceived; afterwards they are propagated by the paſſage of the Nervous Bodies, and by the conſent of the Convulſion there begun, leaſurely into the other *Viſcera*, of the lower Belly, then to the *Præcordia*; and laſtly, into the Head it ſelf: and the Diſtemper being thus by little and little dilated to the Spirits inhabiting the Brain: they moreover, having gotten in their proper Sphear, an Heterogeneous *Copula*, retort the ſame back to the *Viſcera*, and ſo the Morbific Cauſe being made reciprocal, is begun at either end of the Nervous Trunk. Some time paſt I have ſeen a Noble Virgin, in whom a ſmall Tumour ariſing, with moſt cruel pain below the *Os pubis*, did ſtir up huge Convulſions, firſt in the lower Belly, and afterwards aſcending to the *Præcordia* and Head, were at length ſtretch'd to the outward Members: for once or twice in a day, after that great Pains did Torment her in the Affected part, the *Abdomen*, and by and by the *Hypocondria*, were wont to be lifted up: then difficulty of Breathing, on an Inſenſibility ſucceeded, and preſently the Diſtemper being brought outwardly, moſt horrid Convulſions and Contractions of the Members and Limbs followed. Sometimes it alſo happens, that Convulſive Symptoms are induced in Child-bearing Women, by reaſon of ſome hurt or evil brought to the Womb: *Harvie* relates, That wonderful Convulſions were cauſed by the injection of ſome ſharp thing into the Womb: So ſometimes, though rarely it happens, that a Morbific Matter, or Exploſive *Copula* is fixed to the Spirits dwelling about the Extremities of the Nerves, and near the Womb, immediately from the place there Affected, and without fault of the Brain. *This laſt happens after a twofold manner.* *Either by reaſon of the diſſolution of the union.*

There yet remains another caſe, or manner of Affecting, by which the Convulſive diſpoſition is produced from the fault of the parts, lodg'd at a great diſtance from the Brain (though in the mean time, the Taint, which is the cauſe of this Diſtemper, is often mediately Communicated to the Brain it ſelf) to wit, when at any time the Nervous Juice is hindred ſomewhere in its Motion or Circulation, from thence ſtagnating in the Nervous parts, and loading them, does often bring in a Convulſive Diſpoſition: So, when ſome uſual Evacuation, whereby the Superfluities of the Nervous Liquor, were wont to be fitted forth, is ſtopp'd, as from Iſſues ſuddenly ſhut up, or old Ulcers dryed up without a Purge, many fall into Convulſive Diſtempers: Yea, it may obtain here ſome place, what is wont commonly to be noted for a Cauſe of the Hyſterical Paſſions in Maids and Widows, to wit, the untimely reſtraint of the Seminal Humour, which ought to be beſtowed about the Pleaſure of *Venus*; at leaſt, if they receive help from the ſtate of a Conjugal Life, it therefore happens, becauſe the Reſtagnations of the Nervous Humour, which often fix a Taint to the Brain and Nervous ſtock, by this means are prevented: Moreover, the Nervous Juice flows back towards its beginning, becauſe its Paſſage is ſomewhat ſhut up, by a ſwelling or Cancrous *2. Or by reaſon of an obſtruction of the Nervous juice.*

Tumor. Lasty in this City, a notable instance of this kind of Distemper hapned, *viz.* A certain Maid of Twelve years of age, had contracted an *Hernia* or burstness, hence by the order of her Mother, she wore a Truss ill fitted, for a fortnight, not without great pain and torment, a little hard knot much pressing upon the *glandula's* of the Groin: within this space (when before she was perfectly well) she began to complain of a giddiness and heavy dulness of her head; and so a little after she felt Convulsive, and as it were Hysterical Distempers, frequently falling upon her; together with it great swellings arose behind her ears, and in her neck of the same side, to which she was never before obnoxious in all her life. It is not to be doubted in this case, but that from those *Glandula's*, which are the emunctuaries, or sinks of the nervous Liquor, being too much pressed together, the superfluities of that humor, wont to be sent away from thence by the Lymphatic Vessels, restagnating in the head, brought forth those evils; because the arising of the aforesaid symptoms so suddenly and manifestly followed upon the wearing of that Truss upon the Groin, that even her Mother laid the cause of the Disease upon that occasion. Besides, also I have observed in others, the recrements of the nervous humour, being somewhere stopp'd in their course, restagnating towards the head, have not only brought in Convulsive symptoms, but from thence the *Kings Evil.*

Objections against the aforesaid hypothesis answered.

So much for the formal reason of the different original of the Distemper called Hysterical; as also of the *genuine* causes of its symptoms: Out of which, it seems to appear plainly, that those passions do not depend always on the Womb, but much more often on the fault of the brain, and of other parts of the nervous stock: But many things are objected against these; which according to the old opinion, cast all the blame on the Womb: to wit, it seems so to be done because the assault of this Disease invades almost only Women, yea and Women that are not well about their Womb, *viz.* Child-bearing Women, or such who have their Courses stopt, are chiefly obnoxious to it: Besides it may be argued from things helpful for it, because a Plaister worn upon the lower part of the belly, also a strict girding of the belly and *Hypochondria*, by which the ascent of the Womb may be hindred, do not seldom drive away the fit, just falling on them; this also shews it, that sweet things held to the Nose brings on the fit, and stinking things drive the same away, it is said to happen quite contrary, if the same things be laid to the belly or privy member.

That we may wipe off these objections, we say first, that the symptoms, which seem hysterical, do not only happen to Women: for we have shown already, by the History brought by us, that a certain man has been obnoxious to those kind of fits, with the ascention of a bulk in the bottom of the belly: but that Women are much more often troubled with those Convulsive Diseases than men, two reasons may be shown, *viz.* First, for that their animal constitution is much weaker: to wit, they have the brain and nerves softer, and of a less firm texture, that they are not able to suffer any thing strongly, or to resist every injury; also the animal spirits in them, being more prone to flight and distraction, more easily admit an heterogeneous and explosive *Copula:* from hence Women, from any sudden terror or great sadness, fall into mighty disorder of spirits, when men from the same occasion are scarcely disturb'd at all. Secondly, Women more readily receive the Convulsive dispostion, because they gather a more plentiful heap of the morbific matter: for that, whilst they lead for the most part a sedentary Life, the blood, for want of ventilation, becomes more impure; besides in this sex it originally abounds with heterogeneous and fermentative Particles: wherefore it is convenient for it to be more often purged by the flux of their Courses; by which notwithstanding, not always what is extraneous and incongruous, is wholly cast forth from the bloody mass, but that there remains that which being poured on the brain and its appendix, as occasion is given, becomes the cause of the Convulsive Distemper: Moreover, when the menstrual flux, being stop'd, a Convulsive dispostion is occasioned; it is not therefore to be thought that such a Distemper is rais'd up from the Womb, but that the bloody mass, being more than usually imbued with heterogeneous Particles, carries them, together with the nervous juice, to the head: yea, chiefly for this reason also, Child bearing Women are found obnoxious to the Passions, as it were Hysteeal; for besides, that the membranes of the Womb being hurt, a Convulsion there begun, by reason of the felt trouble, creeps upwards, and is at last communicated to the head; it most often happens, that the blood being infected, by the terms being retained, grows hot with a Feverish burning, and then instead of a *crisis*, the malignant infection is carried to the brain, from whence Convulsive, and not seldom soporiferous or sleepy Distempers are excited.

But

But that it is argued, that this Diſeaſe ſeems to be Hyſterical, becauſe Remedies amplied about the *Abdomen*, often bring help; it will be eaſie to ſhew, that the morbific cauſe planted in the meſentery, oftner than in the Womb, is ſometimes either taken away by that means, or reſtrained from its influence: beſides, the ſame kind of applications, about the *hypogaſtrium*, are no leſs profitable, altho the original of the Diſtemper, be derived from the head it ſelf: for we have ſhewn before, that when the heterogeneous and exploſive matter, deſcending from the head, brings a Convulſive diſpoſition to the ſpirits diſpoſed within the whole proceſſes of the interior nerves; the Convulſive motions therefore excited, begin from the extremities of the nerves, and ſo creep upwards towards their beginnings; ſo that firſt of all the *Viſcera* of the lower Belly, then the *Præcordia*, and laſtly the Brain it ſelf are affected; but if the outmoſt ſpirits, *viz.* thoſe dwelling in the enfoldings of the meſentery, be reſtrained from entring into exploſions, all the reſt, in the remaining nervous paſſage, continue in their orders: and this, Plaiſters worn upon the Navel, do often effect: for they repreſs, and compel into order with their odour, the ſpirits from leaping forth; yea alſo, not ſeldom, they ſhake off and drive away, the *Copula* cleaving to them: wherefore, when the exploſions there about to be made, are reſtrained, the Convulſive fit is wholly prevented: which yet is more apparent, for that, if the Convulſion begun in the lower belly, and from thence aſcending like a Globe, be preſently ſuppreſſed, and by a ſtrong binding together of thoſe parts, it be hindred that it creep not upwards, oftentimes the Convulſive Paſſion is broken off, the *Præcordia* and the Brain being untouch'd: wherefore it is a common cuſtom for ſick Women, to bind ſtrictly the *Epigaſtrium*, with ſwathes or rolers, and ſo to ſtop the progreſs of the ſymptoms towards the upper parts: For when the animal ſpirits enter into Convulſions ſucceſſively, as it were a fiery enkindling, wherever the tinder or cheriſhing matter is cut off, or intercepted, the Diſtemper is there reſtrained.

As to the various effects of odors, to wit, that ſweet things bring on the fit, but ſtinking things drive the ſame away, it may be ſaid, that the former do looſen the animal ſpirits, by pleaſing them, and too much releaſe them from their wonted tasks of influence, and ſo provoke them ready to be exploded, in ſuch diſorders, yea and as a flame put to them, do ſomewhat inkindle them: but on the contrary, ſtinking things repreſs the ſpirits, drive them back from excurſions and exorbitances, and compel them into order, yea like Sulphur, mixt with *aurum fulminans*, take away from them their exploſive force.

What we have hitherto ſaid, of the Paſſions called from the Womb Hyſterical, will yet more clearly appear, if for the confirmation of our *Hypotheſis*, we ſhall add arguments taken from Anatomical obſervations; I will therefore lay before you a notable caſe, by which the former reaſon, and cauſes of the Convulſive Diſtempers, may be very much illuſtrated.

Obſervation. A very Noble Lady, of a moſt curious ſhape, and highly indued with a virtuous diſpoſition of mind and manners, of late lived near to this place, who being for many years obnoxious to Convulſive Diſtempers, for that ſhe had originally, or hereditarily contracted this ſickly diſpoſition, and had experienc'd the fruits of this morbid ſeed, almoſt every luſtre of her age, but chiefly as often as ſhe was with Child, (for ſhe very frequently miſcarried) was wont to be tormented above meaſure, with convulſive paſſions, as it were hyſterical; becauſe, preſently after the reſtraint of her monthly flowers, the heterogeneous Particles being tranſlated to the brain and nervous ſtock, cauſed fits of this moſt cruel Diſtemper,

After ſhe had newly conceived, in the firſt months, according to her old cuſtom, ſhe was preſently moleſted with Convulſive Diſtempers; about the ninth week of her big belly, from taking cold, ſhe fell into a dangerous Fever, in which very acute pains tormenting her in her loins and bottom of her belly, for many days, ſeem'd to threaten an abortion: but theſe pains, as the event ſhew'd, rather to be termed Colical, proceeded from a ſharp humor falling down into thoſe parts, from the brain, by the pipes of the nerves: for towards the declining of the Fever, this matter being ſomewhere elſe tranſlated, a great looſneſs or Diarrhæa, pains of the feet, and as it were an Ulcerous diſpoſition ſucceeded.

As ſoon as this Lady became well from her Fever, and thoſe pains, the Convulſive Diſtemper returned; for every morning, wakening from ſleep, ſhe was wont to ſuffer Convulſions, and cruel contractions, about the parts of her face and mouth, as alſo in her arms and thighs; which ſymptoms, without doubt, did ariſe from a ſerous heap or gathering, laid up in the head, about the beginnings of the nerves; and by them imbibed, together with the nervous juice, more deeply in ſleep; and when afterwards the ſame matter was carried by the pipe of the interior nerves, into the foldings of the

Mesentery and Loins, most cruel pains of those parts, and also fits as it were Hysterical, did most grievously infect her.

But these Convulsive motions of her face and members, after a little time ceased; but yet she still remained weak, and without strength, with a pale countenance, an infirm and trembling gate, and desirous only of congruous food, and hot Liquors: about the end of the third month, at which time she was wont continually to miscarry, her *menstrua* broke forth, which coming away for two or three days together, with little pieces of broken membranes, she expected to miscarry: But that flux ceasing, pains as it were of one in labour, in her *abdomen* and loins, as before arose, and for the space of a week, tormented her day and night; at length, having used a bath of *Emollient* herbs, and afterwards put to bed to sweat, she brought forth the burthen of her womb: the conception so coming away with mighty pain, was about the bigness, and like the figure of a Turkie egg: the exterior coat of it was torn and broken, the interior remaining whole, contained about half a pint of clear water, and nothing else besides; there appeared no shape of a Child, or any rudiments that it would ever be one: Afterwards for 4 or 5 days, her flowers flowed forth, with some pieces of broken membranes: in the mean time, pains with their wonted fierceness tormented her; and when the space of a week being elapsed, they left not off of themselves, remedies at length were sought to allay them.

To this end, first Liniments, Fomentations, Baths, and Clisters, were often administred: also Medicines purging the filth of the womb, on which the cause of all the evil was cast, were taken inwardly: Short intermissions of her tortures followed upon the use of the former; but then the Distemper returned, with great trouble; yea the Disease much increasing, in three weeks time, got many other horrid symptoms: for besides the pains in her belly and loins, which became more cruel every day, also she was shortly after tormented in her back, neck, shoulders, as also in her arms and thighs, with most cruel pain; and that more bitterly, as soon as she was warm in her bed; besides, she was afflicted with a frequent giddiness, vomiting, and nauseousness, and often in a day, with most grievous Convulsive fits, *viz.* First a bulk was seen to ascend in the bottom of her belly, and presently it lifted up her whole belly forceably, by and by respiration being restrained, an insensibility, with a dead countenance succeeded: after that she had thus lain as one dead, for three or four minutes of an hour, she was wont suddenly to leap up, that she could hardly be held down, or kept by those standing by; then followed cruel contractions, and distortions in all the parts of the mouth, and face, as also in all the members of the body: These symptoms were indeed judg'd to be Hysterical, because this Noble Lady so lately had miscarried.

But weighing every one of these, I was at last of this opinion, that the cause of either fit, *viz.* Both the *dolorifick*, and the Convulsive, did depend wholly on the evil affection of the brain and nervous stock, and that without any fault of the womb; for that a sharp humor being heaped up within the head, did from thence descend thorow the passages of the Nerves, into parts at a great distance; which lodging upon the membranes and *Fibres*, and fermenting with the humor, flowing in from the bloody mass, did irritate them very much, and so stir'd up most cruel pains: Then afterwards, when the heterogeneous and explosive particles, being admitted with what humor within the head, and entring into the nervous passages, did cleave to the spirits: therefore the Convulsive disposition, then breaking forth into grievous fits, was induced, as shall be by and by more largely laid open.

Instituting Curatory intentions, according tot his kind of *Ætiology*, I order'd to have blood taken from this sick Lady, at what time she most grievously laboured, out of the *Saphena vein*, and within two days, to be given her a gentle Cathartick, and that to be reiterated, once or twice in a week: Also on other days, Morning and Evening, I gave her spirits of *Harts-horn*, and at other hours, twice or thrice in a day, of the *Powder of Pearls*, and *Crabs-eyes*, with a Dose of the following Julup: Take of the *water of Snails*, and of *Worms magisterial* each three Ounces, of *Saxifrage*, and *black-Cherries* each four Ounces, of *Hysterical water* two Ounces, of the *Syrrop of Corrals* an Ounce and a half, of the *tincture of Castor* one Dram, mingle them: The bath of sweet herbs was frequently used; when necessity urged, she took *Opiats* always with good success: *Vesicatories* were applied to the inward part of either thigh, also to the hinder part of her neck; also *Fomentations*, *Ointments*, *Clisters*, *Cupping-glasses*, *Sneezing-Powders*, with many other manner of administrations were prescribed, according to the exigences of the symptoms.

By this method observed for about 14 days, the Noble Lady having received very much ease, was wholly rid of her Convulsive fits. Yea, the torments of her bowels and members, and the other symptoms being very much lessen'd, she hoped quickly to recover

recover her health: But after this, partly by reaſon of an ill order of Diet, which the ſick Lady always indulg'd her ſelf in, or taking little, but chiefly, by reaſon of a ſudden paſſion of fear and ſadneſs, which an unlucky accident hapning within her own Houſe, had cauſed, ſhe fell into a relaps, by and by the Diſeaſe growing into a much worſe condition, for both the Convulſions and Pains did infeſt her more bitterly; yea, and her ſtomach being almoſt tired out with continual Vomiting, would not admit either of Food or Medicines. She took Aſſes milk for ſome days, with ſome ſucceſs; which notwithſtanding, foraſmuch as breeding Choller in her ſtomach, ſhe found it troubleſome, ſhe ſhortly omitted: at length in ſpite of all Remedies, preſcribed carefully by the conſultation of many Phyſitians, my noble Patient from day to day grew worſe, and by degrees death approached: Two days before her death the torments of her belly and loins very much abated, and ſhe became more than uſually chearful, and conceived ſome hope of Recovery; But in the mean time ſhe complained of a pain and great heavineſs in her head; and about the beginning of the night ſhe ſlept ſoundly, but being awakened ſhe fell into a very horrid convulſive fit, which preſently paſs'd into a quick deadly *Apoplexie*, for being made inſenſible and ſpeechleſs, ſhe left this life within twelve hours.

The rational account of the Diſeaſe taken from Anatomical Obſervations.

When various judgments had paſſed about the cauſe of the ſickneſs, of which this illuſtrious Lady died, moſt flinging all the evils on the Diſtemper of the Womb; others on an Ulcer or Impoſthum, which they ſuſpected lay hid ſomewhere about the *Viſcera* of the *Abdomen*: it pleaſed her Friends, that her dead Carcaſe, kept long opened for the Funeral, ſhould be dilligently inſpected, and ſo the genuine cauſes of the Diſeaſe, and her Death, might be inveſtigated: which task being left to my care, I executed with all the dilligence I was able.

Therefore in the firſt place, it was worth Obſervation, about the habit of the body, that the members and lower parts, nigh and beyond the ſeats of the pains, were very much waſted: as her thighs, quite worn away, appeared like a Skelliton: In the mean time her face, neck, and arms, remained full and plump enough: from whence it appears, that the nervous Liquor does help no leſs to the buſineſs of nouriſhment, than to the exerciſe of the animal faculty: wherefore, when that Liquor, being much hindred in its paſſage, the loins and belly taken up with the continual Convulſions, did not deſcend, with a due influx, to the inferior parts, they for that reaſon became preſently both without ſtrength, and lean, and waſted. This kind of Atrophie differs in this from other Hectical waſting, which happens from the vice of the blood, becauſe in this latter, an hippocratick or waniſh face, is the chief ſign of the Diſeaſe: in that firſt mention'd, the countenance, and aſpect, ſhow little or nothing of evil.

The dead body of this Noble Lady, tho very lean, and that her bowels were all emptied, yet quickly putrified, for within 40 hours all the skin was diſcolour'd, and appeared in this part livid, in that green, and in others blackiſh: and her Corps ſo ſuddenly putrifying, yielded a moſt horrid ſmell; the reaſon of which without doubt was, that by reaſon the muſcles were exerciſed with perpetual Convulſions, the principles of their mixture were ſo much looſned, that they being in a readineſs for diſſolution, quickly after death, fell aſunder one from another, after the like manner, as we may obſerve of the fleſh of wild Beaſts, which being tired with a long courſe, or beaten to death with Clubs, for this much ſooner putrifies, than the fleſh of thoſe which are kill'd quickly, and peaceably.

Her belly being opened, the Inteſtines and Ventricle appeared whole enough, *viz.* Intire and well-colour'd, but they were empty, and as it were blown up, foraſmuch as they were troubled, almoſt with perpetual evacuations, *viz.* Thoſe placed above or below: in all this cavity, no foot-ſteps of an Ulcer or Impoſthum were perceived. Whilſt we were ſearching the cauſe of the Diſeaſe, and rolling the inwards here and there, there was ſomething met within the meſentery worthy notice, to wit, about its middle, where it is fixed to the back, and contained the greater folds of the Nerves, a ſubſtance ſomewhat looſe, and inflated, as it were with many little bladders, equalling an hands breadth, was ſeen after that manner; as when in a ſhoulder of Veal the inter-ſpace of the Muſcles are blown up by the Butchers, that thoſe parts might ſwell up, and ſeem fuller and fatter: In this place of the Meſentery, becauſe it was more tumid and ſofter, we thought ſome humor the cauſe of the pain to lodg there; but opening it, I found only the Membranes to have been looſned one from another; and to conclude, nothing but wind within its inter-ſpaces: which ſeparation of the Membranes, and devulſion one from another, was without doubt induced by the frequent Convulſions or Exploſions of the ſpirits, which within the enfoldings and nervous *fibres*, there thickly planted, were almoſt continually provoked; and thoſe Convulſions happened

ned by reason of the Heterogeneous and Explosive Particles being derived thither from the head, by the pipe of the Nerves.

But as to those torments of the belly, and as it were an ascent of a bulk or substance in the Convulsive Distempers, and the inflation of the *Abdomen*, it is not to be doubted, but that the seat of the morbific cause did lie hid in that part of the Mesentery: but because so much suspition was had of the Womb, being chiefly affected, we did next inquire how much this inward deserv'd it: Therefore having dilligently searched the tunnel, placed within the *Os pubis*, I found the womb in its due place, and as to all parts sound, and well-furnished: its body was drawn to its just proportion, altho it was but five weeks since she had miscarried, *viz.* It was like a small pear in figure and magnitude; the *Glandulas* on either side of the bottom of it, which are called the Testicles, appeared very small and flaggy, without any superfluous or virulent humor contained in them; the body of the womb, wherever it was dissected, equall'd a Thumbs breadth in thickness, its inward cavity was no bigger than what would hold a Bean: within this hollowness, as use to be in the Caverns of other inwards, was included a mucous or dreggy matter, in a very small quantity: but in truth, about the Womb, or its *Appendix*, there was nothing, to which might be imputed as a morbific cause of the symptoms but now described: From whence therefore it may be demonstratively concluded, as I at first thought, that the Passions termed from the Womb Hysterical, are most often excited from some other cause than the fault of the womb.

The Intestines being removed, we found also the reins sound enough, but one of them was of an unusual figure, *viz.* It was cleft into many Lobes, like the Kidney of a Calf.

The *Milt*, *Pancreas*, and *Caul* without fault: the *Ventricle* was much blown up, and its inward Coat was plain without folds, or wrincles, which certainly hapned, by reason of its frequent Vomiting, this inward being almost continually troubled with Convulsions: Besides, for this reason, the tone of the stomach being broken, it did neither rightly desire, or concoct the food, or aliment.

The *Liver* very much differ'd from a sound constitution, for it was tumid and somewhat hard, of a pale colour, like rotten wood, wholly dry and without blood, and this without doubt, the frequent use of Cordial, and highly hot Liquors had effected.

The *Lungs* were of a blewish colour, and every where obstructed, and stuffed with a stinking and frothy matter: certainly this inward and the Liver had been vitiated of a long time, wherefore as the blood being degenerate, and very much depraved of a long time, from its right temper, had yielded the first seeds of this sickness, so also it afforded a constant cherishment of it.

But indeed, we sought, and that not in vain, for the chief, and as it were original cause of the Disease in the head; therefore the skull being taken off, the Vessels of the *Meninge*, and those creeping about the Brain appeared full, and distended with blood, when in the rest of the Body, scarce any Blood had flowed forth, in the cutting of it: the thicker *meninge* being removed thorow the other thin and pellucid one, was discerned a clear water, filling the enfoldings and crevices of the Brain, and as it were overflowing its whole substance: In truth, the serous heap of waters, had filled full all the cavities, and inward places of the Brain: the enfoldings of the *choroides*, or net-like membranes of the Brain, being a long while immersed in water, and as it were boiled, were become discolour'd and half rotten: nigh to the beginning of the Splanchnick nerves, or belonging to the Spleen, the water insinuating it self very much, had separated the *pia mater* from the trunk of the oblong marrow or pith, for two fingers breadth: without doubt, the morbifick matter descending from the head, by the passage of these nerves, into the enfolding of the Mesentery, was the cause of the pains and Convulsions: Further, the same matter also afflicting the heads of other Nerves, and passing thorow their Pipes, produced afterwards, these most cruel Distempers in other parts, to wit, almost every where of the whole body.

The method of Curing the Hysterical Distempers.

As to the Cure, or means of healing, used in the Passions commonly called Hysterical: forasmuch as the symproms of this Disease are very much Convulsive, therefore it is fit, that anti-spasmodic or anti-convulsive Remedies, such as were before described, should be chiefly indicated; but when these Distempers most often happen to the Female Sex, in whom for the most part, the menstrual flux, and other accidents of the Womb, do challenge a part in the morbific cause; therefore Medicines respecting the various dispositions of the Womb, are to be added to the former, and many ways to be compounded with them. The Therapeutic or Curatory Indications, are either Curatory, to be administer'd in the fit; or preservatory, which are instituted

out

out of the fit, that take away the cauſe of the Diſeaſe, and prevent its comings or acceſſions.

1. As to the firſt, if the fit is wont to be light, and without other perturbation of the ſpirits, it may be permitted to paſs away of it ſelf; but if it being more heavily troubleſome, there will be need to bring ſome help to nature much oppreſſed, this only thing is to be done, that the ſpirits being freed from the Embraces of an Heterogeneous *Copula*, they may remit their inordinations and exploſions: For this purpoſe, it is grown into uſe, to put to the noſe ſtinking and ill-ſmelling things, the ſcents of which compel and repreſs the too fierce ſpirits, ready to leap forth into their orders, and alſo ſhake off from them the heterogeneous *Copula*, and often drive it quite away: *Aſafœtida*, *Caſtor*, *Galbanum*, being put into fine Linen, and applied to the Noſtrils, are convenient; alſo burning of *Partridg feathers*, *old skins*, and *ſulphur*. Beſides the ſpirits and *oil of ſut*, or of *Harts-horn*, do not ſeldom help: yet I have known theſe kind of ſumigations, being very troubleſome to ſome Women, to increaſe the fit; it is probable that the ſame ſometimes may too much irritate the ſpirits, and drive them into greater diſorders; and as ſtinking things put to the Noſe, ſo the like poured into the mouth, do often bring help: wherefore we give often with good ſucceſs to Hyſterical people, *Tinctures of Caſtor*, *Solutions of Aſſafœtida*, and *Galbanum*, *ſpirits of Harts-horn*, and *Sut*, with proper waters. Take of the *ſpirits of Harts-horn*, from 12 to 15. and 20 drops, let them be taken in a little draught of the following Julup: Take of the *waters of Penny-royal*, and *Mugwort*, each three Ounces, of the *water* of *Briony* compound two Ounces, of *Caſtor* tied in a knot and hung in the Glaſs, half a Dram, of the whiteſt Sugar one Ounce, mix them. Take of the *Tincture* of *Caſtor* one Scruple to half a Dram: let it be taken in a little draught of ſmall Beer. Take of *Aſſafœtida*, and *Galbanum* two Drams, let it be diſſolved in *ſpirit of Wine* to the extraction of a red tincture. The Doſe one Scruple, in two or three ſpoonfuls of *featherfew-water*. *Riverius* very much crys up that of *Solenander*. Take of *Musk*, and of *Dragons-blood*, each one Scruple; take more or leſs of it in *water of the Lilies of the Valley*, three or four Ounces. *John Anglicus* commends *Parſnip-ſeeds*, or the *ſeeds of Penny-royal*, in Wine, or other proper Liquor, as a moſt certain Remedy. If the fit perſiſting a long time, ſhould cauſe want of ſpeech, or motion, the more ſharp Cliſters, as of *Briony-Roots*, and *Carminatives* boiled in water, are to be adminiſtred, and frictions of the thighs and feet are to be order'd; and if they ſhall yet grow ſtronger, Cupping-glaſſes are to be applied to the belly and groin, yea alſo, let them be often provoked to ſneezing: it is convenient to give ſome in the middle of the fit, a draught of ſimple cold water, or in which *Champhir* had been diſſolved. *Curatory.*

2. The preſervatory Indication comprehends theſe three intentions, *viz.* In the firſt place to take away, or to derive to ſome other place the impurities of the blood, apt to be poured forth on the brain and nervous ſtock. Secondly, to fortifie the Brain, and ſo to ſtrengthen the indwelling ſpirits, that they may either not at all receive, or may eaſily ſhake off the Heterogeneous *Copula*. Thirdly, to amend whatſoever is enormous in the womb, and contributes to the Convulſive diſpoſition. *Preſervatory.*

1. The firſt intention is performed by purging, and phlebotomy, and other common ways of purifying and purging the blood and humors. If there be opportunity for an emetic, I judg it beſt always to begin with it, eſpecially in Cacochymicks, or bodies full of evil humors, in the longing Diſeaſe, and Pica, and in ſuch whoſe great load of viſcous phlegm, ſtuffed within the folds and coats of the Ventricle, hinders the virtues of other Medicines: The next day after the Vomit, unleſs any thing bids the contrary, let blood be taken, in women of a hotter temper, preſently from the Arm, and afterwards if need be, from the Foot, or from the ſedal Veins with Leeches; but in bodies troubled with obſtructions, and leſs hot, let blood be taken more ſparingly, and more rarely, and only in places ſcituate below the womb: After theſe Evacuations (if they are to be ordered) rightly performed, once within ſix or ſeven days, a Purge is to be preſcribed according to the following forms: Take of *Pill-fetida major*, one Dram and a half, of the *reſine of Julup* xii. grains, of *Tartar Vitriolat*, and *Caſtor*, each one Scruple, of *Ammoniac* diſſolved in Hyſterical water, what will ſuffice to make xii Pills, for iii Doſes. Or take of the *reſine of Julup* gr. xviii. of *Calomelaus* one Dram, of *Caſtor* one Scruple, make a Powder, let it be divided into iii. parts, for iii Doſes, let it be given in the pap of a *roaſted Apple*, or in *Conſerves* of *Borage*: ſo thoſe indued with a more hot temperament, a Doſe of extract, or our ſolutive Syrrop may conveniently be adminiſtred: for the revulſion of the morbific matter from the head, Iſſues made in the calf of the leg, or thigh, and ſometimes veſicatories, legatures, and painful rubbings, are wont to be adminiſtred: But not only a purging of the blood, and a revulſion of its tecrements from the head, but an alteration of its Liquor, and reductiⁿ on

on of it to its due temperament, have here a place: Wherefore in some hysterical people, steel Medicines help, in others the use of Spaw-water, or whay, in others the baths are wont to be signally profitable.

The second intention, to wit, the rectification of the brain and animal spitits, is performed with Cephalic, and properly anti-convulsive Medicines: which indeed are to be diligently exhibited almost every day, when they do not Purge or Bleed: since there are various *Species* of such like Remedies, and several manner of administrations, we will here add some of the more choice forms:

Take of the Lees of *Bryony*, *Assafœtida*, *Castor*, each one Dram; of the *Salt of Coral*, *Amber*, *Tin*, each half a Dram; of *Galbanum* dissolved in Hysterical water, what will suffice to make a mass: Dose half a Scruple to a Scruple, Morning and Evening, drinking after it a Dose of proper Liquors.

Or, Take of the *Seeds* of *Wild parsnips*, of *Nettles*, each two Drams, of *Vitriol of Steel* one Dram, of the extract of *Gentium*, *Featherfew*, each a Dram and a half, with what will suffice of the *Syrrop of Mugwort*, make a mass, let half a Dram be taken after the same manner.

If the form of a Powder pleases better; Take of the *Roots of Virginian Snakeweed*, and *Contrayerva*, each one Dram and a half, of *Coral* prepared, of *Pearls*, of *white-Amber*, each one Dram, mingle them, make a Powder: Dose one Scruple to half a Dram, Morning and Evening, with an appropriate Liquor.

Opiats are composed after this manner: Take of the *Conserves* of the *flowers of the Lilie Convallis*, of the *male-Pæony*, of *Betony*, each two Ounces of the *Seeds* of *Pæony*, of *red Coral* prepared, each two Drams, of the powder of *Cretic Dittany* one Dram and a half, of the *Salt of Wormwood* two Drams, with what will suffice of the *Syrrop of the rinds of Citrons*, make an Electuary. The Dose Morning and Evening the quantity of a Nutmeg. After the same manner may be given to poor people *Conserves* of the *Tree of Life*, or of the *leaves of Rue*, twice in a day.

The Liquors appropriate against the Hysterical affections, and to be drunk after the aforesaid Medicines, are, either distilled waters, which are to be taken by themselves, or with other things, in form of a Julup; or Decoctions, or Tinctures and Infusions.

Take of the *water of Mugwort*, and of *Penny-royal*, each half a pint; of *Hysterical water* four Ounces, of the *Tincture of Castor* half an Ounce, of the *Syrrop of Corals* one Ounce and a half, mix them. The Dose from an Ounce to an Ounce and a half, with any of the Medicines afore described.

Take of the *leaves of Penny-royal*, of *Featherfew*, of either *Southernwood*, of *Calaminth*, of *Nep*, and of either *Horehound*, each one handful, of the *Roots of Briony* four Ounces, of the *Seeds of Parsnips* two Ounces, cut and bruised, put them into White-wine or Cider, six pints, and so distil them according to art.

Take of the *Root* of the *Male-Pæony*, *Angelica*, *Valerian*, each half an Ounce, of the *leaves of Mugwort*, *ground-Pine*, *Calaminth*, *Penny royal*, and *Misletoe of the Oak*, each one handful, of the *Seeds* of either *wild-Parsnips*, each three Ounces, of *Raisins* one handful; let them be boiled in four pints of *Spring-water*, to the half: add to it of *White-wine*, one *lib.* i. *ß*, strain it, and keep it in close Vessels: The dose three or four Ounces, twice in a day.

Take of the *wild-Parsnip Seeds* bruised, two Ounces, of *Castor* one Ounce; let them be put into a Glass, with one quart of *white-wine*. The Dose two Ounces twice in a day.

3. As to the third intention, which inhibiting the disorders of the womb, doth promote the cure of the passion called Hysterical; I say, first of all what in times past was believed, concerning the cause and scope of curing the Disease, that the womb did ascend, therefore that it ought to be reduced into its right place, is altogether fictitious, as we have elsewhere shown: The falling down of the womb, or its coming forth, oftentimes happens; but rarely or never produces the Hysterical Distempers: Besides, the dislocation of the womb in child-bearing Women, sometimes happens presently after their bringing forth, to wit, when the body of the womb being made capacious, and newly emptied, doth not sink down or fall within the Tunnel in its right place, but upwards, inclines now to the right side, now to the left; and there being drawn together like a purse, is folded into a great bulk, which kind of bulk remaining long nigh the side of the Groin, is wont to give a suspition of another Child, or the secondine or after-birth to be left behind, or also of some hard swelling tumor there increasing; but afterwards, when the *menstruum* coming plentifully away, the womb is reduced to its due magnitude, that tumor by degrees vanishes: but while it there remaineth, unless for that reason, the *Lochia* or *Menstrua* were stop'd, it doth not produce the Hysterical Passions. For the reducing of this part the sooner into its due position, Fomentations,

Lini-

Liniments, and Plaiſters are convenient. But moſt times that ſymptom paſſes over of it ſelf, without any further harm. To what other diſtempers the womb is obnoxious in child-bearing, and by what method to be helped, we have fully ſhown in another place. As to the other vices of that part, which happen to ſome women, not bearing Children, we declare that they chiefly are either a diſeaſe of the womb, made by the breaking of the unity, *viz.* which is either ſome Ulcer, or Tumor; or an inhibition of ſome wonted excretion, or putting forth, to wit, a ſuppreſſion either of the menſtruous blood, or the whites, or the ſeminal humor: Moreover, becauſe of the *Menſtrua* being retained, the heterogeneous particles being often poured forth into the head, bring the Convulſive paſſions: in like manner, when the whites are ſtopped, the excrementitious matter being ſupped up by the blood, is deliver'd to the brain and nervous ſtock: yea, when an uſual evacuation of the Seed is hindred, the ſuperfluities of the nervous humor flow back upon the brain, and infect its indwelling ſpirits with an exploſive and morbific tincture: There is no need here, to diſcourſe more largely or particularly of thoſe Peculiar diſtempers of the womb, but to compound medicines, and intricate adminiſtrations, proper for womens diſeaſes, with anticonvulſive Remedies.

CHAPTER XI.

Of the Diſtempers commonly called Hypochondriack, *which is ſhown to be for the moſt part Convulſive: briefly alſo of* Chalybeats *or* Steel Medicines.

IN the foregoing Chapters we have clearly ſhown, that the Paſſions called Hyſterical, do not always proceed from the womb, yea, more often from the head being diſtemper'd: next, we ſhall inquire concerning the Hypochondriacal Diſtempers, of what original and nature they are, and upon the fault of what parts they chiefly depend. The vulgar opinion is, That the ſymptoms wont to accompany this Diſeaſe are wholly produced from the Spleen; wherefore, they are aſcribed very much to vapours ariſing from this inward, and variouſly running up and down here and there; when in truth, theſe ſickneſſes for the moſt part are convulſions and contractions of the nervous parts: but that it might appear by what cauſes they are wont to be excited, we ought to conſider firſt the ſymptoms themſelves, and to place them into ſome order or rank.

A deſcription of the hypochondriacal affections.

As to the Diſtempers therefore which are vulgarly termed *Hypochondriac*, it is obſervable, that they happen chiefly to men of a melancholly temperament, with a dark aſpect, and more lean habit of body: it is rarely that this Diſeaſe troubles fair people with a freſh countenance, or alſo thoſe indued with a too Phlegmatic complection: It betrays it ſelf in manifeſt ſigns, about the height or midſt of their Age; men are found to be more frequently obnoxious to this, than women; being made habitual in either; it is very hardly, or not at all to be cured in women, by reaſon of their weaker Conſtitution; it is accompanied with a great many more Convulſive Diſtempers; wherefore commonly it is ſaid in this Sex, the Hyſterical to be joyned with the *Hypochondriacal* Paſſion.

The ſymptoms which are imputed to this Diſeaſe, are commonly very manifold, and are of a divers nature; neither do they obſerve in all the like beginning, or the ſame mutual dependency among themſelves: for they ſeem in theſe moſt to affect the Inwards of the lower belly, in thoſe the *Præcordia*, in others the confines of the brain: and in moſt, though not in all, the ventricle labours much; concerning the appetite it is often too much, but preſently burthened with what it hath taken in; and when the food, ſtaying longer in it, by reaſon of ſlowneſs of concoction, their Saline particles being carried forth into a flux, pervert the whole maſs of the Chyle into a pulſe or pottage, now ſour or auſtere, now ſalt or ſharp: from hence pains in the heart, great breakings forth of blaſts, rumbling of wind, and often vomiting ſucceed; and becauſe of a pneumatick defect, or of ſpirits, the chyme or juice is not wholly made volatile, and carried forth of doors, but that the ballaſt of the viſcous or ſlimy matter, ſticking to the coats of the ventricle, is left behind; an almoſt continual ſpitting infeſts

them; a distention in the *Hypochondrium*, and often there, and under the ventricle, a cruel pulsation is felt: also there pains ordinarily arise, which run about here and there, and for many hours miserably torment with a certain lancing: in the mean time, from the contractures of the Membranes, and from the fluctuation of winds, stirred up by that means, rumbling and murmurs are produced: Also in the *Thorax*, oftentimes there is a great constriction and straitness, that the respiration becomes difficult and troublesome upon any motion; also, most grievous asthmatical fits fall upon some: moreover, the sick are wont to complain of a trembling and palpitation of the heart, with a noted oppression of the same: also a sinking down or melting away of the spirits, and frequent fear of a trance comes upon them, that the sick think Death is always seising them: In this Region, about the membranes, and chiefly the *mediastinum*, or that divides the middle of the belly, an acute pain, which is now circumscrib'd to one part, now extended to the shoulders, is a familiar symptom of this Disease. But indeed in the head an iliad of evils doth for the most part disturb Hypochondriacal people, to wit, most cruel pains returning at set times do arise; also the swimming of the head, and frequent *Vertigoes*, long watchings, a Sea, and most troublesome fluctuation of thoughts, an uncertainty of mind, a disturbed fancy, a fear and suspition of every thing, an imaginary possession of Diseases, from which they are free; also very many other distractions of spirits, yea, sometimes melancholly and madness accompany this sickness: besides these interior Regions of the Body beseiged by this Disease, wandring pains, also Convulsions, and numbness, with a sense of pricking, invade almost all the outward parts; nightly sweats, flushings of the blood in the face, and the palms of the hands, eratick Fevers, and many other symptoms of an uncertain original, do every where arise; concerning which, forasmuch as the genuine causes, and the manner of their coming to pass, could not be readily determined, presently all the fault is cast upon the Spleen, and Physitians accuse that, as if it were the chief Author of every irregular Distemper: but by what right or authority, by and by shall be sought into: In the mean time, it is to be observed, that the chief symptoms of this sickness, are Convulsive, and depend immediately upon the irregularities of the animal spirits, and the nervous juice, rather than on the evil disposition of the *Viscera*, serving for concoction. But indeed, from whence the first rise of this most complicated Disease proceeds, and by what means it brings forth the divers manners of Distempers in so many places, will not be so easie to determine.

The hypochondriacal Distempers belong to the nervous kind.

It would be a tedious thing to shew here, what the ancient and modern Physitians thought of the *Hypochondriac* Passion, and of its essence, and causes; we will only take notice, that most of them do ascribe this sickly Disposition to the only fault of the Spleen; In the mean time some contend that the whole confines of this Inward, partaking of part of the fault, the blood flowing every where in the Splenetic and Epigastric Vessels (or those belonging to the Spleen and belly) for that it being guilty of an hot and dry intemperature, and so obnoxious to too much fermentation, brings forth the original, or gives a beginning to this manifold evil: But the famous *Highmore* affording relief as well to the Spleen as the Womb, hath cast the chief cause of this Disease wholly on the vitious constitution of the Ventricle; and from thence he would have the reasons of the aforesaid symptoms to be originally sought: But indeed, that he might frame a fit *Hypothesis* for the solving the *Phænomena* of this sickness, he first supposes the tone of the stomach to become too loose and weak, that for that reason it hardly and very imperfectly concocts the aliments: so that the thin and more spirituous part of the Chyle, being sent from thence, sooner than it ought, to the blood, perverts its disposition to a hot and sour temper; then the residue of the food, by a longer stay within the Ventricle, degenerates into a ponderous, and viscous or clammy Phlegm; which also, by its stagnation (even as it is observable in things to be eaten, being longer kept) becomes very sour, or sharp: But from hence that learned Man argues, that from the blood made too serous and thin, its effervescencies quickly passing thorow it, are induced: and from the stomach, loaded with ballast of ropy or viscous matter, the wind and distentions of the Ventricle and *Hypochondria*, as also the belching, and troublesome spitting do arise: whereby indeed, he wholly exempts the Spleen from this fault; he contends, that it doth neither draw to it self the melancholly dregs of the blood, nor serves for any office whatsoever, about the sanguification or the making of blood; but that its use almost only consists in this, that this Inward swelling up, or growing turgid with very hot blood, it administers heat to the adjacent Ventricle, and cherishes it with gentle warmth.

The causes of the Hypochondriac passion is inquired into.

Altho I may so far assent to this famous Author, concerning this opinion, that I yield, the ventricle doth often grievously labour in this Distemper, forasmuch as the tone of which, being made lax, and its strength broken, by reason of the indigestion of the aliment

The Hypothesis of Dr. Highmore sifted.

ment, a load of viſcous Phlegm, or Petuitous matter, is begotten even in its boſom, to which, by reaſon of the Saline Particles being brought into a flux, by their long ſtay, oftentimes a notable ſoarneſs and auſtereneſs happen; then becauſe the fault in the firſt concoction is not mended, the dyſcraſies and diſorders of the blood receive that want of digeſtion in the ſecond: But yet he cannot draw me into that opinion, that the ventricle is always chiefly in the fault, or that the other ſymptoms of the Hypochondriacal Diſeaſe, depend only on its vitious conſtitution: For I have known many cruelly afflicted with this ſickneſs, who have been well enough in their ſtomach: although they have very much complained of the pulſation in the left Hypochondrium, of the ſtraitneſs of the breaſt, and a wandering pain excited in it; alſo of the trembling and oppreſſion of the heart, with a continual fear, and diſturbed Imagination; in the mean time, they were wont to deſire food greatly, and to digeſt whatſoever was eaten, without any trouble of the ventricle, or heavineſs, and alſo without any ſpitting or acid belching: yea, I have obſerved others, great drinkers, and uſing an evil manner of living, to have contracted a looſneſs of the ſtomach, with an ill digeſtion, windineſs, and frequent vomiting, who found enough about their *Præcordia* and animal faculties, were not at all accounted for *Hypochondriacks*: Beſides, in this Diſtemper, the ventricle is often rather ſick from the vitiouſneſs of other parts, or of the blood, than from its own default; becauſe, it is uſual for thoſe ſort of ſick people to be well in their ſtomach, ſo long as they may lie a bed, and breathe it forth; but when they are raiſed up, the pores being ſhut up, and the dregginess of the bloody maſs ſtagnating within, preſently to be afflicted with the pain of the heart, an aggeſtion of wind, and frequent endeavours to vomit.

For theſe and other conſiderable Reaſons, I judg the original of the *Hypochondriacal* Diſeaſe, to be derived from ſome other Fountain than the weakneſs of the Ventricle: but foraſmuch, as among the parts here primarily ſuſpected to be affected, great complaints are made againſt the Spleen; it will be worth our while to enquire, what office this Inward doth diſcharge; then, as often as it fails in it, whether it contributes to this Diſeaſe.

The uſe of the Spleen is inquired into.

Though I may grant with Doctor *Highmore*, that the Spleen doth cheriſh the Ventricle with its warmth, and ſo perhaps in ſome meaſure help Concoction; yet I do not conclude this part to be framed chiefly for that end, but for ſome more noble uſes; becauſe, there ſeems to be need for the digeſting of the food in the ſtomach, not ſo much of heat, as of an active ferment: For Fiſhes being actually cold, devour their food whole, and without the help of heat, eaſily concoct the ſame, being reſolved as it were by a certain *menſtrum*: beſides, it is obſerved of the Spleen, that though in man its whole ſubſtance lyes near to the Ventricle; in moſt other Creatures, who are indued with a longiſh form, as to the greateſt part of it, it is removed from the Ventricle: Further, if the Spleen be the only Chimny, in which the Blood warming the Ventricle is contained, what is the reaſon that it, rather than the Liver or Lungs, becomes of a livid or blewiſh colour, and is ſtuffed with a black blood, and that leſs hot?

See his diſcourſe of fermentation. Chap. 5th.

When I conſider theſe things, which ſometime ſince I have obſerved concerning the uſe of the Spleen; it ſeems far more probable, that a certain dreggy portion, *viz.* a matter conſiſting of an earthly and fixed Salt, is laid up in this Inward, by the Blood carried to it; by the Arteries, which being exalted there as it were by digeſtion, and into the nature of a ferment, is laſtly committed to the blood, flowing from it by the Veins, which inſpires or quickens it with a certain leven or fermentation, and performs the ſame thing about its Spirit, or making it Spirituous, as our ferment commonly called Leven, doth, being put into a batch of bread or dough; for as a certain portion of the unbak'd bread or dough, being kept to a ſourneſs, preſerves the ſame nature that it doth ferment or leven other bread or dough, and ſtirs up in it the otherwiſe ſluggiſh Particles into motion; ſo it ſeems, that the Blood being laid up in the Milt or Spleen, and there getting a ſourneſs, as it were by ſtagnation, puts on the nature of a fermeut, whereby indeed the reſt of the maſs of blood, and perhaps the other humours, are actuated, and as it were Spiritualiſed into a more lively motion. What hath been ingeniouſly wrote by a late Author, *viz.* the moſt learned *Velthuſius*, concerning the uſe of the Spleen, may have relation to this: for he hath determined as highly probable, a ferment to be contained in this inward, whereby the ſluggiſh Particles of the blood are brought into a ſtate of activity: Becauſe, taking notice that in children, and others indued with a ſanguine temperament, and more fat or dull habit of body, even as their manners and diſpoſition of mind were inclined to idleneſs, ſoftneſs, and dulneſs, ſo their Spleen was ever of a reddiſh colour, and full of florid blood, like the Liver: from hence he concludes, that the Spleen doth but little perform its office in theſe, as the gential parts before ripe age, or in thoſe of weak Loyns; but on

the contrary, forasmuch as men of a middle age, and chiefly in those who are of a severe Countenance, and of a lean Body, as in them appear marks of cunning, sagacity, fortitude, and constancy; so their Spleen is found to be of a livid or blewish colour, and imbued with blood as it were muddy: further he argues from hence, that the blood being kept long in the Spleen, as in a conduit or receptacle, turns plainly into ferment, by which its remaining mass being from thence inspired, is made more subtil, and begets more acute Spirits, both in the vital and in the animal Kingdom or Government: For he supposes our bodies naturally to abound with too much humidity, by which indeed the function of the parts, and many of the *Viscera*, are very much dull'd: but that the Spleen doth communicate to the mass of blood, solid, firm, and constant parts, and not easily to be dissipated; and that those do wipe away that moistness, and with it carry away in some measure that softness from the Blood and Spirits, which is predominate in tender Age, almost after the same manner as the North-wind, or eastern gales, fanning and intimately penetrating the air with the dryness and strength of their parts, breathe health or strength to the Air, and to our Bodies.

But since I have in another place, declared what I have formerly thought concerning the Spleen, there will be no need to repeat it in this: yet I shall further note, that in bodies of living Creatures, compacted out of a quinarie of Elements, as the Spirits ought to be more strong then the rest: so indeed they being intangled with a viscous humidity of Sulphur and Water, are so hindred, that oftentimes they are not able to exercise their strength or powers lively enough; hence saline Particles, for that they are very much fermenting, are required for this, that the spirituous little bodies, almost overwhelmed by the embrace of the others, and stupifyed, might lie awakened, and set at liberty, and into motion. Wherefore we experience in our selves, when the Spirits are dull'd, by the Blood being too much exhal'd, that notable help is brought by sharp Liquors, as chiefly small Wines, and Cider: for these kind of Remedies sharpen the Spirits, and shake off all heaviness. Such a kind of fermenting virtue we easily believe to be continually exercised by the Spleen being in right order, towards the Blood and nervous Liquor.

For as this inward is formed with a threefold sort of Vessels, *viz.* with Arteries and Veins, and besides with great enfoldings of the Nerves, and a most thick contexture of nervous *Fibres*; we think the use of each of them, to be set apart for this end: *to wit*, by the Arteries the blood is carried to the Spleen, hence it lays up its dregs, composed of a fixed Salt, and an earthly matter, in its passages and porosities, and these there laid up, as it were by a certain digestion, are brought into a juice very fermentive: A portion also of which, being carried back to the Blood, by the Veins, is continually mixed with it: and so its whole mass is inspired with those kind of fermentive Particles from the Spleen; by which a certain austerity and sharpness, with vigour of motion, is given unto it; so that for that reason, the Blood it self is carried more lively in the Vessels; also from thence, the nervous juice procreated from the blood, being more active, supplies the animal regiment; But truly, the Spleen doth not only by this means mediately, and by the intervention of the blood, inspire the Brain and nervous stock with a fermentive virtue; but it may be lawfully believed, that this is done somewhat more immediately by the passage of the Nerves, dispersed in the Spleen: For, because in this part Anatomy discovers a great company of Nerves and nervous enfoldings, and of *Fibres* springing from them; it may well be doubted for what use they should serve: Concerning this, it is first to be observed, that the Ventricle and the Spleen have a most intimate commerce with the Brain; insomuch, that *Helmont* did place the seat of the Soul in those inwards; but this is possible to be done by no more commodious way, than by the aforesaid Nerves: Wherefore we may here deservedly suspect, That not only the animal Spirits, are the Messengers between the one part and the other; but also, that the nervous Liquor, which is both the Food and the Ventricle of these Spirits, doth descend now from the Brain towards these inwards, and now being received from these *Viscera's* by the Nerves, doth creep thorow towards the Head; which kind of spleeny Juyce being dilated to the Brain, sharpens the animal Spirits, and raises them up being slothful, and irritates them into quick motions: from whence it is commonly said, the sharpness and sagacity of the mind doth proceed from the Spleen; and splenetick people are accounted ingenious: But it is probable, that the rage and force of the Passions, being begun by the Spirits inhabiting the Brain, are carried to the Spleen by the passage of the Nerves; and so the Spirits there dwelling are pathetically troubled, and the Blood flowing thither is moved into a multitude of perturbations: For from hence it in some measure falls out, that in anger, sadness, and other distempers of the mind, according as the ferment, if the Spleen being more or less moved, is inspired to the blood, its liquor

diversly

diverſly boyls up: Further, for this reaſon it happens, that great Inflations and Commotions of the left *Hypochondrium*, come upon ſplenetick people from every violent paſſion.

The reaſons of the hypochondriacal ſymptoms laid open.

Theſe things being thus premiſed concerning the uſe of the Spleen, it will be eaſie according to our *Hypotheſis*, to lay open very many of the Symptoms belonging to the *hypochondriack* diſtemper, and to give reaſons for each of them: For when the Spleen is wanting in its office; that is, when it doth not ſtrain forth the melancholy Recrements of the Blood, nor Cook them into a fermentative matter, as we but now obſerved in Children, and others of a ſangnine Complexion, or too Phlegmatick, to happen often; the diſpoſition of the mind is made duller, the body grows fat with idleneſs; yea and the blood being more ſluggiſh than it ought to be, is apt to ſtand ſtill within its Veſſels, or at leaſt to be leſs lively circulated: But on the contrary, where the fermenting power of the Spleen is too much exalted or perverted, the blood by that means being more ſharp than uſual, or made more ſower, it runs about rapidly here and there, and conceives irregular motions; yea, and the nervous juice, falling away from its right temper, imbues the animal Spirits with an heterogeneous and an exploſive *Copula*, and ſo irritates them, as it were with goads into frequent Convulſions: as that not wholly undeſervedly, many kinds of Diſeaſes may be imputed to the Spleen being out of order: But the ways or means of affecting, whereby the Spleen being evilly diſpoſed, doth produce the Symptoms of the hypochondriack paſſion, or at leaſt contributes to the riſe of them, are chiefly theſe following.

The Influences of the Spleen in producing the ſymptomes, unfolded.

Firſt, It ſometimes happens, that the ſpongy ſubſtance of the Spleen from the fæces of the blood, being too much impacted in its Pores, and ſtagnating, is very much ſtuffed and obſtructed: That from thence, it doth not ſufficiently receive the Recrements of the bloody maſs: But the ſame being carried thither, but not received, do flow back into the neighbouring branches of the Cæliack Artery, from whence they are preſently carried into the Membranes of the Ventricle, the Caul, the Meſentery, and other nigh parts, and are wont to be affixed to them; hence the tone of thoſe *Viſcera* are ſo much ſpoiled, that they do not rightly perform their due offices about the Concoction of the Chyle, and the Membranes planted every way about, being much imbued with heterogeneous and irritative Particles, for that they are almoſt continually pulled by Convulſions here and there ſtirred up; they are grievouſly obnoxious to wandring pains, contractions, diſtentions, and the encreaſe of Winds, by reaſon of this kind of regurgitation of the blood from the Spleen being obſtructed; it is likely, that the pulſation which is felt by hypochondriacks under the Ventricle, is excited.

2. When the fæculencies of the Blood are excluded from the Spleens being obſtructed, being fixed (as was ſaid) to its neighbouring parts, they bring forth the ſickly diſtemper of the left *hypochondrium*: But though indeed, that inward ſufficiently receives the melancholy or atrabilious juice carried to it from the Blood by the Arteries; yet oftentimes it doth not rightly Cook it, but the Salt being too much excited, it changes it into a too ſharp, or acid, auſtere, or ſower, or ſome other kind of vitious humour; whereby when as the whole maſs of blood, and the nouriſhable juice contained in its boſome, are almoſt wholly infected, the fruits of the hypochondriack Seeds bud forth thorow the whole body; the blood grows unduly hot, is in ſome places impetuouſly moved, and again in others is apt to ſtagnate or ſtand ſtill: from hence, it is familiar with ſplenetick people preſently after eating to grow red in the Face, to have the Palms of their Hands hot, their Hypochondria to ſwell; oppreſſions of the Heart, and noted variations of the Pulſe to ſucceed: But theſe fermentative Particles being tranſlated from the Blood every where into the ſolid parts, wandring pains, running up and down here and there, and a ſenſe of pricking are ſtirred up in many Members of the Body: Moreover, from this infection of the blood, for that its maſs is changed from a benign and balſamick temper, into a ſalt and tartareous, a lean habit of Body, with a black and dark Countenance is induced.

3. From the Blood being ſo depraved by the fault of the Spleen, oftentimes the taint is carried to the animal Government; for heterogeneous and convulſive Particles are poured frequently into the Brain, and from thence into the nervous ſtock; ſo that the animal Spirits dwelling in either Province, conceive various irregularities; by reaſon of the evil being impreſſed on the Head, hypochondriacks uſe to be troubled with various Phantaſms, with an heap and fluctuations of thoughts: beſides to them happen frequent *Vertigoes*, Scotomies, Head-aches, and often paralytical Diſtempers: Then, foraſmuch as the morbifick matter ſlides down from the Head into the nervous ſtock, convulſive Diſeaſes are excited in very many parts of the body, but chiefly about the *Præcordia* and *Viſcera* of the lower Belly; for when the Spirits flowing within the Nerves which reſpect thoſe parts, are greatly diſturbed by reaſon of the diſtemper of the mind, the

Con-

Convulſive Particles the more readily enter into thoſe Pipes, and more eaſily impreſs on thoſe Spirits a convulſive Diſpoſition: Therefore partly by reaſon of the infection mediately tranſmitted to the Brain, and partly by reaſon of the hurt (as hath been ſhown) immediately communicated from the Spleen, the Palpitation of the heart, trembling and frequent ſwooning, conſtrictions of the Breaſt, impediments of Breathing, pains of the Stomach, Belching, Vomiting, and many other accidents in thoſe inwards happen to hypochondriacks.

4. Beſides theſe inordinations which are wont to be derived by the paſſage of the blood from the Spleen, into the humours and ſolid parts, and to the brain it ſelf, and nervous ſtock; there are other farther evils which ſeem to ariſe from this inward, alſo by the paſſage of the Nerves: Becauſe, as we have ſhown, their extream branches, and the nervous *Fibres* themſelves, interwoven in the *Viſcera*, do drink in with their outwardmoſt little mouths a certain humour, and convey it ſometimes upwards; it is highly probable, that the nervous *Fibres* diſtributed to the Spleen, (of which as we but now hinted, there is a mighty guard) do receive its moſt ſharp juice, which creeping higher thorow the nervous Pipes, becomes a Cauſe of convulſive Motions: In truth, that there may be thoſe intimate Commerces between the brain and the Spleen, to wit, far ſooner than what can be made, by the compaſſing about of the blood; it may be lawful to believe, that the nerves of the wandring pair, and the intercoſtal, to be the neareſt means of the paſſage, whereby theſe parts Communicate one with the other, and mutually affect themſelves. For it ſeems that when the black bile or melancholic tumour in the Spleen, grows turgid, or ſwells up of its own accord, or is moved by ſome evident cauſe, its particles enter the nervous *fibers*, thickly diſtributed to the ſame, which diſturb the animal Spirits flowing in them, into exploſions, or at leaſt into ſome diſorder: then the Spirits being ſo diſturbed, infect thoſe next to them, and they others, till by their continued ſeries, the paſſion begun within the Spleen, is propagated even to the brain, and there produces inordinate Phantaſms, ſuch as happen to hypochondriacks; alſo on the other ſide, when a grievous diſtemper of the mind, occaſionally excited within the brain, doth diſturb the Spirits inhabiting it, the impreſſion being carried to the Phantaſie, by the ſeries of the Spirits, planted within the nerves of the wandring pair, and the intercoſtals, and ſucceſſive affection, it is brought even to the Spleen; hence its ferment being put more into commotion, ſtirs up Convulſions, both in that Inward, and in the whole neighbourhood of Fibres and membranes; and beſides, forces the blood into ebbings and flowings, and into various æſtuations or vehement motions, yea and reflects the perturbations of the Spirits, upon the brain. From this kind of reciprocal affections of the brain and Spleen, it comes to paſs, that hypochondriacks are ſo unquiet, unſtable, and fluctuating, at every thing that's propoſed, as if, according to the Poet, Ten minds ſtrove in them at once.

1. *Obſervation.* A certain noble Gentleman, of a melancholick temper, and always accounted for a Splenetic man, very much complained of a pain and inflation of his left hypochondrium, with a frequeut rumbling noiſe, and ſour belching, alſo of a trembling of the heart; of an aſſiduous vertigo, too much waking, and a diſturbed phancy: About the 35th year of his age, the diſeaſe growing worſe, he began hardly to ſleep, and yet more rarely to get it at night, and to be moleſted in the day-time with a world of fluctuating thoughts, to have in ſuſpition all things and perſons, and greatly to be afraid of every object: His *Præcordia* ſeemed to be very much bound and ſtraitned, and to ſink down to the bottom, as if the heart it ſelf were depreſſed even into the belly; which Symptom troubling him, he became very ſad, and dejected in mind: yet afterwards, thoſe diſtempers of the mind remitting, he felt with it his heart to be a little lifted up, and alſo his *Præcordia* to be looſned, and ſtretched forth; beſides, he very often ſuſtained Pains and Contractions, variouſly excited, about the Muſcles of the *Viſcera* and Members, and running up and down here and there.

As to the nature of the diſeaſe, it is plain, that it is this kind of Diſtemper which is commonly called hypochondriacal: but as to what reſpects the cauſes of theſe to be admired Symptoms, we may ſuppoſe the maſs of blood being degenerate, and ſtuffed with melancholick or atrabilary fæculencies, to adminiſter or continually to ſuggeſt its aduſt recrements to the head; from whence the Liquor watering the Brain and Nerves, being made ſharp, and improportionate to the Spirits, did ſtir up the containing Bodies, into painful Corrugations, or Wrinklings, and Contractures: Further, when this Infection is chiefly derived from the Head, into the Nerves of the wandering pair, and the intercoſtal, the Brain and the *Præcordia* are very much puniſhed by the malady from thence raiſed up. But that the Blood is depraved by that means, it ſeems to be imputed to the vice of the Spleen, foraſmuch as this inward, being amiſs, it did not rightly ſtrain forth the atrabilarie dregs from the blood, but ra-

rather did more pervert whatſoever recrements it received from it, and the ſame being exalted into an hurtful ferment, ſent it back to the blood, and ſo very much infected its maſs, and imbued it with a plainly acetous and vitriolick evil Diſpoſition.

It is plain to be underſtood, that thoſe ſymptoms troubling the Head, *viz.* too much waking, the *Vertigo*, a diſturbed Phantaſy, with many others, did proceed from the heterogeneous Particles poured forth from the Blood into the Brain: As to that ſtraitneſs of the Breaſt, and falling down of the heart with great fear and ſadneſs; it may be thought that the nervous *fibres*, inſerting to the heart, and chiefly to the *Pericordium*, being moved into Convulſions and wrinklings, do bind hard thoſe parts, and pull them downwards; wherefore, there is perceived in the whole breaſt, as it were a certain conſtriction, and the heart it ſelf ſeems to be depreſſed: Further, foraſmuch as the *Præcordia* being ſo ſtraitned and depreſſed, the blood within the boſom of the heart is ſtop'd and compell'd, as it were, to ſtagnate, both the vital and the ſenſitive Soul is much hindred from its wonted expanſion and irradiation, and for that Cauſe being leſſened and ſhortned in its conſtitution, thoſe Cruel diſtempers of fear and ſadneſs ariſe; but when the Convulſions remitting that conſtriction of the heart, and its *appendix* is releaſed, the Soul alſo, as a flame more expanſed or enlarged, endeavours by little and little to ſhake off the Chains of theſe Paſſions. For the Cure of theſe Diſtempers, he had for a long time tried very many remedies, and medical Adminiſtrations, but without much benefit; at laſt he was ſomewhat eaſed by the uſe of Spaw-waters, and from thence by degrees finding himſelf better, he became free from thoſe grievous Symptoms; however, he ſtill liv'd obnoxious to the *hypochondriack* Diſtemper.

2. Obſervation.

A certain young Academic, orginally of a Sanguine temper, fair, of a flouriſhing Countenance, excellent Diſpoſition, and Mild, by reaſon of immoderate and untimely Studies, in the mean time exerciſe and good order of dyet being wholly neglected, had contracted an obſtruction of the Spleen, or ſome other morbid diſtemper of that Inward: For he had almoſt continually infeſting him an inflation, and tumor of the left *hypochondrium*, with a moſt heavy *Pain*. After he had laboured with this ſort of Diſtemper about half a year, he began to complain of a frequent giddineſs, a blindneſs of his eyes, an unquietneſs of his mind, and of diſturbed ſleeps: Which Symptoms were then plainly imputed to vapours ariſing from the Spleen: but after that followed a trembling of the heart, with a frequent *deliquium* of the Spirits, a pulſation of the *hypochondrium*, and at length Pains and Contractions in the outward members, with a frequent ſtupor, and a ſenſe of pricking, running up and down here and there: and laſt of all, being broken with a world of evils, contrary to his *genius* and native Diſpoſition, he became greatly hypochondriacal.

That I may diſpatch the Pathologie of this Caſe in a word, it appears here plain enough, that the Spleen was firſt of all in fault; by whoſe fault, when the bloody maſs was depraved, the taint creeping from thence into the humour watring the brain and nervous ſtock, and infecting it, did induce the aforeſaid Convulſive Symptoms.

The Method of Curing the Hypochondriac Diſtempers.

The Curatory Method to be uſed againſt the hypochondriacal Diſtempers, requires chiefly theſe four general Indications, *viz.* In the firſt place, that the Impediments of the Cure may be taken away, the Intention of which chiefly reſpects the purging and preſerving the firſt paſſages. Secondly, it muſt be endeavour'd that the obſtructions of the Spleen may be corrected. Thirdly, that both the recrements of the bloody maſs may be purged forth, and that its due diſpoſition may be reſtored. Fourthly, and laſtly, that the enormities of the brain and nervous ſtock, and alſo of the watering humour, and the inhabiting Spirits, contracted by the fault of the Blood and Spleen, may be amended, or taken away: when any of theſe Intentions, or all of them together, ſhall be endeavoured at, fit times ſhould be choſen, in which each being ſingly propoſed, may be performed without any neglect or hindrance of the reſt.

1. As to the firſt Indication, when a great load of crude or aduſt matter is wont to be laid up in the firſt paſſages, and when the tone of the Ventricle us'd to be ſpoiled, and its ferment variouſly perverted againſt every one of theſe kinds of evils, you muſt bring timely help with fit remedies; therefore, gentle and moderate evacuations, both by Vomit, if it proſpers well, and by Stool, ought to be adminiſtred: For ſuch whoſe ſtomach eaſily caſts forth its contents upwards, I perſwade, that once in a month Vomiting ſhould be ſeveral times provoked by taking *Liquor of Squils*, or *Salt of Vitriol*, or by drinking plentifully ſmall beer poſſet-drink, or warm water; in the time between, a gentle purge, and only a little moving is to be ordered often: For this end, The Pills *Tartareous* of *Bontius*, or Stomach-pills with Gums, or our ſolutive extract,

tract may be of use. Take of the best *Senna* one Ounce; of *Rhubarb* ʒvi, of *Epithim* ʒiii, of *yellow-Sanders* ʒii, of the *Salt of wormwood* ʒii, of *Celtic Spike* ʒi, being cut and bruised, let them be digested in x ounces of *White wine*, and as much of fumitory water, for 48 hours, let the clear straining be evaporated with the heat of a gentle bath, to the consistency of an extract, adding towards the end, of the powders of *Senna*, of *Rhubarb*, and *cream of Tartar* each ʒii, let them be bruised together in a glass mortar, and reduced to the consistency of Pills. The Dose ʒß, ℈ii, or ʒi, the Remedies respecting the tone, and ferment of the ventricle, as they are manifold and divers, out of them the most fit or commodious for the Disposition of the Ventricle, are to be chosen; for to this bitter things, to that Saltish, to another sharp and perhaps biting things, are desirable. Among the number of these kinds of Medicines, (which are commonly called Digestives) are *Elixir Proprietatis*, *Tinctura Sacra*, *powder of Aron* Compound, *Salt of Wormwood*, *Cream of Tartar*, *Tartar vitriolat*, *Vitriol of Steel*, with many others. Besides these inward Remedies, also external applications do often bring help: Because the Stomach being ill affected, a fomentation of *white-wine*, with *wormwood*, *century*, and other bitter plants boyled therein, also oyntments or plaisters, often bring help: Concerning which, there will be no need here to discourse particularly, and to prescribe forms of the Medicines themselves.

2. The second Indication, for the mending the vices of the Spleen, (to wit, if there shall be in the same any obstruction, Tumor or Pain, or simple Dyscrasie or Intemperament) is wont to be performed, or at least attempted by Remedies both internal and external: Those which are of the former sort, fall in with those indicated in the 3*d* place, (to wit, with such, as for the purifying the Blood is intended) because, when chiefly, or almost all that which is carried or born to the Spleen, is done by the passage of the blood, the irregularities of the *Latex* of this, as well as of that Inward, by a Social labour, ought to be cured with the joynt strength of Medicines; by what means is shown by and by. In the mean time some external Applications, under the form of a plaister, or an oyntment, or a fomentation, more nearly and immediately respect the body of the Spleen, and often bring notable help, forasmuch as they discuss tumors, and allay the Convulsive Distempers, and quiet them. Great plenty of these kind of outward Medicines, are every where extant among Authors, the choice of which ought to be made, according to the various passions of the Spleen, or the divers Constitutions of the Patient, so that there will be no need here to shew their particular forms.

3. The Remedies indicated in the 3*d* place, to wit, which take away the dyscrasies or evil temper of the blood, contracted from the vice of the Spleen, and also clear the primary fault of the Spleen, are of a manifold and divers kind and manner, the choice of which ought to be administred, according to the various infection of this or that: of these, some are compounded and prepared according to the prescription of Physitians, as *Electuaries*, *Powders*, *Apozems*, *Tinctures*, *Infusions*, and the like; others more simple, as *whey*, *asses milk*, *Spaw-waters*, and *Baths*.

There are two chief Cases of sick people, in which magisterial Remedies ought to be all accommodated, according to their strength and qualities: to wit, either the blood is thick, coldish, and earthy, with the Spleen being obstructed, which requires more hot fermenting, and chiefly Chalybiate Medicines; or the blood being clearly adust, and hot, ferments too much, and together greatly troubles the *hypochondria*, and in them the blood and humours boyl up; in which state, Remedies only temperate, and allaying the fermenting, and immoderate boyling of the humours, are to be chosen, where Chalybiates are wholly to be avoided.

When therefore to a cold ventricle, cold dyscrasies or evil temperaments of the Blood and Spleen also happen, I am wont to prescribe according to the following forms.

Take of the *Troches of Rubarb*, of the *Powder of the root of Aron*, of *winteran Bark*, each ʒii, of the *root of virginian Snakeweed*, *Centrayerva*, *Diatrion Santulon*, of *Crabs eyes*, each ʒi, of the *extract of Gentian*, of *Century*, each ʒiß, of *ammonia*, dissolved in the water of *Earth-worms*, what will suffice to make a mass of Pills: let them take 4 pills in the morning, and at 4 a clock in the afternoon, drinking after them a little draught of *wormwood wine*, or *chalybiate wine*, with moderate exercise.

Take of the *Conserves* of the *yellow of Oranges*, and of *Lemons*, each three Ounces, of preserved *mirabolans*, *n.* ii, of the *Species* of *aromaticum Rosatum*, of *winteran Bark*, each ʒii, of the *Salt of wormwood* ʒii, of the *vitriol of Steel* ʒi, (or *Steel prepared* ʒiii.) with what will suffice of the *Syrrop of Citron rinds*, make an Electuary, to be taken twice a day, drinking after it a draught of *wormwood-wine*, or of the infusion of the *herb* or *flowers* of *Tamarisk*.

For

For those who are not pleas'd, but with medicines in an elegant form, and in a very little quantity, the tinctures of *Antimony*, and of *Corrall*, also of *Steel*, with the *Spirit of wine*, (the body being first dissolved by a proper *menstrum*, and reduced to a *Calx*) are convenient: as also the *Spirits of Sut*, of *blood*, or of *harts-horn*, to be taken twice a day, with a proper liquor to 12. drops, more or less, are of known benefit, above any other medicine that I know of: moreover the often drinking of *Coffee*, also that made of the Infusion of the leaves of *Thea* gives ease to some.

If that the fervor of the blood, and too fermenting, with the trouble of the Spleen, and unquietness of the mind, be joyned to the hypocondriac Distemper:

Take of the *Conserves of hyps* or *Conaradine*, six Ounces (or of the flowers of *Tamarisk*, and the leaves of *wood-Sorrel*, each three Ounces) of the *Species* of *Diarrhodon Abbatis*, of the confection of *Alkirmis*, each ʒi. of the *powder of Ivory* ʒiß, of *Pearls* ʒß. of the *Salt of Tamarisk*, and *Wormwood*, each ʒi. with what will suffice of the *Syrrep* of *green Citrons*, or *Clove-Gilliflowers*, make an Opiate, to be taken twice in a day, the quantity of a Nutmeg.

Take of the *Powder of Ivory*, ʒii. of the *Powder of Pearls*, ʒi. of the *Species* of *Diarrhodon Abbatis*, of *Diamagarit frigida*, each ʒiß. make a fine powder, add of *white Sugar*, dissolved in *Baume-water*, and boyled to the consistency of Tablets, Six Ounces; make thereof, according to Art, Lozenges, or little cakes: take ʒiß or ʒii twice a day. To these, and other medicines of this nature, may be joyned the use of Spaw-waters; which indeed in either, yea, in all cases of hypochondriac Melancholly, are almost always taken with good success: For want of those waters, our artificial Spaw-waters may be conveniently ordered, yea, and whey; and if any notable atrophie be, let Asses milk be daily taken.

Besides, these inward Remedies; and other outward Applications before-recited, *Phlebotomie*, or the taking away of blood with Leeches from the sedal veins, may be of use frequently: yea, sometimes it may be convenient to open the Salvatella Vein, according to the prescript of the Ancients: Besides Cauteries, or Issues, which may continually carry forth the adust recrements of the blood, and by degrees excern them, are wont to be beneficial almost to all.

4. The fourth Indication, respecting the affections of the brain, and nervous stock, or the Convulsive Symptoms, having relation to, or coming upon the former, is rarely in use of it self, and apart from the others, but that Remedies destinated to this end, are complicated with those aboveſaid. Liquors indued with a volatile Salt, or an armoniac, as *Spirits of Harts-horn*, and *Sut*, are highly necessary for this intention, as also the rest but now recited; wherefore such Remedies, unless any thing shall shew the contrary, may be daily given at fit hours. Further, when Spaw-waters are drunk, let tablets or pills, such as are above prescribed for the Convulsive distempers, be taken, at least twice in a day. In the frequent turning and giddiness, also in the passions of the heart, the sinking down of the Spirits, with dread, and as it were a fear of Death just seizing on one, I have known very often great help to be had by the use of Chalibeat, or steel Medicines.

The preparations and effects of Steel Medicines unfolded.

Since we have made mention so often of Chalibeat, or steel-medicines, it will be worth our while to enquire into their various preparations, and for that Reason their divers manners of effects, which they are wont to produce in the humane body, that it may from hence appear by what means, and for what respects these or those preparations of Iron are greatly profitable to some hypochondriacks, and to others as much hurtful.

The virtue and operation of Chalybeat, or steel'd medicines, depends upon the particles of the concerts, being after a various manner dissolved, unfolded, and brought forth into act: For Steel, or Iron, consists chiefly of a *Salt*, *Sulphur*, and *Earth*; and but slenderly indued with Spirits and Water: But the particles of the former Elements, chiefly the sulphureous and saline, being in their mixture combined together, with the Earth, remain altogether fixed and sluggish; but being soluted, and pulled one from another, they come to be of a very efficacious Energy.

The aforesaid particles are dissolved in a twofold manner, and set into the Liberty of acting; *viz.* either by Art, whilst Medicines are prepared, or by Nature, after they are taken inwardly; for the metallic Body is wont to be dissolved and eaten by the ferment of the ventricle, just like a Chymical *menstrum*: We will consider the several *Species* of either, and their manner of being made, that it may appear what alteration is impressed on the steeled Medicine in the preparation, and what effects every preparation of it doth impress on man's Body.

The most simple way of preparing Iron, is a division of its body into little integral parts with a file, which resemble the nature of the whole mixture, and contain both

little sulphureous bodies and saline, combined among themselves, and with other terrestrial. The filings of Iron being inwardly taken, is dissolved by the ferment of the ventricle, as it were by an acid *menstrum*; the signs of which are both a sulphureous and unsavory belching, as from the eating of hard Egs, also the blackness of the ordure, from steel being dissolved within the *Viscera* of Concoction, active particles, both sulphureous and saline, plentifully sally forth, and being involved with the nutricious juice, are carried into the blood; which as they excel in a divers virtue, do often conspire, as it were, with the joynt forces of either, to bring benefit to the sick. The sulphureous little bodies being brought to the blood, add to it a new and more plentiful Provision of Sulphur; wherefore its mass, if before it was poor and liveless, doth nimbly ferment within its vessels, and being inkindled farther in the heart, acquires a more intense heat, yea, and a deeper colour; for it is so observed in many affected with the Dropsie, arising from white Phlegm, the Pica or evil longings, or green-sickness, to have a pale countenance, cold blood and waterish; but by the use of steel, the countenance soon to be more florid, and the blood to be imbued with a more intense tincture and heat: moreover, from the filing of Iron dissolved in the ventricle, also saline particles are brought forth, and often they bestow a more plentiful fruit or increase both on the solid parts, and on the humors; for since their natures are vitriolick, and stiptick or binding, they bind togetherand, strengthen the too lax and weakned *fibres* of the *Viscera*, and so restore the broken tone: Besides, these saline particles inhibit the foree of the blood, repress it from too much heat and boyling up, and froth, and retain it in an equal circulation: Besides (which is their chief virtue) they contract and straiten the too loose, open and gaping little mouths of the Arteries, that, for that Reason, neither the *Serum*, nor the bloody *Latex* may sweat out, or be broke off from the file of its circuit: Wherefore in the Dropsie, and great bleedings, Remedies, imbued with the saline particles of Iron, are of famous and efficacious use; for very many Diseases proceed from this cause; forasmuch as the little mouths of the Arteries being too open, and the interspaces of the vessels above measure loosened, the *serum*, or bloody *latex* breaks forth; which kind of Affections the Vitriolic Particles of Steel do often help, by binding and corroborating the sanguiferous Vessels, and nervous *fibres*.

After this manner the *filings of Steel* being taken inwardly, seems at once to add to the blood both spurs and a bridle. But forasmuch as from this Medicine an incitation, much more than a restriction, doth arise, therefore it ought to be given only to them whose blood is very thick and cold, as countrey people and strong persons; in very hot and spirituous blood, and in hot inwards 'tis no ways convenient: moreover in delicate persons, and men of a more tender constitution, 'tis dangerous, lest the little portions of the steel, when they cannot be sufficiently dissolved, should like fragments of glass, be driven into the membranes of the *Viscera*, and there pertinaciously sticking, produce some Ulcer, or deadly torments, which indeed I have known sometimes to happen.

2. After the filing of Iron, the next way of preparing it, is calcining it with Sulphur, to wit, let thin pieces of steel, being strongly fired, be laid upon a Roler of *Sulphur*, that the metal may melt into little round balls, which are to be calcined to the consumption of the Sulphur, and pounded in a mortar, are to be reduced into a subtle powder, which is of choice use. In this preparation of Iron, some salphureous particles are exhaled, the sign of which is, That this powder, an acid liquor being poured upon it, much less boyls up, or grows hot, than the limature or filing of Iron: but being taken by the same mouth, it excites a sulphureous savour. In the mean time in this preparation the saline particles seem to be somewhat augmented by new ones sticking to them, from the metal burning with sulphur; so that active particles of either kind, to wit, sulphureous and saline, come almost to an *Æquilibrium*: and when by this means this medicine, the substance of the metal being loosned, may be finely poudered, it becomes of far more excellent use than the filings of Iron: In most Cases where steel ought to be given in substance, as in a Cachexie, or a fulness of evil humors, the longings of maids, or the green-sickness, and such like, this medicine is convenient to be used.

3. In the third place follows the preparation of steel with vinegar; to wit, the filings of the whole steel is moisten'd with vinegar, and dried, till it may be reduced into an impalpable powder: In this preparation the sulphureous particles are yet much more; yea, as to the greateft part evapourated, only a few being left in the mean time, the saline, by reason of others sticking to them from the vinegar, are much encreased, which are mingled with the terrene particles: This chalibiated powder very little or nothing froths or boyls up, a sharp liquor being sprinkled upon it, also being taken at the mouth, has with it scarce any sulphureous savour: wherefore it conduces less to the taking away of the obstructions of the Bowels, or to the restoring the ferment of the

the blood: nevertheleſs in a more hot Conſtitution, in hemorrages, or fluxes of blood, and the hypochondriac diſtemper, it is wont to be adminiſtred with greater ſucceſs than the former preparations.

4. Follows the Ruſt of Iron, which being an extract of the metallic body, ſeems to be, as it were, a fifth Eſſence; becauſe in this excreſcency ſome particles of every kind, to wit, ſulphureous, ſaline, and terrene, being looſned from the whole ſubſtance, are combined among themſelves, and conſtitute, as it were, a new mixture, more ſubtle and defæcated, or clearer from dregs: For that in this concrete there remains leſs particles of ſulphur; therefore it doth not ſo potently ferment the blood, or take away the obſtructions of the *Viſcera*, as ſteel prepared with ſulphur, but in more hot diſtempers of the parts or humours, it egregiouſly performs the requiſite intentions of a ſteeled Medicine.

To this Claſs may be referred by right, our preparation of ſteel, to wit, in which all the particles of the metal being looſned from the bond of mixture, are contained together; which notwithſtanding (the concrete being firſt reduced into powder) and immediately diſſolved in any Water or Menſtruum: This powder being inwardly taken, hath the like vertue as ſteel prepared with ſulphur; but to the liquor or menſtruum in which it is diſſolved, it imparts almoſt only ſaline, or chiefly vitriolick particles, the ſulphureous flying away, and the terrene ſinking to the bottom. I am wont to give in great quantity, and not ſeldom with excellent ſucceſs, common water impregnated with the diſſolution of this, inſtead of the natural acidulous or ſpawiſh waters: moreover I make thereof medicated wine, beer, cyder, whey, or other Liquors, this powder being diſſolved in them; and preſcribe them to be taken for ſeveral intricate intentions. So much for the preparations of iron, in which the elementary particles of every kind are comprehended in a various proportion: There remain others in which the particles almoſt only of one kind, to wit, the ſaline or earthy are left; the reſt, as to the greateſt part, being driven forth; of which ſort are chiefly vitriol, or the Salt of ſteel.

5. For the making the vitriol of ſteel, firſt, the metal is wont to be eaten thorow with a very ſharp and corroſive Liquor, and to be diſſolved into elementary parts: In the diſſolving, the ſaline particles of the menſtruum are joyned to the other ſalines of the Iron, and are with them intimately combined; in the mean time, the remaining ſulphureous and terrene being laid aſide, and excluded from their company; then common water being poured to this ſolution, the ſalts of either kind being combined, are imbibed by the Liquor, and that being laſtly filtrated and evaporated, they are reduced into chriſtals. This kind of making of ſalt or ſalification, ſucceeds, if you do it either with the Spirit of vitriol, the oyl of ſulphur, or ſtygian water, or any others diſtilled from the ſtagmas of minerals: Yea, *Sal Armoniac* only, being ſoluted by melting, diſſolves Iron after the ſame manner, and cauſes it to chryſtalize.

Salt of Steel thus prepared, hath a ſweetiſh taſte, with a certain ſharp ſtipticity or binding, and participates much of the Nature of *vitriol*, that it ſeems not to differ much from Verdigreaſe. Taken inwardly for a medicine, it ſomewhat ferments the humors, and powerfully binds the nervous *fibres*: for cold Cachecical and Phlegmatic people this medicine is not convenient, becauſe there are in it no particles of *Sulphur*; but it is often adminiſtred with ſucceſs in hot diſtempers of the bowels, where there is a predominancy of aduſt *Sulphur*, and in wandring effervеſcencies, in ſcorbutical and unequal heats both of the blood and nervous ſtock by it ſelf, or mixed with other medicines as an enforcement: but yet in more tender Conſtitutions 'tis dangerous, leſt the tone and *fibres* of the ventricle ſhould be hurt by its acrimony, and too great conſtriction or aſtringency.

6. In the laſt place follows the aſtringent *Crocus Martis*, or the *Crocus of Steel* prepared by fire through a long Calcination; *viz.* The filings, the off-ſcourings, or thin plates of Iron, ſhould be ſo placed in a reverberating furnace, that they may be continually heated by a moſt ſtrong flame: The filing being thus expoſed to the naked fire, firſt of all it grows reddiſh, and runs together into little hard round balls; but after Three or Four days, ſwelling up ſuddenly into an higher heap, it becomes extream light, impalpable, and of a moſt curious purple colour: In this preparation the ſulphureous and ſaline particles, whilſt by the force of the fire they begin to come away from the concrete, do mutually take hold one of another, and ſo being combined together, grow into little balls; but afterwards thoſe particles, both ſaline and ſulphureous, being wholly profligated, and fiery particles ſucceeding in their place, the whole maſs ſwelling up into a bulk, and made, as it were ſpungy, becomes moſt light.

A Medicine thus prepared in ſome caſes is of moſt excellent uſe, and ſecond to none of the Chalybeats; to wit, almoſt in all extravaſations, or too great eruptions of the *Serum* and blood, as in outward *hæmorrages*, or in inward bleedings, in the *Diarrhæa*,

the *Diabatis*, and in a vehement Catarrh; also I have known no Remedy better than this in the *Ascitis*, or in the beginning of a Dropsie: and this also I have heard to be highly approved of lately by a most famous and expert Physitian of our own Country: Concerning which medicine notwithstanding since it is wholly destitute both of saline and sulphureous particles, and consists only of earthly and fiery particles, it is very ambiguous by what faculty it operates, and produces so praise worthy an effect in man's body: for there seems to be in this left no more *caput mortuum*, or dead head, or *terra damnata*, than in vitriol, or in any of the other metals distilled by a most intense fire. As to this, if I may conjecture, it seems first, that to this preparation some activity is due, whereby it exerts it self, and unfolds its verrues, either by shutting up obstructions, or by binding together the vessels or nervous *fibres* of the *Viscera*, from the fiery particles shut up in the most fixed earth, and from them breaking forth within the body: But the chiefest Reason of helping, consists in this, That the earthy particles, the saline (by which they were strictly held) being wholly gone, desire greedily to be reunited to them, or such like: Wherefore this *Crocus martis* being immersed in our bodies, snatches to it self whatsoever Salts it meets with, and intimately binds them; and so while it sucks up like a spunge, very many saline particles, it takes away many enormities arising chiefly from the flux of the Salts. By this means *burnt Harts-horn*, *Spodium* and *Antimony Diaphoretic*, when they bring help, exert or put forth their Virtues.

CHAPTER XII.

Of the Convulsive Cough and Asthma.

An example of a Cough meerly Convulsive.

THE History before related, doth clearly manifest, That sometimes a Cough may be caused without any great fault of the Lungs, by reason of the sliding down of the morbifick matter upon the pneumonick Nerves, or those belonging to Respiration; to wit, where it was shown in the Case of the Noble Virgin labouring with Convulsive fits, and also with a grievous and continual giddiness, that when by the prescript of the Physitian, a fomentation of Cephalic Decoction was applied to her head, presently the Giddiness ceas'd, and in its place follow'd a great Cough without any spitting, but night and day, almost, perpetually troubling her; which without doubt hapned by reason of the Convulsive matter being driven from the brain into the beginnings of the nerves: This kind of example of a Cough meerly Convulsive, more rarely happens in persons of ripe years, as the like distemper I have not often seen: But in children 'tis usual (also sometimes I have known it in men) for a Cough to arise from a serous Colluvies overflowing the Lungs; which when at first it was simple and moderate, afterwards it became vehement and convulsive; so that in coughing, the *Diaphragma* being drawn upwards, and held in a long *Systole*, or frequently repeated, the Lungs being greatly straitned, were much hindred in their motion. In the mean time, by Reason of the breathing being hindred, and the blood being restrained within the *Præcordia*, and for that cause stagnating in other places, the sick were in danger of being choaked, and often acquired a livid or dead countenance. But in this Case, besides the Convulsions raised up about the *Præcordia*, by the force of coughing, the Ventricle also being oft brought into a consent, cast forth by vomit whatever it contained in its bosom: yea, and I know in some tender ones after this manner affected, the Disease wandring from thence into other parts, did raise up Convulsive motions in the face, eyes and limbs, and at length became deadly. This kind of Convulsive Cough is very frequent among children, and some years lays hold on so many, that it seems to be plainly Epidemical; when it roots it self, it is very difficult to be cured by Remedies; yea, often being long protracted, it is hardly otherwise to be cured, but by the state of the year being changed.

This distemper frequent enough in children.

The reason of it.

If the causes of the aforesoid Case be enquired into, it will be so plain to refer the procatartic or more remote cause to the redundancy of the serous humour in the bloody mass, and in some sort in the whole body; a portion of which matter dropping forth from the little mouths of the Arteries on the Lungs, creates the ordinary Cough; afterwards when the serous Colluvies, or heap of waters yet exuberating in the blood, and stuffed with Convulsive particles, is also heaped up within the head, the same entring

tring the pneumonic nerves, increases the simple into a Convulsive Cough: For when those nerves, being irritated first about their extremities, are exercised above measure, for that Reason they more easily imbibe the convulsive matter laid up nigh their beginnings: and so when at length they are driven into irregular motions in two places, to wit, in the head and at the tale, and that for two distinct causes, *viz.* from the irritation of the Spirits, and from their explosion, it is no wonder if the Cough at first common, being afterward brought into this evil state, becomes so cruel and convulsive: Moreover when it sometimes happens that the same matter heaped up in the head, does enter some other nerve, therefore Convulsive passions of another manner, often come upon the Convulsive Cough.

The Convulsion Asthma.

Having shown after this manner, That a Cough doth arise not only nor always by the fault of the Lungs, but sometimes from a solitary Convulsive cause, but oftener superinduced by this on a pneumatic Distemper: also we do not doubt to determine almost the same thing concerning another certain Distemper of the *Thorax*, to wit, the *Asthma*: For whether this Disease be continual or periodical in either case, the Symptom chiefly urging, is difficult breathing; which indeed seems to be excited for this Reason, because the Lungs being too much inflated and distended, extreamly fills the Cavity of the *Thorax*; neither do they fall down as they should do by turns: hence the spirit or breath remaining within, is not sent forth freely enough, neither indeed can fresh air be easily induced, by reason the space is before filled: whilst the Lungs are so longer contained in a continual or very little remiss Diastole, oftentimes the *Diaphragma* is urged contrary to its manner, into a violent Systole, and being drawn upwards, is wont more and more to lift up the Lungs, and to hinder their falling down; whereby it comes to pass, that Respiration becomes yet more difficult and more laborious.

Sometimes it depends of the Lungs, together with the nerves being affected.

We easily believe, that this kind of hard breathing Distemper, doth sometimes happen by the fault of the Lungs, because anatomical Inspection hath plainly detected it: For if a great serous Colluvies being laid up in the *Thorax*, very much stuffs the Lungs, and so much obstructs their pores and passages, that the blood being hindred in its Circuit, cannot freely pass thorow the Pneumonic Vessels; for that Reason indeed such like anhelous Distempers are sometimes made: Then as often as the blood growing more hot and rarified, by exercise, or the heat of the bed, requires a larger space for its Circulation within the Lungs; then presently from such an occasion a more frequent Respiration, or an asthmatical fit is stirred up: If beside this morbid Disposition of the Breast, the Sanguineous mass also abounding with a serous water, should be apt to sudden fluxions and effervescencies of the Serum, from hence also, by reason of the violent course of the Serum growing hot into the Lungs, being before obstructed and greatly filled, very often most grievous assaults of this Disease, and almost suffocating do happen. Moreover, sometimes beside the Roots of the Asthma (as it is said) being fixed about the *Præcordia*, certain shoots of the same Disease budding forth from the head, meet with the former, and being complicated with them, produce the more cruel fruits of the *Dyspnæa*, or want of Breath. For because the Lungs being stuffed with *Serum*, another quantity of the same, more largely redounding in the blood, being imbued with Convulsive particles, is poured on the head, the same more readily entring the pneumonic Nerves than others, causes the *Asthma* of the *Thorax*, at first simple and moderate, to become periodically vehement and convulsive.

Of these kind of Distempers, *viz.* the *Dyspnæa*, being excited by the singular fault of the Lungs, and with a Companion, very many instances and examples have fallen under our Observation, and do almost daily happen. For there is nothing more usual than for those that are sick of an inveterate Cough, or any other evil disposition of the Lungs, at length the Dropsy or Scurvy hapning to become Asthmatick, to wit, when the Blood being made much more impure, lays up also its serous dregs in the head, these more readily, and indeed more easily enter thán others, the pneumonic Nerves, as being weaker and often irritated near their extremities, and in them do heap up matter for a Convulsive *Dyspnæa*.

An Asthma sometimes meerly convulsive, proceeds from the nerves only being affected.

Further, sometimes I have observed most grievous fits of an *Asthma* to have hapned without any notable fault of the Lungs; so that truly I did think that this disease was sometimes meerly Convulsive, and its fits only excited, because the serous Colluvies or watery heap, being stufft with explosive particles entring into the Nerves, performing the Diastole of the Lungs, grows to the Spirits therein flowing, which being afterwards struck off together, and for a long while, by reason of plentitude or irritation, the Lungs are detained, as it were, inflated and stiff, to that they can perform neither the Offices of drawing in, or of breathing out: But the fit being finished, a free and equal Respiration follow'd, as before the fit began, and no Cough, or signs of a sickly disposition of the

the Lungs did appear. As I have observed this kind of *Dyspnæa* or difficult breathing meerly Convulsive, to have hapned in many, I will here shew you one or two histories of it.

A certain strong and fat Gentleman having used for some time a more full and inordinate Diet, without any exercise, began to be ill about the beginning of the Winter: at first he was troubled with a pain and heavinesse of his head, with a great giddinesse and fear of swoonding, and believing himself just about to die, being otherways healthful; within a few days these Symptoms pass'd into an apparent *Stupor*, or rather Lethargy: he being let blood in his Arm, I caused carefully to be applied Cupping-glasses, Vesicatories and sharp Clysters, with many other Remedies: In the space of 42. hours coming to himself, he was sensible, and shook off all torpor or drousinesse. But altho his brain was cleared, yet he was taken with a great weakness and numbness in his members, which distempers however were shortly cured with antiparyletic and antiscorbutic Remedies: But after a fortnight he began again to complain of an heavinesse and giddinesse in his head; then the next day after he fell into an horrid *Asthma*; that the Lungs being suddenly inflated, and endeavouring to come upwards, the Breath, which was very quick and laborious, was hindrod, and not being able to come forth, he was in danger every minute of an hour to be choaked. This fit, as it was cruel, so it pass'd over within Twelve hours, without any spitting, cough or vomit; and then, within a weeks space, he lost all the trouble of his breast; but then the like fit of the *Dyspnæa*, or difficult breathing, returning, exercis'd him somewhat more gently; and afterwards he was wont to be troubled with such a fit of the *Asthma*, nigh to the great mutations of the Air, chiefly in great cold, or falling of Snow.

2. Observation. I knew another Gentleman, sick of an inveterate Scurvy, who having no manner of Cough, was troubled now with a great head-ach, and for many days with a giddinesse or *Vertigo*; then at another time, being free from those Symptoms, he was taken with a most cruel fit of the *Asthma*; and he endured these Distempers, now this, now that, frequently, but especially about the greater tropicks of the year.

The Reason. It is not to be doubted, but in the aforesaid Cases, those fits of the *Asthma* did wholly depend on the convulsive matter being fallen into the Nerves, serving to the stretching forth of the Lungs, which cleaving to the Spirits, and being by them struck off, or explosed, by reason of plentitude and irritation, caused the *Præcordia* to be lifted upwards, and, as it were, inflated, and by that means hindred from its reciprocal motion.

An Asthma sometimes excited by reason of the Bronchia being convulsively affected. Moreover we suppose, that such a kind of Convulsive *Dyspnæa*, or difficult breathing, is sometimes excited by reason of the *Bronchia* of the *Trachea* (or the sharp Arteries of the Throat) being too much much streightned, and often almost drawn together: We have shown in our discourse of the Nerves, that very many branches of nervous *fibres*, and of the Nerves, do every where embrace all the tamification of the asper Artery, and bind them about; which Nerves, if it happen that they being possessed by the morbifick matter, should be irritated into frequent Convulsions: for that Reason it follows, that the channels or passages which they compass about, must be greatly bound together, and in some places wholly shut up.

3. Observation. There was a very choice Virgin, of a tender constitution, and of a flourishing countenance, scarce past the second lustre of her Age (*i. e.* about Twelve years old), that began to be grievously tormented with *Asthma* fits; and before she was entrusted to my cure, she had liv'd obnoxious to them at least Four years: sometimes she remained free from any fit of this disease for two or three months: yet oftentimes, by reason of errors in Diet, or the great mutations of the year, or the air, she fell into most cruel fits of the *Dyspnæa*, or difficult breathing: So that the Lungs being inflated, and carried upwards towards her Throat, and there held almost in a continual Diastole, she could hardly, nay, not at all breathe: in the mean time, for that Respiration might be somehow made, the *Diaphragma*, and the muscles of the breast were exercised with repeated endeavours of motions. This kind of fit by degrees remitting within Seven or Eight hours, at length gave over; but then after a week or two it was wont to come again, either of it self, or from any the least occasion; after that the force of the Disease, its matter being bestow'd on very many of these kind of fits, pass'd away, this excellent Virgin was well enough for many weeks, yea, sometimes months after, and breath'd freely, without any fault of the *Thorax*: For this person I instituted this following method, Spring and Fall, and now it is more than two years since she has had any fit of this Distemper.

Take of our *Sulphur of Antimony*, gr. vi. of *Cream of Tartar*, vi grains, mix them: Let it be given in the pap of a roasted Apple; with this medicine she was wont to vomit Four or Five times: Four days after she took this Cathartic, which was wont to be repeated

peated twice, after Six or Seven days between: Take *Calomelan* xii. grains, of the *Resin of Jolop* v. grains, of *Castor* gr. iiii. with what will suffice of *Ammoniac* dissolved, make iii. pills: Every day besides, she took morning and evening of the tincture of *Antimony*, grains xii. in a Spoonful of the following Julap, drinking after it Six or Seven Spoonfuls of the same. Take of the *water of Snails*, Ounces vi. of *Earth-worms*, Ounces iiii. of *water of Penny-royal* and *Rue*, each Ounces iii. of *hysterical water*, Ounces iii. of *Castor* tied in a knot, and hung in the glass, ʒ ß. of *white-sugar*, Ounce i. mix them in the glass, and make a Julap.

4. *Observation.*

About the Autumn of the last year, another noble Virgin, being sick after the same manner, *viz.* with a Periodical *Asthma*, I was sent for to cure her, who received great help by the aforesaid Remedies, being used in a little lesser dose, and the same repeated at the first of the Spring.

An anatomical Observation.

In these Cases also nothing seems to appear more clearly, than that the cause of the Disease, without any phlegm or viscous humour, being impacted in the Lungs, as is commonly believed, doth subsist within the nervous stock; and that this kind of *Dyspnæa*, or difficult breathing, meerly convulsive, is excited, by reason of the pneumonic Nerves, being possessed by the Convulsive Distemper. The verity of this may be yet more clearly evinced by an anatomical Observation, lately communicated to me by the learned Physitian Doctor *Walter Needham*: That most famous man told me, That he knew a *Butcher* of *Wallsullen*, in the County of *Stafford*, who when he had been long sick of a periodical *Asthma*, returning within 14, or 20. days at farthest, at length he died in a fit: The body being opened, all his *Viscera* appeared sound, chiefly his Lungs; neither were there to be seen any signs either of Excrement gathered together in the *Bronchia*, or of the blood restagnating in the Veins; this only hapned besides Nature, that the bladder of the gall contained in it many stones. But (added he) the causes unknown to us, certainly not conspicuous to our eyes, were to be attributed to the nervous stock, being affected.

Another Anatomical Observation.

Sometime past I was consulted with about about a noble child, who being about 12. months old, was grievously afflicted with Convulsive fits, and as it were Epileptic, of which he quickly died. I often observed, that whilest the Convulsion of the outward parts intermitted, he was taken with a cruel sobbing, or hooping Cough; from whence I suspected, that the morbific matter was no less fixed in the breast than in the brain. But after its death, the Body being opened, the Lungs well furnished, appeared clear from any fault, that it clearly appeared, that this Cough meerly Convulsive, was excited by reason of the Distemper of the nervous stock.

As to what respects the Remedies, and curatory means, which ought to be used in the aforesaid cases, when that convulsive Symptoms come upon the Cough, or difficulty of breathing, first excited from the default of the Lungs, and so by reason of the taint, communicated to the brain; it must be carefully heeded, that Convulsive Medicines be aptly compounded, with those respecting all the intentions of the *Thorax*. Yea, that sometimes these, sometimes those, being given by themselves, may between whiles fill up the times of curing; it will not be needful in this place to bring the bechic, or pneumonic medicines, and forms of them, since an immense company of them are extant every where among Physical Authors. It will be sufficient for our purpose, to add a method of Medicine, also some more select Remedies convenient for the Cough and *Asthma*, meerly Convulsive.

The cure of the Convulsive Cough.

As to the former Distemper, which is most familiar to children, the cure is difficult, and for the most part not to be performed but of a long time. The chief Indications will be to purge forth both the serous and sharp humours from the Blood and *Viscera*, that their inclination and falling down in the brain, and perhaps also within the breast, may be sometimes prevented; then to corroborate those parts, that they may not easily admit the superfluities of the boyling Serum. For these ends, Vomits and more gentle Purges for the most part are useful, and in some measure ought to be repeated: Vesecatories are often profitable; yea, if the Disease be contumacious, Issues are to be made in the nape of the neck, or the arm, or about the armpits: Drink and liquid aliments are to be taken in a lesser quantity than usual, and instead of them a Bochet is to be used of *Sarsa*, *China*, *Sanders*, *Shavings of Ivory*, and *Harts-horn*, with diuretic and anticonvulsive Ingredients: In this case, some Remedies, as it were special, are greatly commended, of which sort are pixed musk given in powder, or boyled in milk, and so given daily in a frequent dose: a decoction or *Syrrop of Castor* and *Saffron*; decoctions of the *Root of Pæony*, *Misletow* of the *Oak*, also of *Hyssop*, help many; the waters of *Black-cherries*, of *Saxifrage*, and of *Snails*, distilled with *Whey*, and appropriate Ingredients, are often taken with success.

The cure of the Convulsive Asthma.

2. By what method, and with what Remedies I have cured the periodical *Asthma* in some young ones, hath been already shown; but in most distempered with this Disease, the most famous *Riverius* hath observed, a Vomit is chiefly helpful, also he hath not rightly shown the Reason: which indeed seems to consist in this, to wit, That this medicine greatly shaking and irritating the Emunctories planted about the first Passages, strongly presses out from them, and carries forth of doors the recrements of the blood and nervous juice, apt to be troublesome, and to restagnate on the brain and nervous stock. *Zacutus*, the *Lusitanian*, highly extols, and not without Reason, a cautery to be made, sometimes in the hinder part of the head, sometimes in the nape of the neck, or about the Armpits: A preparation of *milipedes*, *viz.* in form of a dry powder, or a distilled liquor, seldom wants success. For by such like Remedies the superfluities of the *Serum* are deduced from the head and nervous stock, and carried away thorow the urinary passages: For the same Reason a gentle purge, evacuating the ill juice, is often us'd: for this end the decoction of an old Cock, with altering medicines, and gently purging, being stowed in its belly, is praised by many: Besides the Remedies hitherto cited, some others are said to be appropriate, and as it were specifical to the *Asthma*, of which sort are, the *bassom of Sulphur*, *Turpentine*, also *Spirits of Harrts-horn*, or of *Sut*, impregnated with the same, *Syrrop of Tobacco*, of *Ammoniack*, our *diasulphur Lohoch* of *Garlick*, pills of the *Roots of Eluna Campane*, made up with the *milk of Sulphur*, with the *flowers of Benzoin*, with liquid pitch, or liquid amber, with many others, which would be too tedious here to enumerate.

And now the chief *Species*, and manner of Convulsions, together with the Causes of the Symptoms, and the means of curing, being sufficiently explicated, it is time to put an end to this our Pathology of the Brain and Nervous stock, and to our Discourse of *Convulsive Diseases*.

FINIS.

Inflammation, *Of the Lungs, an effect of the putrid Synochus*, 90
Inflammatiens in the Plague, 107
Intentions, *For the Cure of a Tertian Ague*, 66
For curing the Ephemera, 76
Intentions for the cure of every sort of putrid Feavers, 92
For the curing Epidemical Feavers, 150,151,&c.
Judgment, *Or Prognosticks of the event of a putrid Feaver*, 81

L.

Life, *First proceeds from the fermenting of the spirit in the heart*, 11
Light, *What it is, and how made*, 33
Lochia, *What they are, and their use*, 126

M.

Measles, *Of the Measles*, 123
What they are, ib.
Malignant, *Feavers, see Feavers.*
Mault, *How made by fermentation*, 17
Menstrua, *The two chief for the dissolution of bodies, fire and water*, 26
Menstrua's of several sorts, 27,28
Menstrua's for Gold and Silver, 29
Menstruous *Blood, its use, and why it flows not in Women with Child*, 125
Meteors, *What they be*, 9
Milk *In the Breasts, how made*, 125
Minerals, *How they ferment*, ib.
Moldiness, *Whence it is made*, 24
Mustiness, *Whence it comes*, ib.

N.

Nitre, *What it is*, 34

O.

Opinions, *Of Philosophers, concerning the principles of things*, 2

P.

Peruvean *Bark, used to cure Agues*, 71
Pest, *See Plague.*
Pestilential *Feaver, see Feavers.*
Plants, *How they germinate*, 10
Pleurisie, *An effect of the putrid Synochus*, 90
Plague, *Its nature*, 103
Whence its rise, ib.
Of its propagation by Contagion, 105
Its description, 106
Of its signs and symptoms, ib.
Its Prognosticks, 108
Its Cure, ib.
History of it, 111
Pox, *see Small-pox.*
Powder, *Of the Jesuits, a* Peruvean *Bark, and its nature*, 71
How it operates, 72
Poysons. *How they distemper the body*, 101
How they work on the animal spirits and nervous liquor, ib.

Their

Their various properties, ib.
Precipitation, *What it is, and how made,* 38
Principles, *Of natural things,* 1
What he means by Principles, 2
The Principles of the Chymists, 3
Prognostications, *In the Plague,* 108
In the Small-pox, 121
Prognostications of Epidemical Diseases, 140,150
Prognostications from the Pulse, 88
From Urins, ib.
Pulse, *To be considered in a putrid Feaver,* 88
Prognostications from it, ib.
Purple *Spots in the Plague,* 108
Putrefaction, *How made,* 22
Putrid *Feaver, its description,* 77

S.

Salt, *A Principle of the Chymists, what it is,* 4
Salt in the Blood, 49
Salt-nitre, *What it is,* 34
Salts, *How Chrystallised, and the reason of the operation,* 42
Signs, *Or symptoms of Life and Death in a putrid Feaver,* 83
Signs and symptoms of the Plague, 106
Signs of a Pestilential or Malignant Feaver, 113
Signs of the Small-pox, 120
Small-pox, *The causes of them,* 118,119
Signs and symptoms of the Small-pox, 120
Prognostications of the disease, 121
Its Cure, 122
Histories of it, 123,124
Indications of the Small-pox in Child-bed Women, 134
Spirits, *Of the Chymists, what they are,* 3
Spirits in the Brain, wrought by fermentation, 14
Spirits of the Blood, 47
Spots *In the Plague,* 108
Squinancy, *An effect of the putrid Synochus,* 90
Sulphur, *A Chymical principle, what it is,* 3
Of common Sulphur, 34
Sulphur in the Blood, 49
Swooning, *In Feavers,* 86
Symptomatick *Feavers, what they are,* 90,91
Symptoms *And signs chiefly to be noted in a putrid Feaver,* 83
Symptoms to be observed in a putrid Synochus, 84
Synochus *Putrid, its chief symptoms,* ib.
Its kinds and cure, 90

T.

Tongue, *Why covered with a white crustiness in Feavers,* 85

V.

Vitrification, *Or the making of Glass,* 43
Vomiting *In Feavers,* 88
Urins, *Of Urins in Feavers,* 89
Prognosticks from Urins in Feavers, ib.

W.

Water, *A Principle of the Chymists, what it is,* 5
Wind, *The North-wind apt to produce Catarrhs,* 145
Wines, *How made by fermentation,* 19
Womb, *Its falling down in Womens lying In,* 126
Of the distempers of the Womb at that time, 127

THE

TABLE

To the Treatises of

1. *Of Urins.*
2. *Of the Accension of the Blood.*
3. *Of Musculary Motion.*
4. *Of the Anatomy of the Brain:* &
5. *Of the Description and Use of the Nerves.*

A.

Accidents, *Of Urin,* Page 1,2
Air, *Stuffed with nitrous particles,* 22
More nitrous in Winter than in Summer, 23
Anatomy, *Of the Brain,* 45
Anatomy of Urin, 1
Animal *Spirits, see Spirits.*
Appetite, *How stirr'd up,* 75
Arteries, *Of the Carotidic Artery,* 56
Of its ascension into the skull, 59
Experiments of injecting Liquors into the Carotidic Arteries, ib.
the Carotidic Artery in Fowls and Fishes, 62,63
The reason of the joyning together of the Arteries ascending into the Brain, 68
The difference of the passage of the Artery passing through the skull in Man and Beast, 69
Of the Arteries Carotides in an Horse, 70
Of the Vertebral Artery, 71
Why the Carotides Arteries differ in a Man and Horse from other Beasts, 72
How the Nerves like Reins bind the Trunk of the Hepatic Artery, 137
Of the Arteries belonging to the Spine or Back-bone, 146

B.

Blood, *Of the inkindling of the Blood*, 20
Several opinions of the heat of the Blood, 22,23
Blood the life of the soul, 21
The Blood very hot in living Creatures, and for what reason, ib.
How the Blood cometh by its heat, 22
Effluvia of the Blood like the soot of flame, 24
The Blood requires Ventilation, ib.
How the Vital flame is inkindled in the Blood, 25
The reason of the change of the colour of the blood, ib.
The office of the heart as to the blood, 26
The animal soul depends upon the temperature of the bloody mass, ib.
A plentiful stock of inflamable oyl is in the blood, ib.
The blood full of Sulphur, ib.
Why the flame of the blood is not seen, ib.
The blood affords an Elastic Copula for the motion of the Muscles, 43
Of the blood flowing to and from the Brain, 65
The blood carried to four distinct places of the head, 72
Whether bloody humour nourishes, 107
Of the blood-carrying Vessels in the spinal marrow, 146
Why the blood-carrying Vessels in the Spine are frequently ingraffed one into another, 147
Bodys, *Of the Chamfered Bodies in the brain*, 84
Of their difference in Fowls and Fishes, ib.
Bone, *Cuniform or Wedg-like, its office*, 58
Of the sive-like bone, what it serves for, 82
Another use of the Cribrous bone, 113
Bosoms, *Of the Vessels in the Spine*, 147
Why chiefly required in those parts, ib.
Of the Vertebral bosoms, ib.
Brain, *Anatomised*, 45
The method of cutting up the brain, 46
A great analogy between the brain of Man, and of four-footed Beasts, and between those of Birds and Fishes, ib.
A description of the whole brain in the skull, 47, 48
A description of the bulk of the brain being taken out of the skull, ib.
Of the figure of a Mans brain, 49
Of the brains of small four-footed beasts, as Mice, Conies, Hares, &c. 50
The explication of the first and second figures of the Brain, 51
A description and dissection of the hinder part of the Brain, 52
Of the oblong marrow of the brain, ib.
Of the four chief protuberances of the brain, ib.
The prominences very small in the brain of some creatures, and very large in others, 53
Of the tube or pipe in an Horses brain, 54
Of the Cerebel and its Processes, 55
Of the Vessels arising in the hinder part of the brain, 56
The third and fourth figures of the brain explained, 57
The wonderful Net in the brain described, 59
The admirable structure of the brain shews the mighty Wisdom of the Creator, and Workmanship of the Deity, 60
The brains of Fowls and Fishes described, 61
The figure of the brain of Fowls and Fishes, 62
The offices and uses of the brain, and its parts, 64
The brain is the Womb of all the Conceptions, Idea's, forces and powers of the rational and sensitive soul, ib.
The difference of the site of the brain of Man, and of Brutes, ib.
Of the blood flowing to the brain, 65
Of the chief Arteries destinated to the brain, 69
Of the Dura mater, *see* Dura mater.
Of the Pia mater, *see* Pia mater.
How the animal spirits are begotten in the brain, 72
How created only in the Brain and Cerebel, 73
Of the Brain properly so called, its description, 74
Wherefore the brain is made with crankling, turnings and windings, 75
Why the brain of Birds and Fishes, and some Beasts want such crankling turnings, 76
The offices of the cortical and marrowy parts of the brain, ib.
The use of the Callous body, and of the Fornix in the brain, 77
The inward parts of a Sheeps brain explained by figure, ib.
Of the Ventricles in the brain, 79
Of the Tunnel of the Brain, 81
How the humour of the brain is evacuated, 80
Of the oblong marrow of the brain and its parts, 83
The use of the chamfered or streaked bodies in the brain, 84
Of the Chambers of the optick Nerves in the brain, ib.
Of the Pituitary Glandula *in the brain*, 86
Of the Pineal Glandula *of the brain*, 87
Of the orbicular prominences called Nates and Testes in the brain, 88
Of the uses of the Cerebel or little Brain, and its parts, 90
Of the orbicular prominences, and annular protuberance, for what uses, 99
Of the brain of a Fool dissected, 132
Of the Anatomy of a Monkeys brain, ib.
Breast, *Why a Child new born seeks out the Mothers breast, or Beasts new brought forth into the world their Dams teats*, 89
Breathing, *How effected*, 126,127
How variously interrupted, ib.
Brutes, *A single Machine*, 132

C.

Candle, *Why it burns blew in the Mines*, 24
Carotides, *see Arteries.*
Cerebel, *Its description, and of its processes*, 55
The uses of the Cerebel, and its parts, 90
Of its parts and accidents, ib.
Of its difference in substance from the brain, 100
Chewing, *How made*, 117
Choaking, *Why there is a sense of Choaking in the Throat in some distempers*, 132
Chorœdes, *The use of the Chorotides*, 81
Of the Chorœidal Infoldings, 87

Cloude,

Cloude *In Urins, what it means,* 2
Colick, *The cause of the pains in the Colick,* 139
Colour, *In Urins,* 2,3
Of the colour of sick peoples Urins, 6
Conclusion, *Of the Anatomy of the Brain, and the use of the Nerves,* 158
Consistence, *Of Urins,* 4
Contents, *Of the Urins of healthful and of sick People,* 11
Cough, *Why a troublesome one often causes Vomiting,* 127
Cramp, *What it is, and how made,* 46
The Causes of it, ib.
Who are most obnoxious to the Cramp, ib.
Crests, *Of some Creatures, why erected in anger or pride,* 122
Crying, *How made,* 117

D.

Diaphragma, *Why the motion of the Diaphragma conspires with the Præcordia,* 133
Of the Nerve serving to the use of the Diaphragma, 142
Of the irregular Motions of the Diaphragma, ib.
Why the Nerve of the Diaphragma proceeds from the Brachial Nerve, 143
Distillation, *of Urin,* 1, 18
Dura mater *Described,* 46
It uses and offices, 65
Of the Vessels belonging to the Dura Mater, ib.
What the motion and sense of the Dura mater is, ib.
Its several uses rehearsed, 66

E.

Ears, *Why all Animals at a noise or sound erect their Ears,* 96
Elements, *Of Urin,* 1
Experiments, *Of flame and fire,* 23,24
Of cutting asunder the Muscles to perceive their motions, 38
Experiments of a live Dog concerning the voluntary motions of the Muscles, 39
Of intumifying a Muscle, 42
Experiments of injecting Liquors into the Carotidick Artery, 59
Experiment whether the pulse of the heart depends on the influence of the Animal spirits, 124
Eyes, *Why the eyes so readily shew the affections and passions,* 90
The reason of the little black specks or spots, which sometimes seem to be before the eyes, 114
Of the Nerves that move the Eyes, ib.
Of the pathetic Nerves of the Eyes, 115
Why Love is admitted by the Eyes, 116
Why the Eyes are made red in some passions, as anger, joy, &c. 126
Why the Eyes and Mouth answer so readily to the motions of the Præcordia & Viscera, 131
The reason of flame proceeding from the Eyes of persons in burning Feavers, 27
The Fibres in the Eyes, the cause of the act of seeing, 114

F.

Farcy, *Of the Farcy in Horses, what it is, and how cured,* 109
Fibres, *Of the Nerves, whence they arise,* 105
The Fibres in the Nostrils perform the act of smelling, 113,114
The Fibres in the Eyes, the cause of the act of seeing, 114
Figures, *Of the Muscles explained,* 40
Figures of the brain explained, 51
The third Figure of the brain explained, 57
The fourth figure of the brain explained, ib.
The fifth and sixth Figures concerning the skull explained, 60,61
The Figure of a Mans brain, 49
The Figure of the brains of Fish and Fowl, 61
Figures of the Nerves explained, 118
Figures of the Nerves in Tables, from 148 to 158
Figures of the Carotidick Arteries; the wonderful net, pituitary kirnel, and the lateral bosom explained, 71
Figures of a Sheeps brain, and all its inwards explained, 77
The Figure of the oblong marrow, 86
The Figure of the marrowy part of the brain of a Sheep explained, ib.
Fire, *Why it burns fiercer in cold than in moist and hot weather,* 23
Why the Sun-beams put out the Fire, ib.
Why Fire seems to leap forth in the night from the mains of Horses, skins of Cats, and other hot Animals, 27
Fishes, *Why they want the crankling turnings in their brain, as in Man and Beasts,* 76
Of the optic Nerves in Fishes, 85
Of the chamfered bodies in Fishes brains, and their difference from other Creatures, 84
Flame, *How made,* 23
Why flame shut up from the air goes out, ib.
Why the flame of a Candle burns blew in the Mines, 24
How the Vital Flame is inkindled in the blood, 25
Why the Vital Flame is not seen, 27
The reason of a shining Flame, sometimes seen about persons indued with an hot nitrous blood, ib.
The reason of Flames proceeding from the eyes of people in burning Feavers, ib.
Forms, *Predestinated to natural bodies,* ib.
Fowls *Brains, why they want the turnings and windings as are in Men and Beasts,* ib.
Their difference from Beasts, 92

G.

Genital, *How made,* 141
Glandula, *Of the pituitory Glandula in the brain of a Man and a Beast,* 58

H.

Hands, *Why the Hands and Arms of Men conspire so readily with the affections of the brain and heart,* 141
Head-aches, *Great from the distemper of the* Pia Mater, 75
An History of Head-aches, 90

Hearing, *How made*, 93
Of the species of hearing, 97
The difference of the hearing Nerves in a Man, and in a Beast, 98
Heart, *Its office as to the blood*, 26
The heart a meer Muscle, ib.
Of the Nerves going to the heart, 123
Whether the pulse of the heart depends upon the influence of the animal spirits, 124
Histories, *Of one troubled with a Tenanism or Cram*, 38
Of one that died with a Scirrhus or hard swelling of the Mesentery, 68,69
Of Head-aches, 82
Horse, *Of the Tube or Pipe in a Horses brain*, 54
Of the Carotidick Arteries in a Horse, 70
Why different from other Beasts, 72
Humours, *In a Muscle*, 31
A double humour contributes to the making of the animal spirits, 81
How the serous humour is sent from the brain, 80, 81
Of the use of the Nervous humour, 104,108
Of the Nervous and Nutritious humors, 108
Whether the bloody humour be Nutritious, 107
How the genital humour is made, 141

I.

Imagination, *What it is*, 75
Infoldings, *Of the Nerves*, 114
Of the Gunglieform Infolding, 128
Of the Mesenteric Infoldings, 129
Of the Hepatic Infolding, ib.
Of the Nervous Infolding of the Spleen, 137
Of the Renal Infolding, ib.
Inspection, *Of Urins useful*, 16
Instinct, *Of Motion, what it is*, 35
Of natural Instincts, 94
Involuntary *Function, what it is*,
Of the Nerves serving to the Involuntary Function, 95,96
Juices, *Of the Juices nervous and nutritious*, 108
Judgments, *How to be given of the Urin*, 14, 15
The Ignorance of some in the Judgment of Urins, 15
Judgment of Urins wanting colour, consistence, contents and quantity, ib.
Judgment of Urins having praternatural contents, 16

K.

Kings-evil, *Why cured by stroaking*, 109
Kissing, *Why it irritates Love*, 116

L.

Laughing, *Why proper to Man*, 96
Caused by the fifth Conjugation of the Nerves, 117
How made, 131
Life, *A kind of flame*, 22,23
Life, and Fire many ways extinguish'd alike, 26
Liquors, *How they receive heat*, 21
Love, *Why admitted by the eyes*, 116
Why provoked by kissing, ib.
Lungs, *Why the colour of the Lungs is suddenly changed in new-born Creatures*,

M.

Mamillary *Processes, what they are, and their use*, 112
Marrow, *Of the oblong Marrow, and its uses*, 83
How joyned to the spinal Marrow, 101
Of the spinal Marrow, 102
Of the Nerves from the spinal Marrow, 145
Of the blood-carrying Vessels from the spinal Marrow, 146
Man, *A curious Machine*, 132
Meninges, *See* dura mater *and* pia mater.
Memory, *How made*, 79
Mesentery, *Of the Infoldings of the Mesentery*, 129
Why so many Infoldings of the Nerves are about the Mesentery, 134
Monkie *Dissected*, 132
Why it is so crafty and mimical a Creature, 133
Motion, *What it is*, 28
Three things to be considered in every motion, ib.
Of spontaneous and voluntary motion, ib.
Of involuntary motion, ib.
Of the motion and sense of the pia mater, 74
The Vehicle of the Instinct of Motion, what it is, 28
Of local Motion, 29
Of the increase of the force of Motion in Artificial things, 32
How the Motion of the Muscles is made, 34
How the instinct of Motion is performed, 35
Of the Motions of the animal spirits, 78
How the Motion of the Muscles correspond with the Motion of the Heart, 111
Of the irregular Motion of the Diaphragma, 143
Upon what the peristaltic Motion depends, 138
The use of intestine Motions in the belly, 135
How the Motion of Hypochondriacal pains is made from the right to the left side, and so contrary, 138
Of the Motion of the Muscles, see Muscles and Musculary motion.
Muscles, *Of the formation of a Muscle*, 29
Of the opposite Tendons in every Muscle, ib.
A Muscle described, ib.
Of the simple and compound Muscle, 30
Of the membranous covering of a Muscle, ib.
Of the action of a Muscle, 31
Several experiments of cutting a Muscle, 31
Of contraction and relaxation in a Muscle, ib.
Of the humors in a Muscle, ib.
An experiment of a living Dog, concerning the voluntary motions of the Muscles, 32
How a Muscle is moved, ib.
Of the traction of a Muscle, 33
Elastick particulars contained in a Muscle, ib.
Of the trembling of the musculous flesh of a Beast, after its head is off, and heart taken out, ib.
How the animal spirits blow up the fleshy fibres in a Muscle, 34
Experiments of intumifying a Muscle, ib.
Of the nature of the animal spirits coming from the brain into the Muscles, 35
Of the fresh supplies of the animal spirits for the motions of the Muscles, 36

Of

Of the little hairy fibrils of a Muſcle, ib.
Of the irregular and convulſive motions of the Muſcles, ib.
Explanations of the figures of the Muſcles, 40
That the motions of the Muſcles have an analogy with the heart, 110
Muſcular *Motion, how it is made*, 34
Of the Muſcular motion, 28
The blood affords an Elaſtic Copula for Muſcular motion, 34
The reaſon of the inſtinct of Muſcular motion, ib.
See further under Muſcles and Motion.
Muſick, *Why eaſily learned by ſome, and not by others*, 97

N.

Nates, *And Teſtes of the brain, what they are*, 87
Neck, *Why it ſwells in anger, or great paſſion*, 122
Nerves, *The Vehicle of the inſtinct of motions*, 28
Of the Chambers of the Optic Nerves, 84
Of the Nerves which ſerve to the involuntary function, 95
Whence they ariſe, ib.
The fourth, fifth, ſixth, ſeventh, eighth pair of Nerves ſerve to the involuntary function, 99
Of the Nervous Syſtem in general, 102
What the Nerves are, 104
Whence the Nervous fibres ariſe, 105
Of the Nervous juice, 107
Its uſe, 108
Of the firſt four pair of Nerves ariſing within the skull, 112
Of the ſmelling Nerves, ib.
Their uſe, 113
Of the Optic or ſeeing Nerves, 114
Of the Nerves that move the eyes, ib.
Of the pathetic Nerves of the eyes, ib.
Of the fifth, ſixth and ſeventh pair of Nerves, 115
The fifth Conjugation of the Nerves deſcribed, ib.
The ſixth Conjugation of the Nerves deſcribed, 117
The ſeventh Conjugation of the Nerves deſcribed, ib.
The firſt and ſecond figures of the Nerves explained, 118,119
Of the eighth pair of Nerves, or the wandring pair, 119
Of the wandring pair in Man, ib.
Of the wandring pair in Beaſts, 121
Of the Nervous Infoldings, and their uſes, 119
Of the returning Nerve, 121
The uſes of the wandring pair, 122
Of the Nerves inſerted into the heart, 123
Of the communications of the wandring pair, 128
The Intercoſtal Nerve deſcribed, ib.
The uſes of the Intercoſtal Nerve, 131,132,&c.
Of its lower branchings ſerving the lower belly, 134
Of the Nerves that ſerve the Spleen, 136,137
Of the Renal Infolding, 137
Of the Nerves ſerving the Pancreas Choleduct, Veſſels Duodenum and Pylorus, ib.
Of the Nerves of the Womb, 138
Of the Nerves belonging to the Ureters, 139
Of the Nerves ſerving for Dung, Urin, and Seed, ib.
Of the Nerves belonging to the Teſticles, 140
Of the ſpinal Nerve, 141
The ſpinal Nerve conſtantly found in Man, Beaſts, Fowls and Fiſhes, ib.
The uſe of this Nerve, 142
Of the Nerve of the Diaphragma, and its uſe, ib.
Why the Nerve of the Diaphragma proceeds from the Brachial Nerve, 143
The difference of the Nerves of the wandring pair, and the intercoſtal Nerves in Man and Bruits, 144
Of the ninth pair of Nerves ariſing within the skull, 145
Of the tenth pair ariſing within the skull, ib.
Of the Nerves ariſing from the ſpinal marrow, ib.
Why the brachial and crural Nerves are larger than others, ib.
Net, *Of the wonderful Net, and its uſe*, 85
The explication of the figure of the wonderful Net, 69
Nouriſhment *Of the Body, how made*, 109,110
Noiſe, *Why Beaſts at an affright make a ſudden noiſe*, 96,97
Why noiſe or ſchreeching is made in great paſſion, 122

O.

Offices *Of the Brain, and its parts*, 64
Of the skull, 64,65 *See Uſes.*
Optick *Nerves, ſee Seeing Nerves.*

P.

Paſſions, *Why troubleſome to the Præcordia, and why ſeen in the face*, 87,88
Why more clearly ſeen in the eyes, 89
Phantaſie, *How made*, 79
Pituitary *Glandula, what it is*, 85,86
Pia mater, *Its deſcription*, 48,49
Its uſes and ſeveral parts, 67
Of the ſanguiferous Veſſels covering the Pia mater, 68
What ſenſe and motion is in the Pia mater, 74
Pineal *Kirnal, what it is*, 87
Præcordia, *Their agreement with the Diaphragma*, 133
Why they ſeem to be drawn downwards in ſome Hypochondriacks, 136
Prominences, *Of the orbicular Prominences of the Brain*, 87,88,&c.
How different in ſome Creatures, 99
Protuberances, *Of the annular Protuberances of the Brain*, 99
How different in Man, and in ſome Beaſts, 100

Q.

Quantity, *Of Urins*, 2
Of the Quantity of ſick peoples Urins, 6,7

R.

Reſpiration, *Variouſly interrupted, and how, See Breathing*, 142

S.

Saltneſs, *In Urins*, 1
Schreeching *Out in a ſudden paſſion, why made*, 122
Seed, *How made*, 141

Seeing, *Of the Seeing Nerves*, 114
How Seeing is performed, ib.
Sense, *What it is*, 28
The formal reason of the common sense, 78
Sensory, *The common Sensory, what it is*, 84
Sleep, *How made*, 80
Sight, *Why sometimes things appear double to the sight*, 85
Why the sight of some things cause spittle in the mouth, 115
Skull, *The parts of the Skull unfolded*, 58,50
Of the cune-form or wedg-like bone of the Skull, 58
The fifth and sixth figure concerning the Skull explained, 60,61
The uses of the Skull, 64
Of the furrows in the Skulls of Men and Beasts, ib.
Of the difference of the Arteries passing through the Skulls of Men and Beasts, 69
Smelling, *Of the Smelling Nerves*, 112
Why large in Beasts, ib.
The cause of the nearness betwixt the taste and the smell, 113
The Smelling fibres differently figured in several Creatures, and why, ib.
Why the Smell of some things causes spittle in the mouth, 115
Sneezing, *Why people Sneeze, going suddenly out of a dark place into the Sun-shine*, 116
Why Men before other Creatures Sneeze, 143
Why and how Sneezing is made, ib.
Soul, *Two parts of the inferiour soul*, 78
In what the Essence of the sensitive Soul consists, 106
The corporeal Soul of flame and light, 24
The Soul depends upon the temperament of the bloody mass, 26
The root of the corporeal Soul is in the blood, and its branches in the brain and nervous stock, 27
Two chief faculties in the corporeal Soul, 28
Sounds, *Of the Idea's of Sounds in the head*, 97
How sharp and flat Sounds are performed, 123
Spirit, *In Urins*, 1
Spirits, *How the animal Spirits blow up the fleshy fibres in a Muscle*, 34
Of the nature of the animal Spirits proceeding from the brain by the Nerves into the Muscles, ib.
Of the fresh supplies of the animal Spirits for the motion of the Muscles, 36
How the animal Spirits are begotten in the brain, 72
How first begot in the Cortex of the brain, 76
After what manner the animal Spirits diffuse themselves for the producing the faculties of the Soul, 78
The place of the exercise of the animal Spirits, 83
The reason of the passage of the animal Spirits through the Nates and Testes, 88
Of the acts of the Spirits of the involuntary function, 93
The difference of the Spirits flowing from the brain and from the Cerebel, ib.
The passage of the Spirits compared to light, 103
Of the great troops of Spirits, how they pass through the Channels of the Nerves, and supply the whole Body, 106
Whether the pulse of the heart depends upon the animal Spirits, 124
Of the flowing of the animal Spirits from the nervous infoldings, 135
Spittle, *Why the sight and smell of some things causes Spittle to come into the mouth*, 115
Spleen, *Its office*, 135,136
Sulphur, *In Urins*, 1
Sulphur, the food of flame, 24
Sulphur in the blood the cause of flame, 26

THE

TABLE

To the Treatise of

CONVULSIVE DISEASES.

A.

AMulets, *For the Epilepsie*, 21
Apozems, *For the Epilepsie*, 22
Diuretick Apozems in a Feaver, 53
Astmah, *Convulsive*, 92
Of a Convulsive Astmah, by reason of the Bronchia being affected, 94
Histories of such an Astmah, 95
Anatomical observations on the same, ib.
The Cure of it, ib.

B.

Blood, *The Blood not the immediate cause of the Convulsive motion*, 4
The Blood the cause of the morbific matter of spasms, 5
Why the Blood is soon congealed in Convulsions, 35
Brain, *The Convulsive Copula proceeds immediately from the Brain*, 4
The Brain the cause of the Morbific matter of Convulsions by receiving it from the blood, 5

A Table to the Treatise of Convulsive Diseases.

The evil disposition of the Brain two-fold, 6
The Brain the cause of the Hysterical passion, 71
Breast, *Why men beat their Breast in the fits of the Epilepsie,* 16
Bronchia, *The Bronchia being affected, the cause of a Convulsive Asthmah,* 94

C.

Chalybiats, *See Steel Medicines.*
Children, *Of Convulsions in Children,* 22
Children very liable to Convulsions, 23
The causes of them, ib.
Why they follow upon their breeding of teeth, 25
How to cure Convulsions of children, 26
How to preserve children from them, ib.
How to cure the Convulsion in Children coming of breeding of teeth, 27
Of other sorts of Convulsions in Children, ib.
How to cure them, ib.
Children are subject to a Convulsive cough, 92
The reason of it, ib.
Convulsions, *Of Convulsive motions in general,* 1
What they are, ib.
The conjunct cause of Convulsions, 3
Repletion and emptiness not the cause of Convulsions, ib.
The kinds of Convulsions, 4

MEDICINES

IN

Humane Bodies:

SHEWING

The Signs, Cauſes, and Cures of moſt Diſtempers incident thereunto.

In Two PARTS.

AS ALSO

A Treatiſe of the SCURVY, and the ſeveral ſorts thereof, with their Symptoms, Cauſes, and Cure.

By *Tho. Willis*, M. D. and *Sidley* Profeſſor in the Univerſity of *Oxford*; Alſo one of the College of Phyſicians in *London*, and Fellow of the *Royal Society*.

LONDON:

Printed for *T. Dring*, *C. Harper*, and *J. Leigh*, and are to be Sold at the Corner of *Chancery-Lane*, and the *Flower-de-Luce* over againſt St. *Dunſtan*'s-Church in *Fleet-ſtreet*, M DC LXXX IV.

THE PREFACE TO THE READER.

WE have obſerved, that it hath been of exceeding great Benefit to many other Arts and Sciences, that Experiments and Obſervations either by chance or on ſet purpoſe being found out, that preſently the Ætiology or the Reaſons thereof, as much as may be, ſhould be ſet down, which thing we have much deſired in Phyſick, which may be juſtly placed amongſt the nobleſt of the Sciences. In Mathematicks and Mechanicks, Experience and Practice did firſt aſſiſt the Theory, then this ſhewing the cauſes of things and the means of their effecting, hath not only adorned, but very much increaſed and illuſtrated the Practice. But the Mechanical Art, although at firſt known to *Empericks*, and taken up by quacking Juglers and old Women, as if it were a Myſtery into whoſe Reaſons it were not lawful to ſearch, has remained hitherto unexplicated: Wherefore the unlearned, and indeed ſometimes the learned at this time give Medicines (like People ſhooting at random) raſhly and

almoſt fortuitouſly; being uncertain whither they will tend, or what end or effects they ſhall have. From hence it is, that not only ſome learned *Cynicks*, but the vileſt of the ſcum of the people bark againſt and fling dirt upon *Phyſick*. And truly I know not how ſhe will be wholly excuſed from being called a Lyar, Vain, and Jugler, ſo long as yet the reaſons of curing by Medicine, on which the life and health of Man much depends, and oftentimes by which 'tis no leſs indangered, lye hid. But this Doctrine of *Medicinal Operations* either neglected or ignored, ſhewing like a great *Chaſm*, hath been the only, or at leaſt the greateſt Impediment that *Phyſick* is not come to its perfection, and its whole *Syſtem* rightly framed: For though the matter of *Medicine* gotten from each *family* of the *Vegetables*, *Minerals*, and *Animals*, ſeems ſufficiently digeſted and compleated, and that the Types and Natures of all Diſeaſes being collected by moſt accurate Obſervations are explicated by innumerable Authors, and beſides that the *humane Body* as it were a *martial Field*, where thoſe *Champions* try their Skill, be exactly deſcribed as to all its parts by *Anatomiſts*, yet what is of *greateſt moment*, and without which the aforeſaid things ſignifie little, is not yet ſufficiently and clearly detected; to wit, what the *Weapons* of thoſe *Champions* are, what Furniture, what force and Reſiſtance they have, alſo what Action, Paſſion, and Reaction may be between the Particles of the Medicine and the Spirits, Humors, and Solid Parts. But ſince almoſt the whole buſineſs of this *Pharmaceutick Drame* is acted behind the Curtain, therefore the various congreſſions of *Particles*, *Fermentations*, *Impulſes*, and other diverſities of Motions, which performed within, lye hid from the Senſes, are to be ſearched out by

by a more deep Scrutiny of the Intellect, which if it may be at laſt performed, there is nothing more will be deſired, whereby *Phyſick* being performed in all its parts, may grow to a true Science and be practiſed with greater certainty, not inferiour to the *Mathematicks*. For ſo the *Empirical Remedies* left us by the Antients would not be adminiſtred promiſcuouſly and amiſs (as is wont now by *Medicaſters*) in every ſtate of the Diſeaſe or caſe of the Sick, but opportunely and always according to the moſt apt intentions of healing. Beſides, new and more efficacious *Medicines* (as often as ſome great and unuſual Diſeaſes require them) may be eaſily and ſafely found out, without any error of the *Phyſician* or danger of the *Patient*. For whilſt it clearly appears what kind of Particles in the *Patient* are either to be altered or ſtirred up into Motion, and what are required in the *Agent* for that work, it will be no difficult thing aptly to deſign this, and rightly to accommodate one to the other. But the buſineſs is far otherwiſe performed by thoſe *Pſeudochymiſts* with notable danger and abuſe of the *humane Body*, who not contented with the uſe of received and approved *Remedies*, bragg that they have framed in their Furnaces no leſs than a *great Elixir*, a *certain Panacea*, or an *univerſal Medicine*, whilſt in the mean time they unskilfully meddle with *Minerals*, expecting a certain uncertain event rather than deſigning any thing ſeriouſly; If perchance there ſhould appear an unuſual product with this *new Medicine* (the Virtues of which are altogether unknown, or are none, or poyſonous) they promiſe themſelves preſently to Cure all Diſeaſes, and give it boldly in every caſe, to the great hurt, and not ſeldom to the Diſtruction of the Sick;

ſo ſecurely and raſhly are theſe *Executioners* wont to ſport with Man's Life, whilſt they are led to the preparing or adminiſtring theſe Medicines (in which always lurks ſome *venomous Sting*) without any counſel or direction of Method, but by meer chance and with a certain blind undertaking.

Therefore it is highly to be wiſhed, both for the Dignity and Augmentation of *Medicine*, and for the Cure and Safety of Man's Health, that the Energies and Manner, as to the Nature of each, and as it were the Mechanical Means of the working of Medicines in our Bodies might be laid open. For if it ſhall be plainly known by what means *Medicines* being taken do preſently exerciſe their powers in the firſt Paſſages, and from thence by and by diffuſe them through the whole Body, and by what alteration they receive in each Region, and what they do or perform upon the Spirits or Blood, and Humors or Solid Parts, then indeed Evacuation may be much more ſafely and certainly uſed, and with greater Benefit to the Sick.

But if having boldly aſſaulted this Province, to wit, the ſhewing a reaſon of the *Pharmaceutical Operation*, before untouched, I ſhall not ſufficiently perform my Work, I do however deſerve Pardon, becauſe I am forced to travel through not only an *unknown Country*, but alſo one that is *uneven* and as it were a *Labyrinth*; and if perhaps going through this Tract I have not yet ſufficiently found out all the more ſecret Receſſes, and every more intimate Corner, and what is acted in them; yet I ſuppoſe that I have made way for others, who may have a mind more accuratly to find them out.

For

For truly if these two things which I have followed in the whole Disquisition should be exactly known, *viz.* By what means *Medicines* or their *Particles* affect the *Animal Spirits* in every place, also by what and how many ways they Ferment the *Blood* and *Humours*, from thence a Path would lead to the unfolding the *Reasons* of every *Evacuation.* For the better laying open of the ways of the whole curing by *Medicines*, we have taken care to have accurately discribed the *Ventricle* and *Intestines*, even to all the *Membranes* and *Fibres* of them, in which the *Animal Spirits* dwell, and where they are first of all affected by the *Particles* of the *Medicine.* For although the *Substances*, *Figures*, *Cavities*, *Sites* and *Connexions* of these are long since sufficiently enough delineated, yet we have manifested most clearly without any Example or following of any other Authors, the *Nervous* and *Musculary* and *Glandulous Membranes* of each of them, and some *Fibres* meerly sensible, and others motional, as also the thick set enfoldings of the sanguiferous Vessels, and innumerable *Glandula's* incrusting the Back of the interior Coat from the Mouth even to the *Anum*, this making very much for the illustrating the *Pharmaceutical Doctrin:* concerning which *Anatomical Inventions* I must acknowledg my self to be beholden (as formerly to some others, so now again) to the Industry and sedulous Pains of the Learned Doctor *King*, and also my Friend Doctor *Masters* hath set to his helping Hand, in the finishing of this Task.

At the beginning of this Work I did design to handle the whole *Pharmacie* and to weigh the Reasons of all or at least its chief Operations: But whilst this

work

work was under my Hands it grew into ſo great a Bulk, through the Fertility of the Subject, that I was forc'd to break off long before the end, and to finiſh it before I had half done. For beſides the *univerſal Medicines*, whoſe Energies and manner of working we have already deſcribed, there are other *Remedies* (commonly called *Specifick* and *Appropiate*) which belong to this Speculation; to wit, which are given to cure either ſome peculiar Diſeaſes, or which are ſaid to reſpect ſome Region or part of the Body. Of ſome of theſe, and eſpecially of Medicines proper for the Breaſt, I had begun ſome Meditations. But when I conſider that I muſt Sail in a dangerous Sea, every where full of Rocks of Cenſures and Contumelies, I think it no Wiſdom to venture my whole Cargo at once in this weak Bottom, but firſt of all with theſe few to try my Fortune, which if it be proſperous, I may perhaps be leſs affraid to expoſe the reſt of this Nature hereafter.

The

SECT. I.

Of the Operations of Medicins in Mans Body.

CHAP. I.

The Design of the Whole Work.

The Original of Physick.

THat Physick, from its Original down to the time wherein *Hippocrates* lived, was meerly Experimental, is well known to all who have read the History of it. For several Men having tried several Remedies, if they found any thing that was helpful in such a particular case, they afterward applied the same upon the like occasion. Wherefore, as *Herodotus* tells us, the ancient Egyptians brought their Sick, not to Physicians, but into the Street, and publick High-ways, to desire the advice of all Passengers, in order to the Cure of such or such a Disease. Nay not onely in *Egypt*, but in *Greece* too, the Priests took in writing the Receipts for each Cure, and laid up their Observations in their Temples, that they might be in readiness as oft as any other distempered persons should have need of them. But when through the daily and vast increase of Observations, Physick began to be reduced into Rules and Method, their whole business was, first, to take care that their Medicins were well prepared, according to the best Prescriptions; and Secondly, that the Reasons or Circumstances, why and when they were to be used, might be as plainly known. Now therefore if any one understood both these Parts of Physick, he was esteemed as an absolute Doctor. But indeed, in this affair, as well as in the whole Practice of Physick, we may truly say, we want some body or other to tell us, how and by what means all Medicins, inwardly taken, or outwardly applied, perform their operations; *to wit*, First, How, and why one gives you a Vomit, another a Purge, a third causes Sweat, Alteration, or some other Operation: Secondly, What agreement or disagreement there is between the bigger, and the smaller parts both in the Agent and the Patient, as likewise what Motion backward or forward. And Thirdly, What a struggling (as it were) and Fermentation there happens, when such parts mix with one another, and after what manner they produce their effects. To all which the vulgar answer is, that Medicins work by certain specifick Virtues, whereby they exert their peculiar strength and power; which is indeed no more than if a man should say, such a thing is so, because it is so. As when it is said, some things are apt to make People vomit, because they have a faculty of moving us to vomit. Since therefore the knowledge of Medicinal operations hath been hitherto left almost untouched by all Physicians, it seems worth while to inquire concerning that mechanical way (as it were) whereby all sorts of Medicins work upon our Bodies, so that, as we please, they either purge or bind, raise or allay heats in the Bloud and Humours, or relieve the necessities, and make amends for the irregularities of every particular part or member in some peculiar manner. For the performing whereof, although it be not of any great moment in what order the several sorts of Medicins are set down, yet, for Methods sake, I thought fit first to give some general account of them, and then accordingly to reduce them into their proper order. We therefore ought first of all to distinguish the several places, in which Medicins begin to operate, and are commonly divided into three regions, that is to say, First, The first Passages, in which are chiefly comprized the Stomach, Guts, Passage of the Gall and Sweet-bread, together with the Mouths of the Mesaraick Vessels. Secondly, The Mass of Bloud, with all its bloudy appendages, as the *Præcordia*, the Liver, Spleen, *&c.* And Thirdly, The Brain, and Nerves, with all the Members and the Habit of the Body. But besides these several Spheres of Activity, of which sometimes this or that apart, and sometimes more of them, or all together are affected by a Medicin. We must moreover in the second place consider those immediate Subjects upon which Medicins work, which indeed are not solid parts, but either the Animal Spirits or the Humours: though the former are sometimes moved by mediation of the latter. Medicins

The Progress and increase of it.

We want an account of the Operation of Medicins.

The Mechanical reason of them is inquired into.

The places where Medicins begin to operate.

The Subjects on which they operate.

Phar. Rat. Part. I.

inwardly taken work either immediately upon the Animal Spirits that are in the fibres of the Weazon, Stomach, Guts, and other paſſages among thoſe we call the firſt; or, by mediation of the Bloud, upon them that reſide in the Brain, and in the nervous or membranous fibres of the remoter parts. When therefore the virtue of ſuch Medicins makes any impreſſion upon thoſe Spirits, it either provokes and moves them toward purgation, or cheriſhing and recruiting, makes them expand themſelves with a kind of delight, or by aſſwaging of them appeaſes and removes all things that diſcompoſe or moleſt them; or laſtly by over-powering of them lays their fury aſleep. The Humours upon which Medicins inwardly taken work, are both the Ferments, and ſlimy coverings of the Stomach and Guts, the Bloud, with the nutritive Juice and other leſs noble Humours, as the *Serum* or Whey of the Bloud, both kinds of Choler, the Prancreatick or Sweetbread juice, the Watery Humour, and the Nervous Liquor: upon which ſometimes ſeverally, and ſometimes jointly Medicins uſe differently to operate, in as much as that they either ſcatter and make them ſink, or alter their preſent temperament, by ſometimes ſtirring them up when they are dull and heavy, or cooling and aſſwaging of them when too hot; or laſtly by changing and reſtoring them gradually to their natural conſtitution when they are irregular in quality, conſiſtence, mixture, and other accidents. Seeing therefore that the conſiderations touching the operations of Medicins are ſo many and various, I will treat of them in order according to the places where they firſt and chiefly begin to work; and firſt of Catharticks, or cleanſing Medicins, both Vomits and Purges: Next of Diuretick, or Medicins that provoke Urine; Diaphoretick, or ſuch as cauſe Sweating, and Cordials; and laſtly of Opiates, or ſuch as cauſe Sleep, &c. and thoſe that are commonly called Specificks, that is, ſuch as are applied to the irregularities or defects of each particular Member or Entrail. In the handling of which I will obſerve theſe three things:

How they operate upon the Spirits.

The ſeveral ſorts of Humours.

How Medicins operate upon them.

The Method of this Treatiſe.

Three things to be obſerved in every kind of Medicin.

1. To ſhew the manner how each kind of Medicins operate upon the Humours or Spirits of a Mans Body, or upon both together, and likewiſe how they affect the ſolid parts.

2. To ſet down the ſeveral ſorts of Medicins in each kind, or at leaſt the chief of them, with the moſt choice Receipts: And

3. To tell you the beſt Chymical Remedies, relating to each of thoſe ſorts, together with their Cauſes, that is to ſay, the variety of changes and accidents that happen in the preparations of them, and the reaſons of thoſe virtues and effects which are ſo manifeſt in them when prepared.

But in the fourth place, there might be added to all this another Tract alſo concerning the Nature of Medicin, to ſhew how, when the cauſes of Chymical Preparations are rightly conſidered, there may be neater and more uſeful proviſions made of ſuch kind of Remedies. But I ſhall reſerve that Deſign till another time, becauſe it comprehends many Secrets which may be eaſily tranſgreſſed by raſh Quacks, who, to the great hazard of the Sick, (but unpuniſhed) do at this day often make up Medicins which they can onely read. The next thing therefore that I have to do, is briefly and accurately to deſcribe the firſt Paſſages, as they are commonly called, in which Phyſick begins to work, being as it were the firſt Scene of each medicinal action.

CHAP.

Phar. Rat. Part. I.

CHAP. II.

The Deſcription, Uſes, and Affections of the Parts in which Medicins begin firſt to operate.

SInce Medicins and Food go into the Body of Man the ſame way, and are conveyed through the very ſame paſſages in all reſpects, it is therefore neceſſary for the underſtanding how Medicins work, as well as how Chyle is made and diſtributed, to give you a kind of Landſchape of thoſe Parts and Entrails, in which the actions of both are performed. But to make this a full and perfect Work, would be to write the whole Anatomy of Mans Body. Wherefore I ſhall briefly deſcribe onely thoſe parts, into which Medicins are firſt received, and where they begin to work. Now theſe are the Weazon, Stomach, and Guts, with their appurtenances, in which not onely Vomits and Purges, but alſo Cordials, Opiates, and Diaphoreticks, with other Medicins of all ſorts do firſt exert their Virtues, and are determined to every operation. I therefore will not trouble you with a perfect deſcription of them (becauſe that hath been done very accurately already by other Anatomiſts) but will give you onely ſome ſhort account, enough to illuſtrate this practical part of Phyſick. And again, ſince all Medicins work more immediately upon the Spirits, or Humours, or both together, and that the Subjects in which they reſide, are the Fibres, Membranes, Veſſels, and Paſſages, I will particularly ſhew you how theſe ſtand, and uſe to be affected in the aforeſaid Entrails.

The firſt Paſſages.

Spirits and Humours are the firſt Subjects upon which Medicins works and fibres, &c. the next.

1. The Weazon, according to the common opinion and obſervation, hath three coats, whereof the inner hath a kind of vail on its inſide, conſiſting of fibres, like unto ſmall hairs, which covers all its cavity as it were with Down; but the other part of this ſame coat is altogether nervous, and full of fibres, not onely of various ſorts but alſo variouſly interwoven, juſt as the inner coat of the Stomach and Guts. Moreover this membrane is continued to that which covers the Palate, Mouth, Jaws, and Lips; nor onely ſo, but it alſo deſcends as low as the Stomach, and covering the mouth thereof, goes down into it three inches all over the ſides. Now this lower part of this ſame nervous coat, within the orifice of the Stomach is very thick and hairy, and appears much different from the inner coat of the Stomach which it covers; as you may more fully diſcern when it is parboiled: for then that coat which comes down from the Weazon, is much whiter than the inner one, which belongs to the Stomach. That part, no queſtion, contributes very much to exquiſite, nice Senſation. For hence it proceeds, that when we take in and ſwallow down grateful food, we feel a ſort of pleaſure even till it enters the Stomach: and ſo on the contrary, if we eat, or but remember any ungrateful thing, there is ſuch a diſturbance in this part, as that we preſently keck or vomit. And the deep inſertion of this coat into the Stomach, cauſes that near and ſpeedy commerce between the Stomach and the Weazon, in ſo much that if either of them be moved to Vomiting, the other preſently ſympathizes; and being that the ſame coat covers the Palat and other parts of the mouth, they all agree in a mutual conſent to vomit.

The Weazon hath 3 Coats.

The inner Coat is nervous, but covered with a kind of Down.

It goes into the mouth of the Stomach, and covers it for ſome ſpace.

It creates a ſenſe of Taſting in the Weazon and in the mouth of the Stomach.

2. The next Coat belonging to the Weazon is very fleſhy and thick, as if it were a Muſcle with a hole bored through it: and *Hofman* ſays it is really a Muſcle, obnoxious both to the Palſie and Convulſions. Now the fleſhy fibres of this coat are commonly thought to be round and tranſverſe, but the famous *Steno* hath obſerved them to be ſpiral, and in a double order or rank; that is to ſay, going croſs each other, and reſembling, as it were, two Cockles or Snails ſet oppoſite one to another. Of which, that I may tell you what I find by mine own obſervation; the whole Weazon ſeems to conſiſt of two Muſcles put together, which makes four parallel lines with the fibres that are oppoſite and croſs each other. And this will plainly appear, if this middlemoſt coat of the Weazon, being ſtript of the reſt, and bound at both ends, be blown full of wind, and dipt into boiling Water till its fibres be contracted and ſwell; for by that means there will two rows of deſcending fibres diſcover themſelves and their tendons. But then again, if you turn this ſame coat upſide down, and blow into it the other way, the oppoſite ranks of aſcending fibres will likewiſe appear. Laſtly, if it be cut lengthwiſe between the tendons, and laid fairly open, you ſhall ſee two parallel lines on one ſide and as many oppoſite on the other.

The ſecond Coat of the Weazon.

Two oppoſite ranks of fibres that cauſe motion.

3. The third and outmoſt coat of the Weazon, which is common to that and the Stomach, and hath its riſe from the Midriff (to which it is united whilſt it paſſes through the

The outmoſt Coat of the Weazon.

Phar. Rat. Part I.

the hole thereof) is very thin, conſiſting onely of membranous fibres, and thoſe mighty ſlender too.

An inquiry into the uſe of theſe Coats.

As to the uſe and duty of theſe Parts, I ſay in general that the Inner coat is made chiefly for Senſation [by the Taſte], the middlemoſt for Motion, and the third for a covering to them both. But it ſeems worth our while, ſince theſe are the firſt avenues or gates through which all Medicins paſs, to enquire a little more largely and particularly into them.

What the hairy Covering ſerves for.

Firſt therefore, Whereas the Inner coat of the Weazon is covered all over with an hairy vail like Down (which is alſo common to the Palat and the Tongue) the reaſon ſeems to be, becauſe it may the more invite us to eat, which is an action ſo neceſſary to the preſerving of life; I mean, that whileſt we ſwallow grateful food, it may be caught hold on all along as it goes down the Weaſon, by thoſe ſmall hairs, and ſticking ſometimes in them, imprint a ſenſe of pleaſure upon the part. But the coat it ſelf being made of nervous fibres onely, which are variouſly interwoven, contributes very much firſt to Senſation; next is thereby the ſtronger, like a Basket made of Twigs; and Thirdly may be the more eaſily ſtretched out. But their chief uſe is to receive all ſenſible [or taſteful] things, and preſently to deliver them over to the common Senſe, to the end that as they are there judged pleaſant or unpleaſant, the motions of ſwallowing or vomiting, may be either continued or renewed.

The nervous Coat is made for Senſation.

Whether it ſerves for Motion too?

But in this place it may deſerve our inquiry, Whether this coat which is altogether nervous, being interwoven with ſo many and various fibres, ſerves alſo for any motion? For ſince we know that the Weazon, and all the parts of it are moved ſeveral ways in Swallowing, Spitting, Vomiting, Yawning, and the like; and likewiſe that other membranous Entrails (as the Stomach eſpecially, and the Guts) are drawn, blown up, and diſtended into various figures, we ought to explain by what Fibres, and how it comes to paſs, that ſuch various actions and paſſions happen.

Fallopius *his Opinion of the motion of Membranes?*

Fallopius, the beſt Anatomiſt of his time, having obſerved in that Muſcle (which is the chief or onely inſtrument of local motion) *two parts; the one containing the fleſhly body of that Muſcle, and conſiſting of fleſhy Fibres, as the other, which contains the chord or ſtring, does of nervous ones; and that by theſe two, the body onely of the Muſcle moves and contracts it ſelf, whileſt the chord is onely paſſive and doth not move it ſelf:* at laſt concludes, *That no part in any Animal moves it ſelf, unleſs it be fibrous, and made of true Fleſh.* Obſerv. Anatom. p. 412.

That Contractions are performed by Fibres onely.

According to his opinion, I have lately ſhewn in a peculiar Tract, *not onely that it is ſo, but alſo how all Contractions are performed by fleſhy Fibres onely*; to wit, *That theſe Fibres being ſuddenly blown up and ſwollen through the haſty infuſion of the Spirits (which guſh out of the tendinous Fibres) are preſently ſhortned, and conſequently draw the connected parts toward them.* But ſince it alſo very plainly appears that ſome nervous parts, and eſpecially the hollow Entrails, are not onely contracted, but alſo expanded, much bloated, and enlarged into a greater width (which cannot be by contraction,) and ſince it likewiſe is very manifeſt, that the Animal Spirits within the nervous fibres, are moved no leſs than in the fleſhy ones; as alſo that in them they flow not onely very gently, but ſometimes are diſturbed, and diſcharged with great violence. Theſe things, I ſay, being preſuppoſed, I affirm, That the Animal Spirits which are in the nervous or membranous Fibres, cauſe not onely perception, or ſenſe, (which is their proper office) but alſo ſome kinds of local motion, as Expanſions, or Inflations [or Widenings and Bloatings.] For when the Animal Spirits upon their diſcharge are mightily rarefied, and thereupon violently enter theſe Fibres (which contrary to the fleſhy ones, are not ranged in certain rowes, but ſcattered every way, and may be attenuated, diſtended or dilated into a greater compaſs) it neceſſarily follows, that any Entrail conſiſting of ſuch fibres, muſt be totally blown up, and that every ſide of it being unfolded, and laid ſmooth, muſt be attenuated and enlarged into a greater capacity or extent. And indeed if we conſider the deſign of Nature, it is convenient that ſometimes it ſhould be ſo, to the end that whileſt the parts which are either compoſed of Membranes, or otherwiſe ſupported or covered by them, are thus expanded [or widened] the ſuperfluous or vicious Humours, which are ſetled in them, or ſtick to them, may be cleared and carried off. To this end, and by this means I ſuppoſe ſtretching, yawning, and ſome other motions of Inflation and Diſtention are ſet on foot. Upon which account, ſince we ſee that in yawning the paſſage of the Weazon is widened even whether we will or no, and as it were filled with wind, or expanded, we may conclude the reaſon of it to proceed from the inner coat of the Weazon, which, to relieve it ſelf from that immoderate moiſture (with which it is oppreſſed) is widened and enlarged by a kind of exploſion, or diſcharge of the Spirits. Moreover, when we endeavour to hinder our motion to yawn (becauſe it ſeems always troubleſom and indecent)

That Expanſions are cauſed by the nervous Fibres.

As in Stretching, Yawning, &c.

The reaſon of Yawning.

cent) immediately the fleshy fibres of the outward coat are contracted: from whence there arises in the coats of the Weazon a kind of struggling as it were, between these opposite endeavours to stretch and contract them. How the Animal Spirits in Convulsions do so much inflate, or blow up, and raise the membranous Entrals, and swell them with a motion like the skipping of a living Animal, I have shewn in another place. But to proceed; The reason why an ill Medicin, or Poison causes such horrid distentions and inflations of the Stomach and Guts, and also oftentimes such sudden and extraordinary swellings in the whole lower Belly, is, because the Animal Spirits being extremely disturbed, and forced to a violent explosion or discharge, run all together into the membranous fibres, and extend or stretch them out to the utmost; that the Entral which is made up of them, may be immediately filled with wind, and enlarged as much as possible. But now, having digressed in this Discourse concerning the motion of Membranes, let us consider the use of the other coat of the Weazon.

The reason why the Membrans are distended.

2. The middlemost coat of the Weazon being very fleshy and thick, as consisting of two ranks of fleshy fibres, which ascend and descend obliquely across one the other, ought to be reckoned, as it were, a double Muscle; and since the one row of fibres so descending serves for swallowing, the other questionless, ascending, performs the offices of Spitting and Vomiting. I have known some, who having a Palsie in this fleshy coat of the Weazon, have been hardly able to swallow; and others, who through the relaxation or total loosening of those fibres, have died for hunger. Besides which, we may guess, that the sense of being choaked as it were, and the ascent of somewhat like a round Ball in those that are troubled with Fits of the Mother are occasioned by the nervous fibres of the inner coat being too much swelled and distended, when the Spirits that are in them are exploded or discharged.

The middlemost Coat of the Weazon is fleshy and consists of two ranks of motive fibres.

But 3. Of the outmost coat of the Weazon I need not say much; for that, as it consists of very small and membranous fibres, so it seems to be designed onely for a covering to this same Entral.

Secondly, The Stomach (in which the Weazon ends, and inserts its nervous coat into the left orifice thereof) is long like a Snapsack, with a large round bottom, and a plain short top, wherein there are two orifices [or mouths] placed opposite to each other at some distance: through the left of which the meat descends in a streight perpendicular passage down into the Stomach, and being there dissolved and changed into Chyle, ascends again through the right orifice, whose passage is oblique, and goes into the Guts; so that whatever passes out of the Stomach at either door, goes upward; and therefore, that the Stomach may discharge what is in it, either the left way by Vomit, or the right way by Stool, it is necessary that the bottom and sides of it being at the same time contracted and raised up, should lean altogether to this or that orifice.

A description of the Stomach.

So much for the outside of the Stomach: Now we ought further to consider in this Entrail (as it relates to practical Physick) the coats of it, together with the texture [or interweaving] of the Fibres; as likewise its orifices, vessels, and passages, with all their actions and uses. Now the Stomach, just as the Weazon, consists of three coats; the one common, which rises from the Midriff; and two proper, to wit, an outward, and an inward.

It hath three coats.

Of which the innermost is altogether nervous, and (as I said of the Weazon) covered on the inside all over with an hairy substance, like small strait threds, fastned perpendicularly into the coat it self, as you see in Velvet. This Vail or Covering, being spread all over the inside of the Stomach, appears very plainly after it is a little boiled, though different from that which lines the Weazon (as being thin and not so white) but is like to that which covers the Tongue. For the surface both of the Tongue and Stomach too, ought to be rough, as it is, that the small parts of Food which we taste, or swallow, may be detained in it for some time, and then by degrees delivered over to the nervous coat, which might otherwise be in danger of being too much affected by their naked and immediate touching of it, and thereby grow harder and less sensible. But this hairy Vail of the Stomach serves likewise for other uses; for in that the reliques of the Chyle being gathered together, and kept till they become acid, or sharp, turn into a kind of Ferment, which is requisite both for the appetite and digestion. So also this same Down, not onely covers but guards the mouths of the Vessels, which are very numerously inserted into the nervous coat, and receives the Humours which issue out of the Arteries and Nerves, whilest at the same time the Veins suck out the Chyle or other Juices which abound in this part. But this hairy Vail or Covering, on its back-part or convex surface, by which it joins to the nervous coat, is all over set with annular or round glandules [or kernels] to a vast number, which, no doubt, cover the mouths of those Vessels which lie open in the nervous coat,

The inward one is nervous and covered with a kind of Down.

The uses of the hairy Vail.

Phar. Rat. Part. I.

coat, and probably do more immediately receive and ſtrain the moiſture deſigned for them, or diſcharged by them.

This hairy Veil is a Coat by it ſelf.

This hairy Veil or Covering is eaſily ſeparated by dipping the Stomach into boiling Water, and then it appears to be a coat, firm enough of it ſelf, and diſtinct from all others; and may (for the reaſon juſt now given) not improperly be called *the glandulous coat*. When this therefore is taken off, the nervous coat it ſelf appears, conſiſting of fibres of divers kinds, and variouſly interwoven; through the thin web whereof (deſcribed in the Figure *A.A.*) an innumerable company of Bloud-Veſſels ſpread themſelves into a thouſand little branches, and terminate in the inner ſurface of it, where they join to the glandulous coat. Parts of both theſe Membranes, to wit, the nervous and the glandulous too, are repreſented by Figures in the Fourth Table.

The nervous Coat is full of little Bloud-Veſſels.

This nervous coat makes the inner cavity or hollow of the Stomack, like a Chymical Veſſel, called a Matrace, in which the Food is diſſolved and digeſted into Chyle: and the Fibres of it contribute chiefly to Senſation, but it may be, in ſome meaſure, to motion too. As to the former, theſe Fibres being emptied create hunger, and being wrinkled through drouth or ſaltneſs, or heated with Aromatick or Winy Drinks, make us thirſty; but if at any time ſharp or acid humours either prick or gnaw them, we have the Heart-burn. In fine, all Medicins work chiefly upon theſe Fibres, and according to the ſenſible impreſſion made upon them, ſuch or ſuch an operation (as I ſhall hereafter ſhew) ſucceeds. As ſoon as theſe fibres are filled with convenient food, which is conveyed into the Stomach, immediately the Spirits that are in them receive a kind of pleaſure and ſatisfaction, and then, by an univerſal conſent of them all, the ſenſitive ſoul in general is refreſhed, and does as it were rejoice, whileſt at the ſame time the Veins ſtrait ſuck up the thinneſt part of the Chyle, and ſupply the flame of Life with new combuſtible matter.

The uſe of this Coat in point of Senſation.

The motions of it.

As to the motion of this coat, though we utterly deny it to make any ſpontaneous contractions, yet it is plain enough that it is frequently diſtended, blown up, ſwollen and enlarged into a greater compaſs: and that proceeds not onely from wind that is bred within the hollow of the Stomach, but much oftner from the Spirits that reſide in the fibres themſelves; which Spirits if they are very much diſturbed and forced upon an exploſion or violent diſcharge, and run all together tumultuouſly into the fibres, they blow them up, and ſtretch them extremely, ſo as to make the whole membrane ſwell like a Bladder full of wind. For if thoſe nervous fibres were all hollow like ſo many ſmall tubes, or pipes, and ſuddenly filled with wind, it would neceſſarily follow that the Veſſel, which is made of them, muſt be as ſoon diſtended and dilated or widened. So it is, when the Spirits, being ſtung as it were, with ſome great diſturbance, ruſh violently into them. And upon this account it is, that the Stomach in Fits of the Mother, and of the Cholick, as alſo often in [the Spleen or] Hypochondriack Diſtemper, the Stomach uſes to ſwell. Hence alſo comes the Hickock with its reciprocations or returns, for that the Stomach is one while blown up and filled with wind as it were by theſe fibres, and another while emptied again by the Syſtole or contraction of the Midriff. In fine, all venoms and poiſons in reſpect of their extraordinary ſtimulating and diſturbing of the Spirits, and forcing them to run furiouſly into the fibres, do often cauſe horrid diſtenſions and ſwellings of the Stomach and other Entrals; and from ſome ſuch cauſe I affirm alſo the Tympany to proceed.

The cauſe of the Tympany is hinted at.

This inner Coat in ſound Bodies hath many wrinkles or folds in it, which appear in the concave ſurface of the Stomach, and look like ſo many little ditches or furrows, in which the ſeveral portions of Chyle, being diſperſed in very ſmall quantities to divers apartments, might be the better detained from each other in order to concoction, and not ſuffered to run together into one thick maſs. The reaſon of theſe folds is, becauſe this coat is much larger than the fleſhy one which is more outward; wherefore that the former might be contained by the latter, it was neceſſary for it to be contracted or gathered into wrinkles or folds. But in Drunkards and Gluttons, whoſe fleſhy coat is very much ſtretched through their frequent and immoderate gormandizing, the inner coat alſo is of the ſame extent with that, and looſening all its folds, becomes plain and thin like a Bladder blown full of wind. The aforeſaid wrinkles and folds are expreſſed in *Tab.4.Fig.1.*

The reaſon of the wrinkles in the inner coat of the Stomach.

The fleſhy Coat of the Stomach.

2. The next coat of the Stomach which is both proper to it, and altogether fleſhy, conſiſts of none but fleſhy fibres, and ſeems to ſerve onely for ſeveral motions, and thoſe onely contractive. Indeed the whole Body of the Stomach is covered with this membrane or fleſhy cloak, which contracts and compoſes it very differently according to the various uſes and offices that occur. For ſince the Stomach, in the work of chylification [or making of Chyle] and the operations of Medicins ought to be altered and

and modified into ſeveral poſtures, for that reaſon this coat contains many ranks of moving fibres, which are mighty admirable. Now though it be difficult to deſcribe them, as being very intricate, yet becauſe it very much concerns the Nature and operation of Medicins, I therefore ſhall endeavour according to my beſt ability to give you the particular Anatomy of it, which has been hitherto ſcarce touched upon by any other hand. *Phar. Rat.* Part. I.

The Anatomy of the Stomach.

In order thereunto, let the Stomach of a Man or a Sheep, being emptied, and blown full of wind, and then tied at both ends, be dipped ſeveral times into boiling Water till the fibres are by degrees contracted and ſwell, and the whole ſeems parboiled; and then take notice of the outmoſt coat, or membrane, which covers the whole Stomach. The fibres of this coat running out from one orifice to the other, encompaſs the bottom and ſides of the Stomach all the length of them, and according to the different uſe of them, are either longer or ſhorter, more ſtrait or crooked. Beſides which, in ſome places, that is, near the orifices and about the bottom and ends of the Stomach they are much thicker than in the middle, in ſo much that they there ſeem fleſhy, and in ſome meaſure ſubſervient to motion. The nervous fibres of this membrane (as you may obſerve in many Muſcles) cut fleſhy fibres that are immediately under them at right angles; it being their office not onely to cover, but to bind and keep each one of them within their ranks, ſo as not to let them ſtart out: The Figure of which is well repreſented in *Tab.*2. *Of the outmoſt Coat thereof.*

Of the middlemoſt.

When therefore the outmoſt coat is ſeparated and removed, a row of fleſhy fibres lies juſt under at right angles; which encompaſſing the bottom and ſides of the Stomach by way of depth, are terminated in the plain upper part of it (which is the diſtance between the two orifices) and in the orifices themſelves. Without all doubt the uſe of theſe Fibres is, whileſt they are contracted, to raiſe the bottom and ſides of the Stomach, and conſequently very much to ſtreighten the cavity or hollow of it, ſo that the meat or other matter therein contained, being elevated, may be diſcharged through this or that orifice. The outward, or convex ſurface of this fleſhy coat, together with the rank of moving fibres is exactly delineated in *Tab.*3.

But to determine its expulſive motion toward this or that orifice, and that the matter included in the Stomach, may be conveyed both by Vomit or Stool, there needs alſo another row of fibres, which in reſpect of the former, are tranſverſe, and draw one end of the Stomach, to wit, the right or left, toward the other, ſo that when both theſe kinds of fibres act at the ſame time, the Stomach being contracted in all its dimenſions, and raiſed up, may throw out what is in it through that orifice, to which upon occaſion it is inclined. And indeed, that there are ſuch fibres juſt under the former, is very manifeſt to any one that takes notice of the other, inner and concave ſurface of this Coat. Let therefore the Stomach be turned (through the orifice of the *Pylorus* being cut a little wider) with the wrong ſide outward, ſo that the inner and concave ſurface may become the outward and convex, and by that means the hairy covering of that inner membrane, together with the wrinkles and folds (as it is formerly deſcribed, and expreſſed very well in *Fig.*1. *Tab.*4.) will plainly appear. Then after a little dipping of it into boiling Water, let the hairy veil be taken off, and thereby we ſhall diſcover the nervous coat it ſelf, which is covered all over with veſſels that ſpread into an innumerable company of little branches: portions of both which I have taken care to get repreſented in *Fig.*2. & 3. of the ſame Table, that the ſurfaces of them, with the glandules and veſſels, whereby they are joined together, might be diſcerned. Laſtly, If you take the nervous coat quite off, the inner fibrous ſurface of the fleſhy or middlemoſt coat will appear, as it is lively expreſſed in the fifth Table. The order therefore in the branching of theſe fleſhy fibres is very obſervable, in that they ſeem to ariſe behind the mouth of the Stomach, and ſo encompaſſing its left ſide to be carried forward toward the right. A conſiderable number of theſe are conſpicuous in the neck or top of the Stomach, which running along in ſtrait lines on both ſides, go into the *Antrum Pylori*, or hollow of the *Pylorus*, and covering that cavity of it here and there, the whole length of it, are terminated in the very orifice, as is repreſented in the fifth Figure. But the other fibres of this rank go obliquely on both ſides of the Stomach, and forward toward its bottom, where they meet. The uſe of the former ſeems to be, to draw either of the orifices toward the other in diſcharging [what is within] whether upward or downward; for the ſame fibres pull either to the right or left, according as the attractive motion begins from the one or the other end; as I have lately ſhewn in my Treatiſe touching the motion of the Muſcles. If then the contraction begins near the *Pylorus*, [it ſo happens that] whileſt there the bottom and ſides of the ſtomach are gathered up by other fibres both outward and inward, the mouth of the ſtomach alſo is bowed toward the *Pylorus* by theſe ſtrait ones, to the end that what

The uſe of its Fibres.

The ſame fleſhy Fibres cauſe ſeveral contractions.

Phar. Rat. Part I.

what is in the ſtomach may be tranſmitted into the Guts. But if on the contrary the contraction begin in the other ends of theſe fibres near the mouth of the ſtomach, [it thereby comes to paſs that] whileſt the bottom, and ſides of it are drawn that way by other fibres, the *Pylorus* alſo at the ſame time is pulled toward it, as in vomiting. As for the other oblique fibrts of this rank, when the motion begins from their right ends, they are contracted obliquely downward, and by their force inclining the left part of the Stomach toward the bottom and the *Pylorus*, to preſs the meat (as it concocts) the nearer together, and roul it down that way: So on the other hand, if the motion begin at the left ends, that are contracted obliquely upward, making the bottom and right part of the Stomach yield toward the mouth of it, to give you a Vomit. Now according to both the contractions of theſe fibres, the fleſhy ones that are outward and make up the convex ſurface of the middlemoſt coat, do (as it were) conſpire in their action, and thereby rendring the cavity of the Stomach more ſtreight, make it the fitter for evacuation either upward or downward. Wherefore according as by the irritation or firſt motion in the one or the other part of it, the contraction begins near the *Pylorus*, or the mouth of the Stomach, the whole cavity thereof is drawn together, railed, and bowed either one way or the other, to cauſe a diſcharge either upward or downward. Both ſurfaces of this coat, with the diſtinct rows of moving fibres in each of them, I have taken care to get exactly delineated by figures in the third and fifth Table. It is not my buſineſs here to recite and explicate the ſeveral ſorts of contractive motions that this fleſhy coat of the Stomach performs; in that I have already ſhewn elſewhere of what kind thoſe are, which happen in convulſive diſtempers, and do deſign to demonſtrate the nature of thoſe that are cauſed by the operations of Medicins, when I come to treat particularly of them. Yet in the mean time I obſerve to you, that the inſtinct or occaſion of theſe motions which this fleſhy coat uſes to perform, is communicated and given to it ſeveral ways; as firſt and chiefly from the nervous coat that lies under it; which as it is variouſly affected by that which is in the Stomach, does preſently provoke the fleſhy coat to contract it ſelf one way or the other, either to keep in or drive out the matter therein contained. But the nerves that are inſerted into this fleſhy coat infuſe into it ſeveral inſtincts or diſpoſitions to move down from the Brain, or other parts, whether near or remote, below or above. And hence it is, that the Phanſie, Appetite, yea many Affections, [or indiſpoſitions] of the Soul, or of any parts of the Body, diſturb the Stomach and cauſe it to move different ways.

How the fleſhy coat comes to move.

2. The outmoſt coat of the Stomach, which is common to that and the Weazon, I have already deſcribed, as to its ſubſtance and make: as to its uſe, it being the cover of the whole Stomach, inveſts or cloaths (as it were) the fleſhy fibres of the coat that lies under it, binding them with its fibres, as it were with twigs one to another. The fibres of this membrane are (as I before obſerved) in ſome places thicker than ordinary, to the end that when the Stomach is extraordinary full, it may be proportionably diſtended or ſtretched out. Theſe ſeem to ſerve but very little for motion, but for ſenſe they do in ſome meaſure: though indeed there is mighty little uſe of it, becauſe no outward object, nor any thing that is taken in at the mouth can reach it. But if the ſerous Humour [or wheyiſh moiſture] an abſceſs [or irregular gathering of any ill Humour] or a conſtant flux of choler happens in the adjacent, or contiguous parts, it cauſes almoſt a continual naufeouſneſs, want of appetite, and frequent vomiting in the Stomach, by reaſon that this coat is often and much diſturbed, as I have obſerved in many Bodies which I have diſſected. Now the chief uſe of this coat is, that being a cover to the whole Stomach, it inveſts or cloaths the fleſhy fibres of the membrane under it, ſupports the branches of the veſſels, and ſerves to ſtrengthen the Stomach as well as to preſerve the heat thereof. Nor is it improbable, but that in ſome places the nervous fibres of this coat, in reſpect of the fleſhy fibres that are under them ſupply the room of tendons.

The outmoſt coat of the Stomach is wholly nervous.

The uſe of it.

The Stomach being made up in this manner, like a Snapſack, of theſe three coats, as it were a three-doubled piece of cloth, hath two doors, or orifices, which are placed on the top of it, juſt againſt one another. The one on the left ſide, conſiſting of the Weazons inſertion into the mouth of the Stomach (and looks like the Pipe of a Funnel put into the neck of a Bladder which is to be filled, [with any liquor] that ſtreight and perpendicular paſſage whereof, lets every thing that is taken in and ſwallowed, into that part. The other orifice is on the right hand, continued to the *Duodenum* [or Gut of 12 inches long] by a long, oblique aſcent, and by degrees diſcharges the Chyle that is prepared in the Stomach, into it.

Two orifices in the Stomach.

The nerves of *Par Vagum* [or the ſtraggling Pair] being brought down to the Stomach, as their ultimate bound or limit, make, near the left orifice, very notable plaits,

Nerves belonging to the mouth of it.

or

or a kind of Network, which covers it all over: and ſo likewiſe the hairy and nervous coat of the Weazon inveſts and clothes the cavity of it pretty deep: from whence it proceeds, that the mouth of the Stomach being a part of very acute and exquiſite ſenſe, hath ſuch a communication with the other noble parts, and eſpecially with the Brain and Heart; ſo that it is not without ſome reaſon that *Helmont* makes this the ſeat of the Soul.

A deſcription of the Pylorus.

The other orifice, commonly called, the *Pylorus*, going from the right ſide of the Stomach with a long wide hollow, that grows leſs and leſs by degrees, till it becomes very ſtreight, ends in a ſmall hole, from whence being retorted, or turned back again, it is continued, or joins to the *Duodenum*. The coats in this part are much thicker than in any other part of the Stomach. Of which the inmoſt being nervous, hath many uneven wrinkles and furrows in it, and at the very hole is raiſed into an oblong bulky figure (like a Cock in any Veſſel) to the end that the Chyle when it is gone leiſurely out of the Stomach, may not rejounce again into the Stomach. The fleſhy coat, as in all other places, hath two rows of fibres; for ſome of them encompaſſing and binding this Hollow, do upon occaſion ſhut it, whileſt others running out in length all over its ſides, and gathering the other parts of the Stomach upward, draw them toward this orifice. And ſo on the contrary, theſe fibres, when the contraction begins at their other ends, do often draw the Pylorus toward the left orifice, as in Vomiting: but when the attractive force is augmented and carried farther, the Duodenuum is drawn upward and thereby the choler with the Pancreatick liquor [or humour in the Sweetbread] is diſcharged into the Stomach.

The uſe of the Pylorus.

The uſe of the *Pylorus* is not onely to tranſmit that which is in the Stomach freely and in a great quantity to the Guts (as it often does in a Purge or Looſneſs) but rather to receive the Chyle, when it is well prepared, and having for ſome time retained it, by little and little to ſend it forth. For the long and wide hollow thereof ſeems to be a kind of retiring room where the more perfect part of the chyly maſs may go apart and ſtay, till the other and more crude part, which is more newly taken in, be better digeſted in the bottom of the Stomach. Hence it is, that among thoſe things that we eat, we oftentimes quickly vomit up what is ungrateful, whileſt the more grateful part of the food ſtays in the Stomach; in as much as there are in the Stomach ſeveral diſtinct cells, or little rooms, wherein the parcels of meat may retire and ſtay apart from each other. Beſides which it is obſervable that Vomits when they work gently, provoke or move onely thoſe parts that are next the left orifice of the Stomach, but when they operate more ſtrongly, draw the *Pylorus* alſo, and the *Duodedenum*, which is joined to it, inward and upward, and by that means cauſe an evacuation of the choler which is violently hurried into the Stomach.

The Veſſels of the Stomach.

The Veſſels belonging to the Stomach are Nerves, Arteries, and Veins: of which the former are deſcribed pretty accurately in my Book called *Neurologia*, or a Treatiſe of the Nerves; that is to ſay, That the Nerves of the *Par vagum* on both ſides ending in the Stomach, make notable branches and plates in it; as likewiſe, that the nervous plates of the *Par intercoſtale* [or Pair running between the ribs] being ſpread here and there in the *Hypochondria* and the lower Belly, ſend many ſprouts, and thoſe very conſiderable ones too, to the ſtomach: Which is the Reaſon that in Fits of the Mother, the Cholick, and Hypochondriack diſtemper, people ſo often vomit.

Nerves.

Bloud-veſſels in abundance.

There are alſo a great many Bloud-veſſels belonging to the ſtomach; as you may plainly ſee, if you take the ſtomach of a Man, a Dog, or an Hog, (having firſt tied and cut off the cæliack veſſels) and then tying up the orifices, blow it full of wind; for then you may ſee with a great deal of pleaſure the leſſer trunks of Veins and Arteries (inſerted partly into the top of the ſtomach and partly into the bottom of it) which being immediately divided into leſſer branches, and afterwards into moſt minute ſprouts meet one another, mutually embrace, and being expanded every way, creep all over the ſtomach, and cover it with a ſhrubby ſort of hair. Theſe Bloud veſſels, going inward, and being at laſt divided into a thouſand little ſprouts, are terminated in the innermoſt nervous coat, whoſe inner ſurface they dye, as it were, of a Bloud colour, by the thickneſs of thoſe points, in which the veſſels end. And this is plain, if at any time the hairy coat be ſeparated after the dipping of the ſtomach into boyling water; for then the nervous coat by reaſon of the extraordinary thick terminations or endings of the veſſels will ſeem to be covered as it were with a ſmall Net of bloud.

Their uſe.

If their uſe be inquired into; all thoſe who make heat the chief inſtrument of concoction and digeſtion in the ſtomach, may have fewel enough from hence; in that the Bloud boyling up about the bottom and ſides of the ſtomach, as it were a pot, is kept perpetually like a fire, and that lake of Bloud ſeems to be placed there partly for that end. But yet theſe bloudy veſſels have an other office too, which I eſteem as neceſſary as this; and that is, that the Arteries diſcharge ſome humour into the ſto-

Phar. Rat. Part I.

mach, and the veins continually carry thence another ſort of moiſture, ſo that there is an immediate and a conſtant commerce between the chyle and the bloud.

The Arteries bring into the Stomach a fermenting humour.

But that the food taken in may be not onely concocted, but alſo diſſolved, and that much better by fermentation, ſo as to be digeſted to homogeneous chyle, it ought to be impregnated there with a kind of ſpirituous liquor which is like a Ferment [Rennet or Leaven] (as when Ale Yeſt or Balm ſets other Ale a working) and ſuch an humour or liquor (where plenty of it is neceſſary) the Arteries onely can ſupply; which when it is mixed with the reliques of the Chyle that ſtick in the hairy Veil, doth queſtionleſs make that juice, commonly called the ferment of the Stomach. Moreover ſince it is neceſſary oftentimes that a man ſhould be ſuddenly refreſhed by what he eats, ſince that cannot be done by the long windings of the Guts and chyliferous veſſels, what is more likely than that the Veins which lie very thick and wide open, do receive the more ſubtile part of the Chyle, and immediately convey it into the bloud. You may ſee very plainly in the firſt Figure, how theſe Bloud-veſſels, being inſerted into the bottom and top of the Stomach, cover its whole ſurface with very thick and numerous branches.

The Veins take in ſome part of the Chyle.

The Guts are either ſmall or great.

Thirdly, From the Stomach we deſcend to the Guts, which being of two ſorts, either ſmall or thick, I ſhall not need in this place to give you an account of them all, becauſe both their number and figure is already ſo well known, not onely to Anatomiſts, but even to common Butchers. In the former, for as much as concerns the operation of Medicins, we ought to conſider, Firſt, their ſituation and make; Secondly, their Coats; and thirdly their Veſſels and Paſſages. It is their buſineſs to receive the Chyle after it is prepared in the ſtomach, to give it a new fermentation, and to draw from it, when more elaborate and perfect, a nutritive juice into the chyliferous Veſſels. In theſe Guts chiefly do purging Medicins work.

The ſituation and dimenſion of the ſmall ones.

Now though there be but one continued paſſage of the ſmall Guts, yet by reaſon of the diſtinct offices which they bear, there are as it were, three ſtages in it, and as many diſtinct names aſſigned to them, as if they were three ſeveral Entrals. In the firſt of theſe, the Chyle deſcending from the *Pylorus*, is preſently mixed with new ferments, to wit, the Choler and the Pancreatick or Sweetbread-juice, with which, ſince the whole maſs of it ought by degrees and parcels to be impregnated, therefore every part of it paſſes this region, to wit, the *Duodenum*, with a ſpeedy motion. In the next place, that is to ſay, the *Jejunum* [or hungry Gut] the Chyle by being fermented, grows more perfect, is reſcued from acidity, and gains a greater volatility [or lightneſs] but ſeeing it ought not to ſtay long here neither, it is preſently fermented, and being carried farther, leaves this paſſage oftentimes empty. Then in the third cavity, the Chyle being volatilized [or lightned] and quite perfected, is plentifully gathered together, and ſtopped for ſome time; and whileſt the Gut called *Ileon*, being ſo full of Chyle, is a little compreſſed by the fleſhy fibres, the purer and ſubtiler part of it, which is to be tranſmitted into the bloud, is ſqueezed into the milky veſſels (and in my opinion, into the Meſaraick veins too) ſo that at length the remaining fœces or dregs, which are almoſt quite robbed of all their vertue, are thruſt on into the great Guts.

Three Coats of the Guts.

All theſe ſmall Guts, that is to ſay, the whole train of them, have the ſame Coats, and thoſe of the ſame make too; not much different from the membranes of the ſtomach, unleſs in this, that they are ſomewhat thinner. All the Guts both ſmall and great (except at the beginning and end of them, and ſome part of the Colon which is faſtned to the *Omentum* or Kall) are connected to the rim of the Meſentery, which is as it were exactly round: at which, in the mean time, a man would wonder how they, though they are about ſix Ells long, could be comprehended by that circumference which is onely one ſpan from its center. But in this caſe you muſt obſerve that the plain [body] of the Meſentery being gathered into many great folds, is in its circumference near three Ells about; and then, that the ſame circumference, in order to its contracting the length of the Guts, contains, in every hands breadth, about twelve hands breadth of Guts. And as it ought to have been ſo for many other reaſons, ſo eſpecially for this, that the Guts might not onely lie in a ſmall narrow ſpace, diſtinctly and without confuſion; but likewiſe that they might move with a ſlow, ſucceſſive motion, and as it were creep from one end to the other. For the tendons of the motive or moving fibres, whereby the paſſages or cavities of the Guts are contracted, are placed in the border or rim of the Meſentery, and from this Entral doth the original inſtinct of every motion in the Guts proceed; as I ſhall more clearly ſhew you by and by: In the mean while let me go on and diſcourſe of the Coats of the ſmall Guts.

How they are faſtned to the Meſentery.

The inmoſt Coat of the ſmall Guts.

The innermoſt of them hath a great many wrinkles, that go athwart it; which being alſo movable, are, as it were, ſo many lets to the Chyle, and conduce to the moderate retention or ſtaying of it; leſt it ſhould flow away too ſoon to the great

Guts

Guts and the very Excrements, before it is ſufficiently perfected or prepared and ſqueezed out. Thoſe wrinkles are there, as *Fallopius* hath well obſerved, by reaſon that this inmoſt Coat is much longer than the outward one, and ſo is curled as it were, and wrinkled. For if that be ſeparated from this, and thoſe folds laid open, it will be found to be full thrice as long. *Phar. Rat.* Part I.

Moreover this inner Coat being altogether nervous, and containing in it the mouths of the milky and the bloudy veſſels, is covered on the inſide with ſuch an hairy veil as the Stomach is, and for the ſame uſes, in my opinion: to wit, this covers and defends the mouths of the veſſels, receives the firſt acceſſes of the Chyle and all things therein contained, delivering it over by degrees to the nervous coat. But this Coat conſiſting of all kinds of Fibres, and being the innermoſt Chamber as it were of the inteſtinal paſſage, or way through the Guts, ſerves very much for ſenſation, and according to the impreſſions made upon it, moveth the fleſhy coat that is over it, to the performance of expulſive motions, either ſlow or quick, downward or upward, though it is but ſeldom. If at any time either the inner ſurface of this coat is pricked, or ſtimulated by ſharper things than ordinary, or that diſagreeable humours fall upon its fibres, great pains and gripes proceed from ſuch pungent cauſes. Beſides, this nervous coat is found to be very obnoxious not onely to diſtenſions [or being ſtretched out] by wind incloſed in it, but alſo to expanſions [or widenings] and ſwellings through the violent diſcharge or exploſion of the Spirits that are in its fibres. But beſides theſe nervous fibres, of which ſo variouſly interwoven it conſiſts, it is likewiſe covered all over with very thick and numerous branches of bloud-veſſels that terminate in it, juſt as I obſerved the Stomach was. From whence we may conjecture, that the Arteries, it may be, diſcharge (and that in moſt parts) a kind of rejectaneous, or baſer moiſture into the cavities of the Guts, and that the Meſaraick veins as well as the milky veſſels do there receive ſome part of the Chyle, and carry it more immediately into the bloud.

This Coat is nervous and covered with an hairy veil.

There are alſo a great many bloud-veſſels in it.

2. The ſecond or middlemoſt coat of the ſmall Guts is ſomewhat thicker, and altogether fleſhy. There are in it two ranks of moving fibres, the one under the other; of which the firſt and innermoſt is annular [or like to rings] and incompaſſing the whole paſſage or cavity of the Guts all over with thick rows, is inſerted into the rim of the Meſentery, as it were, into a tendon. The other rank of fibres is of ſtrait ones, or ſuch as run out into length; which, being above the others, and cutting them at right angles, go all the length of the Guts; and to them the outmoſt coat ſeems to ſerve in ſtead of tendons, becauſe it being altogether nervous, or as it were, tendinous, is ſpread over all that row of fibres.

The fleſhy or middle coat. In which there are two orders of moving fibres, right and circular.

As to their uſe; ſeeing it is the buſineſs of the Guts to puſh forward the Chyle and Excrements from one part to another, and ſo by degrees ſtill on, till at laſt they have thruſt them quite through their whole paſſage; and likewiſe (whileſt they themſelves are contracted and ſhortned ſo, as to be ſtreightned in their cavities) to ſqueez and preſs the more ſubtle part of the Chyle into the milky veſſels and meſaraick veins, it is obvious to conceive, how the aforeſaid fibres perform both theſe offices: for when the circular fibres being contracted ſucceſſively or in order, diminiſh the depth of the Guts, and at the ſame time the long-way fibres being bloated and ſwollen, make them ſtill more ſtrait and ſhorter withall, it muſt of neceſſity follow, that what is in theſe Entrals, being preſſed behind, muſt be ſtill puſhed forward.

Their uſe.

But yet you muſt not think, that the contractions of both theſe ſorts of fibres are ſo great and continual, as that all that which is in the Guts is moved from one part to another at the ſame time (though I do believe that in a Purge or Laſk it doth ſometimes ſo happen) but that ordinarily, thoſe light and interrupted, though regular and orderly contractions, being often repeated, do as it were, jog the Guts and cauſe the Chyle with the Excrements to move gently from place to place. But by ſuch jogs of the Guts, and thoſe repeated contractions, the Chyle being continually in motion is rendred more perfect and flows more eaſily into the veſſels, that gape to receive it. Now if it be asked, how or by what means both theſe ſorts of fibres aforeſaid, are put upon ſuch a motion, and determined to contract ſometimes theſe, and ſometimes thoſe parts in order, I anſwer, that it is in the Guts as in the Stomach; that is, that in both of them the motions of the fleſhy coat depend upon the ſenſe of the nervous one, ſo that according as this is irritated or provoked, that is, contracted. And therefore whenever any diſagreeable object makes a ſad impreſſion upon the nervous fibres, immediately, for removing of that, the motive fibres contract the indiſpoſed or affected part of the Guts, that they may eaſe them of all moleſtation and trouble.

Their motion proceeds from the irritation of the nervous Coat.

The nervous fibres are irritated or provoked to motion ordinarily and gently, Firſt, By the reliques of the Chyle, which, when the purer juice is ſufficiently ſtrained out, be-

How the nervous fibres come to be irritated.

Phar. Rat. Part I.

become effœte [or without any vertue in them] and troubleſom; for as long as the diſtribution of the Chyle laſts, the moving fibres, being contracted before, will not ſuffer it to glide forth too haſtily, but afterward, by contractions behind, they thruſt it out as a thing of no uſe. Secondly, The nervous fibres are a little too ſharply irritated by the choler and Pancreatick juice iſſuing out of their ſeveral paſſages, and likewiſe by humours that are ſharp and pungent, poured in out of the Arteries; which cauſe greater and more frequent contractions in that part. Thirdly, there is another cauſe of this irritation [or provocation to motion] in theſe fibres, which is yet more vehement and preternatural, and that is from diſagreeable or diſproportionate food, as alſo from Medicins and Poiſons, of which Medicins I ſhall ſpeak particularly in the ſucceeding part of this Book.

Beſides, the fleſhy and motive fibres of the Guts are ſometimes ſtirred up to ſuch contractions as looſen the Belly through other cauſes more remote. For oftentimes violent paſſions or diſorders of the mind or body bring a Looſneſs or *Diarrhœa* upon a Man; that is, when the Spirits that are in the Brain, or other principal parts related to the nervous family, are extraordinarily diſturbed, they forthwith transfer all their own diſorders through the paſſages of the nerves, or nervous ſprouts and branches, to the Spirits that inhabit the Guts, and ſo move them by contraction to thruſt out their Excrements. After irritation, however it be cauſed, there always ſucceed contractions, in that the animal Spirits guſhing violently out of the tendinous rim of the Meſentery into the annular fibres, and likewiſe out of the tendinous fibres of the outmoſt coat into the fleſhy ones that run lengthwiſe, doth ſo bloat and ſwell both ſorts of them, that they thereby render them more contracted and ſhorter. It would be too much beſides my deſign, in this place to ſhew what part the Meſentery bears in the performing of this periſtaltick, or expulſive motion of the Guts; for beſides that the tendons of the circular fibres are rooted in the rim of it, you may alſo obſerve, that in the plain of it, the motive fibres go ſtrait from the center to the circumference: of which there can ſcarce be invented any other uſe, than that they being contracted in ſeveral parts, according as occaſion is given, may cauſe the ſame contractions in ſuch and ſuch parts of the Guts.

How Contractions ſucceed irritation.

Of the outmoſt coat of the Guts I need not ſay much, becauſe this coat ariſing from the *Peritonæum*, or inner rim of the Belly, and being ſpread over the former, as likewiſe altogether nervous and very thin, it is commonly taken to be onely a cover to the reſt: but beſides that, I have reaſon to believe, that ſince the ſeveral rows of lengthwiſe fibres are immediately under this coat, and none of their tendons are found any where elſe, this coat is really tendinous, and that the animal Spirits guſh out of the nervous fibres thereof, according to the contractions of thoſe fleſhy ones, but return again as ſoon as the motion is over.

The outmoſt Coat of the Guts.

The veſſels and paſſages belonging to the ſmall Guts are the conveyances either of Spirits or Humours. Of the former ſort they reckon the Nerves with their plates and branches, all which I have treated of at large in my Book called *Neurologia*, or a Treatiſe of the Nerves. As to the other paſſages, they either carry Humours to the Guts, as the Paſſage of Bile or Choler, the Sweetbread paſſage, the Arteries, and in ſome meaſure the Nerves too (as I have elſewhere ſhewn in a Diſcourſe of the Colick) or they carry and export humours out of the Guts, as the milky veſſels and meſaraick veins. Now every one of theſe Paſſages, with the Spirits and Humours that are in them, and likewiſe ſuch as are contained either in the cavities of the Entrals, or reſide in their nervous or fleſhy fibres, are either the ſubjects or objects of *Pharmacy*, or Practical Phyſick, and are uſually firſt and more immediately moved or affected by the operations of all Medicins whatſoever: but after what manner, I ſhall endeavour to ſhew in the particular examination of every ſeveral kind of Medicins.

The Veſſels and Paſſages belonging to the Guts.

Of the Bilar and Pancreatick Paſſages, ſince Authors have already ſaid ſo much of them, and yet the truth is not exactly known even to this day, or at leaſt is in diſpute, it will not be pertinent or convenient for me to raiſe an argument in this place, which muſt of neceſſity be very prolix and intricate, or tedious and entangled. How Vomits and Purges work upon theſe parts, I ſhall ſhew hereafter.

As for the Bloud-veſſels, it is a common obſervation, that a vaſt number of Arteries and Veins are ſpread into branches all over the Meſentery, and that from thence there is an infinite company of ſprouts diſtributed to all the Guts. Of which I have likewiſe taken notice, that being inſerted into the outmoſt coat, they beſtow but few of their ſprouts upon that coat, but that almoſt all their greater branches, going ſtrait into the Guts come back into the inner coat, in which they are terminated, and ſend forth an extraordinary quantity of ſmall ſprouts, which cover the ſurface of it.

A great many Bloud-Veſſels in the Guts.

Now

Now upon this conſideration a man would wonder, why ſo much bloud ſhould be deſigned to flow into theſe Entrals, that of themſelves are almoſt bloudleſs. It is not likely that the onely reaſon of it is to ſupply heat and nouriſhment, ſince the muſcles and outward coats of the Guts, which have need of greater plenty of ſuch veſſels, are yet content with a leſs number. The famous *Mabius* (to untie this knot) affirms, *That Nature hath placed ſo many Arteries in the Guts, that in an Embryo, the Excrements of the Mothers Bloud wherewith at that time it is nouriſhed, might be diſcharged into the inteſtines.* And he gives the reaſon of it, which is, *Becauſe the Guts of an Embryo or Infant new-born, contain in them a blackiſh excrement.* But indeed this argument is eaſily anſwered, if we grant (as we ought to do) with *Harvey* and other Neotericks or Modern Phyſicians, that an Embryo in his Mothers womb does ſuck and receive a nutritive liquor at his mouth. And yet my opinion is rather, that thoſe Arteries in adult Animals do often times purge forth the groſſer parts of the bloud (which by ſweat, and other ways, are unapt to paſs) through the Guts as through a Sink. But that in the mean time the Veins do receive ſome part of the Chyle, and having preſently reduced it, mix it with the Bloud.

Phar. Rat. Part I.

The reaſon of it.

Concerning the great Guts, in relation to the practice of Phyſick, I ſhall not need to ſay much in this place, becauſe the virtue of Medicins taken in at the mouth is almoſt quite ſpent before it comes to thoſe Entrals; in ſo much that the irritation or cauſe of motion in them, ariſes partly from conſent with the upper Guts, and partly from the violent expulſion of what is in them, rather than from the Medicin it ſelf. They have the ſame coats as the ſmall ones; and ſeeing that in the Colon the excrements aſcend ſtrait upward, there is a neceſſity for ſtronger fleſhy fibres to make the motion of contraction the more forcible. For which reaſon, if there happen an inflammation or impoſthume (as I have often known it hath) about the beginning of the Colon, ſo that the fleſhy fibres being hurt, cannot perform their contractions to raiſe their excrements upward, the excrements ſtop, and lie toward the *Ileon*, which cauſes the *Iliack* paſſion, beyond all cure. Moreover in this Gut there are likewiſe framed thoſe arched cavities or chambers, as it were to the end, that the excrements being thereby longer kept in, the trouble of going too often to ſtool might be prevented. The Phyſick that belongs to this part conſiſts principally in Clyſters. But in ſome People the inner coat of the Colon is ſo very tender and ſenſible, that if you give them but a gentle Clyſter, the ſpirits are preſently in a combuſtion, and being exploded or diſcharged within the nervous fibres, blow up and ſtretch the membranes to the utmoſt degree, and thereby create very great pains in the whole Belly. What I have ſaid juſt now concerning the expulſive motions of the Entrals that depend upon the contractions of the fleſhy fibres, will more plainly appear, if you conſult my Hypotheſis, not long ago publiſhed, concerning the frame and motion of a muſcle. All that is more to be done, I have taken care, for the better illuſtration of the Anatomy of theſe parts, to get the Figures of them exactly delineated by a very skilful Artiſt and placed here hard by; and though in the deſcription of the Stomach, with the Weazon and Guts, I have followed *Fallopius* and other Ancient as well as Modern Anatomiſts, who aſſigned them onely three coats; yet if you ſeparate theſe coats ſomewhat more carefully than ordinary (after they are dipped in boyling Water) there will appear four very diſtinctly. For the hairy covering, which is eſteemed onely as an excreſcence of the nervous coat, is a pretty thick and peculiar membrane of it ſelf, and by reaſon of thoſe numerous glandules which are upon its outward ſurface, may properly be ſtiled the glandulous coat, as it manifeſtly appears by the Figures.

Of the great Guts.

The Explications of the Figures.

The firſt Table repreſents a Mans Stomach taken out and blown up, with the Veſſels full of Bloud; ſo that all the Arteries and Veins, with their branches (which are truly and exactly delineated) may be plainly ſeen.

A *The Weazon.*

B *The mouth of the Stomach, where the moving fibres of the Weazon, which are oblique upward, become ſtrait by reaſon of the ſudden ſhutting and opening thereof.*

C *The orifice of the Pylorus, with the Duodenum joined to it.*

D D *Part of the Duodenum, whoſe fleſhy fibres do there appear thicker under the outmoſt Coat.*

F F to C *The* Antrum Pylori, *or Hollow of the Pylorus.*

G G *The top of the Stomach, where the Bloud-Veſſels are inſerted and deſcending, ſcatter their Branches and Sprouts every way.*

Phar. Rat. Part. I.

H H H *The bottom of the Stomach, into which the Bloud-Veſſels being inſerted, do in their aſcent, diſperſe thick numerous branches and ſprouts to every part of it.*
I I I *The mutual inoſculations and wonderful communications between the Veſſels of each inſertion.*
K L *The right and left end of the Stomach.*

The ſecond Table expreſſes the outmoſt coat of a Mans Stomach, which is altogether nervous; whoſe nervous fibres running out the whole length of it, cut the outward fleſhy ones that are under them almoſt at right angles.

A *The Weazon, in whoſe outward Coat all the nervous fibres go ſtrait downward, and croſs the fleſhy ones that are under them obliquely.*
B *The mouth of the Stomach.*
C *The Pylorus with its Antrum or Hollow,* D, *and part of the Duodenum joined to it,* E.
F *The top of the Stomach, where the Bloud-Veſſels appear in very great numbers.*
G G G *The nervous ſmall fibres that go all along the Stomach from one orifice to the other and on both ſides.*

The third Table ſhews the Stomach of a Man ſtript of its outmoſt nervous tunick or coat, that the outward or convex ſurface of its middlemoſt coat, together with the fleſhy fibres thereof, may appear.

A *The mouth of the Stomach, into which the Weazon* a a a *is inſerted; which alſo the circular fleſhy fibres* b b b *encompaſs, and, upon occaſion, being contracted, cloſe or ſhut up.*
B *The Pylorus with the Duodenum joined to it.*
C *The orifice and cave or hollow of the Pylorus, both which are ſtreightned by circular fibres (whileſt they are contracted) and thereby (I ſuppoſe) ſhut up or cloſed.*
D D D *The circular fibres that encompaſs the whole Body of the Stomach in depth.*
E E E *The top of the Stomach, where thoſe fibres ariſe, and being contracted, draw the whole frame of the Stomach, which they very much ſtreighten, toward it.*

The fourth Table; whoſe firſt Figure ſhews the whole Stomach, with the inner, concave ſurface, changed into the outward and convex, that the hairy veil or covering, with thoſe wrinkles and folds that go all over the Stomach, may come in view.

A *The left orifice, or mouth of the Stomach.*
B *The Cave or Hollow of the Pylorus, in which the coats are thicker than ordinary.*
C *Its orifice, by which it is faſtned to the Duodenum.*
D D *The top of the Stomach between the two orifices.*
E E E E *The ſides, ends, and bottom of it, in which the hairy veil of the inner Coat, and therein the wrinkles and folds, or furrows, are lively expreſſed.*

Figure II. repreſents a part of the Nervous Coat, in which, the hairy covering being taken off, the inner or concave ſurface, together with a thick and numerous company of branches of Veſſels doth appear.

Figure III. Shews a part of the hairy or glandulous coat, in which the outward ſurface, whereby it is connected to the Nervous Coat, is apparently very full of glandules and mouths or orifices of veſſels.

The fifth Table ſhews the inner and concave ſurface of the fleſhy coat, turned with the wrong ſide outward, that the other row of moving fibres may come in view.

A *The mouth of the Stomach, near which the row of fibres ſeems to ariſe, and is carried forward, partly in right lines, and partly in oblique ones.*
B B B *A notable company of fibres, which encompaſſing the mouth of the Stomach, above the neck or top of it, go toward the Pylorus, and covering the cave or hollow of it all along, are terminated in the orifice.*

D *The orifice of the Pylorus.*
E *The Cave, Den, or Hollow of the Pylorus.*
F F F F *Other fleſhy fibres, that running obliquely from the left ſide of the Stomach to the right, deſcend to the bottom of it.*

The

The ſixth Table repreſents all the Coats of the ſmall Guts ſeparated from each other, ſo that the nervous fibres, with the glandules and branches of Veſſels, as alſo the ranks of moving fibres may clearly and diſtinctly be obſerved. *Phar. Rat.* Part. I.

A A *Shews the outmoſt ſurface of the whole Gut, whoſe nervous coat appears to be very thin, with its nervous fibres, which are extraordinary ſmall and round.*

B B *The outward ſurface of the middlemoſt or fleſhy Coat, which, when the other is taken off, appears very plainly with its row, or rank of moving fibres, that run lengthwiſe.*

C C C *The circular or annular fibres of the ſame Coat, which, when the former row or rank is taken off, moſt plainly appear.*

D D D *The inner, nervous Coat, whoſe inner ſurface, when the hairy veil is taken away, comes into view, with thick and numerous branches of Veſſels.*

E E E *The outward or convex ſurface of the hairy or glandulous Coat, which ſticks to the nervous Coat, and is full of glandules and little mouths of Veſſels.*

SECT. II.

CHAP. I.

Of Vomiting and Medicins that give Vomits.

HAving thus marked out, as it were, the Place of Medicinal action, or at leaſt lightly ſhadowed forth the firſt Scene thereof, my next buſineſs is to give you an account of the ſeveral kinds of Medicinal Operations, together with the Reaſons of them, and the manner how they work upon, or affect the parts. Firſt therefore let us inquire, what is done in the firſt ſtage, to wit, in the Stomach, and how Vomits work there. Where in the firſt place it will be neceſſary to explain what Vomiting is, as likewiſe from what cauſes, and upon what occaſion, whether naturally or preternaturally, it uſually happens. And then in the ſecond place, I ſhall ſhew upon what Parts, Spirits, or Humours, and how Medicins operate whileſt they provoke us to vomit.

How the Stomach and Weazon are affected in vomiting.

As to the firſt, if at any time any perſon be ſet on vomiting, he feels within himſelf the bottom of his Stomach drawn upward, and the upper orifice opened (whileſt the *Pylorus* in the mean time is very probably ſhut, or drawn inward) and that the whole paſſage of the Weazon at the ſame time ſtrains to make a ſpiral winding kind of motion upward, to the end that what is within, being by degrees puſhed higher, may at length be diſcharged through the mouth. Which motion of thoſe parts is queſtionleſs performed by the fleſhy fibres that compoſe the middlemoſt coat of the Stomach. For I have obſerved, that there are in this two diſtinct ranks of fleſhy or moving fibres, which encompaſs the Stomach in all its dimenſions, and being contracted at the ſame time, gather up the bottom and the ſides thereof, draw it upward, and bend it toward this or that orifice, that what is contained in it may be caſt forth through one or the other door. As for the inner fibres, that determine the contractions of all the reſt to this or that evacuation, if, through a ſmall irritation made any where about the bottom or ſides of the Stomach, the motion begins near the Pylorus, and the inward moving fibres are firſt and more ſtrongly contracted at their right ends, then the whole frame of the Stomach being drawn that way, pours out its load into the Guts; but if the irritation being vehement and very provoking, be cauſed in any part of the Stomach, and cannot eaſily be allayed or transferred toward the Guts, the motion beginning near the left ends of the inner fibres, and drawing towards the mouth of the Stomach, makes all the body of the Stomach, which is extremely ſtreightned and contracted, lean that way: in ſo much that the Pylorus being drawn inward, or ſhut up, and the mouth of the Stomach open, all things therein contained are thrown out, by way of Vomit. Now the ſame fleſhy fibres (according as the animal Spirits being variouſly provoked, do firſt guſh out of the ſeveral tendons into their right or left ends, and there begin the motion) are reſpectively determined to purging or vomiting. Moreover, when the Stomach is diſpoſed to throw a thing upward in manner

What fibres perform the buſineſs of Vomiting.

Phar. Rat. Part. I.

ner aforesaid, the Weazon too conspires in the action, and strives to get it out. For seeing we have observed that there are two double ranks of motive fibres in the fleshy coat of it, whereof the one part ascending obliquely, and the other descending after the same manner, cross one another, it seems to be the office of the former, being orderly contracted whilest the Party strains to vomit, still to shut the Weazon behind the matter that is to be thrown out, and so by degrees to push it into the cavity of the mouth.

Vomiting a Convulsion.

Vomiting therefore, being a violent, and oftentimes an involuntary motion of the Stomach, may very well be called a kind of Convulsion: which I also affirm to proceed from the explosion [discharge] or a great expansion [or broadning] of the animal Spirits that possess or inhabit those fibres, according to our account of Spasms or Contractions and Convulsions elsewhere laid down. For those Spirits being extremely irritated or disturbed, and upon that account growing presently very vehement and springy, they rush impetuously out of the tendons that lie near the left orifice, and afterward immediately out of others into the fleshy fibres, which they extraordinarily blow up and shorten, in so much that all the parts of that coat are brought nearer to each other, the whole cavity of the Stomach being streightned, folded together, and consequently contracted toward the left orifice, drives all that is in it upward, in order to its being discharged by Vomit.

How Vomiting differs from other Spasms.

In most other kinds of Spasms the convulsive motion is wont to proceed the same way as the natural: But Vomiting seems to be quite contrary, or at least opposite to the ordinary and natural action of the Stomach. For the usual and almost constant gesture or motion of that, is to be contracted either wholly or in some parts, downward or toward the Pylorus; for such a motion or tendency it wants, not onely to swallow meats, but that they may descend into the bottom of the Stomach, and there being more streightly compressed, be rolled from side to side, digested into Chyle, and after that transmitted to the Guts. Wherefore for these uses the moving fibres of both ranks, being blown up by the kind incursions of the Spirits, put the Stomach into such a posture as the instinct of Nature requires and suggests.

Again, If any irritation happen in the nervous fibres of the Stomach as long as the offence is slight and easily removed, the expulsive contraction works toward the Pylorus rather than the Weazon; but in Vomiting, the contraction of the motive fibres beginning from their other, that is, their left ends, and growing immediately more violent and impetuous, forces the whole cavity of the Stomach, being gathered up together, and much streightned, to bend toward the left orifice, and empty it self that way. The reason of which is, because if there be any thing in the Stomach that is very disagreeable and repugnant to Nature, it ought not to be carried the ordinary way through the long circuit of the Guts, and so at last be voided at the Fundament, but to be rejected by a nearer passage, and immediately be thrown out, lest by remaining there it should cause in the Body some incurable disaster. Besides, when any great mischief befals other parts remote from the Stomach, it oftentimes so happens, that People Vomit by consent [of the parts] for the greater security of the Stomach, lest whilest Nature is imployed about those other parts, the Stomach (in which is the original nourishment and fewel of life) should receive any thing that is hurtful. So well it is contrived by the providence of the Divine Creator, that for the greater security of Mans Body as of some Castle, as often as a foreign Enemy comes upon it, or that its own Natives raise Civil Wars, immediately all Strangers are turned out of the very Avenews, to wit the Stomach, as Persons suspected.

The immediate cause of Vomiting.

Now therefore the principal and immediate cause of Vomiting is, the sudden and vehement explosion or discharge of the Animal Spirits that are in the fleshy coat of the Stomach; by which they being very much irritated or stirred, and consequently expanded [or widened] and rarified, and gushing impetuously out of all the tendinous fibres, but first and chiefly out of them, that are planted near the mouth of the Stomach into the fleshy ones, do so on a sudden inflate or blow up and shorten them, that the sides and bottom of the Stomach being drawn nearer to each other, and at the same time raised toward the left orifice, throw out what is therein contained into the passage of the Weazon, through which (since that is likewise presently contracted all along from the bottom to the top) they are carried off at the Mouth.

How the Spirits are moved in Vomiting.

These Spirits are so exploded or discharged in Vomiting, because they are extremely irritated or provoked: which how it comes to pass, I have shewn in my Treatise of Convulsions: to wit, that they, being of a very elastical or springy nature, when any thing disturbs them, yea sometimes of their own accord, and by reason that what should be their couple to keep them together is of a different nature, break forth, and hurry themselves impetuously toward all parts. But upon what account, and how it happens

pens that they are ſo provoked, we ſhall enquire by and by. In the mean time we may obſerve, that the Spirits which reſide in the fibres of the Stomach are in ſome people either thicker or ſtronger, ſo that they are not moved to ſuch emetick exploſions or diſcharges by Vomit, unleſs the irritation or provocation be very great and ſtrong: but in others they are more ſubtle, *i. e.* ſlender, or elaſtical and ſpringy, ſo as to be eaſily incited to vomitive Spaſms or Contractions. So alſo we may take notice, that when the provocation is given to the fleſhy fibres of the Stomach, the contraction that is cauſed in them, tends more readily toward the Pylorus, but in others, toward the mouth of the Stomach; and conſequently it is accordingly attended with Vomiting or Purging.

The more remote cauſes of Vomiting.

Wherefore, as to the more remote cauſes of Vomiting, I am of opinion, that they are all ſuch things as do extraordinarily irritate or provoke the Spirits, which are in the fleſhy fibres of the Stomach: which being performed after ſeveral manners, I ſhall reduce them to ſome certain Heads. And firſt, All unproportionate objects that affect the other inner and nervous coat of the Stomach, or rather the Spirits that reſide in it, are to be looked upon as conducing thereunto; for that coat being vellicated, or twitched by them, doth oftentimes move the other which lies over it to vomitive contractions. Now thoſe provocatives are either taken in at the mouth, that is, they are either diſagreeable Food, Medicins, Poiſons, or other matter generated in the Stomach; or laſtly, are brought thither from remote parts by the Arteries and Nerves: or elſe ſecondly, the Spirits that reſide in the fleſhy fibres of the Stomach are irritated or ſtirred up by ſome diſtubance given to other Spirits that are here and there diſperſed at a diſtance, and do communicate their grievance to the Stomach by the paſſages of the Fibres or Nerves. Vomiting which is excited by the former of theſe two cauſes, is ſaid to be a proper indiſpoſition of the Stomach, but this latter happens by conſent. Of all which I will give you ſome inſtances.

The chief cauſe of Vomiting. An Organ of Senſe in the Stomach.

Firſt therefore an irritation or provocation in the inner coat of the Stomach, cauſes Vomiting ſooner than any thing elſe: For this part being nervous and very ſenſible, receives impreſſions from all thoſe things that are contained in the Stomach; and accordingly, as thoſe are pleaſant or unpleaſant, the fleſhy coat that is above it, is excited to keep in, or throw out what is within; and as to theſe two laſt motions [of reteining or expelling] we either Purge or Vomit, according as the unproportionate object is more or leſs injurious to Nature. Moreover, in this coat of the Stomach there ſeems to be a kind of peculiar Senſory, or Organ of perception, either of Touching or Taſting, diſtinct from any other in the whole Body: For though ſome ſorts of Medicins or Food, as *Stibium*, *Mercurius vitæ*, *Flower of Antimony*, and *Barbels eggs*, with many other things, when they are chewed in our mouths, do not offend the Senſe at all, yet the ſame things when ſwallowed down into the Stomach, do violently irritate or provoke this coat, and in a ſhort time cauſe very grievous contractions, or convulſions. So if any one even unawares ſwallows down a bit of meat that he hath an Antipathy againſt, though it be never ſo ſmall, and covered with other meats, as it were with a Viſor, yet the Stomach knows it, and turns it preſently out, like an Enemy that had got in by ſtealth. The Provocatives to Vomiting that are taken in at the mouth, are either Medicins whoſe manner of working ſhall be demonſtrated by and by; or they are Poiſons, which produce that effect, in as much as they upon their firſt contact or touch, being of a very deſtructive Nature, aſtound the Spirits of the Stomach, and make them as it were mad. Or Thirdly Food, concerning which it is commonly known, that if they offend us either in their manifeſt or hidden quality, or in their quantity, or manner of being taken, they become unproportionate to the Stomach, and conſequently very often cauſe Vomiting.

The Provocatives to Vomit, are either taken in at the mouth;

Or generated in the Stomach,

Secondly, The matter that cauſes Vomiting is ſometimes generated in the Stomach, that is, though there be no fault in the Food, when taken in, yet ſometimes the chyle, or the fermenting juice of the Stomach, degenerates into an acid, ſower, or bitter humour, or ſuch as is otherwiſe irkſom, and conſequently provoking; as it very uſually happens in cholerick and hypocondriacal perſons.

Or is ſent from ſome other part.

Thirdly, Nor is the provoking Humor leſs frequently ſent into the Stomach from ſome other part: for beſides that the Gall, and (as ſome think) the Pancreatick or Sweet-bread juice ſometimes ſeverally, ſometimes together (whilſt they mutually boyl and are diſcharged into the Stomach) excite the fibres to vomitive contractions; and that likewiſe other heterogeneous matter, which is brought hither by the Arteries, cauſes oftentimes extraordinary Vomitings: ſo in the fits and criſis of Fevers, but eſpecially in the Plague and Small Pox it very often happens. Sometimes the maſs of Bloud when it ſwells ſo that it cannot expel or throw off its groſſer part by perſpiration, it carries it into the cavities or hollows of the Stomach and Guts by the branches of the *Arteria Cœliaca*; ſo

Phar. Rat. Part I.

The Vomitive matter comes through the Nervts too.

that the coats of thoſe parts being mightily vellicated or twinged, undergo horrid Vomitings, and even Dyſenteries too at the ſame time. Nor doth the Vomitive matter ſeem to deſcend onely through the Arteries, but ſome times through the Nerves too. And from hence I have plainly ſhewn the Colick very often to ariſe: Yea in many People (that have been ſubject to Convulſions) I have obſerved, that after an Headach, with drowzineſs and ſwimming in the Brain, they have been diſpoſed to vomit: in ſo much that every day they would throw up all they had eaten without any ſignal uncleanneſs in their Stomachs. Now the matter being thus brought in by the Arteries or Nerves upon the coat of the Stomach, if it be fluid and eaſily diſperſed, is preſently ſhook off again, and the Fit is ſoon over; but if it be more fixed, and ſticks to them more ſtifly, or (as it ſome times will) grows into Tumours or Riſings of ſeveral kinds, it cauſes a diſpoſition to Vomit, which ſtays long by one, and is not eaſily cured.

Vomiting by ſympathy or conſent.

So much for that kind of Vomiting, whoſe material or provoking cauſe, being planted ſomewhere about the inward ſurface of the Stomach, and affecting the nervous fibres with meer touching of them, doth excite the Spirits which reſide in the fleſhy fibres, to violent exploſions, or diſcharges, by way of Vomit. But there are other kinds of Vomitings, in which the firſt provocation is in other places, and the Stomach is immediately moved to contract it ſelf by conſent. For ſince there is ſuch an alliance and mutual dependence between this Entrail and many other parts, it often happens, that when any animal Spirits are any where very much diſturbed, immediately other Spirits that are inhabitants in the Stomach, are likewiſe moved, either by the continuity or connection of the fibres and nerves, and ſo are put upon vomitive exploſions, or violent diſcharges by way of Vomit.

By conſent of what parts.

The places of this ſympathetical Vomiting, are either nearer; to wit, the two orifices of the Stomach, with the Duodenum and the Weazon; or more remote, to wit, the Brain and the membranes thereof, as alſo the Spleen, Reins, Ureters, Meſentery, Womb, and perhaps other Entrals in the lower Belly: in one or more of which, if a contractive motion be begun, and from thence communicated to the Stomach through the Nerves, it excites the fleſhy fibres thereof to cauſe a Vomit. So likewiſe in the Head, when the animal Spirits are much diſturbed, their diſorder preſently affects others that are in the Stomach, by conſent, and raiſes them into the like tumults. I will lay down inſtances of every one of theſe ſorts, together with their cauſes.

Firſt from both orifices of the Stomach.

Firſt of all both the orifices or doors of the Stomach, ſince they are very ſenſible by reaſon of thoſe manifold inſertions of Nerves, are eaſily provoked; and conſequently, being drawn ſometime inward, ſometimes outward, and variouſly expanded [or widened] and ſhut, they cauſe expulſive motions, either upward or downward, in the whole Stomach. There is hardly any man but may feel in himſelf certain acid or bitter Humours floating in his Stomach, and that by biting the left orifice, they cauſe queazineſs, or vomiting; and ſo doth the Gall too, when it rejounces into the Pylorus.

From the Pylorus.

It would be too impertinent to tell you *Helmonts* Dreams concerning the dignity and dominion of theſe parts: where he makes the left orifice to be the Seat of the Soul: and the right, to wit, the Pylorus, that of the Appetite, as alſo the Shop or Workhouſe from whence ſome other actions or paſſions purely natural have their original; and ſo likewiſe that from the indignation (as it were) and obſtinate ſhutting up of this part, horrid vomitings proceed. Although I do not at all agree to what he ſays, yet the following Stories will ſhew you, that if theſe doors are too faſt bolted or barred, it will occaſion Vomiting, and other evil diſpoſitions of the Stomach.

Inſtance in a particular caſe.

A young Gentleman that had been long out of order, was troubled firſt with frequent Vomiting, and afterward every day for ſeveral moneths, in ſo much that it was almoſt continually upon him, till at length being quite ſpent with it, he died. I therefore opened the Body and found the Pylorus encompaſſed round about with very tender and ſenſible ſmall bumps or ſwellings, that did almoſt ſhut its mouth quite up; in ſo much that the Chyle which was got into the little diſtances between the nodes or knots, did putrifie extremely, and the whole Entral in a manner was in very great pain, and troubled with a continual Spaſm or Convulſion. So likewiſe it is very plain from that extraordinary caſe of an *Oxford* Man, that the ſhutting up of the left orifice cauſes in a manner continual vomiting. There was a very ſtrong perſon, and a man that was otherwiſe ſound enough, who had for a long time been troubled with frequent vomiting, and uſed to bring up what he had eaten oftentimes, though not always, as ſoon as it was got into him: At laſt when all remedies had been tried and found of no uſe, the diſtemper came to ſuch an heighth that he would eat very hungryly

Vomiting from the ſhutting of the left orifice of the Stomach. A notable caſe.

gryly, till ſuch time as his Weazon was top full up to his throat, and then preſently throw all that he had ſwallowed up again crude and unconcocted as it went in, ſo that nothing at all went into his Stomach; now therefore ſince Medicins [Phyſick] did him no good, but that he was ready to faint for hunger, and in danger of dying every day, I got him an inſtrument, like a ſmall rod, made of Whalebone, with a Button or Knob of Spunge faſtened to the end of it: which inſtrument the diſtempered perſon putting into his throat and weazon immediately after he had eaten and drank, he opened the mouth of the Stomach and thruſt the meat (which otherwiſe would have ſtaid by the way) down into it; and thus did he ſuſtain himſelf for 16 years, uſing the ſame Engine to this day, and being ſtill alive and in health, though without that inſtrument he would certainly die for want of nouriſhment. Without queſtion in this caſe the mouth of the Stomach being always ſhut, either by a Tumour or a Palſie, admits nothing into it, unleſs it be violently opened.

The cauſe of ſympathical Vomiting.

2. As often alſo doth a Spaſm or Convulſion which is once begun, and by the continuity of the fibres promoted into the ſtomach, cauſe contractive motions to vomit, by reaſon of the provocatives that are hard by above this left orifice, and below the Pylorus. When the meat, as it goes down, ſticks in the Weazon by reaſon of a Palſie, or ſome obſtruction there, and conſequently ſtimulates or pricks the nervous fibres, immediately the fleſhy ones, being drawn upward, make the ſtomach alſo conſent in the motion. The like effect is often produced by the irritation or provoking of the palate or uvula. And hence it is that meat or drink which is ungrateful, even as ſoon as it is in our mouths, or a Fether put down the throat, cauſes vomiting, or very often ſtraining to vomit. For the ſame reaſon in a Pthiſick, a violent fit of coughing is accompanied, or attended with vomiting: to wit, through the vellication [or plucking] or concuſſion of the ſame coat, that covers both the Weazon and the top of the Windpipe too: So likewiſe in the lower appurtenances of the ſtomach, to wit, the Guts, if any pain and convulſion happens in thoſe parts, it often cauſes vomiting through the continuity of the fibres by which it creeps into the ſtomach. For this reaſon in the cholerick Diſtemper, the Iliack Paſſion, or Twiſting of the Guts, and other torments of the Bowels, people often vomit. And hence alſo ſome men that have Guts more tender than ordinary, do conſtantly vomit when they take a Clyſter. It were eaſie to heap together upon this occaſion many more inſtances of this kind, but let us paſs to other cauſes of vomiting.

Vomiting cauſed by intercourſe of the Nerves.

In the Head.

3. Beſides theſe that I have juſt now cited (in which the provocation begins either in the Stomach it ſelf or the appendages of it) it ſometimes happens that the Stomach, though it be in it ſelf ſound enough, and free from any fault, ſuffers for the miſdemeanours of other parts a great way diſtant from it; which is not brought to paſs by the continuity of the fibres, but by the intercourſe or commerce of the nerves. For through them, when the animal Spirits in one place are diſturbed, others that reſide afar off, conceive the like diſorder, and ſuffer convulſions: whence it is, that if a man receives any great wound or blow upon the Head, it often cauſes him to vomit, becauſe the Spirits within the Brain, being diſturbed, excite the others that inhabit the Stomach into the ſame commotion, by the commerce or intercourſe of the eighth pair of Nerves: for the ſame reaſon ſome that go in a Boat or a Coach are apt to vomit extremely; of which the cauſe is not (as ſome ſay) an agitation or joging of the humours, but indeed the animal Spirits which are in the Brain, being forced into irregular motions, do throng into the mouths of the nerves, and through them cauſe contractive motions to vomit. In the mean time the matter that is thrown off by vomiting, is meer choler, which is drawn forth from the Veſſels deſigned for the reception of it, by a ſpaſm or convulſion formerly cauſed in them; ſo far it is from being the primary or chief cauſe of vomiting. Moreover if at any time the ſprouts and lower branches that grow out of the trunk of that ſame eighth pair, and are diſtributed into peculiar Entrals of the Abdomen or lower Belly, are provoked to convulſions, other ſprouts very often, though untouched, undergo ſuch irregularities, and do alſo communicate convulſive motions to other Entrals, but eſpecially to the Stomach. This is evident from that vomiting, which frequently happens in Fits of the Stone in the Kidneys, the Colick and Fits of the Mother.

In the lower Belly.

Hitherto of Vomiting in general, together with its ſubject, nature, cauſes, and various productions; in which I have plainly ſhewn that this effect is produced altogether by the Spirits, which inhabiting the fleſhy coat of the Stomach, are extraordinarily provoked and forced into convulſive exploſions or diſcharges; but that thoſe Spirits are for the moſt part and chiefly moved to ſuch contractions by the painful impreſſion that is made upon the inner nervous coat. And yet farther, I have alſo ſhewn that thoſe Spirits which cauſe vomiting are diſturbed by the diſorders of other

Phar. Rat. Part I.

Spirits in ſome diſtant parts, which either by the continuity of the fibres, or the paſſages of the nerves communicate their troubles to the Stomach. Theſe things therefore being thus premiſed, it remains in the next place (what I propoſed to do in the ſecond place) that I treat of Vomiting Medicins, and demonſtrate how, and with what difference they work upon the Stomach and other parts of the Body.

How Vomits work.

For the performing of this, it is obvious to conceive, that Vomits taken in at the mouth and received into the Stomach, do firſt irritate or provoke its inner coat, which is altogether nervous, and put it to ſome pain; then that by the inſtigation of this nervous coat the fleſhy one that is over it, is alſo affected or moved and excited to contract it ſelf and throw out that troubleſome matter which is within. But in the doing of this, there are ſome differences both in the modes of irritation, and ways of evacuation, the reaſons of which do not eaſily appear.

For firſt, ſince purging Medicins, being ſwallowed into the Stomach, provoke the fleſhy fibres thereof to expulſive contractions, whence comes it that ſome of them ſhould more frequently and rather incline to vomiting, and the reſt onely to purging, and not indifferently to either?

Secondly, Among thoſe things that commonly, and almoſt conſtantly cauſe vomiting, you may obſerve, that ſome of them produce that effect by a way of working that is very manifeſt; as when that we take, is altogether ungrateful to us in Taſte, Smell, or any other ſenſible quality; or that it offends in quantity; and likewiſe that there are other Medicins which are more properly and ſpecifically reckoned Vomits, whoſe Vomiting virtue or power, though altogether hidden from our ſenſes, ſhews it ſelf by effects which are produced in the Stomach. The ſolutions or rational accounts of all which do much contribute to the right underſtanding of Vomits, and the operation of them.

The reaſon why we vomit rather than diſcharge by Stool.

1. As to the firſt, All Medicins that you would have to work by Vomit rather than by Stool, ought to conſiſt of ſuch particles, as being irkſom, or at leaſt diſagreeable to Nature, may likewiſe be of ſuch a quality or quantity, that they cannot be either totally overpowered by the ſtomach, or ſo long endured by it, till they may be by degrees wiped off from the fibres or hairy veil thereof, and carried out of the Pylorus with other juices by little and little. Now if thoſe kind of particles do either vellicate or twinge the fibres of the ſtomach too violently, or ſtick to it too faſt, or diſturb and ſtretch it with their motion, immediately tke fleſhy fibres are ready for an expulſion, and then by inſtinct of Nature they are the rather contracted in ſuch a manner, as that they may throw off what is offenſive with the greater force and the neareſt way. How the fleſhy fibres are moved in the buſineſs of Purging, I ſhall hereafter tell you in its due place.

Vomits are either ſtronger or more gentle.

As to the diſtinction of Vomits, and the ſeveral ways or reaſons of their working, ſince they are commonly divided into two ſorts, to wit, ſuch as are more gentle, and thoſe that are more ſtrong; whereof the former carry their force, and power or virtue in view (as it were) declaring their irritative or provoking quality by manifeſt ſigns; as when a Decoction of Hyſſop or Carduus, an infuſion of the roots of Squills, or Radiſh, diſſolved Vitriol, warm Water or Water mingled with Honey (if you drink a great draught of it) and the like (which upon the firſt ſight or taſte move the ſtomach) are given for Vomits: and when they are given, it oftentimes is neceſſary for them to be aided by the irritation of the palate and throat in order to their producing of a Vomit. Secondly, The ſtronger Vomits (which are more properly ſo called) are ſuch Medicins, that if they are taken in a due quantity they move moſt People to Vomit; as for example, *White Hellebore*, *Nux Vomica*, *Vitriol*, with many Preparations of them and Mercury: which though they are uſeful, yea very neceſſary in Phyſick, yet in their nature and virtues, wherein their vomiting quality conſiſts, they ſeem to differ very little from poiſon: wherefore if they are taken in a doſe too great, they often are the death of the Patient. Now ſince it remains as the ſubject of our next enquiry to ſearch how, and by what means theſe Medicins work upon the ſtomach and other parts of the Body, I ſhall in the firſt place lay down all the *Phænomena* or appearances which are worthy our obſervation in this kind of Medicins.

Strong Vomits are next to Poiſons.

How they operate in the Stomach.

Vomits made of *Stibium*, and other ſtronger ones ſwallowed down into the ſtomach, do not uſe preſently (unleſs in thoſe that have queazy ſtomachs before hand) to irritate or diſturb it; but afterward, ſometimes ſooner and ſometimes later, the Patients feel a kind of maukiſhneſs and diſorder; then the ſtomach is contracted and aſcends, its orifice opens, and the Weazon moves briskly upward toward the Throat, being attended immediately with vomiting; which when it is over, thoſe Entrals ſink down (as it were) and are a little at reſt: yet in a ſhort time after, the maukiſhneſs and diſorder of the ſtomach, together with the aſcent of that and the Throat return,

and

and are accompanied with Vomiting; and so now and then the straining and ceasing to vomit alternately succeed each other for several times together, till the force of the Medicins being quite spent, this operation ceases.

How they affect it.

In the beginning of a Vomit, the stomach seems onely to be contracted upward, and not extraordinarily provoked. But after the convulsions of it are more strong and vehement, and diffuse themselves to a greater distance, in so much that the Duodenum, by an invested kind of contrary motion, directs all its contractions upward, and poureth all that is within it into the stomach, which makes the motion to vomit so much the stronger. Now if the irritation or provocation be still more augmented, not onely Spasms [*i.e.* contractions] distensions and swellings, and especially that more dangerous convulsion of the stomach, to wit, the Hickock succeed thereunto: but also for that the animal Spirits are disturbed throughout, and sometimes scattered or excited too much, there happen frequent Faintings, cold Sweats, and many times deadly convulsions of the Limbs or the whole Body.

What and of how many sorts the matter is, thrown off by Vomits.

After the taking of a strong Vomit, when the stomach begins to vomit, first that is thrown out that floats in the cavity thereof; then whatsoever viscous or clammy flegm, that sticks to the hairs, or is laid up in the folds of it: if the vellication or twinging continues, there are serous humours squeezed out at the mouths of the small Arteries and Nerves; then when the contraction is communicated to the Duodenum and the passages of it, the Gall and Pancreatick juice, being forced out of their channels and poured into the stomach, are there discharged: from whence it comes to pass, that cholerick humours are oftentimes last cast forth, and then very frequently men vomit meer Gall, and that in great plenty: which if it so happen, every time any thing is thrown out, there is a griping a little below the stomach on the right side, that creeps upward; which, no doubt, proceeds from the Gall that is expelled into the Duodenum, and from thence through the convulsive and invested motion of that Gut, poured into the Pylorus. If the irritation doth not yet cease, the Arteries (whose mouths are exceedingly provoked) send out humours from the whole mass of Bloud to be evacuated by vomiting.

How Vomits work.

From this account of Vomiting, you may guess how and which way a vomitive Medicin works in the Stomach, to wit, when it is swallowed into the stomach, and hath mingled it self with the humour therein contained, impressing a tincture of it self is gradually received by the hairy veil which covers the inward surface of the stomach, and then the nervous fibres that make up the inner coat, and sustain or uphold this veil, do by degrees imbibe or drink in that virulent tincture; wherewith when they are in some measure sated, by reason of the disagreeableness of its juice, they begin to be wrinkled and much disturbed: whereupon the fleshy fibres that lie over them, being provoked by that pain which the nervous ones suffer, suffer at first some light convulsions in several parts here and there (from whence proceeds maukishness and disorder of the stomach) but soon after the spirits that reside in all of them which belong to the two inward ranks are excessively disquieted, and being at the same time exploded or discharged (as it were) cause very strong contractive motions to vomit, to the end that they may throw off by Vomit all that is troublesom to the nervous fibres: And when by this means those fibres are freed from that Medicinal juice which they had drank in, the inclination to vomit ceases for some small time, till the fibres being again moistened with a fresh supply of the same virulent tincture, which they quickly suck out of the hairy veil, are urged and forced to the same trouble and put upon a motion to vomit. And so for some several times the violent inclination to vomit comes upon a man, till such time as the matter of that venomous tincture be wiped clean away even from the hairy veil, and all at length thrown out, so as that the nervous fibres of the inner coat may never after imbibe or drink in the poison of it.

Why there are intervals in Vomiting.

Vomiting not easily stopped.

But it doth not therefore happen always that people cease to vomit, but though the Medicin be quite and clean thrown off, and no contagion of it left behind, yet oftentimes those Spirits in the stomach, being much provoked, do very difficultly lay aside their fury; in so much that may be irritated by any other juice (which the nervous fibres have imbibed) and moved to vomitive contractions, which they now and then do several times repeat: wherefore at that time if you would have your vomiting cease, take no drink either for food, or as a cordial into your stomach, but onely keep your self warm without, and go to sleep.

Humours squeezed into the Stomach increase the operation.

Moreover, Sometimes other Humours pressed out of the vessels, and especially the Gall, poured forth from the vessel that is prepared for the receiving of it, into the stomach, do not onely add strength to the vomit; but when its operation is over, persist or continue to provoke the stomach still on, and move it to expulsive contractions:

yea

Phar. Rat. Part. I.

yea, the nervous fibres thereof imbibing that yellow, nauſeous humour, which is as provocative as the vomitive tincture it ſelf, cauſe convulſions, and beyond the force of the Medicin, prolong the frequent inclinations to vomit in order to exclude that troubleſom matter. For this reaſon, when the Gall overflows, ſeeing it is eaſily brought into the ſtomach, oftentimes exceſſive vomiting is cauſed by a gentler kind of Medicin, and is attended by horrid ſymptoms: for the allaying whereof, ſometimes it is proper to give a Lenitive, or eaſie Clyſter, to draw the ſwelling Gall toward the lower parts.

Why Vomits work ſooner in ſome People.

But whereas ſometimes when a man takes a Vomit, the effect follows ſo immediately, that is to ſay, when a Medicin reaches the bottom of the ſtomach, but doth not enter deep into the fibres of it; the reaſon is, either becauſe the hairy veil being partly wiped off (as in Gluttons and Drunkards it uſually happens) the nervous fibres being made bare, are ſoon and eaſily provoked; or, becauſe the Fanſie loathing Phyſick, had made the Party qualmiſh before-hand: Or laſtly, becauſe the ſtomach being oppreſſed with a putrid conflux of excrementitious matter, was formerly of it ſelf diſpoſed to vomit. As to the nervous fibres, which by drinking in the vomitive tincture, have a ſenſe of that diſturbance, whereby the fleſhy fibres are irritated or provoked into convulſive motions, they are the very ſame, that being very empty cauſe hunger; and being very dry, thirſt; ſo likewiſe when they are filled with a grateful kind of juice which comes out of the food, they beget a complacence in the ſtomach, and refreſh the whole Body beſides.

How Vomits in a ſolid form work.

Since Vomits uſe to be adminiſtred either in a liquid or a ſolid form, it will be eaſie to underſtand how the former enter into the nervous fibres of the ſtomach, and fill them ſo as to provoke or irritate them; but of the latter ſome Phyſicians do juſtly doubt, how a little Duſt or Powder, as of *Stibium*, or *Flower of Antimony*, given in the weight of three or four grains, ſhould make ſuch a ſtrong Vomit, ſeeing that it looks very improbable that thoſe fibres ſhould in any meaſure be impregnated (at leaſt not enough to cauſe a Vomit) by ſo ſmall a Medicin, which would not eaſily get into them. To this we muſt anſwer, that ſuch a Medicin given in a dry ſubſtance, is preſently diſſolved and imparts its virtue to moiſture enough in the ſtomach; in ſo much that if you make an Infuſion of *Crocus Metallorum*, the fibres of the ſtomach drink in the diſſolved particles of Antimonial Sulphur, and are thereby provoked to vomitive contractions or convulſions.

Vomits do not work alike in all Doſes.

As to what ſome affirm, to wit, That a Vomit, be it given in a Doſe never ſo great, works no ſtronger than if it were taken in a ſmall quantity, is altogether falſe, and a thing not to be experimented without a great deal of danger; for if there be ſeveral ſmall parts of the Medicin at hand, they will impregnate a proportionate number of fibres, and enter deep into them, ſo as to provoke them very much: and conſequently very great and frequent convulſions muſt of neceſſity follow.

Vomits do not work by a ſpecifick virtue.

As to the vulgar Opinion, That Vomits raiſe and expel the Humours upwards by a certain ſpecifick propriety, I think it very frivolous; for what kind of virtue that is, no man can tell, or ſo much as prove that there is ſuch a thing in nature. In the mean while it is enough, for the underſtanding the reaſon of Vomits, to conceive, that the ſmall parts of the Medicin, being very repugnant to Nature, are imbibed or drunk in by the nervous fibres of the inner coat of the ſtomach, and create a great commotion in them; and then, for the expelling of that juice quickly, and a nearer way upward, that the fleſhy fibres of the other coat are irritated and provoked into emetick or vomiting convulſions. But what is urged by ſome, to wit, that white Hellebore applied to the Navel, and the Infuſion of *Crocus Metallorum* given in the form of a Clyſter, is a Vomit, I have found by frequent Experiments to be utterly untrue: Though if ſometimes it ſo happens, why may not a violent irritation or diſturbance made in the Guts, cauſe convulſions and inverted contractions, and ſo ſecondarily and by conſent of the parts, produce vomitings in the ſtomach? (as well as when the ſame thing very often falls out in the Colick and Iliack paſſion or twiſting of the Guts.) I formerly cauſed Wine, that was impregnated with the Infuſion of *Stibium* to be injected into the jugular vein of a ſtrong Dog, to the quantity of ſix ounces, and after five or ſix minutes he began to ſtagger, and totter as he went, and then to vomit exceſſively. Yet I believe that this effect was wrought by the Medicins working upon the Brain rather than the Stomach; ſince the like vomiting enſueth from anointing or bathing the head with the juice or decoction of Tobacco.

Vomits do not work upon peculiar Humours.

Nor do I think but that their opinion, who ſay ſome Vomits work upon the Gall, others upon the Phlegm, and others upon Melancholick matter, (bringing forth this or that Humour diſtinct from all others, and as it were, pure) is far from truth, and ſtands upon a very trifling foundation. But in the choice of Vomits, the chief differe-

rence

rence, to be obſerved, is, that in ſome caſes you muſt give the milder Medicins, which may make no diſturbance farther than the ſtomach, but may gently bring forth thoſe things onely that float in the hollow of it, or ſtick to the coats thereof: though in other caſes, the ſtronger are more convenient, that by creating a convulſion in the other Entrals too, all Excrements that lie in them, or are any where gathered together, may be removed from their ſtation, and thrown out either upward or downward. But whereas ſometimes a ſlimy, and as it were, phlegmatick matter is chiefly expelled, the reaſon is, becauſe the load of the ſtomach is almoſt onely purged away, without ſtirring of the receptacles of the cholerick humours; yet when thoſe veſſels which received the choler are drained, the Excrement is, for the moſt part cholerick: The expulſion of a black humour depends moſt commonly upon the tincture of the Medicin; for Compoſitions of Vitriol dye the excrement black. *Phar. Rat* Part I.

As evacuation by Vomit is more violent than by Stool, ſo if it be conſiſtent with the ſtrength of the Patient, it doth more good in ſome caſes than ten Purges: for by this means the ponderous phlegm that ſticks in the folds of the ſtomach, and which all other cleanſers would ſlip by, is cleared away as with a Beſom; and ſo likewiſe the adjacent parts, as the Pancreas or Sweetbread, the Meſentery, the Spleen and Liver it ſelf are violently concuſſed or ſhockt, in ſo much that all obſtructions in them, together with all ſtagnations or ſetlings of the Bloud and Humours whatſoever are very eaſily removed by this kind of Medicin. All ſtrange Ferments, wherever generated in the Body, and alſo the deeper ſeminaries of diſeaſes, are ſeldom rooted out without adminiſtring of Vomits; but eſpecially in the diſtempers of the Brain and Nerves the uſe of Vomits is found to be very advantagious. For by this kind of Phyſick not onely the filth of the Stomach and Bowels, which vitiates the Chyle and Bloud, is more plentifully cleared away; but alſo the glandules, which are the emunctories or Dreins of the Bloud and nervous juice, and ſeated in the Bowels, are cleanſed; the choler veſſels and other receptacles of Excrements more copiouſly evacuated, ſo that they being emptied by this means, do more readily receive the *Serum* or Whey of the Bloud, with other rejected or ſuperfluous parts of both Humours, which otherwiſe would ſettle in the head: and beſides all this, ſeeing there are an innumerable company of Arteries mouths that open under the hairy veil into the ſtomach; theſe when they are vellicated or twinged to any purpoſe by a Vomit, pour forth all the ill, malignant humors that are in the bloud, in order to their being thrown out there by way of Vomit. And for this reaſon chiefly it is, that great Diſtempers are beſt cured by Vomits, and ſcarcely without them. For thoſe Medicins being of a ſtrong and active nature, do not onely expel the ſuperfluous humours out of the Maſs of Bloud by twinging the Arteries, but by getting into the paſſages of the veins, which are there without number, they make the Bloud float, and cauſe the ſerous part of it, with other leſs noble Humours to ſink and ſeparate themſelves. But in the mean time Vomiting Phyſick is not to be uſed by all People without any diſtinction. For in ſome the tone of the ſtomach is too looſe and weak, and their conſtitution ſo tender, that their Spirits preſently faint with vomiting, and their ſtrength is enfeebled; ſome alſo have their Bowels endued with extraordinary retention of ſuch ſenſible impreſſions as are made upon them; and though they are long before they can be made to vomit, yet their vomiting, when once begun, is not eaſily ſtopped; yea, through their frequent ſtraining to vomit, they are expoſed to great loſs of ſtrength and oftentimes ſwoonings too.

If Vomits are convenient, they are better than any other Phyſick.

It is to be uſed with caution.

Wherefore, rightly to adminiſter a Vomit, we muſt conſider what ſhews when it is proper, what permits it, and what forbids it. Now Vomits ſeem to be proper, when the cholerick and bitteriſh Humour floats in the ſtomach, ſo as to cauſe a qualmiſhneſs, ill taſte, or headach; ſo likewiſe if the ſtomach be oppreſſed with clammy Phlegm, as in the Green Sickneſs, and in men after hard drinking and gormandizing. In many caſes, where beſides ſhortneſs of Breath, the ſtomach being clogged, is troubled with want of Appetite or naufeouſneſs, Vomiting is uſeful. Moreover when the ſtomach is beſet with any ſtrange ferment, ſo as to reject all that comes into it, even for the ſake of remote parts, Vomiting oftentimes is uſed with good ſucceſs: for by this means the choler veſſels are mightily emptied, and ſo the Choler being the more plentifully purged out of the Bloud, the feverish indiſpoſitions thereof are removed. And then again, in reſpect that the ſuperfluities or ſtagnations of the nervous Humour are moſt eaſily cured by ſuch evacuations as theſe, the uſe of Vomits contributes very much toward a cure in the Gout, Aſthma, Epilepſie, Madneſs, and many other diſtempers that are accounted great and herculean Diſeaſes. 2. This remedy may be permitted to be uſed, if the Bowels are ſtrong, and the Conſtitution of the Body firm, and eſpecially in ſuch perſons as having ſhorter necks and breſts than ordinary, have their ſtomach and mouth nearer one another; and to this alſo doth relate facility, or eaſineſs

The Indications of Vomiting.

Things that permit it.

to

Phar. Rat. Part. I.

to vomit, looſneſs of the matter which is to be purged out with a ready faculty of ſeparating of it, as alſo a ſedateneſs of Nature, and as it were, leiſure to apply her ſelf to this work. 3. Thoſe things that forbid Vomiting, are difficulty to vomit, or an indiſpoſedneſs to it found by former experience, a tender and ſoft conſtitution of body, a ſlim tall ſtature, and weak Bowels, but eſpecially if a man be inclined to a Conſumption, with an ulcer in the Lungs, or ſpitting of Bloud: ſo likewiſe a great and general indiſpoſition, in which it is dangerous, leſt the Humours ſhould be preſſed tumultuouſly out of the whole Body into the Stomach: ſo alſo an unuſual boyling up of the Bloud, fits of Fevers, and expectation of a Criſis [or time when to make a judgment of the Diſtemper] do totally exclude this kind of Phyſick.

Things that probibit it.

The Medicins called Vomits, are uſually diſtinguiſhed according to their operations, into gentle ones, middling ones, and ſtrong ones. As to the matter of which they are made, that is ſome parts of Minerals, Vegetables, or Animals; and they are either ungrateful to the taſte and palat, as *Vitriol, Tobacco, Briony-root, &c.* or they taſte well enough, as the *Mezerean Fruit*, the *Nux Indica*, the *Eggs of a Fiſh called a Mullet or Barbel*; or laſtly, they are almoſt inſipid, and without any taſte at all, as *Flower of Antimony, Crocus Metallorum, Mercurius Vitæ, &c.*

CHAP. II.

Receipts for Vomits, together with a rational account of ſome of them, as to their Preparations and Chymical Reſolutions.

TAke of Oxymel of Squils ℥i. ℈. *of Wine of Squils* ℥ ij. *mingle them, and make a Vomit.*

Take of the Leaves of Aſarum or Wild Spikenard freſh gathered from 6 to 9, and when you have bruiſed them, pour to them ℥iij. *of White Wine; then ſtrain it and take it according to order.*

Take of the Powder of the Root of Wild Spikenard ʒ j. *to* ℈ iiij. *of Oxymel of Squils* ℥ j. ℈. *mingle them and take it in a draught of Poſſet-drink.*

Take of the Salt of Vitriol ℈ j. *to* ℈ ij. *or* ʒ j. *and drink it in a draught of Poſſet-drink.*

Take of the Infuſion of Crocus Metallorum ℥℈. *to* ℥j. *or* ℥ j. ℈. *and drink it in a draught of Poſſet-drink, according to order.*

Take of the Infuſion of Crocus Metallorum ʒ vj. *of Wine of Squils* ℥ j. ℈. *of the Syrup of plain Sorrel* ℥℈. *mingle them and make a Vomit.*

Take of the Sulphur of Antimony gr. vj. *to* viij. *of cream of Tartar* ℈ j. *mingle them and let it be given in the pulp of an Apple, or a Stewed Prune, or in a Spoonful of Panade.*

Take of Mercurius Vitæ gr. iij. *to* vj. *and take it the ſame way. Take alſo Flowers of Antimony, Aurum Vitæ, or Præcipitatum Solare, and mineral Turbith, after the ſame manner.*

Thoſe Chymical Vomits that are of chief note, are uſually made firſt out of Vitriol, ſecondly out of Antimony, and thirdly out of Mercury.

Salt of Vitriol.

Vitriol Vomits.

Salt of Vitriol is preſcribed ſeveral ways, to wit, out of Colcothar prepared in a Lie, out of Blew Vitriol, calcined (according to *Angelus Sala*) and out of white Vitriol purified by frequent ſolutions and coagulations; which Medicin is commonly called *Theophraſtus's* Gilla, and is the ſafeſt of all others, as well as eaſieſt to be had; but yet the two former Medicins are extraordinarily ſtyptick or aſtringent, and for as much as they have endured the fire, ſomewhat corroding; but the latter being gentle and kind enough, doth amicably pluck together the fibres of the Stomach and makes them ſomewhat wrinkled; in ſo much that they at laſt (to excuſs or ſhake off what is troubleſom to them) betake themſelves to contractions, and ſtrain to vomit: but that is ſoon over, and the diſturbance of the Stomach is preſently appeaſed.

Theophraſtus his Gilla.

The uſe of it.

Salt of Vitriol is therefore of more eſteem and value, becauſe it ſeldom works beyond the Stomach, nor doth it as Stibiates do, cauſe Convulſions in the Bowels, diſorders in the Bloud, or fainting of the Spirits; yet it is ſaid to have this fault, that it operates ſlowly, and ſometimes hardly at all; and therefore after any one hath taken

Vitriol,

Vitriol, and drank a deal of Poſſet-drink, they are often fain to provoke themſelves to vomit, by thruſting a Fether down their throat, or drinking Carduus Poſſet, or Oxymel of Squils. *Phar. Rat.* Part I.

Antimonial Vomits

2. Crude Antimony, whileſt the mixture is entire, works neither by Vomit nor by Stool; of which the reaſon is, becauſe the Sulphureous and ſaline particles, from which the Vomiting quality proceeds, being bound up in it, and ſtifled, as it were, by the reſt, cannot exert their force; but when this mixture is diſſolved by preparation, and ſomewhat looſened, thoſe particles are made free enough and ready for action. Now if it be queſtioned, whether the vomiting quality depends upon the ſulphureous or the ſaline particles? My opinion is, that it proceeds from neither of them apart, but from both of them together: becauſe when the former are given diſtinct from the latter, as in the tincture of Antimony; or the latter from the former, as in the ceruſs of it, it never provokes Vomiting. I have elſewhere obſerved that particles meerly ſulphureous or ſaline, ſcarce move the Taſte or Smelling, but that both of them together do very ſtrongly affect thoſe ſenſes: and ſo I ſuppoſe it to be in the peculiar ſenſe of the Stomach, that is to ſay, that that Senſe receives its pleaſure or diſturbance from ſulphureous and ſaline particles mixt together; as alſo, that all Cordials and Vomits conſiſt of ſuch Compoſitions which are either grateful or ungrateful. Stibium (that it may become an active Medicin) is uſually prepared either by it ſelf (as the Glaſs or Flowers of Antimony are made) or with Salts, that is, either with nitrous Salt, as the Crocus of it, or with fixt Salt, as the Sulphur of it; or with acid Salt, as the Butter of it, and *Mercurius Vitæ*, which is made of it. There are many other vomiting preparations of Stibium, but thoſe aforeſaid are of greateſt note, or moſt frequently uſed. Now for the right preparation of thoſe and all other Medicins, you muſt firſt take ſpecial care to chuſe your Antimony pure and unmixed with Lead. In this affair, beſides the brightneſs of it, and the elegancy of its *Striæ* or Streaks; the ſureſt way to try it, is by calcining a bit of the parcel you would buy, with an equal quantity of Nitre, and it is a ſign of its goodneſs if it all turns into an *Hepar* [of a Liver colour] and to droſs; for otherwiſe a part of it ſometimes melts into pure Lead. By this means I once drew out of one pound of Antimony ℥ ij. of Lead.

Crude Antimony no Vomit.

Wherein the Vomiting power of Antimony conſiſts.

How the Particles of it become a Vomit.

1. Glaſs of Antimony.

Take of the Duſt of choice Antimony q. ſ. *and let it be calcined in an earthen veſſel, keeping it ſtill in motion till it leaves ſmoaking, and gains an aſh colour; then taking it out, melt it in a Crucible, and pour it upon a Table, or into a Baſin; when it grows cold, it will turn to a tranſparent purple Glaſs. The Doſe of the Duſt hereof is from* iv. *to* vj. gr. *and the Doſe of the Infuſion of it in Wine from* ℥ vj. *to* x. *works very ſtrongly.*

Glaſs of Antimony.

The reaſon of the aforeſaid preparation is (I conceive) this. The Antimony whileſt it is calcining is long kept in motion, to the end that whileſt the ſulphureous particles do plentifully evaporate, the ſaline ones, which are apt to vitrifie, or turn to Glaſs, may be gathered into a cloſer conſiſtence; and afterward, when the Maſs is melted by a fierce fire, theſe ſaline parts, getting hold of the earthy ones too which are attenuated, grow eaſily together into a Glaſs; which alſo by reaſon of ſome ſulphureous particles that are yet left in it waxes red, and is a Vomit. Now that Stibium when robbed of its Sulphur, either in great part or totally, turns into Glaſs, is very evident from this inſtance; to wit, in as much as the Calx or *Caput mortuum* which is left from the Diſtillation of the Butter of Antimony, melts into Glaſs, which yet is white and hath no vomiting quality, for as much as all the ſulphureous particles aſcended and left the Maſs quite deſtitute of them.

The reaſon of the Preparation.

2. Flower of Antimony.

Take a quantity of choice Antimony, that is pulverized, and ſublime it in Cucurbita with an Alembick, or in Earthen Veſſels made on purpoſe, upon a moderate Fire, either by it ſelf, or with Sand or Duſt of Bricks, or calcined Tartar mixed among it: the Flower riſe yellow, Citron coloured and white; of which gather up the whiteſt and keep them for your uſe.

Flowr of Antimony.

In this Preparation of Antimony the ſalt and ſulphureous parts, having ſeparated themſelves from the watery and earthy ones, ariſe and knit together; by which means when the Mineral Body is much looſened and diſſolved, and the moſt active parts

The reaſon of this Preparation.

Phar. Rat. Part I. (the duller, that rebate their force, being laid aſide) are joined into one Body, this becomes an exceſſive ſtrong Vomit and not very ſafe to take. The Doſe is gr. ij. iij. or iv.

3. Crocus Metallorum.

Crocus Metallorum prepared. *Take of choice Antimony and the pureſt Nitre of each ℥ iv. pounded ſeverally, and well mixt, put them into a brazen Mortar, and with a live coal ſet them on fire; they will flame and make a great noiſe; then let the remaining maſs which will be reddiſh (and called from the colour of it Hepar or Liver of Antimony) be ſeparated from the droſs (that lies round about it, partly black and partly white) and keep it for your uſe: The Hepar is given in the ſubſtance to* gr. iij. iv. *or* v. *the Wine of its infuſion from ℥ ß. to ℥ j. or ℥ j. ß. This works kindly enough, and is the moſt uſual Vomit.*

The reaſon of it. The reaſon of this procedure is, becauſe it hath Nitre pounded and mixt with Antimony and common Sulphur: for both mixtures are very eaſily fired, in as much as both particles, to wit, the nitrous and ſulphureous too, that were requiſite to any degree of kindling were copiouſly and intimately conjoined. By this deflagration or burning of it, the Mineral Body is ſufficiently opened, and the particles thereof are looſened from each other, and though ſome part of the Sulphur flew away, yet there is enough left to make it of a Saffron colour, and produce an emetick or vomiting quality, by being joined with the Salt. In this preparation, if by mixing too great a proportion of Nitre the Antimony be calcined above the uſual rate, the Maſs that is left after the burning of it, being now impregnated with leſs Sulphur, becomes not red, but yellow, or of a Citron colour, and leſs apt to make you vomit.

4. Sulphur of Antimony.

How to prepare Sulphur of Antimony. *Take Salt of Tartar, or Wormwood, ℥ viij. and having put it into a Crucible, let it melt in* Anemius's *Furnace, then throw in by ſpoonfuls of crude Antimony powdered ℥ vj. let it flow or melt a quarter of an hour, then pour it out into a Silver or a Brazen veſſel, and let the Maſs being of a Saffron colour be ſweetned with frequent ablutions or waſhings. The Doſe is* gr. v. *to* x. *which works more gently and kindly than any other Preparation of Antimony.*

The reaſon of it. In this Preparation the fixt Salt, being melted by the Fire, opens the body of the Antimony, which is compounded chiefly of Sulphur and acid Salt; for whileſt the Salts are ſo conjoined, the ſulphureous particles become more looſe, leſs ſharp than the ſaline parts; and therefore though it be extraordinary red, yet it doth not much, nor very violently provoke the Stomach. Moreover by reaſon that the Sulphur is more looſened, and the Salt grown freer, the Duſt of it eaſily gives a tincture to Spirit of Wine; which being altogether deſtitute of ſaline particles, and conſequently deprived of its vomitive quality, becomes a great ſtrengthener of Nature.

The Compoſition of Antimony and common Sulphur. Now that Antimony and common Sulphur, like, it may be, many other things of the ſame kind, conſiſt of an acid Salt and Sulphur joined together, is eaſily proved by many Experiments: For beſides that ſuch Compoſitions are very eaſily diſſolved by fixt Salt; ſo likewiſe if at any time they are ſeparated by a ſulphureous menſtruum, as *Oil of Turpentine, Juniper,* or *Flax,* the ſulphureous particles are drunk in by the Diſſolver, and the ſaline ones being left grow eaſily into Chryſtals, which being diſtilled turn into an acid ſtagma or diſtilled liquor. This evidently appears in the Preparation of Balſom of Sulphur. But if the acid ſtagma, to wit, *Aqua fortis,* or *Aqua Regia,* be poured into powdered Antimony, and the Diſtillation be over a fierce fire, there will a great deal of Citron coloured Sulphur ariſe, which is not to be diſtinguiſhed from the common ſort: which is a plain argument, that common Sulphur conſiſts chiefly of ſulphureous particles joined with an acid Salt. Out of Sulphur of Antimony, prepared as is formerly deſcribed, I make a liquor like Oil, which being the pureſt Sulphur of Antimony, will gild Silver at the firſt touch, and is of excellent uſe in Phyſick.

5. Mercurius Vitæ.

Take of choice Antimony and Mercury ſublimate, of each ℥ vj. which when you have pounded and well mixt together, diſtil them in a Glaſſen Retort by the heat of Sand; there will ariſe a gummy liquor like Ice, and very corroſive, which ſticking to the neck of the

the Retort, if you put a live coal to it, will melt and fall down into the Receiver. This Liquor being purified by rectification, will, if you pour Fountain water upon it, ſink into an extraordinary white Duſt; whileſt the watery part in the mean time gains an acid taſte like Spirit of Vitriol; and that Duſt being ſweetned and dried, is commonly called Mercurius Vitæ, *but falſly; becauſe it hath nothing at all of Mercury in it, and except it be warily adminiſtred, is oftener the occaſion of death than a preſerver of life, [as the name ſeems to intimate.] The Doſe is from* gr. iij. *to* vj. *Phar. Rat.* Part. I.

The reaſon of the Preparation.

In this Operation the acid Spirits of Vitriol and Nitre, being beforehand incorporated with the Mercury whileſt it is a ſubliming [or forced upward by the heat of fire] when they are again looſened by the fire, forſake that their firſt entertainment, and embrace the more hoſpitable particles of Antimony, and being elevated with them by the force of the heat, grow together into a ſubſtance like Ice; which conſiſts of the whole Sulphur of the Antimony together with a quantity of its Salt, as alſo the acid ſtagma, or diſtillation of Nitre and Vitriol; and by reaſon of the ſalt particles it grows hard like Ice, as it on the other hand melts upon the fire by reaſon of the ſulphureous particles. This matter by pouring Water upon it, is precipitated into a white Powder; ſuch as conſiſts onely of Stibiate particles, much like the Flower of Antimony, whileſt in the mean time the acid Salts being diſſolved in a menſtruum, or diſſolving Liquor make it become ſharp like ſpirit of Vitriol. But that this Powder hath nothing of Mercury, is evident from this, that being bereft of the congealing Salts, it reſumes its former nature of Quickſilver, and is all gathered together in a Retort. Indeed thoſe Salts are eaſily drawn away from the Mercury, and do of their own accord deſert it, whenever they find any more amicable body: and hence it is, that if you boil it, after it is ſublimed, with plates of Iron, in common Water, the Salts will preſently embrace the Iron, and the Mercury will recover it ſelf again. This Powder is too ſtrong a Vomit, but if you pound it with Sea Salt, and by frequent waſhings take away its ſweetneſs, it becomes much gentler, and ſafe enough; in as much as the ſaline ſharp particles of the Medicin are rebated and tamed by Salts of another nature. Moreover if it be put into Nitre, melted in a Crucible, when the ſulphureous particles are totally taken away, it quite loſes its vomiting quality, and becomes mere Antimony that will make you Sweat.

The Correction of this Medicin.

Stibiate Vomits, and how they work.

So much of Antimonial Vomits, the Particles whereof being diſſolved in the Stomach, make a ſulphureous-ſaline tincture, which the fibres of the Stomach imbibing or drinking, are thereby ſo vellicated or twinged, that the Convulſion which is therein cauſed, being propagated every way into the whole cavity of it, as alſo into the Bowels near adjacent, as the Duodenum, the paſſage of the Gall and Sweet-bread, forces out all that is within them, and pours them into the Stomach, cauſing the Arteries alſo to diſcharge their ſerous or wheyiſh Humours; ſo that violent Vomitings, and ſuch as long diſturb us, follow thereupon. But it is probable, that ſome ſmall part alſo of this vomitive tincture is received by the Veins, and being carried into the maſs of Bloud, by reaſon that it meets, and ſtruggles, and joins with the Salt, creates precipitations and expulſions of a certain kind of matter: and this is the reaſon that Diſtempers of the remote parts, as all cutaneous Diſeaſes, Leproſies and Gouts are ſometimes cured by Stibiate Medicins.

How alſo Mercurial Medicins work.

But Mercurial Medicins (of which we ſhall now in the next place treat) do this much more effectually; for that they do not onely provoke twingings and vomitive expulſions in the Stomach, but cauſe like, by their more active particles, that are communicated to the Bloud, many kinds of fluxes and diſſolutions, precipitations, and ſeparations of the *Serum* or Whey and other Humours; from whence proceed, beſides Vomiting and Purging, diſcharges by Urine, Sweat, and ſometimes ſpitting: which is the reaſon that in old Diſtempers, which are not eaſily cured, People have recourſe to this Medicin as their laſt refuge.

Mercury or Quickſilver by it ſelf is not purging.

How it is made operative.

Mercury or Quickſilver, if it be taken plain and by it ſelf, doth not vomit or purge any more than Antimony, or cauſe any other conſiderable diſturbance in mans body. But if the mixture of it be diſſolved, and its active particles being let looſe, it be reduced to a Powder, it becomes a moſt operative and forcible purging Medicin. Now though there are many ways of fixing this giddy, fugitive *Proteus*, and preparing it for Phyſical uſes, yet theſe are the two chiefeſt, to wit, either by ſubliming [or forcing it upward] or precipitating [that is, making it ſink.] Preparations of it in the former way are not properly reckoned among Vomits, but moſt of the latter kind ought to be reduced to this Head. But it will be enough for us to give you a ſhort account in this place of ſome few thereof that are of greateſt note. We therefore obſerve that Mercury is precipitated either by it ſelf, or with Metals onely, or with Salts onely, or with Metals and Salts together.

Phar. Rat. Part. I.

1. *Precipitated by it ſelf.*

1. Mercury precipitated by it ſelf.

Take of the beſt purified Mercury ℥iij. *and put it into a Glaſs made on purpoſe (which being ſomewhat like an Hour-glaſs, conſiſts of a double bottom running out in the ſhape of a Top; but is broad and plain in both, as in the middle narrow, and both a Nozel with a very ſtreight orifice, reaching from one bottom into the belly of it) and place this Veſſel in an Oven of Sand at equal poize upon a fire that muſt at firſt be ſlow, though afterward quicker, till part of the Mercury turns to an aſh-coloured Powder, and the other part being raiſed into the upper bottom, ſticks there like Quickſilver; then turning the Veſſel upſide down, put the upper bottom into the Sand, and ſo turn the Glaſs for ſeveral times till all the Mercury turns to Powder, which, having broken the Glaſs, you muſt gather together, and waſh in fair water. The Doſe is* gr. iv. *to* v. *or* vj. *It almoſt ever cauſes vomiting, and doth not work at all by ſpitting.*

The reaſon of this Procedure.

The reaſon of this procedure ſeems to be, in that the emanation or ſtreaming forth of a continual fire, firſt looſens the body of the Mercury, by degrees diſſolves the particles thereof, and at laſt ſeparates them from each other, ſo that they mutually part, and being broken as it were into ſmall crums, remain diſtinct; from whence it happens, that the moſt active parts, to wit, the ſaline chiefly, and the ſulphureous ones, being ſet at liberty, cauſe great commotions in a Mans Body by vellicating the fibres and boiling up with the Salts: but yet this Precipitate works leſs upon the Salts which are in the bloud, than Mercury præcipitated with Salts onely; becauſe this latter very eaſily cauſes ſpitting, which the former doth not at all. As Mercury, ſo alſo ſome other Mineral Bodies, as Lead, Tin, Antimony, and Iron, are uſually calcined into a Powder or a Crocus by the conſtant heat of fire.

2. Solar or Golden Mercury Precipitate.

Take of Gold purged with Antimony, and ſubtlely filed ℥ j. *of purified Quickſilver, or that which is drawn from Cinnabar and Sublimate* ℥ viij. *and make an Amalgama* [or Paſte] *in a Crucible, by throwing the Gold when red hot into the Mercury actually hot; Let this when it is well waſhed with Salt and Vinegar, and ſtrained through a linen cloth, be digeſted in Sand with ſuch a Glaſs and after the like manner as the Mercury precipitated by it ſelf was, till it be reduced to a red Powder; and let it be ſweetned with cordial Waters. The Doſe is* gr. iij. *to* vj. *and works moſt commonly by Vomit onely, nor doth it cauſe ſpitting, as ſaline Precipitates do. So likewiſe may the Lunar Precipitate, or the Jovial, be prepared.*

The reaſon of this Preparation

The reaſon of this procedure is the ſame with the former, to wit, that the particles of fire, like ſo many peſtils, pound the Mineral body into ſmall parts, and for a time do ſo break them, that they will not eaſily ſtick together, and unite. Moreover this *Analgama* [or Paſte] by reaſon that the Bodies of the Mercury and Gold are beforehand looſened from each other, will turn to a Precipitate much ſooner than Mercury by it ſelf.

3. Common Precipitate Mercury.

Mercury precipitated with corroſive liquors

Take of pure Mercury ℥ ij. *of Aq. fortis* ℥ iv. *and having diſſolved it, put it into an earthen glazed Veſſel, wherein let it evaporate firſt over a gentle fire till the moiſture be all ſpent; then increaſe the fire, and let it calcine even till the Veſſel be red hot, ſtill ſtirring it with an Iron Inſtrument till it gain a ruddy colour: Let the matter when taken out and powdered, be firſt ſweetned with frequent waſhings in ſweet water, and after that again kindle Spirit of Wine, and pour upon it, and ſo keep it for your uſe. The Doſe is* gr. iij. *to* v. *or* vj. *It works violently enough by Vomit, and cauſeth ſpitting more certainly than any other Precipitate of Mercury.*

The reaſon of this Preparation

If you enquire into the reaſon of this Chymical attempt, I ſay, that the Mercury is diſſolved by the *Aqua fortis*, in as much as the ſaline particles of the Menſtruum [or Diſſolver] meeting with the Salts of the Metal, do preſently ſnatch ſuch Salts to them, and conſequently, when by the diſſolution of the mixture all the other particles are ſet at liberty, and expanded every where lie lurking in the pores of the menſtruum; but afterward when the moiſture is conſumed, the ſaline particles that are left, and expoſed to view, do quite take off the force of the Mercurial ones within them, which

are

are mixt in every part. Now the reaſon why Mercury being precipitated on this faſhion with *Aqua fortis*, or *Aqua Regia*, grows red, and of another colour than when it is prepared with Oil of Sulphur or Spirit of Vitriol, is partly from the Nitre that always gives it a Flame colour (for Nitre is an ingredient of the former menſtruum, though not of theſe later) and partly from the Mercury it ſelf, whoſe particles when it is diſſolved, ſo long as they are free and not hid in others, are of their own nature red, as you may ſee in Mercury precipitated by it ſelf, and in the diſſolving of it in Oil of Tartar, wherein it leaves a ruddy, that is, a Mercurial Powder. *Phar. Rat.* Part I. *Why it grows red in this caſe.*

This Medicin conſiſting of Salts that are very corroſive, as well as Mercurial particles that are diſſolved, in as much as it extreamly provokes the fibres of the Stomach, cauſes moſt violent Vomiting, ſo that it is rarely given alone for this end. But if at any time it be taken, and having paſſed the Stomach and thoſe firſt paſſages, it be carried into the bloud; in as much as the native Salts thereof are thereby very much fermented, and with them the Mercurial particles being plentifully infuſed, and throughly mingled, are ſo entangled, that they can be diſcharged again no way better than by the *Ductus Salivales*, or Spittle-paſſages (as I have elſewhere ſhewn) for that reaſon this Medicin cauſeth ſpitting in many People before any other. *How Mercurial Medicins work upon the Stomach.*

4. Turbith Mineral.

Take of Quickſilver purified, of Oil of Vitriol (or Sulphur prepared in the Bell) purged from the flegm, of each an equal proportion; put them into a Glaſſen Retort, and diſtill them, increaſing their fire by degrees, till all the moiſture be conſumed, and there remain in the bottom a white maſs, which, if you pour clear water upon it, immediately grows yellow. This when it is unſweetned (by frequent waſhing and burning of Spirit of Wine) and dried, may be given from gr. iv. *to* vj. *or* vij. *It works by Vomit ſomewhat more gently than the common Precipitate, and ſometimes alſo cauſes ſpitting.*

The reaſon of this Preparation, as to the Precipitation of the Mercury, is the ſame as that of the former; but the remaining calx, or earthy part, is not red like the former, partly becauſe there is no Nitre in it, and partly becauſe the Mercury being leſs ſubdued, will not endure ſo ſtrong a calcination, as that the Salts being for the moſt part ſcattered or carried off, it may ſhew its own, to wit, a ſcarlet colour; for if to the end it be forced by a violent fire, it will fly quite away; and therefore from the Salts that ſtick to the particles of the Mercury and hide them, there proceeds a whitiſh colour; which being afterward ſomething taken away, there ſucceeds a yellowneſs. Moreover, in as much as the Mercurial particles are not ſo ſtrictly conjoined with the Salts, and conſequently are not brought into the bloud by them in ſo great a quantity, ſpitting is not ſo readily and certainly the effect of this Medicin. *The reaſon of the Preparation*

This Medicin may be prepared after a compendious manner, and not leſs effectually thus:

Take of refined Quickſilver, of Oil of Vitriol or Sulphur, of each ℥ ij. *put them into a Crucible, and firſt let all the moiſture evaporate over a ſlow fire; then make the fire ſtronger to the end that the calcined matter may be the better fixed.*

5. Aurum Vitæ.

Take of purified Mercury ℥ v. *of Solis very well purged* ℥ ß. *let them be ſeverally diſſolved in their proper menſtruums [or liquor to diſſolve them] let the diſſolved matter of both kinds be put together, and by diſtillation in a Retort, let all the moiſture be drawn forth; let the remaining calx be calcined upon a Plate of Iron red hot, that the Salts moſt of them may be carried off, and let the remaining matter be ſweetened by waſhing it in fair water and burning Spirit of Wine.*

6. The Hercules [or ſtrong Medicin] preſcribed firſt by *Bovius*.

This Medicine will be the better prepared, if both the Metallick Bodies are diſſolved in the ſame menſtruum, which by the preſcription of *Thomas Bovius* is thus performed:

Take

Phar. Rat. Part I.

Take of calcined Vitriol and Nitre, of each one pound, diſtil them in an Oven for reverberation, pour the Liquor diſtilled into one pound of Sea-ſalt calcined, in a Glaſs Retort, and let it be drawn forth by the gentle heat of Sand, for it very eaſily ariſes: Let one part of this diſſolve the Mercury, and the other the Gold; after which, putting both the diſſolutions together, draw them off, and by frequent ſuffuſions, adding every time a little leſs than a third part of the ſame menſtruum, diſtil them again till the matter be ſufficiently fixed, which being ſweetened, you may keep for your uſe, as aforeſaid. The Doſe is gr. iij. *to* vj. *or* vij. Or,

Take of purged Mercury ℥ iv. *of filed Gold* ℥ ß. *make an Amalgama* [*or Paſte*] *as aforeſaid, to which when it is waſhed and put into a Retort, pour* Bovius's *forementioned menſtruum, draw it off in an Oven of Sand, and by frequent ſuffuſions, adding every time ſomewhat leſs than a third part of the ſame menſtruum, diſtil it again, till the matter be ſufficiently fixed; then calcine it upon a red hot Iron Plate, and unſweeten it by frequent waſhing and burning the Spirit of Wine. The Doſe is from* gr. iij. *to* vj. *It works indifferently by Vomit, and in as much as it operates, beyond the Bowels, upon the maſs of Bloud, it is helpful often in great Diſtempers.*

The reaſon of both theſe Preparations.

Now, for the reaſon of this Chymical procedure, I ſay, that whileſt theſe two Champions ſtruggling between themſelves, get hold of, and weaken each other, a third (and ſometimes a fourth) comes and binds them together ſomewhat faſter, and breaks them into ſmaller parts. For not onely the Gold by the Mercury, but both of them are diſſolved by the menſtruums, and divided into minute particles; then when the moiſture is drawn away, the ſaline particles of the Metals are joined with the Salts of the menſtruum, whileſt in the mean time the other metallick particles are intermingled, and ſhut up in the pores of the Salts. But yet this combination of theirs is not ſo cloſe, as when the Metals among themſelves, or either of them, with its proper menſtruum, is by ſolution and coagulation reduced into a Precipitate. For in that compound Precipitate the menſtrual particles, as well metallick as ſaline ones, being ſo many and diverſe, cannot all be throughly united: wherefore that matter (as I have often obſerved) is uſually not without much difficulty fixed and reduced to a Calx fit for medicinal uſes; for if the heat whereby the menſtruum is drawn off be too great, the Mercury will riſe, and the Gold that is left will reſume its own nature; but if the fire be weaker than it ought to be, the Salts will not join ſo faſt as they ſhould do with the metallick particles, but may be ſeparated by meer waſhing; ſo that common Water, if poured upon the Precipitate, will quite diſſolve it, and ſwallow into it ſelf the whole matter, in ſo much that you muſt go to work almoſt anew, if you would make this Medicin.

The reaſon of the Hercules of Bovius.

The foundation of this Medicin is Mercury, upon the account of which it is expected that the particles thereof ſhould ferment or leaven all the juices in Mans Body, and promote the expulſion of any heterogeneous matter that is gathered either in the Bowels or in the Veſſels. The Gold ſeems to be added to tame the Mercury, and ſomewhat to rebate and take off the fury of it. Beſides which, the Salts break both the bodies into ſmall parts, and thereby the more eaſily lead them (as it were) into the maſs of Bloud, and all other more retired parts.

The reaſon of this Menſtruum.

In the Diſtillation of that Epicæne or common Menſtruum that *Bovius* hath deſcribed (it being ſuch an one as diſſolves both the Metals) there are notable ſtrugglings and contentions (as it were for Religion and Property) between the Salts: for when the *Aqua fortis* is poured to Sea-ſalt already prepared, it ſeizes (as it were) the Country thereof, and takes poſſeſſion, as of its own Inheritance, driving the ſpirit of the Salt thence like a Perſon diſfranchiſed, or baniſhed his own Native Land. This is more plain, if at any time the ſpirit of Vitriol, being poured to Sea-ſalt calcined, be put to be diſtilled; for with the leaſt heat of a Balneum or Bath of Sand, the ſpirit of the Salt will ariſe altogether pure, like one forced out of his Country, when the Stagma, or diſtilled Liquor of Vitriol invades its habitation. Indeed theſe Salts are too near of kin than that they ſhould incorporate; and that is the reaſon that when they are put into an habitation too narrow for them, they being not able to unite, nor cohabit, the ſtronger uſurps a dominion over the weaker, and turns it out of doors.

CHAP.

Phar. Rat. Part I.

CHAP. III.

Touching the Cure of exceſſive Vomiting, as alſo of Medicins to ſtop it.

WHere Nature is put into a violent motion, ſhe often goes beyond her bounds, and over-ſhoots the mark, in ſo much that ſometimes ſhe lacks to have a ſtop put to her career. This is evident in Vomiting, if at any time, through the operation of a Medicin, or other occaſions, it be immoderate: and therefore it is the buſineſs of Phyſick, as well to aſſwage, as to provoke this fury in the ſtomach. How many ways and from what cauſes Vomiting uſes to proceed without taking a Vomit, I have formerly declared; but beſides that, it is obvious to our common obſervation that this evacuation, when cauſed by a Medicin, is ſometimes ſo violent, and continues ſo long, that unleſs it be ſtopped by the help of Art, a mans life is thereby in manifeſt danger. As therefore in the Practice of Phyſick Emetick Medicins [or Vomits] are of neceſſary uſe; ſo ſometimes, to ſtop that way of diſcharging [what is in the ſtomach] (as often as it is exceſſive or preternatural) we muſt uſe remedies quite contrary to the others, or Antidotes againſt Vomiting. I therefore ſhall ſhew, Firſt, what Medicins cure exceſſive Vomiting, that is cauſed by taking a Vomit, and then, in the ſecond place, how and by what remedies Phyſicians ſtop preternatural Vomiting, which proceeds from other cauſes. *Immoderate Vomiting proceeds either from an Emetick Medicin, or other cauſes.*

As to the former, Vomiting that is cauſed by a Medicin, becomes more violent, and continueth longer, becauſe the Animal ſpirits being extraordinarily provoked, and ſet on fire (as it were) do not eaſily or preſently lay by their fury, but being often exploded [or diſcharged] cauſe violent motions to vomit, which they ſeveral times repeat. Moreover, that exploſive force being begun in the ſtomach, is propagated oftentimes into the ſpirits that inhabit the neighbouring parts, and from thence into others, till at laſt ſometimes it gets into the whole race of them; in ſo much, that after Vomiting there come gripes and convulſions in the bowels; after that, in the parts near the heart, and laſtly, in the whole body, to the manifeſt hazard of a mans life.

The ſpirits are irritated or provoked either by a Medicin onely, which is diſproportionate to them in quantity or quality; or over and above by other humours, as Gall, ſharp Serum, and other things poured into the ſtomach whileſt we are vomiting. Moreover in ſome People the Animal ſpirits are ſo tender and elaſtical, that when there is any motion to vomit, though but ſmall, not onely thoſe which reſide in the ſtomach, but alſo all that are near it, are ſtirred into convulſive exploſions. And hence it is, that many People when they have taken a Vomit, complain of the Spleen, [pains in] the Womb and other Bowels, as if they were very much out of order, and not eaſily recoverable, imputing the whole matter to vapours raiſed by the operation of ſuch a Medicin, when really and truly that comes to paſs by no other means than that the Animal ſpirits are put into too brisk a motion, and are not eaſily to be reduced. *The reaſons of the former are explained.*

In exceſſive Vomiting, cauſed by a Medicin, the Patient muſt be preſently put to Bed, and plyed very carefully with outward as well as inward remedies; and firſt of all, to appeaſe the Inhabitants of the ſtomach, either you muſt uſe an hot fermentation made of the decoction of Wormwood of Pontus, Mint and Spices in red Wine, or a Cake made of Crums of toaſted Bread, and dipped into hot Claret. Give the Party a Clyſter of Milk and Treacle: let him be rubbed with warm clothes and bound hard above the Knee, to prevent Convulſions in thoſe parts. In the mean time let the ſtomach be kept empty, unleſs in caſe of fainting; but as ſoon as he can take any Food or Phyſick, let it be Cordial Water, or hot burnt Wine. In an extraordinary commotion, if the Pulſe allow it, *Treacle of Andromachus*, or *Diaſcordium*, as ſometimes diſſolved *Laudanum*, or *Tincture of Opium* are good. *The Cure of it.*

In preternatural Vomiting, that is cauſed by other means, you muſt conſider, whether it be critical or ſymptomatical. In the former caſe, we are to do nothing raſhly or on the ſudden; let not ſuch a diſcharge, if the Body can bear it, be ſtopped by any means; but let the paſſage of the matter which is to be expelled, be made more eaſie or haſtened, or turned ſome other way. And hence it is, that when any naukiſhneſs, or motion to vomit comes upon a man, it is proper to give him Ale, either in Poſſet, or by it ſelf, or altered with the leaves of *Cardus* boyled in it, and ſometimes alſo *Oxymel*, or *Wine of Squils*, or *Stibiate*. So likewiſe ſometimes a Clyſter will do well, and otherwhiles a gentle Purge carries off the matter that ſwells in the ſtomach an eaſier way through the Guts. *Natural Vomiting is either critical or ſymptomatical.*

In

Phar. Rat. Part I.

In ſymptomatical Vomiting the conjunct cauſe (as I told you before) either is in the ſtomach, where it produces ſuch an effect, or in other parts, where it cauſes Convulſions, and by communication of the Nerves, cauſes motions to vomit in the ſtomach, as in fits of the Stone in the Reins, the Colick, Fits of the Mother, Meagrim, and many other Diſtempers it uſually happens; the Cure of which ſympathical Vomiting depends upon the curing of the primary or original Diſeaſe.

The latter is either idiopathical or affecting one proper part, or ſympathical affecting two, by conſent.

When the ſtomach is firſt affected, the reaſon is, becauſe the nervous fibres thereof being irritated above meaſure, ſet the other motive ones upon contractive expulſions. But they are provoked by an improportionate object, to wit, in as much as a certain matter lies upon them, which they cannot well concoct, ſubdue, or thruſt down into the Guts; but muſt of neceſſity caſt it out as ſoon as poſſible by way of Vomit. That matter grows ſo incongruous or unruly, either through its own illneſs, as it offends in quality or quantity, and diſturbs the nervous fibres; or through fault of the ſtomach, that is, when the tone of it is looſe, and the fibres thereof ſo weak, that they cannot maſter, or endure ſo much as the Chyle it ſelf, much leſs excrementitious humours, but being impatient of all burdens: throw off all that is within, by Vomit. Of both which caſes, ſince there are ſeveral inſtances and various ways of bringing it ſo to paſs, I will here briefly lay down ſome of the chiefeſt, together with the remedies and the reaſons of them.

What Method we ought to uſe when the Stomach is firſt affected.

The matter that gives the Vomit, being in the ſtomach, is either poured into it from other Veſſels, or through defect, or depravation of concoction, is therein generated; but in both reſpects the preſent load ought firſt to be removed, and then care to be taken how to prevent its farther growth for the future.

That therefore the impure conflux of viſcous matter may be cleared out of the ſtomach, let the Patient take a gentle Vomit of Whey with *Carduus* infuſed in it, or *Oxymel*, or *Wine of Squils*, or with the Decoction of *Camomile Flowers*, *Roots*, the Diſſolution *of Salt of Vitriol*, or other the like Medicins; and then let the reliques be carried away gently by Clyſters or Purging, with Maſtich ſtomach Pills, Gum, or *Tinctura Sacra*, or the Infuſion of *Rhubarb*. Moreover when the Bloud being impure or putrid, brings new ſupplies of incongruous matter into the ſtomach, either through the Arteries or Choler veſſels, which oftentimes overflow, and thereby diſpoſeth a man to vomit, Bloud-letting ſometimes is good, and therefore vomiting in Women great with child is frequently cured by this kind of remedy. Thoſe things alſo are helpful, that ſo temper the Bloud, as that no aduſt or dry filth may be generated in it. Hence Whey, drinking the Waters, the Juices of Herbs, Sal Prunella, and the like, very often remove that diſpoſition to vomit, in as much as that they ſet the Bloud a float, and carry the droſſie part of it another way. And theſe kind of remedies too will be uſeful, if frequent and daily vomiting proceed from the contention and ſtruggling of the Gall and Sweetbread juice which rejounce (as ſome think) into the ſtomach.

That Vomiting is more frequent and harder to be cured, which proceeds from incongruous matter, that is conſequently emetical [or vomitive] and generated within the ſtomach; in as much as all things which the Party eats, through the vitiated ferment of the Bowel, degenerate into a provoking kind of putrifaction. Wherefore in this caſe, when the filth of the ſtomach is carried off by gentle Purges, the Remedies commonly called Digeſtive are wont to be made uſe of; which, according as the fermenting juice of the ſtomach (which is moſt commonly of a ſalt nature, and ſometimes of a ſulphureous) differs either in fixedneſs, fluidneſs, or aduſtneſs, are of divers ſorts, and work ſometimes one way and ſometimes another.

How Vomiting that ariſes from a vitiated Stomach is to be cured.

Remedies againſt the too acid ferment thereof.

In belching and ſower Vomitings, try the Medicins following, and take your meaſures for the uſe of them from the help you find by them.

Take of the Powder of Cuckow-pintle compound ʒ j. ß. *of Salt of Wormwood* ʒ ij. *of Sugar of Roſes* ʒ iij. *make a Powder and give* ʒ j. *of it in the morning, and at five of the Clock in the afternoon, in a ſmall draught of Mace Ale, and a Toaſt, or in diſtilled Water, or the tincture of Wormwood of Pontus.*

Take of Powder of Ivory, Crabs eyes, and red Coral, of each ʒ ij. *of calcined Coral* ʒ j. *of red Sanders and Cinamon of each* ʒ ß. *make a Powder. The Doſe is* ʒ ß. *after the ſame manner.*

Take of the Powder of Lignum Aloes, Citron-coloured Sanders, and Winter Bark, of each ʒ ij. *of the whiteſt Chalk* ʒ vj. *of white Sugar* ʒ ß. *of Gum dragant diſſolved, with Mint Water a convenient quantity, make a Paſte, and form it into Trochies or Balls*

Balls of the weight of ʒ ß. *of which let the Patient eat* iij. *or* iv. *three or four times a day.* Phar. Rat. Part I.

Take of the Tincture of Salt of Tartar ℥ j. *The Doſe is* ℈ j. *to* ʒ ß. *twice in a day in diſtilled Water made on purpoſe.*

2. In ſharp and hot Vomiting Medicins that have acid and vitriolick Salt in them are more proper. *Againſt the too ſharp ferment of it.*

That famous Medicin of *Riverius* takes place in this caſe.

Take of the Salt of Wormwood ℈ j. *give it in a Spoonful of the juice of Limons.*

Take of prepared Coral ʒ ij. *of Salt of Wormwood* ʒ j. ß. *of juice of Limons* ℥ iv. *let them ſtand in a Glaſs big enough, and put to them of ſtrong Cinamon Water* ℥ ij. *The Doſe is one Spoonful or two twice in a day, ſhaking the Veſſel firſt.*

Take of the Powder of Ivory and Coral, of each ʒ ij. *of Vitriol of Mars* ʒ j. *of white Sugar* ʒ j. *mingle them and divide them into 6 or 8 parts, and let the firſt part be taken twice in a day with a convenient vehicle, or matter to convey it down in* [*as Wine or the like.*

In this caſe Mineral Waters that are purging, having a great deal of Nitre in them, as likewiſe Iron ſtone Waters, yea and our artificial Chalybeates or Steel-waters too, uſe to afford extraordinary help.

3. If the Stomach at any time by changing moſt things that are taken into it, to cholerick and bitter putrefaction (as it is often uſed to do) doth thereby incline to frequent Vomitings, then ſuch remedies are moſt proper as are acid and bitter. *Againſt the bitter ferment of the Stomach.*

Take of the Elixir proprietatis ℥ j. *The Doſe is* ℈ j. *twice in a day in a convenient vehicle.*

Take of the Powder of Rhubarb gr. xxv. *of Salt of Wormwood* ℈ j. *of Cinamon water* ℥ ß. *of juice of Limons* ℥ j. *mingle them, and take it either by it ſelf, or with any other Liquor.*

Take of the Powder of Cuckowpintle comp. ℥ j. ß. *of white Chryſtalline Tartar* ʒ iij. *of Vitriol of Mars* ʒ j. *of Sugar* ℥ ß. *make a Powder. The Doſe is* ʒ ß. *or* ℈ ij. *drinking upon it each morning a draught of the Tincture of Wormwood of Pontus, or Coffee.*

Take of the Powder of Crabs eyes ℥ ß. *of Chalybeate Tartar* ʒ ij. *of white Sugar* ʒ j. *make a Powder. The Doſe is* ʒ ß. *with a convenient vehicle twice a day.*

The cauſe of frequent and habitual Vomiting proceeds oftentimes not ſo much from the matter irritating the ſtomach, as the weakneſs of the nervous fibres thereof, and their too great aptitude to be provoked; in as much as they being very tender and infirm, can neither concoct what comes in, nor endure the burden or load of them; but on the contrary are preſently diſturbed by any thing that lies upon them, and conſequently, in order to expel and drive out whatever is troubleſom to them, excite the fleſhy fibres to put themſelves into a motion of Vomiting. *Vomiting cauſed by the weakneſs of the Stomach.*

Of this Indiſpoſition there are two ſeveral caſes: to wit, either this weakneſs of the ſtomach, being in the fibres themſelves, is cauſed by inordinate ways, as by Cropſickneſs, Debauchery, for laſt nights drinking conſtantly and to exceſs, frequent guzling of Wine, or hot Waters, and other errours in our Diet; in as much as the fibres being beyond meaſure diſtended, or too much heated, and as it were roaſted, cannot admit, or keep in them, animal ſpirits enough: Or ſecondly, thoſe fibres, though well enough diſpoſed in themſelves, and through the obſtruction of the Nerves in ſome part or other, are deprived of the due afflux of ſpirits, and conſequently being languid and ſlack or lank, cannot indure what is brought in, but preſently force it upward by way of Vomit. So I have known ſeveral perſons, that without any uncleanneſs of the ſtomach, or languidneſs contracted by inordinacy, being troubled with a kind of Palſie in this part, have wanted an appetite, and were ſubject to perpetual Vomiting. *Vomiting cauſed by weakneſs of the Stomach. Two caſes. Either the fibres are too much relaxed; Or the Nerves are obſtructed. ſo as that the animal Spirits cannot flow into them.*

In the former of theſe caſes, ſuch remedies are proper, as may by their ſtyptick or reſtringent virtue cauſe the fibres that are too much diſtended, and thin, to ſhrivle and contract *The Cure in the former caſe.*

Phar. Rat. Part. I. contract themſelves into a leſſer ſpace; and alſo ſuch, as by their grateful allurements may entice the ſpirits thither in greater plenty, and likewiſe refreſh or recruit them, when weak.

Take of Elixir of Mynſichts Vitriol ℥ j. *The Doſe is from* gr. 10. *to* 15. *twice or thrice a day, in a ſpoonful of the following diſtilled Water, drinking of the ſame thereupon* 7. *or* 8. *ſpoonfuls.*

Take of the tops of Cypreſs m. vj. *of the leaves of Clary* m. iv. *the outward rinds of* 12. *Oranges, Cinamon and Mace of each* ℥ j. *of the roots of Cyperus* [*one kind of Galingal*] *and the leſſer Galingal, of each* ℥ ß. *which having cut and bruiſed, pour to them* lb viij. *of Mum. Diſtil them with the common inſtruments.*

Take of the Tincture of Balſam of Tolu, and of the Tincture of Salt of Tartar extracted ℥ j. *The Doſe is* gr. 20. *with the ſame vehicle. Tincture of Wormwood prepared with the ſame menſtruum, may be tried.*

Take of the Powder of Wormwood leaves, of Myrtle dried in the Sun, of each ℥ ij. *of Cinamon, and the flowers of red Roſes, of each* ℥ j. *of Cubebs, of the roots of the leſſer Galingal, of each* ℥ ß. *of red Coral* ℥ j. *make of them all a ſmall Powder, then of the whiteſt ſort of Sugar, diſſolved in Cinamon Water, being made into Tablets* ℥ vj. *and let the weight of each Tablet be* ℥ ß. *Let the Patient eat one or two of them at any time when he will.*

Take of the Conſerve of red Roſes vitriolated ℥ iv. *of preſerved Myrabolans* ℥ vj. *of Ginger pickled in India* ℥ ß. *the ſpecies of Jacinth* ℥ ij. *of the reddeſt crocus of Iron* ℥ j. *of Syrup of Corals, as much as will ſerve, and make an Electuary. The Doſe is* ℥ j. *twice a day, drinking upon it a draught of the diſtilled Water.*

How the Palſie in the Stomach may be cured.

2. In caſe of weakneſs or ſlackneſs in the tone of the ſtomach by reaſon of an obſtruction ſomewhere in the Nerves, thoſe Medicins which are antiparalytick, or good againſt the Palſie, together with ſtomach remedies too, will be of ſpecial uſe.

Take of Elixir Proprietatis tartarized ℥ j. *The Doſe is* ℈ j. *twice a day with the Water formerly preſcribed. Tincture of the Salt of Tartar, of Coral and Antimony, may be uſed the ſame way. In this caſe Spirit of ſweet Salt, as alſo Spirit of Sal Ammoniack, or the flower of it, do a great deal of good. Vomits, Purges, and even Sweating Medicins are oftentimes helpful. I have known this Diſtemper cured ſometimes by bathing in our Baths at* Bath.

Phar. Rat. Part I.

SECT. III.

CHAP. I.

Of Purging and Purgative Medicins.

PUrging ſeems to be a motion or diſpoſition quite contrary to vomiting, or rather vomiting at the wrong end, becauſe in one as well as the other we ſet forth from the ſame barriers of the ſtomach toward a different Race-end. For as in Vomiting, the inner fleſhy fibres of the ſtomach being inflated or blown up at their left ends by the ſudden incurſions of the ſpirits, and conſequently, being contracted, cauſe the bottom and ſides of it to be drawn together, and upward toward the left orifice, that ſo the matter therein contained may be thrown out the upper way; ſo in Purging, the ſame fleſhy fibres, being in the ſame manner inflated at the right ends, force all the body of the ſtomach together, and make it lean toward the Pylorus, which cauſes an evacuation by ſiege. Now as the expulſive motion begun by the ſtomach is continued, in Vomiting, through the Weazon, ſo is it in Purging, through the Guts; and is propelled on both ſides by the fleſhy fibres, from one part to another, till it get out. In both caſes the motion of the Stomach is violent, and in a manner convulſive; nay now and then the one is changed into the other. For Purgation, if cauſed by a Medicin too ſtrong and quick, does oftentimes produce Vomiting; and ſo on the other ſide, a Vomit is many times attended with a Purge: the reaſon of which is, becauſe the animal ſpirits being vehemently provoked, and exploded or diſcharged, fly differently ſometimes into theſe, and ſometimes into thoſe ends of the fleſhy fibres; ſomething after the ſame manner as if you ſpur a metled Horſe too much, you will make him one while run forward, and another as much backward. *Purging contrary to Vomiting.*

Purging therefore is an expulſive motion in the Stomach and Guts, which by reaſon that their fleſhy fibres are ſwiftly and regularly contracted, is more frequent and nimble; whereby not onely the Chyle and Dregs of it, but alſo the droſſie and corrupt part of the Humours which are there engendered, or brought thither from other places, are puſhed on from part to part till they are diſcharged by ſiege, as through a Sink, or Common-Sewer. For the ſtomach being irritated by the ſharp particles of the Purge, and ſo contracting it ſelf more nimbly and cloſely toward the Pylorus, poureth whatſoever is in it forth into the Duodenum, whileſt at the ſame time the Guts alſo being twinged by it, repeat more frequent and greater expulſive convulſions, whereby the greateſt part of what is contained in them, that was either gathered thither before hand, or attracted and drawn forth at that inſtant, is thrown out. Now Purging is onely the violent and forced performance of that evacuation, which Nature when ſedate and undiſturbed, deſigned to effect leiſurely and by intervals; which alſo, when ſhe is provoked ſhe cannot perform without ſome ſort of tumult and diſorder. It is therefore requiſite (in my opinion) to the more perfect knowledge of the Nature of Purging, that we firſt ſhew what kind of matter is properly contained in the ſtomach and Guts, and then what comes thither from other parts, to be evacuated by Stool. Which being premiſed, it will be eaſie to explain how and with what difference Purging Medicins perform their operations. *The deſcription of Purging.*

1. As to the firſt, The chief contents of the Stomach and Guts are the maſs of Chyle, and the dregs of it that remain after the diſtribution of the nutritive juice, the ſlimy matter in theſe Entrals, which ſmeers over the hairy veil, and the water that ſticks in the glandules thereof; to which you may add the ſerous water iſſuing forth from the mouths of the Arteries, as alſo the droſſie parts of the Bloud and Humours that are conveyed into the inner cavities thereof through the Choler veſſels, the Sweetbread paſſage, mouths of Arteries, and likewiſe through the ends of the nervous fibres, and it may be other ways beſide. For very frequently the filth of the whole Body is thrown out by paſſages in the Guts as it were through a Sink; which filth if it ſettle within, doth either ſwell, by reaſon of its great quantity; or is ſo ſharp, that by lubricating [making glib] or ſtimulating [pricking or ſpurring, as it were] the belly, cauſes more frequent and plentiful evacuations. *The chief contents of the Stomach and Guts, that are thrown off by Purging.*

2. Beſides this kind of contents, there is alſo another ſort reſulting from them, and *vink.*

Phar. Rat. Part I.

The production of it in the Bowels.

that is Wind, which being usually created in the Stomach and hollow of the Guts, more than in any other part of the whole Body, seems to be thus produced: whilest the food (which is concocted and digested in the Bowels) is dissolved by the ferments and heat of them, a great number of *effluvia* [or particles that flow from it] go out of it; which if they could get a free and open passage, would flie and vanish into air; but being shut up in a membrane and crouded together, make an heap (as it were) of vapours like unto wind, which oftentimes bloats and distends the Guts, and where it can find vent goes forth with violence, promoting evacuation in its passage; but when it is shut up and kept in, it causes very frequently the Gripes, and many times swellings in the belly. The Wind that is created in the Bowels by the dissolution of Food, is generated after the like manner as when Pearl or Coral, or other concrete or hard matter is put into a matrace [a Chymical Vessel] and dissolved by their menstruums [or dissolving Liquors:] for in such dissolutions there are a great many vapours that flow forth, which if they are strictly kept in, force the containing vessel to break and fly in pieces: so when the Food in the first passages is either dissolved, concocted, or fermented, a vast number of such small particles flow from it, which being gathered together and shut up within the membranes, cause wind, to the more copious increase whereof, there are also other things that contribute. For it is notably produced by the struggling and boyling of juices which are not easily to be mingled. For whilest foreign humours, or heterogeneous matter, and especially Medicins, ferment with the other things which are contained in the Stomach, a great number of particles that flow from them, are gathered into a vapour by the mutual refraction of them. Moreover since many exhalations arise on every side from the boyling of the bloud, part of them breaking forth out of the Arteries into the cavities of the Bowels increaseth the stock of wind which is there already generated. But to the further augmentation of Wind, the extensions and convulsive swellings of the Bowels do likewise conduce. For whilest the membranes by reason of the greater explosions and inordinate excursions of the Spirits are very much distended, the inward cavity, like a bladder blown full of wind, is much enlarged, in so much that part of the Humour inclosed within that empty space (which is like a cucurbit after the flame is out) is rarified into wind; which afterward, when the membrane slackens, or remits of its distension, breaks out with violence, or ever now and then tumultuously breaks through the next passages of the Guts. For this reason, when any part of the Guts is obnoxious to convulsive extensions, through inflammation or setling of sharp Humours, there is wind also immediately produced, and grows extraordinary troublesom. Having opened a great many Bodies that died of an inflammation in the Colon, I have found in all of them the Guts extremely stretched, and as it were blown full of wind; which no doubt happened, not because the *flatus* or wind was first generated, and then had distended the Bowels; but the membranes being mightily stretched by the spirits which were much provoked, and exploded or discharged within their fibres, therefore these *flatus* or parcells of wind were produced secondarily, and by consequence to fill up the void or empty space. From this cause I before intimated that the Tympany did arise, and shall shew the same perhaps in another place more at large. Whereas therefore the increase of wind uses to be very plentiful in the Stone in the Kidnies, the Colick, Hypochondriack distemper, and Fits of the Mother, that is not the cause of such diseases, but the effect onely; that is to say, when in the Fits of such Distempers the membranes are extended, and the hollow Bowels swell with spirits which are violently exploded or discharged, a kind of moisture therein inclosed, is presently resolved into vapours (from which wind proceeds) to fill the empty space. And that is the reason that when the distention of the affected part is slackened, the *flatus* or wind that was so suddenly produced, is pushed forward by the falling together of the membranes, into some other part. So much for that which is contained in the Stomach and Guts, and is the object of Purging Physick, let us now in the next place inquire, as to its subject, what kind of motion that of the Bowels is, whereby the matter contained in them, being softly moved forward, is leisurely, and by intervals thrown out, or being hastily tumbled down, is voided in an hurry.

Wind is sometimes the cause and som times the effect of extensions in the Bowels.

How wind is generated in convulsive Distempers.

Of the natural expulsive motion of the Guts.

Because, for the preserving of life, all Animals stand in need of frequent and plentiful feeding, it is therefore necessary that the reliques of the Food, which is constantly altered into nutritive juice, should be seasonably carried off, and that thereby the dregs of the old nourishment should ever now and then give place to its new supplies. For when the more pure and perfect part of the chyle (in which the elements being totally dissolved, are freed from the bonds of mixture) are squeezed into the chyliferous or chyle-carrying passages, that which remains, partaking of thick sulphur and sharp salt, contracts a grievous stinking scent; wherefore it ought to be removed

removed out of the Neighbourhood of the new maſs of Chyle into the bigger Guts, and at laſt be thrown quite out of the Body. Which that it may be the better done, Nature hath planted an expulſive motion in the Guts, (that is almoſt conſtant, and as it were ſolemn or at certain times) whereby the dregs of the nouriſhment are puſhed ſtill ſoftly on, and hath appointed many Spurs as it were, or incitements to the ſame. *Phar. Rat. Part. I.*

1. As to the firſt, the expulſive motion of the Guts as well as of the Stomach, is performed altogether by the fleſhy fibres of each bowel, that compoſe the middlemoſt coat, of which I have obſerved two orders or rows in the whole paſſage of the Chyle, to wit, from the *Oeſophagus* or Weazon, even to the *Rectum*, or Arſe-gut. The outward row of fibres in the Guts, runs all along upon the ſurface of them in a ſtrait line, as you may ſee it expreſſed in Fig. 2. of the ſixth Table: but the inward row or rank conſiſts of annular or ringy fibres that encompaſs the paſſage of the Guts in every part, with thickſet circles, as is repreſented in the third Figure of the ſame Table. And when both theſe kinds of fibres are contracted, at the ſame time they ſtreighten the cavities of thoſe Entrals in every dimenſion; which being performed ſucceſſively and in order, as it were by ſeveral joggings of the matter contained, it muſt neceſſarily follow that all things therein contained muſt be puſhed ſtill forward ſlowly and with a kind of creeping motion, the former part being continually thruſt on by the latter. This motion of the Guts is commonly called the Vermicular or Wormy motion, becauſe as when a Worm creeps it is continued from one part to another like the creeping of a Worm; and according to the neceſſity of Nature, it is more or leſs performed at all times, even when we our ſelves do not perceive it; becauſe indeed thoſe Bowels ought to disburthen themſelves by degrees; and leſt they ſometimes ſhould be idle and deſiſt from this their task, they are upon occaſion ſtirred up with many incitements. *How it is performed.*

For firſt of all the very bulk of the Chyle and the dregs of it, oppreſſing the nervous fibres of the inner coat, upon which it lies, with the weight of it, and conſequently provoking them, impreſſeth upon them a ſenſe of trouble; whereupon they preſently, being already ſatisfied with nutritive juice, and weary of any other load, excite the fleſhy fibres to vermicular or worm-like contractions, in order to thruſting of the matter contained ſtill outward. When, in this manner, the contents or ſtuff contained in the belly, being puſhed ſtill leiſurely forward from one part to another, are come down near the end of the Colon, becauſe at that time there is a preſſure felt by the muſculous part of the *Rectum* or Arſe-gut, therefore the voluntary motion helps the natural, whereby after the ſphincter [or muſcle that ſhuts the *Anus*, or Arſehole] is opened, and the muſcles of the lower Belly preſſed together, the excrements are forced out. Moreover the Inſtruments of Reſpiration do ſomewhat contribute to this expulſive motion of the Guts, in as much as they continually moving the lower Belly, to and fro, cauſe that which is contained in it, by their ſhaking of it, to move ſlowly forward. *How the expulſive motion of the Bowels is excited.* *1. With the load and noiſomneſs of the excrements.*

Beſides the forementioned irritation or provocation, by which the fleſhy fibres are moved by inſtinct of Nature, and conſtant cuſtom to frequent, and almoſt continual worm-like contractions, there are alſo ſome other incitements and various inſtigations that upon occaſion do increaſe or haſten thoſe expulſive endeavours, and oftentimes force them into convulſions; in ſo much that the Belly is compelled to caſt forth its load in great plenty, with great impetuoſity, and as though it were moved by a Purge. Now thoſe internal provocations of the Belly are, firſt of all incongruous or immoderate diet, the corruptions of bad chyle, the copious dregs of the bloud and nervous juice, or ſharp humours that flow from the Glandules and other Emunctories or Drains of the Bowels, and eſpecially out of the Gall-bladder and Sweet-bread paſſage; yea and ſerofities [or wheyiſhneſs] or Humours that are ſuperfluous and incongruous, ſetling within, and proceeding from the Bloud, Nerves, or habit of the Body. Of the chiefeſt whereof (becauſe in Purging they often diſcover themſelves, and heighten the operation of the Medicin) I ſhall ſpeak particularly, and in ſhort. *2. By many other accidental cauſes.*

1. Firſt therefore Food, if in the concoction it be at any time perverted, or cannot be digeſted, very frequently cauſes a Lask; as after hard drinking over night, by inordinate Diet, eating things diſagreeable, and other errours, or from depravations the Stomachs ferment often happens. Yea, for want of concoction, and ſometimes through obſtructions in the Meſentery or paſſage of the Guts, from too much ſlimineſs of the glandulous coat, or in the mouths of the veſſels, the diſtribution of the nutritive juice is hindered, and conſequently the whole matter that is taken in, being gathered and reſtrained in the firſt paſſages, produceth more frequent and plentiful evacuations. *Food that is incongruous, &c.*

2. The

Thar. Rat. Part I.

2. The dregs of the Bloud, and the nervous juice being gathered together in the Glandules of the Bowels, the Bladder of Gall, the Pancreatick or Sweet-bread paſſage, and perhaps in other receptacles too, if at any time they overflow through fulneſs or irritation, and are abundantly diſcharged into the cavities of the Guts (in as much as they there twinge the nervous fibres, or boyl up with other juices) they oftentimes cauſe a Lask. The Gall ſeems to be a kind of natural Purge, which flowing in a great quantity out of the Choler Veſſels, cauſes Purgation of its own accord.

Gall and the Sweetbread-juice.

Humours out of the Bloud, the Nervous juice, the habit of the Body &c. move us to evacuation by Stool.

3. The Purgative matter being ſometimes tranſmitted from a ſtill more remote region, to wit, from the maſs of Bloud, the nervous Juice and its emunctories, or from the whole habit of the Body into the Guts, provokes the nervous fibres thereof, and conſequently excites the fleſhy ones into expulſive convulſions. For in the aforeſaid parts and places, and eſpecially in the maſs of Bloud, the ill ſuperfluous humours that ſwell there, being not eaſily or ſufficiently to be purged by Sweat, or Urine, oftentimes retire inward, and flow out at the mouths of the veſſels that are in the Guts and gape very thick to diſcharge them, whereby they cauſe frequent and wateriſh Stools. Yea ſometimes the Bloud it ſelf, when vitiated in its conſtitution, and apt to coagulate, if it circulate not readily through theſe ſmall Veſſels, breaks out frequently in a great quantity, and produceth a Dyſentery. But you may obſerve, when the external pores are bound up by the cold from without, or that Tumours or Swellings in the Skin, do ſuddenly diſperſe themſelves, that they are commonly attended by a Looſneſs. I have known many People who have been ſubject to be bound in their Bodies, to have been cured with this ſort of remedy; to wit, by riſing early in the morning out of their Bed, before the uſual time. For look how much is taken away from the wonted perſpiration, ſo much is added to the lubricating [or making glib] the Guts.

Theſe things being thus premiſed concerning the divers ſorts of matter contained in the Guts (as well that which it generated there, as that which comes out of other places) as likewiſe touching the expulſive motion (both natural and conſtant, as well as violent and compelled) of theſe Bowels, and alſo of the various incitements or provocatives, whereby the Belly either of its own accord is naturally looſened, or inordinately diſturbed, it will be eaſie to ſhew you how, and with what difference Purging Medicins move the Stomach and Inteſtines to evacuations, and cauſe that which is in them ſometimes ſeverally, and ſometimes jointly to diſembogue.

How Purges work upon the Stomach and Guts.

When Purging Medicins are taken in a liquid form they are immediately ready enough to operate; but if they conſiſt of a ſolid ſubſtance, and being ſo ſwallowed into the Stomach, are diſſolved and impregnated by the ferment thereof, they make as it were a kind of Tincture, which in the ſame manner as the Purging Liquor becomes Cathartick [or evacuating] as follows. That kind of Liquor being ſhut up firſt in the Stomach, and then in the Guts, immediately impregnates the hairy threds of the inner coat with its glandules, and whileſt it ſticks cloſe to them, the particles of it enter into the nervous fibres, and bloud-carrying as well as chyle-carrying veſſels, provoking each of them, as alſo the choler-paſſage, and that of the Sweet-bread, to give up and ſpew out, as it were, that which is in them. In the mean while, when the nervous fibres of the inner coat are twinged partly by the Medicin that they have drunk in, and partly by the humours ſqueezed into the cavity of it, the fleſhy fibres of the outward coat begin to ſuffer expulſive contractions, whereby to remove all that which is troubleſom to them. How theſe things are performed; firſt in the Stomach, and then ſucceſſively in all parts of the Guts, and what kind of Humours are drawn forth in the whole paſſage, we will conſider a little more accurately.

How they act in the Stomach.

1. As to the Stomach, it ſeems to be as follows; that is to ſay, the Cathartick or Purging Tincture being diffuſed in the Stomach, doth firſt impregnate the hairy threads of the inner coat, and ſticking faſt to them, is from thence by degrees delivered over to the nervous fibres; which having entered, and quickly filled, till they are ſated with it, it begins at laſt to irritate or provoke them: and they being thereby preſently ſhrivelled up, endeavour to diſſolve or diſcharge the Liquor that they have drunk in together with their own juice and the ſlimy flegm that is between the wrinkles of the Stomach. Moreover ſome other particles of the ſame Medicin (whileſt it ſtays in the Stomach) get into the mouths of the Veſſels and Glandules, which they twinge, and make them to disburden themſelves of ſerous matter and other Humours. So whileſt the bottom of the Stomach and the nervous fibres are oppreſſed and provoked by ſuch offenſive things as theſe that are in it, the fleſhy fibres being excited into expulſive contractions, draw the bottom and ſides of the Stomach upward, and make it lean toward the *Pylorus*, that ſo the load within, together with the Medicinal Tincture, may be caſt forth and tranſmitted into the Guts. Hence for a time the Stomach

Stomach enjoys some quiet, till the nervous fibres by drinking in a new stock of the same Tincture, that still sticks partly in the hairy threads, are again provoked; and when by that means a new load is poured into the cavity of the Stomach, and there disturbed, the fleshy fibres repeat the same expulsive contractions to throw it out; and thus are these things performed many times one after another, till the virtue of the Medicin be quite and clean washed out of the hairy threads, and that the spirits which reside in the fibres remit their heats; which sometimes easily and quickly comes to pass, in so much that the Stomach after one or two hours, is free from all offence which the Medicin gave it, and the remaining part of the disturbance is altogether removed into the Guts. Yet it frequently happens, that presently after taking of a Purge some People Vomit very excessively, and that notwithstanding they have thrown up the Medicin, yet they Purge very plentifully afterward. The reason of which is, that the irritation being too violent at the beginning, causes stronger convulsions, that is, such as happen in vomiting: but then when the force of that provocative is over or remitted, the gentler contractions grow purgative. For the virtue and manner of operating in a Vomit and a Purge doth not differ onely in their specifick qualities, but also chiefly in this respect, to wit, that the offence given by the provocation of a Purge may be longer and more easily endured, and at last transmitted to the Guts, but not so of that which is caused by a Vomit. But forasmuch as after the operation of a Purge that hath wrought plentifully by Stool, People sometimes vomit, the reason seems to be, because the Tincture of the Medicin which was deeply drunk in by the hairy coat, is not easily wiped away: whereupon, after many vain motions to evacuate, at last a contractive motion to vomit cleareth it quite away. 'Tis common for men, if they eat before their Stomachs are cleansed of the Medicin, to vomit mightily and be very sick withall; and the reason is, because through the hindrance or depravation of concoction, the chyle degenerates into an incongruous and irritating putrifaction: though for the most part a Purge slips out of the Stomach too soon, and without sweeping away the dregs thereof, but layeth out its greatest forces upon the passage of the Guts. Now how that comes to pass, is the next thing that falls under our consideration.

Phar. Rat. Part I.

The cause of the frequent repeated motions to Purge.

2. The Tincture of the Purging Medicin being thrown out of the Stomach, and thence carrying along with it a sort of excrementitious matter, flows into the Guts; where it presently impregnates the threads of the hairy coat in its passage through the *Duodenum* and upper part of the *Ilium*, sticking fast thereunto; after which the particles of the Medicin being more plentifully diffused about those parts, get into the nervous fibres, and likewise into the passages of the Glandules, and other vessels, provoking the Spirits that reside in them, fermenting with the humours that abound therein, and forcing them out as it were by squeezing or milking of them, in so much that that causes a great disturbance in them: by which means the fleshy fibres being bloated and contracted by the spirits that are irritated, and driven to discharge themselves, are set upon expulsive contractions in order to cast forth that which is offensive to them. Hence it is, that when the upper part of the Guts is provoked to more frequent and strong vermiculations [or Worm-like motions] whereby to thrust the matter contained in them forward, the expulsive motion being begun there, is propagated to the other Guts, and then being stimulated, or provoked by the matter contained in the uppermost, which is thrust down into them, are put all along into expulsive contractions, till the excrement that is outermost be voided, whilest there is still more and more comes into the room of it. The purging Tincture, as it is offensive to the Spirits, puts the nervous fibres upon shrivelling themselves, and causes very often most painful extensions, provoking the fleshy fibres also to expulsive contractions, as I have shewn: then for as much as it fermenteth with the Humours and matter contained in the Guts, it makes an ebullition or bubling in the cavities thereof, creates wind therein, and variously bloateth and distendeth the containing membranes, and consequently produces evacuations of the belly, with gripes, or breaking of wind.

The operation of Purges in the Duodenum and the small Guts.

Whilest the nervous and fleshy fibres are thus provoked, through the spirits being irritated by the purging Tincture, to offensive sensations, and expulsive contractions; the passage also of the Gall and Sweetbread juice being twinged and shockt, pour forth their humours, spewing them as it were into the cavities of the Guts: by both of which, and especially by the Gall, if it flow too copiously, the membranes being vellicated or twinged as much as by the Medicin it self, are urged to more frequent and greater expulsions; and therefore when the excrements are died with the yellowness of that humour, it is commonly (though falsly said) that the Gall is drawn forth, and that peculiarly by such a medicin: but if the humours that flow out of those passages do mutually boyl up, and, as some think, struggle with each other very furiously, then there

How they work upon the Gall and Sweetbread juice.

Phar. Rat. Part I.

there will be in the cavities of the Guts, a ſtill greater diſturbance, with a ſwelling of the humours and wind.

And how upon the Glandules and mouths of the Arteries.

Nor are the Gall and Sweetbread juice onely ſqueezed, or preſſed by the Purge into the paſſages of the Guts, but alſo there are ſerous humours (milked as it were out of the Glandules of the inner coat, that are bound up by being twinged, and likewiſe out of the mouths of the Arteries, which are rubbed againſt and opened) which more dilute or waſh down the matter contained in the Belly, and not only by lubricating, but by irritating promote evacuation. But the very ſlime of the Guts that ſmears over the hairy veil, if it be waſhed off by ſuch ſerous humours, and be wiped clean away by reaſon that the nervous fibres are ſhrivelled and ſhockt, is an addition to the excrements, and increaſeth their bulk. Yea, ſometimes when this ſlime is very much wiped away, and the mouths of the veſſels are thereby much twinged, and as it were ſhaven, pure bloud comes forth and cauſes gory Stools.

Thus do Purging Medicins operate in the cavities of the Stomach and Guts, in as much as they provoke the ſpirits and ferment with the humours. But from what particles or ingredients of the Medicin this irritative or provoking, and likewiſe the fermenting quality proceeds, we ſhall by and by inquire; in the mean time I obſerve, that the operation of a purging Medicin reaches far beyond the firſt paſſages, to wit, into the maſs of bloud, the nervous liquor, and conſequently into the brain, heart, and other parts or bowels.

How Purges work upon the Bloud: and alſo upon the whole habit of the Body.

1. As to the Bloud, it is manifeſt that the particles purging Medicins are received into the maſs of it, and circulate [or go round the body] with it, from this, that the Urine borrows its ſmell and colour from ſome of them. The Milk of a Nurſe that hath taken Phyſick, purgeth the Child. Some Medicins evacuate the Water of thoſe that are troubled with a Dropſie by Stool. *Reſin of Jalap* uſes to purge forth a Lieiſh Serum that ſmells like piſs. Moreover from the common obſervation of both the Ancient and Modern Phyſicians, a Purge that is opportunely given in the declenſion of a Fever, draws forth the feveriſh matter that was before ripened and apt to come away. Wherefore I make no queſtion, but that ſome particles of the purging Medicin are admitted into the Bloud, and diffuſed through its whole body or maſs. And indeed we need not trouble our ſelves to make any long enquiry about the paſſages at which it enters, for of neceſſity ſome particles of the purging Medicin being mixt with the nutritive juice, muſt creep in at the milky veſſels. Moreover ſince there is a thick Wood as it were of Veins, inſerted or planted in the inner coat of all thoſe Bowels where concoction is performed, it will be natural enough to conceive, that ſome parts of a Medicin as well as of the Food, may be carried through theſe paſſages into the Bloud; and being diffuſed in great quantity, firſt into the Veins, and then into the Arteries (if they are altogether heterogeneous [or of a contrary nature] and untamable) diſturb the maſs of Bloud, toſs it to and fro, and provoke the exoneration or excluſion of themſelves as well as that of the Blouds dregs: but the Bloud being ſo diſturbed, and put into an expulſive fermentation, diſchargeth the particles of the Medicin together with other recrements or dregs that are to be thrown out through the mouths of the Arteries belonging to the Guts (which at that time are likewiſe twinged and opened by the Medicin) into the cavities of thoſe Entrals, in order to their immediate evacuation. In this manner the ſerous or wheyiſh excrements and corruptions or ſuperfluities of the Bloud are purged out of its maſs, together with the purging Tincture that is remanded [or ſent back] into the Guts. Moreover when the bloud veſſels begin by this means to be emptied, then other ſuperfluous or dreggy humours, that were ſetled about the Bowels, Heart, Brain, or habit of the Body, are again ſucked into the maſs of Bloud, and being drawn immediately (whileſt the expulſive fury of it yet remains) toward the Guts, are caſt forth any way that is then open; by which means purging Medicins work upon the whole Body, and draw forth incongruous and noiſom matter from all parts, be they never ſo remote.

Three degrees of Purging by Medicin.

As therefore I formerly obſerved that there were three degrees of a Lask proceeding from Humours, or a natural Purge; ſo I thought fit at preſent to make as many kinds or ranks of Purges that are cauſed by Medicin. The firſt of them I take to be when by reaſon that the nervous fibres of the Guts are gently irritated, the fleſhy ones being contracted beyond their uſual rate a little faſter and ſhronger, thruſt forward all the looſer matter that is in them more ſwiftly from one part to another, till at laſt they kindly caſt it forth. In the ſecond ſort of Purgation, ſome other Humours that are preſſed out of the Gall paſſage, the Sweetbread paſſage, and mouths of the veſſels which are vellicated by the Medicin, are voided together with the excrements of the belly. In the third, not onely theſe paſſages being more vehemently provoked, do pour forth a greater quantity of Humours of all kinds into the cavities of the Guts, but alſo there

is a recrementitious ſort of matter that is brought by the Arteries out of the Bloud (which is diſſolved and precipitated by the particles of the Medicin that are admitted into it) and by conſequence alſo out of the nervous juice and other parts, into the Guts, through which it is evacuated. *Phar. Rat.* Part I.

Hence I think it is very manifeſt, that Purging is performed onely by irritation, fermentation, and expulſion, and not (as the Vulgar ſuppoſe) by attraction. Nor ought any Philoſopher or other, that pretends to give the reaſon of things, or to uſe his own, to aſſert, that any Medicins through the ſimilitude or likeneſs of their ſubſtance, or by reaſon of any (I cannot tell what) ſpecifick qualities, act upon any particular and determinate humour, ſo as to purge that forth peculiarly by it ſelf. But whereas ſometimes Gall, Phlegm, Serum [or Whey,] or Melancholy [black choler] is ſuppoſed to be ſeparated and diſcharged apart from any other, that ſeems to be, either becauſe the Medicins provoke the Entrals in a different manner, or that they ferment divers ways with the Bloud and other Humours: or laſtly, that they give a tincture or die to the very excrement it ſelf. And it will be worth our while to give ſome reaſons and inſtances for each of theſe caſes. *Purges do not work by attraction or ſpecifick qualities, &c.*

Firſt therefore Medicins, according as they contain particles that are more volatile or fixed, gentle or ſharp, ſmooth or rough, do variouſly irritate or provoke the Bowels, and conſequently cauſe expulſive contractions either weaker, or ſtronger, and ſometimes in one place ſometimes in another, ſooner and with more force. For example, Roſes, Violets, Caſſia, Manna, and other the like, that are compounded of ſubtle and thin parts, moſt commonly diſturb not the *Stomach* at all; but when they are got over the *Pylorus* they begin to irritate the nervous coat of the *Duodenum*, which is more exquiſitely ſenſible, and before they go any farther, ſpend almoſt all their force there; and by that means the paſſage of the Gall being ſhockt through the vellication or twinging and ſhrivelling of that coat, the excrements are mixt with Gall when we void them. On the other hand other Medicins, as Gum Ammoniack, Opopanax, Sagapenum, Turbith, and the like, that conſiſt of a thicker and more viſcous matter and particles more obtuſe or dull, are not ſo ready in their operations, as preſently to provoke the parts, but when they are diſſolved in the Stomach, and from thence got into the Guts, begin their vellications or twingings, not on a ſudden, but when they are advanced ſome ſpace, and have ſtuck for ſome time to their coats, and that below the paſſage of Gall: whereupon, beſides the common excrements and ſome ſerous humours that are ſqueezed out of the mouths of the Veſſels, they ſhave and wipe off the ſlime that covers the Guts, and thereby cauſe Stools that are ſeemingly petuitous or phlegmatick. *The differences of Purging operations.* *1. From their different irritations in the Bowels.*

2. In as much as Medicins, being indued with particles of ſeveral kinds, do variouſly ferment with the Bloud and other juices, they cauſe evacuations ſometimes of ſerous, ſometimes of cholerick, or other kinds of Humours. For ſome, as Aloes eſpecially, and Rhubarb, becauſe they contain in them particles of matter that is, as it were, aduſt, beget ſuch like particles in the Bloud; ſo alſo they excite the aduſt dregs thereof to motion, and force them more plentifully into the choler paſſages: ſo that when by this means the choler is more copiouſly gathered together, and flows out of its receptacles into the Guts, the excrements become more cholerick. I have known ſome that by drinking raw, plain Milk, to the quantity of two pints, have uſually been purged, and voided excrements altogether yellow: The reaſon of which is, that the Milk it ſelf turned to choler, as by bitter Belches and heat of the Bloud, which was preſently cauſed (as if the Gall ſwelled up) I might reaſonably conclude. Moreover other purging Medicins, as *Jalap*, *Colocynthis*, *Elaterium*, and ſome Preparations of Mercury, conſiſt of ſharp particles, which are often corruptive, and being admitted into the Guts, and thence tranſmitted into the Bloud, do notably diſſolve the maſs thereof, and precipitate it very ſtrongly into a ſerous or wheyiſh conſtitution; yea, ſometimes they do as it were invenom it, and corrupt the temper of it. Then, if at the ſame time that the Bloud is ſo diſſolved, there be a vellication in the Guts, the ſerous dregs of the Bloud, with its corruptions and meltings, are ſpewed out of the mouths of the Arteries, that are there opened, into the cavities of the Bowels, and by that means our Stools are very wateriſh. But if, after the Bloud is ſo melted, as it were, by the Medicin, and injured in its temper, a man hath but few Stools, the Bloud becomes ſtill more depraved by that incongruous and corruptive mixture, and thereby gains a notable ill temperament; or elſe by diſtributing its dregs and corruptions into the habit of the Body, makes puſtles and watery bladders break out in the Skin. For ſo, by the unskilful uſe of Phyſick oftentimes great evils do enſue. Nor is it for nothing that the vulgar are ſo afraid, if at any time a Medicin doth not work as they expect, leſt the virulence thereby contracted and left in the body, after it hath lain there a conſidera- *2. As they variouſly ferment with the Bloud.* *The ills that follow from ſtrong Purges.*

Phar. Rat. Part I.

ble time, may at last produce bad effects: for from such an occasion sometimes Leprosies, as it were, arise. Not long ago, a purging Powder (and as I supposed, Mercurial too) was given to a certain persons two sons at *Oxford*, by an Emperick or Quack; whereof the one was purged for the space of 24 hours an hundred times at least, with gripes and great fainting of his spirits; whilest in the mean time the other, who was something the elder, had never a Stool; but in a few days his hair came off, his nails grew black, and in a short time after watery Pushes broke out all over his Body, which being hardened into one continued scabby scurff, fell away, and immediately new ones arose in the room of them: which Distemper, through the extraordinary vitiousness of the temper of his bloud, which was as it were poisoned, being altogether incurable, tormented the poor Youth most grievously for above two years before he could be perfectly cured. Nor is the mass of Bloud depraved by Mercurial Medicins onely, but sometimes also by other Purges, taken from the Family of Vegetables, in so much that it cannot be restored, or renew under a long time. So that it is not without cause that *Helmont* complains and says, that purging Physick doth not always or onely draw forth Humours that are in the Body, but also by its corrupting qualities depraves them.

A notable example of it.

Whence came the errour of elective Purge.

3. The errour of elective Purging hath taken root yet deeper, from this, that Liquids which are voided through the belly (being they borrow sometimes their colour from the Medicin, are falsly believed, because they are cholerick or melancholick before hand, to be educed or drawn forth apart from other humours. Nothing is more usual, than for Urine and Siege too to be died yellow by *Rhubarb*, *Alloes*, Roots of *Termerick*, and some other Medicins that People take; so also the Infusion of *Senna*, and purging Medicins that have Chalybeate or Vitriolick ingredients in them, make the excrements which they evacuate; look black. Moreover a different constitution of Body, and temperature of the humours, produces divers appearances in the excrements. For since in some the choler Vessels swell with the humour they contain, and in others vitriolick Salts which are the Parents of that black tincture settle in the first passages, whilest some again, by reason of their ill diet, have abundance of serous matter gathered in their whole Body, it therefore makes People think, that when such Stools follow upon the taking of such or such a Medicin (if it happens that one sort of Humours are purged by that which they commonly call a *Cholagogon* [or Gall-purger] and another sort by a *Melanogogon* [black Choler-purger] and so another by an *Hydragogon* [or Water-purger] that such Humours are purged by such a Medicin electively [or as it were out of choice.] Wherefore as to the choice of purging Medicins, although those classes or peculiar sorts of Medicins appropriated to this or that juice, do not at all please me; yet I think that all Purges are not to be used indifferently in all cases; but on the contrary, you must take the advice of a good Physician, who can tell how to distinguish between them, and according to the strength of the Patients, their temperament, the strength, and constitution of the Bowels, their ability, custom in Diet, and imagination, yea, and according to the nature of the Distemper, as also the time and condition of it, may apply a weaker or a stronger Purge, of hot or temperate, gentle or sharp, solid or liquid, or any other kind of Medicins.

Purging not needful to prepare the Humours.

The ancient Physicians, to whom also the Modern ones, (a great many of them) assent, affirmed not onely Purging to be elective, but also that a preparation of the Humours was previous, and as it were necessary to it: Wherefore in their practical Books, where-ever Purging is prescribed, you have very formally and pompously, as it were, a long Bedrol of Preparatives designed for such and such Humours; the use whereof, although it seems very plausible, yet is, methinks by no means advantagious; because indeed there are no such humours in nature, as I have elsewhere clearly shewn. But seeing Purges are not convenient at all times, nor in every constitution of the Body, for the right performing thereof there is required both opportunity and some sort of preparation too; both of which respect or concern not onely the first passages, but the mass of Bloud.

What Preparation is required for Purging,

1. In respect of the Stomach.

As to the first, If at any time the Stomach is oppressed with a load of slimy phlegm, or troubled with a boyling of the Gall when it swells, it is oftentimes in vain or irregular to purge, unless the matter contained therein be first cleansed away by a Vomit, or that their oppression and heat be taken off by Digestives.

2. In respect of the Bloud.

But as to the Bloud, many times a Purge is unseasonable, and sometimes also incongruous; and in neither of these cases do Preparatives, but onely things that alter it, agree: for those imaginary Humours are not to be disposed for evacuation, but the bloud it self ought to be reduced, either from a troubled and confused state to a calm; or from weakness or ill temper to strength and an even constitution. Whilest the Bloud, as it boyls in a Fever, is disturbed in its mixture, Purging is always found

to

to be hurtful; and therefore it is condemned by *Hippocrates* and the Ancients: So alſo whileſt the maſs of it, being languid and weak, doth not riſe to a due ferment, all ſuch Medicins are forbidden. Moreover when the Bloud is exceſſively full of Choler or Water, or is inclined too much to coagulations or diſſolutions, Purges for the moſt part do not remove ſuch defects or depravations of it, but oftentimes increaſe them. But rather in ſuch caſes Medicins that alter the Bloud are proper; that is, ſuch as may deſtroy the hurtful ſeparations or combinations of Salts, Sulphur, or Serum, and remove all other their enormities. Of which Medicins for purging, whether previous[or preparative] or (which moſt commonly are the better of the two) ſuch as ſupply the place of a Purge, to wit, digeſting and altering Phyſick, I ſhall ſpeak hereafter in particular. *Phar. Rat.* Part. I.

Concerning the Theory or ſpeculation of purging Phyſick, I ſhall not ſay much more; unleſs it be, that ſeeing (as is manifeſt from what I have already told you) that Purges not onely provoke the ſpirits that reſide in the fibres of the Bowels (ſome of them) to reſent the trouble given them, and (conſequently others) to contract themſelves into expulſive motions, but alſo ferment the Humours and the Bloud, compelling them into various diſſolutions and ſeparations of the parts; it remains that we enquire, upon what ſort of particles, whether Elementary or Secondary, and (if I may ſo ſay) qualitative particles, both thoſe qualities (as well the irritating as the fermenting quality) depend. Hereupon in general I have obſerved what ſhall hereafter be confirmed by inſtances, to wit, that the irritating quality which is uſually exerted in the Bowels, and by the inſtinct whereof the purging contractions are cauſed, proceeds in no wiſe from the principles or particles of the Medicin, whether ſpirituous, watery, or earthy, no nor from the Salt or Sulphureous ones alone, but from them always joined together, and ſometimes alſo when joined with others. For though that Salt and Sulphur are the chief inſtruments of purging Irritation, yet neither of them by it ſelf uſes to be ſo offenſive to the Bowels as to excite the motive fibres into expulſive contractions; but when they are joined together, they exalt and ſharpen each other; yea, they put our Bodies into a temperature which is very hurtful and never to be reduced. The tincture of Antimony, as likewiſe the Ceruſs of it, give no offence to the Stomach, but are rather grateful and cordial. But *Crocus Metallorum*, *Stibium*, Butter of Antimony, and other things prepared out of Sulphur and Salt mixt together, are exceſſive ſtrong Vomits or Purges. In like manner I have elſewhere obſerved, that ſulphureous and ſaline particles, when ſeparated from each other and alone are grateful enough both to the ſmelling and the taſte, but when they are intimately mixed with each other, gain preſently a ſtink, or ranck rotten ſmell.

The virtue of a Purge is either irritating or fermenting.

upon what particles both of them depend.

1. The irritating quality.

But now as to the purging Fermentation, it doth not ſo plainly appear, whether the ſame particles that provoke the ſpirits to expulſive contractions, do alſo diſſolve the Bloud and make it ſeparate into ſeveral parts, ſo as to pour out the dregs of it through the mouths of the Arteries into the cavities of the Bowels. Indeed the Bloud, like Milk, is uſually diſſolved and precipitated into ſerous Humours, moſt commonly by Acids onely, as I ſhall by Experiments and Reaſons hereafter plainly demonſtrate. Alchali Salts, fixed and volatile, yea, and nitrous too, do not at all diſſolve the mixture of the Bloud, but rather keep it entire, and reſtore it when diſſolved; ſo likewiſe doth Spirit of Wine, and other things that are purely ſulphureous; but ſo far are Acids from promoting purgation, that nothing doth more infringe, or weaken, and totally take off the purging quality of Medicins.

Upon what particles the fermenting quality depends.

That therefore we may make a judgment concerning Purges by ſenſe, I think it probable, that they (being endued with a taſte that is moſt commonly ſharp, and ſomewhat poignant) together with Sulphur, are impregnated with a kind of volatile and ſharp Salt, which in the ſtronger ſort of them, is in ſome meaſure putrefactive; and that ſuch particles in them, which are ſulphureoſaline, do not diſſolve the Bloud like Acids, or other precipitating Salts, that is to ſay, by embracing ſome parts of it, more intimately and cloſely, and ſo ſeparating them from their aſſociates, to oblige them to become their own companions; but on the contrary, the purging particles, being diſagreeable to the whole maſs of Bloud and all its particles, as alſo immiſcible [or not mingleable with it] and untameable, put them all into confuſion like themſelves, and excite them to an expurgative effervеſcence [or boyling up]; which by the immediate aſſiſtance of the pulſe of the heart, growing quicker, is not allayed or cooled before all heterogeneous parts are thrown out, together with ſome portion of the ſerous Humour wherewith they are mingled, and ſometimes alſo other dregs of the Bloud too.

The maſs of Bloud being impregnated with the particles of a ſtronger ſort of Purge boyls up at the ſame rate, as generous Wines, when other ſorts are thrown

Phar. Rat. Part I.

into the ſame Veſſel, are ſaid to ferment anew to expel that which is diſagreeable to their body; and therefore ſometimes they continue to bubble up in the Fat, till either the Veſſel breaks, or their temper be quite vitiated. But this doth not happen ſo frequently to the Bloud, becauſe not onely the incongruous particles of the Purge are thrown out of the Arteries (which are open in all parts, but eſpecially ſomewhat more apparently into the cavities of the Guts) but alſo the other parts of the Bloud it ſelf, which are vitiated and ſeparated, are eaſily evacuated. Although purging Medicins too ſometimes, if they are too violent, do much pervert the temper of the bloud, and as it were poiſon it. For indeed ſome of them that plainly corrupt the bloud, work by way of Lask, juſt as Cantharides do by Urine; that is, they in ſome meaſure melt and corrupt the maſs of it, and then thoſe melted parts of it together with the rejected particles of the Medicin, do by their ſharpneſs very much provoke, or many times corrode the parts that they paſs through. Wherefore let thoſe that deſire health or long life, avoid all Quacks that uſe hardly any thing but Mercurial and ſtrong Medicins, more than they would a mad Dog or a Serpent.

CHAP. II.

The ſeveral ſorts of Purges, with the Receipts and Reaſons of ſome Compoſitions.

Scarce any Purges made of Minerals, though Vomits and Sweating Medicins are.

Minerals do not much contribute to the number of things that are purging, though the beſt Vomits and Sweating Medicins are taken chiefly out of that Storehouſe: but purging Medicins, being of a midling and a different operation, cannot be formed out of thoſe impure and harder ſubſtances. For if the purging quality, though never ſo correct, be in any meaſure left as a Spur, in the mixt body, whatever irritation proceeds thence in the Stomach, will prove a Vomit; but if that quality be totally removed, then there will be no evacuation cauſed in the Bowels, but through the virtue of ſome Reliques of the *Sal Alchali*, all the operation will end in Sweat.

The reaſon of that difference.

For vomiting Medicins ſeem to be ſuch, as being not by any means to be ſubdued and tamed in the Stomach, but impregnated with ſharp, and as it were, pointed particles (that is to ſay, Sulphureoſaline ones) provoke it to violent, expulſive contractions, to the end that they may be thence exterminated, or diſcharged by the ſhorteſt paſſage, which is immediately by Vomiting: on the contrary, Sweating Medicins though they cannot be ſubdued and tamed, yet if their ſharpneſs be taken off, and their particles broken into round bits, as it were, which have no edge, they do not at all provoke the Stomach, but paſſing into the maſs of bloud, ferment it (as being unmingleable and untameable) and put it into an univerſal heat, whereby they make way for themſelves to evaporate along with the ſerous Liquor and other dregs of the bloud. But Purges being endued with particles that are incongruous, more dull, and weak, do not either immediately or vehemently irritate the fibres of the Stomach; but when they are got ſomewhat deeper into them, they firſt cauſe an offenſive perception, and then, that they may caſt forth what is troubleſom without any great diſturbance, they increaſe and multiply the uſual expulſive and ordinary motions, that is to ſay, through the paſſages of the Guts.

Some Purges are taken from Minerals, but are improperly ſo called.

But ſome purging Medicins are taken out of Minerals, as *Mercurius Dulcis*, *Lapis Lazulus*, *Armenus*, and ſome other, which for all that, are improperly ſo called, for they are very uncertain in their operation, in ſo much that they are ſeldom uſed for that end by themſelves, though with other purging Ingredients they are given very ſucceſsfully.

Purges are taken moſt from Vegetables, and are of various ſorts.

But when we come to Vegetables, here we enter into a Field that is broad, and largely planted with things that are purgative: which ſince they are of many ſorts, are uſed to be recounted and diſtributed in ſeveral manner; that is to ſay, into the more gentle ſort, the middling ſort, and the ſtronger; ſo alſo into Gall-Purgers [*Cholagoga*] Melancholy-Purgers [*Melanogoga*] Phlegm-Purgers [*Phlegmagoga*] and Water-Purgers [*Hydragoga*]: and furthermore, into Excoproticks [or Dung-Purgers] Minoratives [or leſſeners] and Eradicatives, [or rooters out of any Humour.] I need not inſiſt upon each of theſe diviſions, but will reduce all Purges to three kind onely: that is, in the firſt place I will give you, ſuch as make no great irritation in the bowels, and cauſe in the bloud and humours no more than a gentle fermentation: of which ſort are *Violets*, *Caſſia*, *Tamarinds*, *Roſes*, *Rhubarb*, *Senna*, *Myrobalans*, *Epithymum* or *Dod*,

Theſe ſorts of Purging Vegetables.

Phar. Rat. Part. I.

der, Carthamus or *Wild Saffron, Agarick, Aloes* and the like. Secondly, Such as create not onely a twinging in the Bowels, but alſo a ſomething ſtronger effervеſcence [or boyling] in the humours; in ſo much in theſe latter great diſturbances, and thoſe ſometimes feveriſh ones too, are raiſed; and in the former, [to wit, the Bowels] contractions, and gripes, though not very intolerable, are excited: in which rank there are placed *Scammony, Turbith, Hermodactyls, Mechoaca, Jalap, Ebulus* or *Dwarff-Elder*, or *Wallwort, Elder, Opopanax, Sagapenum.* In the laſt place I ſhall ſhew you ſuch as vellicate or twinge and lance, as it were, the Stomach and Guts extremely; yea, ſuch as very much diſorder the bloud and other humours with a kind of putrefactive quality, melting as it were, and diſſolving the mixture of it. Such are *Hellebore, Elaterium, Soldanella* or *Bind-weed, Euphorbium, Eſula* or *Spurge, Coloquintida*, &c.

Purging Vegetables do not need much chymical Preparation.

Vegetables do not always need, as Minerals do, any long preparation to open their compoſition; for they oftentimes whileſt their mixture is entire (quite contrary to what I have obſerved concerning Minerals) work the more ſtrongly. For ſuch things whoſe virtue conſiſts in a ſubtle and fugitive compoſition, ought not to be reduced into Extracts, Magiſteries, or Quint-Eſſences by any great chymical trials or preparations: but many of them, as *Rhubarb, Manna, Caſſia, Senna, Myrabolans*, &c. being reduced into Pills or Powder, or infuſed or boyled in a convenient liquor, work not onely better but more eaſily too; which, if they be tortured with too much artifice, either totally loſe their purgative quality, or exert it very ſlowly and with ſome reluctancy.

Some of them are bettered by extraction.

It hath been uſual to draw forth the tinctures of Vegetables by impregnating the liquor, into which they are infuſed, with Salts of Tartar or Wormwood; for by that means it quickly gains a deeper colour. Although I do not diſapprove of this method, in as much as the fixed Salts of Herbs boyl up with the acid juices of the Stomach and Guts; yet I may lawfully diſcover the cheat that lies hid in it, for the Salts do not draw forth that full Tincture, but onely make it appear. For if you put the Salt of Tartar into an Infuſion of *Rhubarb, Senna*, or any other vegetable, which is already made and ſtrained, immediately the tincture or colour of it will become deeper: the reaſon of which is, becauſe the Salt-fixed particles, being very obtuſe or blunt, ſtop the pores of the Liquor, in ſo much that the rays of light are very much refracted in their paſſage: wherefore any tincture, which is made deeper by the Salt of Tartar, will become preſently more clear and thin, by pouring into it the ſpirit of Vitriol, whoſe particles are ſharp, without the precipitation of any matter at all.

What Salt of Tartar contributes to the extracting of a Purging tincture.

But yet among vegetable Purgers, ſome are mended by Chymical preparation; for in thoſe that are filled with Salt and Sulphur, in which active and kind particles can be ſeparated from the more dull and hurtful ones, and be reduced into reſinous, or otherwiſe compendious extracts, no queſtion, but the reſolution and new compoſition of them may be performed with good ſucceſs. Wherefore, when we would rightly prepare ſome ſorts of Purges, we extract with ſpirit of Wine, the ſulphureous part, and ſomething of the ſaline too, as in the reſinous magiſteries of *Jalap, Scammony, Mechoaca*, &c. For others we uſe ſaline menſtruums [or Liquors to diſſolve them,] to wit, diſtilled Vinegar, or Waters ſharpened with ſpirit of Vitriol, or Salt of Tartar, and that in a double reſpect; that is, either that the Medicin may be compoſed in a leſs bulk and a neater form, through the ſeparation of the active particles from the earthy matter; or that all the vehement or virulent qualities of the mixed body, may be drawn out or tamed.

It would be an infinite pains and trouble to me particularly to relate in this place all the ſimple Purges, with their Preparations, Diſpenſations, and Doſes: but it is ſufficient for my purpoſe, ſince the principal compoſitions of Purging Medicins are Potions, Powders, Boluſes, Morſels or Tablets, and Drinks or Infuſions in Wine; to lay down ſome choice Receipts of each, and thoſe of a threefold nature; according as the operation of the Medicin ought to be, gentle, middling, or ſtrong; to which I ſhall add, in the fourth place, the Receipts of purging Medicins that are eaſily had, for the benefit of the Poor.

The chief Receipts for Purges.

I. Gentle Potions.

Gentle Potions.

Take of Rhubarb ſtreded ℥ iij. *of Citron-coloured Santalum* [*or Sanders*] ℥ ß. *of Salt of Tartar* ℈ j. *infuſe it cold all night in water of Cichory, and of white Wine* ℥ ij. ß. *of the clear ſtraining* ℥ iij. *add to theſe of Syrup of Cichory with Rhubarb* ℥ ß. *of Cinamon water* ℥ ij. *make a Potion.*

2. Mid-

Phar. Rat. Part I.

2. Middling Potions.

Middling ones. *Take of the beſt Senna* ℥ iij. *of Rhubarb, Agarick trochiſed, of each* ℥ j. ß. *of Citron-coloured Santalum* ℈ ij. *of Salt of Tartar* ʒ ß. *of Coriander ſeeds* ℥ j. *infuſe it cloſe and hot* ℥ iij. *of white Wine and as much Fountain water, all night; of the ſtraining thereof* ℥ iv. *add to it of the Syrup of Citron or Oranges* ℥ j. *of aqua mirabilis* ℥ ij. *make a Potion.* Or, *Take of the Decoction of Senna Gereon* ℥ iv. *of Syrup of Roſes diſſolved* ℥ j. *of Cream of Tartar* ℥ ß. *of Cinnamon water* ℥ ij. *Make a Potion.*

Take of the beſt Senna, of Caſſia Fiſtula, and Tamarinds, of each ℥ ß. *of Coriander Seeds* ℥ ij. *boyl in Fountain water* ℥ x. *of it, till the third part be conſumed of the ſtraining clarified with the white of an egg, adding of the Syrup of Citron or Oranges* ℥ j. *Make a Potion.*

3. Strong ones.

Strong ones. *Take of the 'Decoction of Senna of Gereon (with the addition of the fibres of black Hellebore, and Agarick, of each* ʒ j. ß.) ℥ vj. *of Syrup of Roſes diſſolved, or of Orange flowers* ℥ j. *of aqua mirabilis* ℥ ij. Or,

Take of the beſt Senna ℥ ß. *of the fibres of black Hellebore, of Turbith, of each* ʒ ij. *of Citron-coloured Sanders* ʒ j. *of Coriander ſeeds* ʒ j. ß. *of Salt of Tartar* ʒ ß. *make a cloſe and hot infuſion in* ℥ viij. *of white Wine all night, of the clear ſtraining* ℥ v. *add to it of Electuary out of the juice of Roſes* ʒ iij. *Syrup of the Purging Thorn* ʒ vj. *of Cinnamon water* ʒ ij. *Make a Potion.*

4. Potions that are eaſily had for the benefit of the Poor.

Take of Purging Flax one handful, of the ſeeds of ſweet Fennel ʒ ij. *boyl them in Spring water, as much as is ſufficient, to* ℥ vj. *add of white Wine* ℥ ij. *Make a Potion. In the ſame manner you may make a draught, to purge you, of the flowers of red Damask Roſes; as alſo of the leaves of the Orange Tree, and of the Roots of Eupatorium of Avicenna.*

II. Pills. Firſt of a more eaſie operation.

2. Gentle Pills. *Take of Stomach Pills with Gum* ℈ j. *to* ʒ ß. *of Tartar Vitriolized* gr. ij. *of Balſam of Peru as much as is convenient, make* iij. *or* iv. *Pills. You may make them in the ſame manner from a maſs of Pill Ruffi, Maſtich of Amber, or ſweet Gum, and alſo of my Extract diſſolved, the deſcription whereof you may ſee in my Treatiſe of the Scurvy.*

2. Middling ones.

Middling ones. *Take of Stomach Pills with Gum* ʒ ß. *Roſin of Jalap* gr. iv. *to* x. *of Tartar vitriolated* gr. vj. *of Ammoniack diſſolved a convenient quantity, and make* iv. *Pills. In like manner you may make them out of a maſs of Pills of Succinum, Tartarized according to Quercetan. So alſo in the room of Roſin of Jalap put of Scammony ſulphurized* gr. vj. *to* xij. *or Roſin of Scammony* gr. viij. *to* xiv. Or, *Take of Stomach Pills with Gum, of each* ℈ j. *of Roſin of Jalap* gr. vj. *to* xij. *of Balſom of Peru, a convenient quantity, and make* iv. *Pills.*

3. The ſtronger.

Strong ones. *Take of Pill Rudy* ʒ ß. *Roſin of Jalap* gr. viij. *to* xij. *of Balſom of Peru a convenient quantity, and make* iv. *Pills to be taken according to order. In like manner you may prepare them out of a maſs of Pill Cochy of Sagapenum. Take of the Pill of two ingredients* ℈ j. *to* ʒ ß. *of Calamelas* ℈ j. *make* iv. *Pills, to be taken according to order.*

4. Thoſe that are eaſie to be got, and of a leſs price.

Thoſe that are eaſie to be had, of a leſs price. *Take of the Powder of choice Jalap* ʒ ij. *of Diagridium* ʒ j. *of Cloves Ginger, of each* ℈ j. *of Ammoniack diſſolved a convenient quantity, and make a maſs. The Doſe is* ʒ ß. *Take of Pill Cochy* ʒ ß. *to* ℈ ij. *and make* iv. *Pills.*

III. Pow-

Phar. R. Part I.

III. Powders. First Gentle ones.

Take of Rhubarb pulverized ʒß. *of Salt of Wormwood* ϑ ß. *of Cloves* gr. ij. *make a Powder and give it in a ſpoonful of clear Cinnamon Water, or in a draught of Ale.* *Gentle Powders.*

Take of the Powder of Senna major compound. ʒ ß. *to* ʒ j. *give it in a draught of Poſſet drink.*

Take of the Powder of the leaves of Senna ϑ j. *of Calamelas,* gr. xvij. *of Citron-coloured Sanders* ϑ ß. *make a Powder, and give it in a Spoonful of Panada.*

2. Middling ones.

Take of the Powder of Diaſenna ʒ j. *of Cream of Tartar* ϑ j. *make a Powder, and give it in a draught of Ale.* *Middling ones.*

Take of the Roſin of Jalap gr. x. *of Calamelas* ϑ j. *of Cloves* gr. vj. *make a Powder, and take it the ſame way.*

Take of the ſpecies of Diaturbith with Rhubarb ʒß. *to* ʒ j. *of Cream of Tartar* ϑ j. *to* ʒ ß.

3. Strong ones.

Take of Turbith and Hermodactyls of each ʒ iij. *of Diagridium* ʒ j. *of Ginger* ϑ j. *make a Powder. The Doſe is* ʒ ß. *to* ʒ j. *Strong ones.*

Take of the Powder of Cornachinus [a Mans Name] ʒ j. *give the Powder of Hermodactyls compounded, the ſame way; as likewiſe the Hydrotick, or Water-purging Powder of Riverius.*

4. Such as are cheap and eaſily gotten.

Take of the Powder of the Roots of choice Jalap ʒ j. *of Ginger* ϑ j. *Give it in a draught of White Wine. So likewiſe of the Powder of the Roots of Mechoaca, as alſo of the Leaves of Senna to* ʒ j. *Take it in any Liquor.* *Cheap ones.*

IV. Boluſſes and Electuaries. First, Such as work gently.

Take of Lenitive Electuary ʒ ß. *of Cream of Tartar* ʒß. *of Syrup of Roſes a convenient quantity: make a Bolus. Take of freſh Caſſia* ʒß. *of the Powder of Rhubarb* ʒ ß. *of Cream of Tartar* ϑ j. *of Syrup of Roſes as much as ſuffices, and make a Bolus.* *Gentle Boluſſes and Electuaries.*

2. Middling ones.

Take of Lenitive Electuary ʒß. *of Cream of Tartar* ʒ ß. *of Roſin of Jalap* gr. vj. *of Syrup of Roſes a convenient quantity, and make a Bolus.* *Middling ones.*

Take of Electuarium Diaphœnicum ʒ ß. *of Powder of Hermodactyls comp.* ʒ ß. *of Syrup of Elder a convenient quantity, and make a Bolus.*

3. Strong ones.

Take of Electuary of the juice of Roſes ʒß. *of Roſin of Jalap* gr. x. *of Cream of Tartar* ʒ ß. *Syrup of Elder a convenient quantity, and make a Bolus.* *Strong ones.*

Electuaries are compounded of the ſame ingredients in a greater quantity, adding thereto Conſerves of Damask Roſes, or Peach Flowers: the Doſis being the quantity of a Cheſnut, to be taken every day early in the morning, or twice or thrice in a Week.

4. Boluſſes and Electuaries that are eaſily had.

Take of Powder of the Roots of Jalap ʒj. *of Mechoaca* ʒ ß. *of Ginger* ʒ ij. *of Cloves* ʒ j. *Such as are eaſily had.*

Phar. Rat. Part I.

of Cream of Tartar ʒ iij. *of Salt of Wormwood* ʒ j. *of Sugar* ʒ ij. *of Syrup of Roſes diſſolved, a convenient quantity, and make an Electuary. The Doſe is the quantity of a Wallnut.*

The looſening Medicin called *Confectio Solutiva*, and that made of looſening Raiſins, as alſo the *Diaprunum* [or Medicin made of Prunes] by *Sylvius*, are to be found in *Praxis Medica, p.* 30.

V. Morſels or Tablets of indifferent operation.

Morſels or Tablets.

Take of the Powder of Mechoaca, and of Gummy Turbith, of each ʒ ß. *of Scammony ſulphurated* ʒ ij. *of Roſin of Jalap* ʒ j. *of yellow Sanders* ʒ j. *of Cream of Tartar* ʒ ij. *of Conſerve of Violets* ʒ j. *of Sugar diſſolved in Roſe water, and baked into Tablets* ℔ j. *according to Art; let the weight of each Tablet be* ʒ j. *The Doſe* i. *or* ij. *purging Tablets: in* Sylvius Praxis Medica, p.28.

VI. Infuſions in Wine and Ale, or the like, or gentle Purgers.

Infuſions in wine and Ale, &c.

Take of the Leaves of Senna ʒ j. ß. *of Turbith and Mechoaca, of each* ʒ vj. *of the fibres of black Hellebore* ʒ iij. *of Cubebs, of the Roots of Gallingal, and of ſharp Cinamon, of each* ʒ ij. *put them in a large Glaſs with four Pints of Rheniſh Wine, and of Salt of Tartar* ʒ j. ß. *Let them ſtand cold and cloſe ſix days, then put to them of white Sugar* ʒ iij. *and ſtrain them through* Hippocrates's *ſleeve. The Doſe is* ʒ iij. *or* iv.

Take of the Leaves of Senna ʒ iij. *of the Roots of Polypody of the Oak, or Oak Fern, of Sharp Dock prepared, of each* ʒ ij. *of Turbith and of Mechoaca, of each* ʒ j. ß. *of Epithymum or Wild Time, and of yellow Sanders, of each* ʒ i. *of Coriander Seeds* ʒ i. ß. *ſhreded and bruiſed, and prepare according to Art, a ſmall Bag of them for* iv. *Gallons of Drink. The Doſe is from* ʒ xij. *to a Pint, every day early in the morning, or twice or thrice a Week.*

The Reaſons of ſome Chymical Preparations.

Mercurius Dulcis.

Mercurius dulcis.

Take of Mercury ſublimate, corriſive ʒ vj. *of Quickſilver very well purged* ʒ iv. ß. *pound them together in a Glaſſen Mortar to a perfect mixture, then let them be ſublimed in a Furnace of Sand, increaſing the Fire to the height by degrees, for* 12. *hours, then ſublimate them again and again, adding the Mercury, which in the ſubliming grew crude: at laſt when the matter is perfectly ſublimated, pure and white, take out the droſs, and gathering it together, keep it for your uſe. The Doſe is* gr. xv. *to* xxx. *by it ſelf, or with the addition of other Purging Ingredients, to carry the Mercury quickly off by Siege, without the danger of ſalivation.*

Corroſive Mercury ſublimate, out of which the *Mercurius Dulcis* is made.

Mercury ſublimate corroſive.

Take of calcined Vitriol ℔ j. *of Sea Salt calcined, and of the beſt Nitre, of each* ℔ ß. *of purged Mercury* ℔ j. *pound them in a Glaſſen or a Woodden Mortar to a perfect mixture, adding a little Aqua fortis, or Spirit of Vinegar. Sublime them in an Oven of Sand, increaſing the fire gradually to the height; do it over again, if need be, that the matter being ſublimated to the ſides of the Veſſel, may gain a white, ſnowy colour. This buſineſs will go the better forward, if the Quickſilver be diſſolved in Aqua fortis diſtilled out of the aforeſaid Minerals, and then the matter, when the moiſture is taken away, be ſublimed upon a fierce fire.*

The reaſon of both.

Now as to the reaſon of the aforeſaid Medicin, in the firſt place, concerning the corroſive Sublimate it is plain enough, that the Mercury is diſſolved by Salts (whether they are in the Minerals themſelves, or in the *Aqua fortis*) and being as it were coagulated with them, is ſublimed by the force of the fire: and then that by the ſame Salts which congele the ſaline particles of the Mercury, and hide the reſt of them within their pores, the ſnowy colour, as it were, is produced; and that at the ſame time the corroſive quality ariſes from the extreme ſharp ſmall ſurfaces of the ſame Salts. Furthermore, as to the taking off of that ſame ſharpneſs by the repeated ſublimation after the Quickſilver is added and incorporated, in almoſt an equal quantity; the reaſon

ſon is, becauſe the ſharp ſalt particles are ſo rebated and weakened by the Mercurial ones that are copiouſly augmented, and ſtick to them on all ſides, that they do not prick or lance (as it were) the ſenſitive fibres at all in that manner as they did before: Beſides, The Powder of this ſublimate when it is pounded in the Mortar grows yellow by reaſon of the quantity of Mercury that doth as it were emerge. But that the common Precipitate, in which the Mercurial particles exceed the Saline ones that are congealed, is extremely corroſive; the reaſon is, becauſe the ſmall parts of the fire ſharpen all the mineral particles, in as much as they drive out all the gentle atoms, and ſtick or cling to the mineral corpuſcles themſelves, which are exceſſively pungent or pointed.

Phar. Rat. Part I.

2. *Roſin of Jalap.*

Roſin of Jalap.

Take of the Roots of Jalap, that is ponderous, black and bright, beaten ſomewhat thick ℔ j. *of Spirit of Wine* ℔ iij. *digeſt them cloſe and hot for two or three days, then put the tinged [or died] ſpirit into a glaſſen Cucurbit [or Gourd] a Chymical Veſſel ſo called] and draw it off [or let it evaporate] till the fourth part onely remains; into which if you put or inſtill cold Water, the Roſin will ſink to the bottom of the Veſſel, which when you have waſhed from the dregs and dried it, you may keep for your uſe. The Doſe of the Powder thereof is* gr. vj. *to* xij. *or* xiv.

The reaſon of this Preparation.

In this Preparation the Spirit of Wine extracts or draws forth the ſulphureous particles of that ſubſtance, and ſo much the eaſier, in as much as theſe were before hand, of themſelves, ſeparated and gathered together in the mixed body; as you may conclude from the Veins which are roſiny and ſhine. Whileſt the ſulphureous part is extracted, ſome quantity alſo of the ſaline ſeems to be joined with it; and that is the reaſon that this Roſin which ſmells very ſtrong, and is ſharp to the taſte, purges violently, and is eaſily ſet on fire. This works ſtronger, and in a leſs quantity than the mixed body it ſelf when it is whole, for as much as all the active particles are united together, and the dull ones removed.

3. *Roſin of Scammony.*

Roſin of Scammony.

This is prepared in the like manner as Roſin of Jalap; but in this Medicin, in as much as the ſaline particles, many of them, fly away whileſt it diſſolves, and are not all gathered together in the Roſin with the ſulphureous ones, the operation thereof is gentler and weaker than that of the whole mixed body. For though there be a great quantity of Sulphur in the Scammony, yet the operation thereof depends very much upon the ſaline particles: wherefore whileſt the Powder of it is ſmoked by Sulphur burnt under it, the purging quality is much weakened; in as much as the acid Salts that are ſent forth with the Smoke, do ſubdue or fix the particles of that mixt body which are otherwiſe ſaline. After the ſame manner as out of Jalap and Scammony you may make roſiny Extracts out of Turbith and Mechoaca.

4. *Extract of Black Hellebore.*

Extract of black Hellebore.

Take of the fibres of black Hellebore ℔ ß. *bruiſe them in a ſtone Mortar, ſprinkling them with* ʒ iii. *of the beſt ſpirit of Salt; then put them into a Matrace, and pour to them* 3 *pints of thin ſpirit of Wine impregnated with Salt of Tartar till it grows yellow, adding of Lignum Aloes and Cloves bruized, of each* ʒ ij. *Digeſt them cloſe and hot in Sand for three or four days; then filtrate all the Liquor, and let it evaporate over the heat of a gentle Bath to the conſiſtence or thickneſs of an Extract. The Doſe is from* ℈ j. *to* ʒ j.

This Medicin works in a leſſer quantity and more gently than the Powder of the roots, becauſe the active and benign particles being ſeparated from the reſt, which are both duller and virulent, as likewiſe being more fixed and ſubdued by the Salts of the Menſtruum are of themſelves reduced to a maſs: And moreover, by reaſon of the Salts joined with it, which boyl up and ferment with the Salts that are in the Bowels and Humours of our bodies, it is more effectual.

So much for Medicins, that being ſwallowed into our Stomachs, direct your operations moſt commonly through the moſt open paſſages, and as it were, the Kings Highways, to wit, upward or downward, through the Weazon into the mouth, or through the Guts to the *Anus*, or Fundament. There are a great many others of ſeveral ſorts, which, deſigning to go both the ways that thoſe do, exert their actions upon the bloud and the nerves with different reſpect to the Heart, Brain, Reins, and other Bowels, or the habit of the whole Body. Of which at laſt we will ſpeak in their turn, after that I have ſaid ſomewhat firſt of exceſſive purging, and eſpecially of the Dyſentery [or Flux] at *London*.

Phar. Rat. Part I.

CHAP. III.

Of the Remedy for exceſſive Purging, or of Medicins that ſtop too violent Purgation, or a Lask. As alſo of the London *Dyſentery, into the Nature and Cure whereof we here inquire.*

TO order Purges as well as Vomits aright we muſt make uſe of Bridles as much as Spurs, that is, ſomething to reſtrain Nature, as well as to provoke it. For as Purging Medicins are ſometimes of neceſſary uſe to lubricate the Belly, or to cauſe a plentiful evacuation; ſo, if that evacuation be immoderate, or not eaſily to be born, you muſt apply remedies that are contrary and antidote to a Lask of Flux, called a Dyſentery. How and in what manner purging Medicins perform their operations, and alſo for what reaſons, and upon what occaſions ſpontaneous Purging doth frequently happen, I have formerly ſhewn. At preſent I ſhall lay down in every caſe, to wit, both in exceſſive Purging cauſed by Medicins, and alſo in a Lask and Dyſentery, the ways to cure them, with the choicer Receipts for their Remedies.

The reaſon of exceſſive Purging cauſed by Medicins.

A purging Medicin that is diſproportionate either in quality or quantity, worketh more ſtrongly and longer, not onely for that, by irritating the nervous fibres too much, it forces the animal Spirits into diſturbances that are not eaſily appeaſed, but alſo in as much as it diſſolves, and as it were, melteth the bloud and humours; ſo that the melting parts of them being diſcharged into the cavities of the Bowels create ſtill greater expulſive irritations.

The care to prevent it;
1. Before the Medicin is given.

The method of Practical Phyſick reſpecteth both the prevention and curing of exceſſive Purgations. As to the firſt there is need of conſideration and care before the Doſe is given, in its operation and after it. For firſt of all you muſt cautiouſly weigh the conſtitution, ſtrength and uſage of the body that is to be purged; then the nature, doſe, manner of operating, and ordinary effects of the Medicin that is to be given: and laſtly, it muſt be conſidered, from comparing of Symptoms or Tokens, how to proportionate the force of the agent to the ſtrength of the Patient. Secondly, Whilſt the Medicin is a working, ſee that the Bowels that ſerve for concoction as alſo the bloud and animal ſpirits be kept free from all other diſturbance. Wherefore at this time you muſt eat nothing that is thick or clammy, or ſo much as to moleſt the ſtomach; and have a great care of the outward cold, whereby the pores of the Body are bound up; in fine, let the mind be always calm and ſerene, and void of care, or ſerious contemplations. Thirdly, When the operation of the Medicin is over, you muſt allay the fury of the animal ſpirits, and cool the boyling of the bloud and humours: to which ends you may give an Anodynous, or gentle, ſleepy Medicin, according to the following Receipts.

2. In the operation of it.

3. After the operation of it.

Take of the Water of Cowſlip flowers ℥ ij. *of Cinamon infuſed with Barley, of Syrup of Poppies, of each* ℥ ß. *of Pearl* ℈ ß. *and make a draught, to be taken when you go to bed.* Or, *Take of Conſerve of red Roſes vitriolated* ℈ ij. *of Diaſcordium* ʒ ß. *of Pearl* ℈ ß. *of Diacodium a convenient quantity, and make a Bolus, to be taken at night when you go to bed.*

The Cure of exceſſive Purging.

But if ſo be that notwithſtanding ought by omitting this kind of caution, exceſſive Purging follows upon the taking of ſuch a Cathartick Medicin, immediately the Patient muſt be put into a warm bed, and treated in manner following. In the firſt place you muſt apply either a Plaiſter of Treacle, or a Fomentation of the decoction of Wormwood, of Mint and Spices, in red Wine, with locks of Wool, dipped in and ſqueezed: then preſently let the Patient take either a Bolus of Treacle of *Andromachus*, or the diſſolution of it made in Cinamon water. Beſides which, let him drink burnt Wine, diluted with Mint water oftentimes by Spoonfuls. If he be troubled with the Gripes, let him take a Clyſter of warm Milk with Treacle diſſolved in it; and in the mean time let his outward parts be rubbed with warm clothes, and ſometimes bound about in certain parts, to call the bloud outward, and keep it from too great colliquation and flowing into the cavities of the bowels: after which, at Evening, if his ſtrength will permit it, and that the Pulſe be ſtrong enough, let him take a Doſe of *Diacodium* or *Liquid Laudanum*, with a convenient vehicle.

What is to be done in Symptomical Lasks.

As to other ſorts of exceſſive Purgations, which, without giving of a Purge, are wont to happen from ſeveral cauſes and upon ſeveral occaſions, and require a Medicin,

cin, I ſay, that many of them being meerly ſymptomatical depend upon other Diſtempers, and that the cure of them is altogether the ſame as that of thoſe other Diſeaſes whoſe off-ſpring, as it were, they are. So if in the Scurvy and a Conſumption it hath been uſual for the Parties ſo affected to be troubled with looſneſs, the method of curing them reſpecteth not this ſymptom at all, but the cauſe of the primary Diſtemper, which is to be removed. But yet notwithſtanding, the looſneſs of a mans belly (which is ordinarily called either a Diarrhœa [or Lask]or a Dyſentery [or Flux)] ſeems ſometimes a Diſeaſe of it ſelf; and indeed in this City of *London*, ſince this ſort of Diſtemper, which hath uſed to reign almoſt every year, is commonly accounted popular, and almoſt proper to the Place and People, it will be convenient here to inquire into the Nature, Cauſes, and Cure of it a little farther.

The London *Dyſentery.*

Although the word [Dyſentery] in the common acceptation thereof, ſignifies a Bloudy Flux of the Belly, as a Diarrhœa [or Lask] doth that of the Humors; yet, ſaving the Etymology, I ſhall apply that name to this *London* Diſeaſe, even when it is not at all bloudy. For I have often and a great while ſince obſerved, that there are two very different ſorts of this ſame Flux, which almoſt every year is wont to be ſo rife here about Autumn, and is commonly called in our language, *The Griping of the Guts*; in the one whereof the Stools were watery, and as it were, limpid [or clear] with a ſudden weakning of the Body; in the other they are bloudy, but tolerable; whileſt in the mean time the ſiege is rarely cholerick or phlegmatick (whileſt either of theſe Diſtempers reign) which ſhews that the malady is not ſo obſtinate as one would think. Now that you may clearly know both theſe dyſenterical Diſtempers, as to their formal reaſons and cauſes, as likewiſe their differences from each other, I think it will be neceſſary to ſubjoin in this place an Account of them both as they were obſerved (and then exactly deſcribed) by me ſome years ſince when they were rife.

Two ſorts of it, a bloudy and a watery one.

A Deſcription of the former.

In the year 1670. about the Autumnal Æquinox [or in Autumn, *i.e.* the Fall of the Leaf] a great many were ſick of an unbloudy, but a very ſharp and dangerous Dyſentery. The Diſtemper came upon them on a ſudden, and oftentimes without any manifeſt cauſe, and reduced the Patients, by grievous Vomiting, frequent Stools, and thoſe watery ones, in a ſhort time to very great weakneſs, horrid faintings of their ſpirits, and deſtruction of their ſtrength. I knew a great many that though the day before they were well enough and very hearty, yet within twelve hours were ſo miſerably caſt down by the tyranny of this Diſeaſe, that they ſeemed ready to expire, in that their Pulſe was weak and ſlender, a cold Sweat came upon them, and their breath was ſhort and gaſping: and indeed many of them that wanted either fit Remedies, or the help of Phyſicians, died quickly of it. This Diſtemper raged for a whole Moneth, but began to decreaſe about the middle of *October*, and before the firſt of *November* was almoſt quite gone. Few at that time had bloudy Stools, and not many cholerick ones, but a great many had both Vomitings and Evacuations that were wateriſh, almoſt limpid, and in great quantity. And whileſt this common Dyſentery raged ſo ſeverely within this City, there was ſcarce any one ſick of it in the Country, or at leaſt above three miles off. Moreover though very many were ſick in this place, the Diſeaſe did not ſeem to be infectious, but onely to affect thoſe that were prediſpoſed to receive it. For in the ſame Family thoſe who converſed with the ſick, were no ſooner ſeized by it than ſuch as moſt avoided their company.

The Cure of it.

For the cure of this Diſtemper, no Evacuation availed, but on the coutrary, Bloud-letting, Vomiting and Purging were always hurtful; but Remedies that were moſt commonly Cordials, and thoſe very hot; that is, ſuch as abounded with volatile Spirit, and Sulphur or Salt, were helpful; inſomuch that Spirit of Wine a little burnt with Sugar, was the popular, and as it were epidemical or univerſal Remedy; and in ſuch a Dyſentery almoſt always good; though in the other, which was bloudy, being indifferently uſed, it was often found to be dangerous. The Method of curing it, that I took at that time in moſt caſes and with ſucceſs, and that which I upon the like occaſion ſtill uſe, was as followeth.

A Bolus.

Take of Treacle of Andromachus ʒ j. *or* ʒ j. ß. *and take in Bed, drinking thereupon of the following Julap* vij. *or* viij. *Spoonfuls, and repeat it every third, or fourth, or fifth hour.*

A Julap.

Take of Mint water, and of Cinamon infuſed with Barley, of each ʒ iij. *of ſtrong Cinamon, of Plague and Treacle water of each* ʒij. *of Powder of Pearl* ʒj. *of Sugar chryſtallized* ʒ ß.

Phar. Rat. Part I.

mingle it, and make a Julap. At the ſame time take a Cake of toaſted Bread ſpread over with Treacle, and dipped into hot briſk red Wine, and apply it to the Stomach, changing it for another ever now and then.

Opiates. At Evening, if the Pulſe and breath be ſtrong enough, let the Patient drink of *Liquid Laudanum* prepared with Quinces gr. xx. in a draught of Plague water.

Take of Diaſcordium ʒ j. *of Liquid Laudanum* ℈ß. *of Powder of Crabs Claws compounded* ℈ j. *of Cinamon water a convenient quantity, and make a Bolus, to be taken when you go to bed.*

Thoſe that cannot take Treacle or Mithridate, but find it diſagrees with them, may take a Doſe of the following Water, or ſpirit of Treacle, every third hour with the Julap.

A Powder. *Take of the Powder of Crabs Claws compound. of the Roots of Contrayernum and Virginia Creeper of each* ʒ j. *of Cinamon and the Roots of Tormentil, of each* ʒß. *of Saffron, and of Cochinele, of each* ℈ j. *and make a Powder. The Doſe is* ʒß *to* ℈ ij.

A Spirit. *Take of Spirit of Treacle Armoniack* ʒ iij. *The Doſe is* ℈ i. *with the Julap, every fourth hour, or between times before and after the Doſes of the Powder. In the ſame manner you may uſe Spirit of Hartſhorn or of Soot. Let your drink be Ale with a Toaſt and Mace, and Cinamon, ſweetned; or burnt Wine diluted with Mint water. Let your food be Chicken broth, or Grewel, or Panada with ſhavings of Hartſhorn, Ivory, Roots of Scorzonera, &c. boyled in it.*

The reaſon of this Diſtemper. Concerning the reaſon of this ſame popular Diſtemper, in the firſt place let us inquire what may be the principal or immediate cauſe of it: that is to ſay, what humour that is which by its offenſive and burdenſom quality doth ſo infeſt the bowels, and irritate or provoke them into expulſive contractions with Gripings, diſturbance of the whole body, and a ſudden debilitation or weakening of all its forces. Surely no man will think it to be the Gall or Sweetbread juice, or any other that is generated within the paſſages of the Guts: nor indeed do I believe it to be poured forth from the bloud alone into the bowels (as it often happens in the Criſis of a Fever) but I rather ſuppoſe (what a man may gueſs from the ſudden languidneſs, quick fainting of the animal ſpirits, and weakneſs of all the parts), that in this Diſtemper, the beſt juices of the Body, that is to ſay, the nervous and nutritive, that is joined and united to the ſolid parts, are totally vitiated in their temper, and being made fluid, as it were, are melted, and ſo run into the maſs of bloud; then immediately from thence (ſince they are incongruous, unmingleable, and unapt to be carried off by Urin or Perſpiration) they are transferred through the *Vaſa cæliaca* [Belly Veſſels] toward the Stomach and Guts, and there flowing out at the numerous thickſet mouths of the Arteries, cauſe theſe horrid ſymptoms of a Dyſentery. Moreover it is likely that the very bloud alſo being mixed with a deluge of other humours is melted at the ſame time, and being diſſolved in its temperament, poureth out its melted parts with its other dregs into the cavities of the Bowels.

It ariſes firſt from the vitiation of the nervous juice. Moſt certainly there is no other reaſon why all the motive fibres ſhould be ſo ſuddenly weakned, and the whole Body languiſh, but that the humour that actuates or enlivens them, and in which the animal ſpirits reſide, forſook them totally, and flowed out; and indeed we ſuppoſe it to flow out, in as much as being vitiated in its temper, it not onely moleſteth the containing parts like ſowering Milk, but puts them upon ſhriveling themſelves with ſuch a motion as throws that Humour out. Beſides, I almoſt always obſerved that this Diſtemper began with a chilneſs; but not ſuch as was followed with the heat and burning of a Fever, becauſe the bloud, although in it ſelf but little vitiated, yet being almoſt overwhelmed by a Floud of other juice that came in upon it, could not recover or recollect it ſelf ſo far as to boyl up feveriſhly or into a *Criſis*. For this reaſon Cordials (but none except the ſtrongeſt and hotteſt) as alſo hot Waters and Spirits, Treacle, Mithridate and the like were of uſe: that is, ſuch whoſe particles being extreme active, would repel or drive back the Humours that were ready to flow out, whileſt they eaſily get into the mouths of the Splenchnick [or Bowel] Veſſels; and likewiſe ſuch as gradually inſinuating into the maſs of bloud might ſtrengthen and excite it to a fermentation and a motion to ſweat; whereby it might not onely recover its former temperament, but alſo retort or throw back into the habit of the Body what ever was carried into it that was diſagreable.

So

So much for the immediate or conjunct cauſe of this diſtemper, the more remote are original or antecedent, and manifeſt or evident; the former of which denotes from what occaſion or original this kind of morbid and infectious diſpoſition proceeds, and the latter, through what cauſes it the ſooner breaketh forth into a Dyſenterical Diſtemper. As to the former, this Diſtemper, becauſe it rages moſt commonly in Autumn is aſcribed by many to the immoderate eating of Summer, or rather Autumnal Fruits; which indeed I could eaſily admit to be partly the cauſe of a Bloudy Flux; nay, I have reaſon alſo to think that in ſome perſons the aforeſaid Diſeaſe had from thence a kind of ſeminal origination. But that this is not the total and adequate cauſe of that Diſtemper is plain even from hence, becauſe many Inhabitants of this City, who abſtain from Fruits, or uſe them more cautiouſly, were ſick of an unbloudy Dyſentery or Flux, whileſt it was Epidemical or rife; and others that eat a great deal of Fruit in the Neighbouring Villages, were altogether free from this, though troubled with other Fevers, but without any Gripings or Fluxes. For I have oftentimes obſerved (what happened alſo in this year) that after an exceeding hot and dry Summer, an Epidemical and unuſual Fever hath been very rife at Autumn in many places of *England*, and that at the ſame time in *London* very few have been ſick of that Fever, but a great many of the Dyſentery or Flux: the reaſon whereof ſeems to be, that ſince our Bodies, by reaſon of the foregoing unſeaſonableneſs of the Summer, are diſpoſed for autumnal Fevers, thoſe, in this ſmoaky thick Air, are the rather determined to this kind of Diſtemper. For when tranſpiration is hindered, the corruptions of ill Humours, being unapt to make their paſſage through the pores of the Skin, ſettle on the inſide, and there breaking forth out of all the Arteries at once, are the cauſe of theſe horrid effects in the Bowels.

The remote cauſes of it.

Why it is Autumnal and Epidemical.

The firſt cauſes of it are, 1. The thickneſs of London *Air.*

Moreover the Summer, as it is more or leſs hot or cold, moiſt or dry, maketh a great alteration in the Humours of our Bodies, as it doth alſo in all fermentative juices, and changes them oftentimes from their natural habit into a ſharp, ſower, or aduſt temper. And then ſome years this change is impreſſed chiefly upon the bloud, though in other years it is more upon the nervous juice. From the former moſt commonly follow Autumnal, or acute, or intermitting, but very ſevere Fevers. From the latter ariſe irregular and unuſual Fevers; in which very dangerous diſeaſes in the Brain and Nerves enſue, and are very rife without any great heating of the Bloud, or Criſis of the diſtemper. Moreover in this ſort of Diſtempers, either the dregs of the nervous juice which gradually and inſenſibly decays, being ſlowly and by degrees without any critical turgeſcence, or ſwelling gathered together, and remaining for a long time within the containing parts, produce Fevers in the Nerves with ſluggiſhneſs and dizzineſs (ſuch as I formerly deſcribed in my Treatiſe called *Spaſmologia* [or of Convulſions:] or the corruptions of that juice which is ſuddenly and much altered in its temperament, being more fierce and active, ſwell with a kind of fluidity, and run over out of the fibres, the nervous and ſolid parts on all ſides into the maſs of bloud, and from thence flowing preſently into the cavities of the Bowels produces this unbloudy kind of Dyſentery, ſuch as is here juſt now deſcribed. And indeed that this ſame watery Flux proceedeth from a depravation and colliquation or melting, as it were, of the nervous and nutritive juice, rather than of the Bloud it ſelf, is evident, not onely from the ſudden and great dejections of the Spirits (which ſuch an effuſion of more bloud could never cauſe) but likewiſe from hence that thoſe who are ſick of this Diſeaſe, are not troubled with heat or droughth in their mouths, or roughneſs on their tongues, but well endure the hotteſt Medicins; and as ſoon as by the application of ſuch Medicins the peccant or offending humour is inverted, and retorted into the habit of the Body, they quickly recover without either Fever, wakening, or any other conſequences of corrupted bloud.

2. The unſeaſonableneſs of the Year.

As to the evident cauſes of this Diſtemper I need not ſay much, ſince the conſtitution of the Year is ſuch, that through the malign influence of the Air or Heavens, the juices that are generated from the bloud, that is to ſay, the nervous and nutritive do degenerate from their genuine temper, into another nature, which is offenſive, and as it ſeems, ſower, and conſequently dyſenterical, or inclined to a Flux. Errours in Diet, and other unnatural things at that time committed, do cheriſh and augment that ill diſpoſition, and bring it much the ſooner to a fulneſs that ſwells even to evacuation. It will not be worth my while here to recount particularly all the manifeſt cauſes and occaſions by which they are produced, but rather let us go on and ſhew the nature of that other, to wit, the Bloudy Dyſentery or Flux.

The evident cauſes of it.

Phar. Rat. Part I.

Of the Bloudy Flux.

The Deſcription of it.

The Fall of the Leaf in the Year 1670. (which was famous for the Unbloudy Flux juſt now deſcribed) was attended by a Winter that was exceeding cold, and ſuch an one as ſcarce any man living had ever known: nor did the following Summer participate leſs of the other extreme, being extreme hot and dry; and in the Autumn after that there was an Epidemical or univerſal Fever that raged almoſt all over *England*. This Fever, obſerving the form of an intermitting one, had Fits ſometimes every day, and ſometimes every other day, but with none or onely very little cold, though with exceſſive heat, which laſted for many hours together, and many times above a day and a night, but hardly paſſed into Sweat, or if it did, it was but in ſome parts, and that oftentimes interrupted too, without any remiſſion after it. Thoſe that had this Diſtemper were preſently taken with an unuſual languidneſs, with wakening, dizzineſs, and oftentimes the Head-ach very intolerably: and the diſeaſe which was ſeldom or never capable of a perfect *Criſis* [or Judgment of Phyſicians] continued very long, and oftentimes having fixed an incurable Malady in the Head or Breſt, ended in a Diſtemper that was ſleepy or conſumptive, and many times deadly. I formerly deſcribed a Fever that was like this in my Treatiſe called *Puretologia* [or an Account of Fevers] together with the Nature and Cure of it; before which alſo went the like conſtitution of the Year.

An irregular Fever uſes to be at the ſame time with this in other parts of England.

But whileſt this Fever raged almoſt in all parts of the Country, through the Villages and Towns, there was a Flux at *London* which was really a Bloudy one; and not onely ſo, but extraordinary ſharp and ſevere, inſomuch that it tumbled a great many People ſuddenly into their Graves. When this Diſtemper came firſt upon a man, he moſt commonly voided Bloud very plentifully and frequently with pains and gripings in the belly; long watchings with feveriſhneſs, and extreme thirſt uſed to afflict him; yet their ſtrength continued ſtill ſo firm, that thoſe who were ſo affected, after they had been ſick about a Week, and gone to Stool almoſt twenty times every day, could riſe out of their Beds. Though the bloudy evacuations ſeemed terrible, yet the Patients did not die ſuddenly, but continued ſeveral Weeks, yea ſometimes Moneths, voiding Bloud every day in great quantity; and at length, when the Diſtemper growing ſtill worſe and worſe, tended to their deſtruction, there appeared before their death other ſymptoms, and eſpecially watchfulneſs, roughneſs of the tongue and mouth, thirſt, and ſometimes deſtructive Thruſhes; and if the Flux were reſtrained, or ſtopped unſeaſonably, or ſooner than it ſhould have been, thoſe ſymptoms broke forth the ſooner, and ſignified great danger of death. Poor People that had for a long time been uſed to an ill ſort of Diet, and ſuch alſo as had either no care taken of them at firſt, or at leaſt all remedies miſapplied, oftentimes died, or with great difficulty recovered: On the other hand, thoſe that were happy in a better habit of Body, and truſted to ſeaſonable and proper Phyſick, many times eſcaped. Moreover the Diſtemper it ſelf, though it were Epedemical, or univerſal, yet it was not equally malignant in all perſons, but ſeemed in ſome more mild, and in others more ſevere; that is, the Flux at the beginning was ſometimes gentle, and not unlike to a Diarrhæa, or Lask, in which tho the Stools were frequent, yet being without pain, or much bloud, they were eaſily, and ſometimes quickly cured. But ſometimes again this Diſtemper ſeemed very ſharp and horrid, that is to ſay, when the bloud was poured forth in great quantity, with gripes and extreme torment. But in ſome People the Stools were liquid and died with pale bloud, like the waſhings of raw fleſh, whileſt in others they were thicker, full of bloud, and alſo ſtuffed with a whitiſh ſlime, as likewiſe very often with bits of membranes. The ſeat of pain being ſometimes higher and ſometimes lower, ſhewed that the ſmall Guts in ſome, and that in others the bigger were the more affected.

The way to cure it.

The way to cure this Diſtemper, with remedies that I found helpful to very many People, was as follows.

Firſt, In ſome meaſure to ſtop or moderate the Flux.

A Bolus.

Take of Treacle of Andromachus ʒ j. of liquid Laudanum prepared with Quinces gr. xx. *and make a Bolus, to be taken when you go to bed.*

An Electuary.

Take of Conſerve of Red Roſes vitriolated ʒ ij. of Treacle of Andromachus ʒ j. of Powder of the Roots of Tormentil and Contrayernum, of Pearl and prepared Coral, of each ʒ j.

Syrup

Syrup of dried Roſes a convenient quantity, and make a Confection, to be taken every fourth or fifth hour in the quantity of a Cheſnut, drinking thereupon ʒ iij. *of the following Julap.* *Phar. Rat.* Part I.

Take of Mint Water, of Balm, and of Cinamon, Barly Water, of each ʒiv. *of Treacle and Plague Water, of each* ʒ ij. *of Pearl* ʒ j. *of Sugar* ʒj. *mingle it, and make a Julap.* *A Julap.*

After one or two days give this purging, and yet ſtrengthening Potion.

Take of Rhubarb ſhreded ʒ ij. *of yellow Myrobalans ſhreded* ʒ j. ß. *of Red Sanders and Cinamon, each* ϑ j. *Make an infuſion all night in Plantaign Water and Cinamon infuſed with Barley, of each* ʒ ij. ß. *Squeez it well and put to it of ſtrong Cinamon Water* ʒ ij. ß. *and make a draught.* *A gentle Purge.*

Every Evening, and in ſome caſes alſo in the day time, I uſed to give a good Doſe of *Laudanum*; nor did I ever know that this Medicin was hurtful to any one that was troubled with a Dyſentery or Flux; whether it were that the ſtupifying quality of the Medicin was overpowered, and as it were, tamed by the more acid juice of the Stomach, or rather, that the particles thereof being tranſmitted to the bloud, are thrown out again preſently from thence along with the Bloudy Stools, that they may not affect or hurt the Brain. *Opiats.*

Thoſe that cannot take, or do not find it convenient to take the aforementioned Confection, let them take in ſtead of it this following Powder.

Take of Red Pulvis Pannonicus, or Hungarian Powder ʒ j. *of Contrayernum Root* ʒ ß. *and make a Powder, dividing it into three parts, of which take one part in any Liquor.* Or, *Take of Bole Armeniack, an Alexiterium (that is, impregnated with the juices of the leaves of Tormentil, Biſtort, Red Roſes, &c. and dried in the Sun) and of Contrayernum Root, of each* ʒ j. *of Pearl, of Red Coral, and the whiteſt Amber, each* ʒ ß. *Make a Powder. The Doſe is from* ϑ ij. *to* ʒ j. *A Powder.*

Take of Radix Caryophillata or Avens root, of Scorzonera, of each ʒ j. *of Tormentil, Biſtort and Contrayernum, each* ʒ ij. ß. *of Harts horn burnt* ʒ iij. *of Shavings of Ivory and Harts horn, each* ʒij. *of Cochinele* ʒß. *of the Flowers of Red Roſes* ʒ ij. *and boil them in a convenient quantity of Spring water to two Pints. About the time that you have ſo done, put to them, of the Conſerve of Red Roſes* ʒ iij. *and to the clear ſtraining of it add of Plague water* ʒ iv. *The Doſe is* ʒ iij. *An Aperient, or Decoction.*

For allaying the Gripings in the Guts, and to cure the gnawings in them many times Clyſters are of good uſe.

Take of the Decoction of the tops of Hypericon or St. Johns Wort, with Sheeps Feet, or the Meſentery of a Sheep ʒ viij. *or* xij. *of Treacle of Andromachus* ʒ ij. *of Oil of Hypericon* ʒ j. ß. *and make a Clyſter.* *A Clyſter.*

I here omit many other Forms of Medicins that are extant every where in the Books of Practice, and which every one upon occaſion may and ought to preſcribe. We have nothing elſe to do but to enquire a little into the reaſon of this Diſtemper which was Epidemical, or rather popular and peculiar to ſuch a place.

From what I have already ſaid, it is evident enough that the Dyſentery or Flux (neither the Unbloudy, nor the Bloudy one) doth not proceed meerly from the ſharper matter which is contained in the Guts. Moreover as that other Diſtemper ſeems to have had its original from the flowing of the Nervous Liquor and Nutritive Juice, that was degenerated, ſo this had it chiefly from the corruption and vitiation of the Bloud; and therefore as there was elſewhere a Diſtemper of the Nerves which was contemporary of that Endemious or popular malady in this place, ſo when a Bloudy Flux afflicted the *Londoners*, an intermitting Fever much like to a Semitertian (as it is deſcribed by the Phyſicians) infeſted all *England* beſides. And indeed it will be eaſie enough to conceive, that ſince the Bloud being roaſted, as it were, with the Summer heat, and conſequently about Autumn apt to riſe into feveriſh effervescences [or boylings] and, like Wines, into immoderate Fermentations, whereby they are purged, if

it

Phar. Rat. Part I.

it cannot carry off the degenerous and excrementitious particles (by reaſon that Tranſpiration is hindered in a thick Air) the ordinary way by Sweat, that being ſtill in a boyling heat, it tranſmits them toward the Guts, and endeavours to throw them out through the mouths of the Arteries that are there thick ſet and much wider than the pores. But then if the incongruous dregs, or morbid corruptions of the Bloud when degenerated, being throughly mixt with it, and intimately confounded in it, cannot be eaſily ſeparated or drawn off; it therefore being big and oppreſſed with this load, is very much ſtreightned in its circulation, as it paſſes through the ſmaller Veſſels; and conſequently about the inward ſurface of the Guts, where the coats of the Arteries are more tender, and the mouths wider, the Bloud that begins there to ſwell, and at the ſame time is thickened by the heterogeneous particles, wherewith it is filled, being apt to coagulate, doth eaſily break forth; and ſeeing it cannot ſeparate and caſt forth its dregs, it pours forth ſome portions of it ſelf that are moſt offenſive to them.

Three things concur to cauſe this Diſtemper.

Wherefore to cauſe a popular Dyſentery, theſe three things muſt needs concur; that is, In the firſt place the maſs of Bloud muſt be vitiated, through the unſeaſonableneſs of the Year, whereby it may be inclined to feveriſh effervescencies [or boylings] either on its own accord, or occaſionally. And that is the reaſon that when this Diſtemper is at *London*, an irregular Fever uſes to rage in other places. Secondly, The dregs and corruptions of the Bloud, ſo boyling and degenerated from its temper, are ſo intimately mixt and confounded with it, that they cannot be eaſily ſeparated, or be thrown out either by Sweat or Urine of a ſudden. Whereupon I have obſerved, that the Fever which was contemporary with this Dyſentery, was always of a long continuance, and very hardly capable of any true judgment; as alſo that the Fits of it ſcarce ever ended in a remiſſion. Thirdly, Add to theſe the ſtoppage of the Pores (which determins the aforeſaid diſpoſitions into a Bloudy Flux) which is cauſed by the ſmoky and thick conſtitution of the Air: For this directeth the purgative boyling of the Bloud toward the Guts; where ſeeing the dregs thereof cannot be ſeparated and eaſily parted from the other maſs of Liquor, it ſelf ſpontaneouſly flows forth by portions that are moſt infected, and conſequently ready to be extravaſated or thrown out of their Veſſels.

This Diſtemper is either more mild or malignant.

By this means the ordinary *London* Dyſentery, which is not very malignant, is uſually produced; which though it be preſently horrid or dreadful by reaſon of its bloudy Stools, and moſt commonly of a long continuance, yet it is not very contagious, nor often mortal. But this Diſtemper alſo being ſometimes virulent, and as it were peſtilential, kills a great many People, diffuſing its infection very largely by contagion. Moreover in ſuch an habit of the Bloud, the parts of it being touched with a kind of malignity, begin to be corrupted as in a Plague, and ought immediately to be ſeparated from, and thrown out of the reſt of the maſs, leſt the whole ſhould be thereupon infected: which portions, notwithſtanding, being thicker than ordinary, and conſequently apt to be purged forth through the Belly rather than through the habit of the Body or by Urine, are carried by the paſſage of the *Arteria Cæliaca* and *Meſenterica* into the coats of the Guts; where they do not eaſily part from the reſt of the bloud, but partly breaking out of the Veſſels, cauſe bloudy Stools, and partly fixing in the membranes of the Guts, beget in them either inflammations or ulcers, or ſometimes alſo mortifications, which occaſion ſudden deſtruction.

So much of the cauſes (both immediate and antecedent) of a Bloudy Flux, as it uſes to be the peculiar Diſtemper of this place about Autumn. As to the manifeſt cauſes or occaſions that bring the morbid diſpoſition the ſooner into act, they are to be reckoned chiefly an ill courſe of Diet, and the pravity or badneſs of the Air that we breath in: and that is the reaſon that in all Countries it is very common in Camps among Souldiers, and in Priſons among Captives, by reaſon of the ſtench of the place and their ill diet. Moreover many other errours in unnatural things ought to be referred to this head, of which I have no leiſure, nor were it worth while in this place particularly to diſcourſe.

The ways to cure it.

Two in reſpect of the Bloud;

The chief and primary means into which the method or practice of Curing this Diſtemper, which is before ſhadowed out, may be reſolved, are four; that is to ſay, two in reſpect of the Bloud, and as many in reſpect of the Bowels. And firſt, as to the Bloud, it will be neceſſary to drive forward not onely the dregs and corruptions thereof (that would go inward) outward toward the habit of the body, to the end that they may exhale by tranſpiration, but alſo to diſſolve the coagulations of it, and reſtore its temper as much and as ſoon as poſſible. The former of which is performed by Sweating Medicins, and the latter by convenient *Alexipharmica*, or Medicins that reſiſt and rectifie corruption. Secondly, as to the Bowels, the painful ſenſe of the

And two as to the Bowels.

nervous

nervous fibres ought to be allayed, as likewiſe the irritation or provocation of the fleſhy ones, by which they are excited to expulſive convulſions, and alſo the mouths of the Veſſels ought to be ſhut, leſt they pour forth the bloud and humours into the paſſages of the Guts. The former of theſe is uſually effected by Opiates, and the other by Remedies that are ſtyptick or aſtringent; beſides which you ought to take care of the moſt urgent ſymptoms and evil diſpoſitions that are uſually incident to this Diſtemper, of which ſort in the firſt place are a Fever with Thirſt and Watching, Gripings of the Guts, and ſometimes Gnawing, Inflammation, and Ulcers. *Phar. Rat.* Part I.

It will not be neceſſary to inſiſt upon theſe primary Indications, particularly and ſucceſſively, but it is my buſineſs to compriſe them all together, and ſet them forth at the ſame time. Wherefore the Receipts of ſuch Medicins ought to comprehend Remedies of ſeveral kinds, to wit, *Alexiteria*, or Medicins to expel or rectifie infection; *Stypticks*, or aſtringent Medicins; *Diaphoreticks*, or Sweating Medicins; and *Opiates*, or ſleeping and reſting Medicins. But becauſe it will not be eaſie to reduce theſe Medicins into a certain Method, or into precepts that may ſuit with ſo many conſtitutions, I therefore thought it better to give you at preſent ſome Examples of Dyſenterical Cures, done in the Autumn of the Year 1671. when this Diſtemper raged very much.

The firſt Story of Cures in caſe of the Dyſentery.

A young Gentleman about 25 years of Age, of a ſanguine temper, and a conſtitution formerly very hale, about the firſt of *October*, fell into a Dyſentery without any manifeſt cauſe; and though immediately from the firſt day his ſtools were plentiful and bloudy with Gripings, yet being ſtill ſtrong and well in heart, he deferred taking of Phyſick till the third day; at which time I was ſent for late at night, and preſcribed him this following Bolus.

Take of Treacle of Andromachus ʒ j. *of Liquid Laudanum prepared with Quinces* ℈ j. *mingle them, and let the Patient drink thereupon a ſmall draught of the following Julap.*

Take of Water of Tormentil, Mint, and of Cinamon, Barly water, each ℥ iv. *of Treacle and Plague water, each* ʒ ij. *of Pearl* ʒ j. *of Sugar* ʒ j. *make a Julap.*

Then every third hour he took of the following Electuary about ʒ j. ß. with the ſame Julap.

Take of Conſerve of Red Roſes ʒ ij. *of Treacle of Andromachus* ʒ j. *of the Powder of the Roots of Tormentil, Contrayernum, Pearl and Coral prepared, each* ʒ ß. *of Syrup of Rhead Poppy, a convenient quantity.*

With theſe Remedies the fury of the Diſtemper was ſoon taken off, ſo that in four and twenty hours he had ſcarcely more than 6 or 7 ſtools, and ſuch too which did not appear very bloudy as before, but full of little bits of fleſh, as it were, pieces of the membranes: which no queſtion was occaſioned by ſome ſmall portions of the hairy veil which were gnawed off: every Evening he took Opiates with *Laudanum.*

The fifth day that he was ſick he took the following draught.

A Purge.

Take of Rhubarb ſhreded ʒ ij. *of yellow Myrabolans* ʒ j. ß. *of yellow Sanders* ʒ ß. *of Cinamon pulverized* ℈ j. *of Salt of Wormwood* ℈ ß. *make an Infuſion all night in Plantaign Water and Cinamon, Barley Water, of each* ℥ ij. ß. *to the ſtraining of which, add of ſtrong Cinamon water* ʒ ij.

He purged three or four times, whereby he found eaſe, and the next day his Fever being abated he was better; in ſo much that ſeeming to grow well again, he eat fleſh; but by that means he fell into a relapſe, and the Dyſentery immediately returning with a Fever, was more ſevere than at the beginning: at which time, ſeeing the former Medicins began to be nauſeous to him, I preſcribed in manner following.

A Powder.

Take of the Powder of the Roots of Tormentil, Contrayernum, and of the Bolus called Alexiterium, each ʒ j. *of Pearl, red Coral prepared, and the whiteſt Amber, each* ʒ ß. *and make a Powder. The Doſe is* ʒ ß. *in* ℥ iij. *of diſtilled water.*

A Diſtilled Water.

Take of the Tops of Cypreſs and Myrtle, each iv. *handfuls, of the leaves of Medowſweet,*

Phar. Rat. Part I.

Pimpernel, and St. Johns wort and Avens, of each iij. *handfuls, of the Roots of Tormentil and Biſtort, each* ʒ vj. *of the Flowers of Red Roſes* iv. *handfuls, of Berries of Chermes* ʒ iv. *of Cinamon and Mace, each* ʒ j. *when you have cut them and bruiſed all to pieces, pour to them of red Florence Wine, and of red Roſe water, each* iv. *Pints; diſtil them with the common Inſtruments, and let the whole Liquor be mingled and ſweetned when he takes it with Syrup of Corals.*

He alſo took three or four times a day of the following Decoction ʒ iij. or iv.

A Decoction. *Take of Avens root and of Sconzonera, each* ʒ j. *of Tormentil* ʒ ij. *of Harts horn burnt and pulverized,* ʒ vj. *of ſhavings of Ivory and Harts horn, each* ʒ ij. *of the tops of Hypericon one handful, of Flowers of red Roſes, and of Balauſtians, each one ſmall handful. Boyl them in ſpring water till three Pints ſinks to two, add at the end of Lisbon red Wine* ʒ iv. *of Conſerve of red Roſes* ʒ iv. *Let them boyl cloſe for an hour, and then ſtrain it through Hippocrates Sleeve.*

He every night took of *Liquid Laudanum* ℈ j. in ʒ iij. of the Dyſenterical water juſt now deſcribed, with Syrup of Clove Gilliflowers.

A Decoction for ordinary drinking. For his ordinary Drink he had a Decoction of *Harts horn burnt, with Barley, a Cruſt of Bread, Mace and Cinamon, of which half a pound was put to a Pint of new Milk.*

The purging Infuſion was taken again, by the help of which and the former Remedies, within ten days the Fever went off, and the Dyſentery abated very much; which, though it were without Gripings, or much bloud, yet it ſtill continued with ſmall pieces of fleſh, bits of the Membranes, and phlegm or bloudy ſlime which he daily voided.

Therefore to ſtrengthen and heal the Guts, the following Remedies were given.

A Clyſter. *Take of the tops of Cypreſs, of the leaves of Vinca Perwinca, or Periwinkle, and Mouſe-ear, of each one handful, of the Flowers of red Roſes two ſmall handfuls: boil them in the Broth of Sheeps Guts. To a Pint of the ſtraining thereof, add of Oil of Hypericon, St. Johns wort* ʒ ij. *of Honey of Roſes* ʒ j. ß. *mingle it for two Clyſters, of which the one was given in the morning, and the other at* 5 *of the Clock in the Afternoon.*

A Plaſter. He wore a Plaſter *of Red Lead and Paracelſus upon his Belly; and took alſo every day twice; of Plantaign juice ſqueezed out with Water of Scordium or Water Germander and Plague Water,* ʒ iij. *and likewiſe eat each day a Quince ſcooped, filled with the Powder of Olibanum, Maſtick, and Balſam of Tolu, and roaſted under the Aſhes.*

A Quince made a Medicin.

Having uſed theſe Remedies conſtantly, he perfectly recovered in a Moneths time.

The ſecond Story. About the ſame time another ſtrong young Man fell into a terrible Dyſentery; and from the very firſt day his ſtools came from him very faſt, and mighty bloudy, with pain and gripings; as likewiſe an extreme Fever with exceſſive vomiting, thirſt and watching did afflict him; but when by his taking of Opiates theſe ſymptoms were ſomewhat mitigated, he was taken ſtrait with a degree of madneſs, called a *Pelirium*, and a ſwimming in his Brains, with an intermitting pulſe, and horrid numneſs, in as much as the malignant matter, being kept within, flowed preſently into the Brain and Nerves; but theſe indiſpoſitions were ſoon over, as often as the flux and vomiting returned. The fifth day he vomited a gory matter, and complained of the great pain and torture in his ſtomach as if he had had an ulcer in it; in ſo much that I really thought there might be ſome inflammation, or ulcer there, as it uſually happens about the Guts: but by taking of gentle Broths, his vomiting and gripings in the ſtomach were ſoon allayed, though the Flux in the mean time increaſed. He took that night of *Diacodium* ʒ j. with ſmall *Cowſlip and Cinamon water*, of each ʒ j. ß. by which Medicin he was ſo much relieved, that he continued for a night and a day pretty well, without vomiting or pains, and onely a few ſtools, with a tolerable good pulſe and frequent ſlumbers; but the night following, though he took the ſame Opiates again, yet the Flux returned upon him very frequent and bloudy. The day after he took

Infuſion

Infusion of Rhubarb, with Myrabolans, Red Sanders, and Cinamon. He often voided cholerick matter, extreme sharp and altogether unbloudy; and then that Evening he took of *Liquid Laudanum* prepared with Quinces *gr.xxv.* in a Spoonful of Cinamon-barley Water, after which he had moderate and more quiet rest. Afterward being averse to any more Physick, he onely took an Opiate every Evening, sometimes one and sometimes another, and in a short time recovered. *Phar. Rat.* Part. I.

SECT. IV.

CHAP. I.

Of Purging by Urine, and of Medicins that provoke it.

I Have formerly treated very largely concerning the Nature and Composition of Urine, as likewise of the Offices thereof, whilest it is a part or dreg of the Bloud, together with its ways of separation. I shall now in this place observe, that there is some affinity between that and Sweat; in so much that they oftentimes change turns, and the matter of the one is conveyed forth at the Emunctories or Drains of the other. For perspirations through our skin, if they are too strong and impetuous, take away with them very much of the serous liquor that was designed for the Reins or Kidnies, and turn it into Sweat; so on the contrary, when the Serum is poured through the Kidnies in greater quantity than ordinary, it calls in to it a great many small particles, such as used to breath through the skin, and involving them in its torrent carries them off by the passages of Urine. Hence it comes that Diaphoretick and Diuretick Medicins [or such as provoke Sweat and Urine] are very nearly related as to their use, and sometimes reciprocal [or such, as that one may be taken for the other.] By both of them, when taken, the mass of Bloud is dissolved or precipitated, or at the least compelled to divide into several parts, to the end that the *Serum* or Whey, being separated from the rest of the Bloud, may be thrown out at the most easie passage. *The Relation between Piss and Sweat.*

Although the immediate matter of Urin flows onely from the bloud and be carried to the Kidnies and Ureters solely by the conveyance of the emulgent Arteries; yet it often uses to have many mediate fountains and those very different too; which may be distinguished in a threefold respect at most; that is to say, Piss is either a meer excrement, and a watery part of the bloud when it grows stale; which having circulated with it for some time, gains a lyish tincture from the saline and sulphureous particles that are incorporated with it. Or, Secondly, It is that dilute part of the Chyle, whilest it is yet crude, which being poured into, mixed with the bloud in great quantity, is separated again before it be infected with the tincture, and makes the Urin extraordinary clear. Thirdly and lastly, The matter of the Piss is often great part of it a kind of Water, poured, or as it were exstilled out of the bloud into the solid parts, glandules, and lymphæducts, which being copiously gathered there, and afterwards of its own accord, or occasionally gaining a fluidity, and running out of its receptacles through the lymphæducts [or water-passages] is carried back into the Veins; from whence with a swift motion, going through the Arteries unmixt, it is discharged into the Kidnies; and because no particles of Salt or Sulphur are mingled with it by reason of its short stay in the bloud, the Urine therefore is limpid or clear, as water. The Urin of men in health does most commonly partake in some measure of each of these, and according as this or that, or any other matter prevails, they appear more or less, or not at all died. The *Serum* whencesoever it comes, when mixed with the bloud, is separated again from it in its circulation, in divers places, but especially in the Reins. For the bloud boyling up, and being very much rarified within the Arteries, must of necessity cast off its serousness, and divert it some other way, that being separated thence it may pass into the Veins. Now this, as it is performed in all parts of the whole Body, so it is more copiously and in a peculiar manner within the Veins. But though People generally know and acknowledge that the separation of the *Serum* is made in this place, yet there are great controversies among them about the ways whereby it is performed, whilest some say that the serous Liquor is attracted to the Reins; others, that it is onely strained there; and others gues that there *what the matter of urin is, and from whence it comes. It is threefold.* *How the Serum is separated from the bloud.*

Phar. Rat. Part I.

is a kind of ferment which lodges in the Reins, by the mixture whereof the whey of the bloud, like that of Milk, is dissolved and precipitated by the acid Rennet, as it were: and indeed the rancid and ungrateful smell and taste of this Bowel seem to argue that the thing is in some measure so. Before we can determine any thing certainly concerning the virtues and operations of Medicins that provoke Urine, we must of necessity explain this doubt, to wit, what is done in the Kidnies by the ordinary course of Nature, and what in the mass of bloud, for the separation of the *Serum*.

The Serum is not attracted to the Reins.

And first of all, that the *Serum* is not attracted to the Reins, needs no proof among Philosophers, since similar attraction is of late days quite exploded by most Virtuosoes, and all local motion declared to be performed by impulse onely. And truly, as to the present affair, to all those that are acquainted with the circulation of the bloud, it is very manifest, that as the bloud, so also the Serum of it, which is its constant companion within the vessels, is driven forward toward the Reins by the meer motion or impulse of the heart. But in order to shew you whether it be there separated by percolation onely, or also by a kind of precipitation it seems necessary to inquire a little more accurately into the Anatomy and use of the Reins.

The make of the Reins, &c.

Of the Structure or Make and Use of the Reins, since many, Ancient and Modern Authors have given us several accounts, the famous *Bellinus* hath most accurately delivered the Anatomy of them. Indeed every one may easily perceive that the bloud is carried to the Reins by the emulgent arteries, and back by the veins. This the Laws of circulation and ocular testimony do manifestly declare. But in what places, through what conveyances, and by what art the Serum is separated in the Reins from the Bloud, and discharged into the *Pelvis* [or Basin] was long unknown to the most diligent inquirers; till the aforesaid Author by great good hap found out that the substance of the Reins was neither a *Parenchyma* [or stuffing] as that of the Liver or Spleen; nor fleshy fibres, as the bodies of the heart and muscles, but an heap of membranous small pipes; and that the *Serum* being carried through those passages, though very extraordinary small ones, from the circumference of the Kidnies to the center of it, was exstilled into the *Pelvis* or Basin. For the emulgent Artery being divided first into greater branches, and then into lesser, and at last into very small sprouts, conveys the bloud every way all over the outmost surface of the Kidney; and when the bloud boyling up and being rarified, flows out at the mouths of the Arteries, whilest the bloudy part, that is to be carried back, is received into the Veins, the serous or wheyish part gets into the exceeding narrow pores of those small pipes, which are impervious [or unpassable] to the bloud, and flowing through them every way toward the *Pelvis*, is discharged into the *substantia papillaris* [a part of the Kidney so called] out of which it drops by little and little into the *Pelvis*.

The use of them.

The Serum is separated by percolation.

From what I have said, it is manifest that the *Serum* is separated from the Bloud by a kind of percolation in the Reins, after the same manner as when it is discharged in many places out of the Arteries into the Glandules to supply matter for tears, spittle, snot, and other excrements. But I am also of opinion that this is likewise performed in some sort by dissolving of the Bloud, which is in its own nature thick and apt to curdle, whilest it passes through the Reins, is very much dissolved and attenuated by the leyish ferment of this part; in so much that the serous liquor separates from it the more easily. For the Piss being impregnated with a Saltness, whilest it continually washes through the very streight passages of the Reins, affixes on them saline particles, and consequently infects them with a kind of leyish odour or tincture, with which when the bloud is influenced as it passes through those parts, it is kept from thickening, still fluid, and apt to divide into several parts by percolation; as in like manner Milk is preserved from curdling by throwing Salt of Tartar into it. Yea the bloud it self, though out of its Vessels, it presently uses to grow thick and curdle, yet if you pour into it a quantity of Salt of Tart or Sal Armoniack, it remains fluid. The ferment therefore in the Reins doth, as it is commonly supposed, precipitate the bloud, but keeps it in such a state as that it may it self the more freely circulate, and the *Serum* of it be separated in a due quantity by percolation. And indeed that the Reins are impregnated with such a leyish ferment, is sufficiently manifest from the flesh of them, when prepared for eating; in that it hath from thence a very rank and ungrateful smell and taste.

The Reins have a ferment in them.

Part of the nutritive juice is carried away thorow the Reins with the Serum.

Whilest the *Serum* is separated on this manner in the Reins, partly by fusion and partly percolation, not only the bloudy part, but also most part of the nutritive juice too, escaping through the narrow pores of this same Strainer, is remanded with the bloud through the veins, whilest in the mean time the serous liquor it self, being impregnated with a saltness, not onely in the mass of bloud, but also by the ferment of the Reins, gleets down

through

through the Urinary pipes, or ſmall paſſages perpetually into the *Pelvis*, and waſheth away with it ſome of the more thin, and elaborate part of the nutritive juice, which is the ſediment of found Urine. *Phar. Rat.* Part I.

The matter of the Urine proceeds chiefly from the maſs of Bloud.

But indeed the Piſs or matter of the Urine, as to its ſubſtance, quantity and qualities, proceeds chiefly from the maſs of bloud. For ſince there are three chief and ſpecial offices which this performs (as I have elſewhere ſhewn) that is to ſay, by kindling or cauſing an heat to keep in the fire of life, by inſtilling the animal ſpirits into the Brain, and diſtributing the nutriment to all parts of the Body; for all and every of theſe purpoſes it muſt of neceſſity be diluted with a great deal of watriſh humour, and likewiſe be moiſtened perpetually with it ſtill freſh and freſh, after it hath ſent away that which is ſtale; and that this be performed in a due and conſtant method is of great conſequence to the preſerving of health.

The Serum is ſeparated from the Bloud ſometimes with difficulty, and ſometimes too eaſily.

The freſh ſerous liquor is very eaſily introduced into the Bloud along with the nutritive juice, and is throughly mingled with it moſt commonly without any impediment; but the ſtale doth not part from it always ſo readily and rightly as it ſhould do; but there are many errours in the ſeparation of it, from whence many Diſeaſes are occaſioned. For the *Serum* ſometimes ſticks to the Bloud unſeaſonably, and cannot deliver it ſelf from the embraces thereof: as in Fevers, of which there is no judgment at all, or at leaſt but an ill one to be made, as alſo in a *Leucophlegmatia* or Dropſie cauſed by white phlegm and a *cacochymia* or depravation of the Humours. But ſometimes though it is expelled from the Bloud, it leaves the Reins (which is the natural way of voiding it) and goes another way; as in Catarrhs, Gouty or Scorbutick defluxions, and in all ſorts of Dropſies; and ſometimes too on the other hand, the *Serum* getting too ſoon out of the Bloud, runs away before it hath done its task or office, and ſucking in ſome portions of the humours that are more uſeful, carries them along with it; as in a *Diabetes*, and great diſcharges of Urine that ſometimes fall out, and preſently ceaſe again. In theſe caſes, that is to ſay, as often as the quantity of Urine is either defective or exceſſive, the Reins are not always, or chiefly, but the Brain, and the Bloud moſt of all uſes to be in the fault; in as much as the maſs thereof being ſometimes too ſtrict and compact doth not eaſily diſmiſs the *Serum* and other things therein contained, which ought to be evacuated, and being otherwhiles too looſe and apt to diſſolve, cannot contain or keep in the *Serum* and nutritive juice long enough. Now from what cauſes and operations ſuch Irregularities proceed, we will a little enquire.

The reaſon of it is beſt explained by the diſſolving, curdling and reducing of Milk.

And indeed to reſolve this doubt, the analogie or reſemblance of Milk to Bloud (which, becauſe I have explained more at large elſewhere, I will here but briefly touch upon) doth very much conduce. Of Milk you may obſerve, that as long as the mixture thereof is preſerved entire, though it boyls or bubbles up upon the fire, all its particles being promiſcuouſly mingled make up one uniform liquor; but if you drop into it, whileſt it is boyling, any thing that is acid, the thicker particles of it turn preſently into a groſſer curd, and the watery ones in the mean time are diſſolved, with many of the ſaline ones, into a thin and plentiful liquor. Beſides, it is a common ordinary obſervation, that if Milk that is kept ſo long till it grows ſowre, be boyled upon a fire, it curdles of its own accord without pouring of any acid matter into it. And on the contrary, if at any time Milk be impregnated with any Salt of a nature different from acid Salt, (as for example, fixed, nitrous, or volatile) that is firſt diſſolved in it, it is not at all curdled by an acid poured into it, when it is boyling upon the fire. For this I have often tried with Salt of Tartar and Wormwood, with Mineral Chryſtal, with Flower of Salt Armoniack, with Spirit of Hartſhorn, and other things of the like kind. Moreover (which is ſtill a ſtranger thing) if you drop any of theſe Salts, or any diſſolution of them into the Milk whileſt it is a boyling upon the fire, and curdled by the acid matter that was infuſed into it, the curdling which was before, is for the moſt part diſſolved, the white thick and hard ſubſtance preſently vaniſhes, and the liquor is made thin and almoſt limpid again, though it does not totally reſume the form and homogeneous nature of Milk. And indeed that ſuch alterations as theſe do conſtantly happen, I have ſufficient knowledge by frequent experience; to wit, that if you put Ale, or White Wine, or Cider, or Vinegar, or any acid juices into Milk whileſt it is boyling upon the fire, it all preſently loſes the form of Milk, and turns to a white Curd and thin Whey. Then afterward, if you pour into the whole whileſt it is yet hot, either Salt of Tartar, of Wormwood, or any other Vegetable diſſolved, or the diſſolution of Salt of Nitre, or Armoniack (yea the Flowers or Spirits of it, as alſo of the Spirit of Hartſhorn, Soot) and the like, and mixture be a little diſturbed, moſt of the thick part of it will diſſolve, ſave onely ſome few remaining ſmall portions, and little curdled bits, that will ſwim here and there upon the top of the liquor. Moreover on

How to hinder the curdling of Milk.

the

Phar. Rat. Part I.

the other hand, if you throw fixed or nitrous Salt, or Flower or Spirit of Sal Armoniack, or Spirit of Hartshorn or Soot into boyling Milk, and then put Ale or White Wine, or Cider, or any other acid liquor into it, the Milk will not thereby dissolve or coagulate. How and from what causes these things happen and proceed, and what analogy or resemblance they bear to the dissolving or inseparability of the *Serum* in the mass of Bloud, I think it worth while here to consider.

The reason of these things is given.

From the Anatomy of Milk it plainly appears, that there are in it some few spirituous, a great many wateriſh, a pretty many sulphureous and earthy, and likewise some saline particles, which are partly volatile and partly fixed; whilest therefore the mixture is preserved entire, the saline particles sticking to the sulphureous ones, divide them from each other, and likewise hinder them from flying away, or uniting with the earthy ones; in the mean time the serous ones, being put in between the rest that are so equally mixed, fill up all the void spaces, and make the whole liquor as it were homogeneous: but whereas by the dropping in of the acid matter there happens presently a dissolution and coagulation of the liquor, the reason is, because the particles of fluid Salt in the acid matter catch hold of any other saline particles, whether fixed or volatile, in the Milk; to which, whilest they are fast united, the sulphureous particles getting out of the embraces of those that are acid and salt together, gather into one body, and so being united mutually among themselves, and with the earthy ones, they make up that thick curd that separates from the rest of the liquor: whilest in the mean time the watery Humor (in that its pores are almost quite destitute of sulphur and earth) being impregnated with little else besides the combinations of several Salts, grows presently thin and diluted. That it is really so, is very evident from the experiment just now cited, in as much as that curdling of the Milk is hindered, or taken off by the injection of fixed, nitrous, or volatile Salt: for every one of these Salts takes hold of the acid Salt which is in the Rennet that is infused, and by that means either preventeth or breaks off its union with the saline particles that are in the Milk: but whereas, though curdling of the Milk be taken off, yet its former hue is not restored to it, the reason is, because the extraneous particles of the Salts that are put into it, remaining still in the mixt body of it, do hinder the entire restoration of its mixture; but without doubt if those particles could be again expelled, or driven out, the former mixture would return as like Milk as before. Wherefore I may conjecture of the Bloud, that though it be sometimes depraved by fusion or coagulation, because it uses to exterminate or drive out from it all heterogeneous particles, may recover its due and former mixture.

But whereas Milk that is kept too long and grows sowre, is curdled of it self upon the fire without any acid matter infused into it, the reason is, because in that liquor, which then tends to putrefaction, the saline volatile particles (as is usual) being depressed to a fluidity, become acid; and therefore they (since the pores of the Milk are opened in the boyling) catch hold of the saline fixed particles that are allied to them; to which whilest the sulphureous ones that came out of them, stick fast and close, (being also mutually united among themselves, and likewise with the earthy ones) they make a white Curd whilest the *Serum* with the combinations of the Salts is dissolved into a wateriſh humour. Cold Milk will not curdle either of it self, nor if you put an acid into it; because when the pores are closed, the inward particles, however disposed, do not easily set themselves upon making either new unions or separations; but when the pores are opened by the heat, then as occasion is given, they presently make divisions and private combinations.

Having premised these things concerning the dissolution, coagulation, the prevention of that condition, and the reduction of it to its former state; let us now consider whether any thing like or analogous to what I have said, agree to the Bloud or no. Now truly, though we cannot resolve, variously separate, or curdle the Bloud when taken out of the Vessels (and then reduce it to its former state again) by the affusion of saline matter, nor divide it into its constituent parts, as we can Milk upon the fire; because indeed the consistence of Bloud is thicker than that of Milk, and more apt to grow grumous [or into a Gelly] and also that when the vital flame of it is extinguished, that consistence is very much changed from what it hath in the Vessels; yet I have often tried and known (what the experience of others also doth confirm) that the same liquors that dissolve and precipitate Milk, as distilled Vinegar, Spirit of Vitriol, the dilution of Salt or Nitre, and other acids, when poured into hot Bloud, do presently curdle and discolour it, in such a manner, as that when the whole mass grew black, one part turn into a thick Cake like Gelly, and the other into a thin, watery *Serum* or Whey. So likewise those things that hinder or take off the curdling of Milk, as Oil of Tartar, the fixed Salts of Plants, the dissolution of the Salt of Nitre, or slacked Lime, Spirit of Sal Armoniack, of Harts horn, and the like, if poured into the Bloud when

There is somewhat in the Bloud analogous to the curdling of the Bloud, &c.

What alterations Chymical Liquors poured into Bloud when it is hot, do produce.

Phar. Rat. Part I.

when it is hot, preſerve its mixture entire, or rectifie it, as we may conclude from its ruddy bright colour, and the conſiſtence of it that remains ſo long and ſo even: ſo that it eaſily follows from hence, that Bloud conſiſts of the ſame elementary particles as Milk, though in a different proportion. For in the Bloud there is a greater quantity of Spirit, Sulphur, Salt, and Earth, and leſs Serum than there is in Milk. From whence we may conclude, that the Bloud when rightly diſpoſed, that is, the thicker ſort of it, is too apt to curdle or turn to a Gelly, but is not ſo liable to diſſolution, or being turned into many ſerous parcels; and yet, that whileſt it paſſes through the Reins in its circulation, all ſuperfluous wateriſhneſs is ſeparated and carried off from it, partly by the ſtrainer of the Reins, and partly by the ferment of them, which keeps the Bloud from too exceſſive coagulation. But when the Bloud is vitiated in its temper, there are many irregularities both in the conſtitution of it, and in the ſeparation of the *Serum*. As to the firſt, the Bloud ſometimes is too hot and ſharp, and otherwhiles too thick and fæculent or dreggy, as at other times alſo exceſſively thin and wateriſh; and according to theſe ſeveral degenerated conditions or ſtates of it, ſeveral Diſtempers do ariſe, of which it is not proper in this place particularly to treat. But howſoever the Bloud is diſordered in its temper, yet whileſt the *Serum* of it is ſeparated in its due meaſure and method, the Party is not therefore preſently very ſick upon it. But a great many Diſtempers happen to ſpring from the ill ſeparation of the *Serum*. And in this caſe, as there are many ſorts of errours, ſo moſt commonly the fault lies either in exceſs or defect. For ſometimes the ſerous Liquor ſticks too cloſe and faſt in the embraces of the Bloud, and on the contrary, ſometimes ſlips away too ſoon; and in this reſpect, the Bloud being not able to keep in the *Serum*, ſpews it out at the mouths of the Arteries in many places, almoſt all over the Body; and by that means diſcharging it into the Bowels, or the habit of the Body, produces an *Aſcites* [a Dropſie ſo called] or an *Anaſarca* [another kind of Dropſie] yea and ſometimes ſending it immoderately into the Reins, cauſes a *Diabetes*. The Bloud when it keeps in the *Serum*, too ſtrictly, either boyls up for the moſt part in a Fever, and is more compact in its conſtitution (whileſt the thicker particles at the ſame time are mixt, and contempered with it) ſo as that the thinner particles do not eaſily break forth; or being filled with ſcorbutick Salt and Sulphur, it becomes very clammy and glutinous, in ſo much that the ſerous parts can ſcarce get away out of the company of the reſt. Now ſeeing that the ſeparation of the ſerous Liquor is hindered or peryerted ſo many ſeveral ways, there are alſo Diuretick Medicins of a different nature and operation; which yet may be diſtinguiſhed; and firſt of all, as to their end, as they reſpect the maſs of Bloud, or the Reins, or both together. Secondly, As to their Matter, as they are either ſulphureous or ſaline: and theſe again are very various, according as the ſaline particles are in a ſtate of fixedneſs, fluidity, or volatility, or otherwiſe, nitrous or Alchalized. Thirdly, As to their Form, theſe Medicins are very different; but moſt commonly the Compoſitions of them, as to their appearance, are either Potions, or Powders, or Boluſſes, or Pills, or Chymical Liquors, of which hereafter we will particularly diſcourſe. In the mean time, although it may ſeem that the explanation of the particular deſigns and ends of Diureticks belongs more to the ſpeculative than the practical part of Phyſick, yet I think it neceſſary in this place briefly to point out the chiefeſt of them. Then in the ſecond place, to diſtinguiſh Diuretick Medicins, as to their Matter, which in every one of them is moſt commonly ſaline onely. And in the laſt place, to ſubjoin the choiceſt Forms of Receipts in every kind.

That the Bloud may rightly ſeparate the Serum it ought to be kept from growing too thick or too thin.

The exceſſive ſeparation of the Serum.

The defective ſeparation of the Serum.

A diviſion of Diuretick Medicins,
1. As to their End.
2. Their matter.
3. Their Form.

Firſt therefore, when the Bloud becomes ſo thick and clammy through the mixture and mutual combination of fixed Salt with Sulphur and Earth together, that the watery particles cannot eaſily part from the reſt, the Diureticks, to looſen its conſtitution and diſſolve the *Serum*, ought to be ſuch as are full of volatile or acid Salt: for ſuch particles chiefly diſſolve the Combinations made by the fixed Salt. But ſeeing this diſpoſition is common both to the Fever and the Scurvy, in the former caſe the moſt proper Diureticks are not onely the temperate acids of Vegetables, as alſo Salt of Nitre, Spirit of Sea Salt, Vitriol, &c. but alſo ſuch as are impregnated with volatile Salt, as Spirit of Harts horn, and of Sal Armoniack, Salt of Amber, of Vipers, and others of the ſame kind; which we have hereafter recounted in the number of Diaphoreticks alſo. In the Scurvy, ſeeing the Urin is but little, and that thick too, the juices of Herbs, and Preparations, both acid and ſharp, are of great uſe; as alſo Sal and Spirit of Piſs, of Sal Armoniack, of Tartar, &c.

I. Saline Diureticks:
1. Such as agree beſt when the Bloud is too compact.

Secondly, Sometimes the Bloud doth not keep the *Serum* within it long enough, but being obnoxious either to fluxions, or rather coagulations, diſchargeth it here and there in very great quantities, and cauſes Catarrhs, or Tumors in ſeveral places; or the Bloud being habitually weak, and at the ſame time of an ill temper, that is inclining

And 2. what agree beſt when it is too looſe.

Phar. Rat. Part I.

ning to acidity, is apt, as to its thicker particles, to curdle; in ſo much that the thinner parts of it being ſent away, whileſt it circulates, and ſettling in the weaker parts, produce ſometimes pains in the head or breaſt, and ſometimes an *Aſcites* or *Anaſarca* [two ſorts of Dropſies]. Moreover from the like cauſe I ſhall by and by ſhew that a *Diabetes* proceeds. For indeed many obſtinate Diſeaſes that are imputed to the ill temperament of the Bowels, ariſe from this cauſe; to wit, for that the Bloud being of an ill temper and liable to coagulation, ſeeing it cannot continue the whole motion of its circulation, doth in many places diſcharge and leave the *Serum* which is too apt of it ſelf to ſeparate, and lodge where it ſhould not. In theſe caſes ſuch Diureticks are to be given that may not diſſolve the Bloud, but take off its coagulation onely; ſuch as are Medicins impregnated with fixed, volatile or even alchalized Salt; and likewiſe ſuch as corroborate and reſtore the ferment of the Reins, as ſome ſulphureous and ſpirituous ones. To theſe ends ſerve Diureticks that are ſulphureous and mixed, lixivial or leyiſh Salts of Herbs, Powders of Shells, Sal and Spirit of Piſs, &c. Millipedes [or Woodlice] Roots of Horſe-radiſh, Parſley Seeds, Nutmeg, Turpentine and the Preparations of it, and Spirit of Wine; the virtue of all which, is not to diſſolve the Bloud, and precipitate ſerous matter out of the maſs thereof (for that acids do beſt, and in ſuch caſes often hinder the flowing of the Urin) but to diſſolve the curdling of the Bloud: ſo that the conſtitution of it having recovered its entire mixture, and circulating more ſwiftly through the Veſſels, may ſuck back the *Serum* that is any where extravaſated [*i.e.* out of its Veſſels] or lodged where it ought not to be, and may at laſt deliver it to the Reins to be by them carried off. How Diureticks of all kinds work according to both theſe, almoſt oppoſite ends of Phyſick, and under what Forms they are moſt commonly preſcribed, I ſhall now in the next place ſhew you.

CHAP. II.

The ſorts and forms of Diureticks [or Medicins that purge by Urin] as alſo the Reaſons of the Chymical Preparations of ſome of them.

FIrſt therefore, as to Saline Diureticks [or ſalt Medicins that purge by Urine] that which I have oftentimes inculcated, ought to be here taken notice of, to wit, that what ever Salts of different tempers are put together, they mutually lay hold of each other, and are immediately conjoined; and that whileſt they ſo combine, the other particles, being looſened from the mixture, divide or fly ſeveral ways. This is evidently ſeen when fluid or acid Salt is put to fixed or alchalized; and likewiſe when fluid or fixed is mixed with volatile or ſharp Salt. Indeed the whole buſineſs of Diſſolutions and Precipitations depends upon this one quality of Salts. Wherefore ſince the Bloud and Humours of our Bodies abounds with much Salt, and that uſually altered from one ſtate to another, and conſequently the cauſe of various indiſpoſitions; and ſeeing furthermore that there are divers kinds of ſaline Diureticks, filled with fixed, fluid, nitrous, volatile, or alchalized Salt, it will require great diſcretion and judgment in a Phyſician ſo to order it, that the ſaline particles in the Medicin may differ from thoſe in our Bodies. How this may be done I will ſhew you by running over each kind of ſaline Diureticks.

The diverſe ſtates of Salts.

Their various affections.

Diureticks impregnated with acid Salt.

Among ſaline Diureticks impregnated with acid Salt, the Spirit of Salt or Nitre, as alſo the juice of Limons, and Wood Sorrel, White Wine, Rheniſh Wine and Cider are of prime note among the Vulgar, and oftentimes perform that intention: for theſe alone diſſolve the Bloud, and precipitate it into *Serum*, as when an acid is dropped into boyling Milk. But this doth not happen alike in all, nor even to any equally. In an hale conſtitution, or ſuch as is not much different from it, the Salt of the Bloud is partly fixed, partly nitrous, and partly volatile; ſo alſo in ſome Scorbutick and Hydropical Bodies, it becomes moſt commonly fixed. Wherefore in every of theſe caſes, Diureticks impregnated with acid Salt, are uſed with ſucceſs; but in Catarrhs, and ſome hydropical and ſcorbutical Diſtempers, when the ſaline-fixed particles of the Bloud are exalted into a ſtate of fluidity, and the volatile ones are depreſſed (as it often happens) acid Remedies uſually do more hurt than good; in as much as they more pervert the Bloud, that is already degenerated from their right temper: but in ſuch caſes, Medicins impregnated with fixed or volatile Salt will be more helpful.

Where they are agreeable.

The

Phar. Rat. Part I.

The Forms of Diureticks that have acid Salt for their Foundation.

Powders.

Take of the Powder of choice white Tartar, of Chryſtal Mineral, each ℥ j. ß. *of Crabs eyes pulverized* ℥ j. *and make a Powder. The Doſe is from* ℥ ß. *to* ℈ ij. *in a convenient vehicle, repeating it every ſixth or eighth hour.*

Take of Tartar vitriolated, or nitrated ℥ ij. *of the Powder of Egg-ſhells* ℥ j. ß. *of Parſley or wild Carret ſeed* ℥ ß. *and make a Powder. The Doſe is* ℥ ß. *to be taken in the ſame manner.*

Take of the beſt Spirit of Salt ℥ ij. *of Harts horn burnt and pulverized, a convenient quantity as much as will imbibe the Spirit, and make a Powder. The Doſe is from* ℈ j. *to* ℥ ß.

A Drink.

Take of the juice of Limons ℥ ij. *of compound Radiſh Water* ℥ j. ß. *of Syrup of the five Roots* ℥ iij. *and make a Drink or Potion.*

Take of the juice of Sorrel ℥ ij. *of White Wine* ℨ vj. *mingle them and make a Potion.*

Take of compound Radiſh Water ℨ ij. *of Pellitory of the Wall* ℨ iv. *of Spirit of Salt* ℈ j. xv. drops, *of Salt of Tartar* gr. xv. *of Syrup of Violets* ℨ ß. *and make a Potion.*

Diuretick impregnated with fixed Salt.

2. That Medicins impregnated with fixed or lixivial Salt, provoke Urin, is very manifeſt from the vulgar and quack Phyſick that is commonly uſed to cure Dropſies; for in an *Anaſarca* [or Dropſie that goes through the habit of the Body] and ſometimes in an *Aſcites* [a Dropſie that makes the Belly ſwell like a Bottle] when the Bowels or Fleſh are exceſſively ſwelled with a conflux of Water, they frequently give a *Lixivium* or Lie, made of the aſhes of Wormwood, or Broom, or Bean-ſtalks, with White Wine: from whence commonly proceeds plentiful piſſing, by which the Diſtemper is removed. But yet I have obſerved, that that Medicin in ſome People hath not been at all Diuretick, but hath increaſed rather than cured the dropſical indiſpoſition: of which if you would know the reaſon, it is manifeſt from what I have already ſaid, that lixivial Salts do neither diſſolve nor precipitate neither the Bloud nor Milk, and therefore are not in their own nature diuretick; but yet that effect ſometimes follows, in as much as the fixed Salt, being copiouſly taken in, deſtroys the operation of the acid and coagulative or curdling Salt that predominates in the Bloud; and conſequently the Bloud, though before it were too apt to be diſſolved, and could not contain its *Serum*, but thruſt it forth in all places, yet now by the approach of the fixed Salt, recovers it due temper, and therefore ſucking back the *Serum* that was extravaſated, and carrying it down to the Reins, it cauſes plentiful piſſing.

Their Forms of Receipts.

2. Forms or Receipts of Diureticks that have fixed Salt for their Foundation.

Take of the Salt of Tartar or Wormwood ℥ ij. *of Coral calcined till it be white* ℥ j. ß. *of Nutmeg* ℥ ß. *make a Powder. The Doſe is* ℥ ß. *to* ℈ ij.

Take of the Tincture of Salt of Tartar ℥ j. *to* ℨ j. ß. *of compound Radiſh Water* ℨ j. ß. *mingle them, and give it in a draught of Peſſet drink, with Roots and Seeds of Burdock boyled in it.*

Take of the Deliquium [or Oil] *of Salt of Tart, that floats beneath, whileſt the Tincture is extracting, and of Wine impregnated with Sulphur* ℈ ij. *to* ℨ j. ß. *of White Wine* ℨ iv. *to* vj. *of Syrup of the five Roots* ℨ ß. *mingle them, and make a draught, to be repeated twice or thrice a day.*

Take of the whiteſt aſhes of Vine twigs half a Pint, of Nutmeg ℥ ij. *pour to it of White or Rheniſh Wine two Pints and an half. Let them ſtand hot and cloſe for a day, and then keep the ſtraining for your uſe. The Doſe is* ℨ vj. *twice or thrice a day.*

Take Flints heated red hot in the fire, and quench them in White Wine or old March Beer, and drink of that Liquor ℨ vj. *or* viij. *twice a day.*

Take of ſlacked Lime water ℨ iv. *to* vj. *of the Tincture of Salt of Tartar* ℨ j. *to* ℨ j. ß. *make a draught, to be taken twice or thrice a day.*

Phar. Rat. Part I.

Diureticks impregnated with volatile Salt. Why they do good.

3. For the ſame reaſon that fixed Salt is uſed, in a ſharp indiſpoſition of the Bloud, to provoke Urin, they uſe alſo volatile Salt ſometime, and that with ſucceſs; in as much as the particles thereof being admitted into the Bloud deſtroy the predominancy of the fluid Salt that is in it; and conſequently the Bloud, recovering its due mixture, and being freed from curdling and defluxions, ſucks back all the *Serum* that is extravaſated and delivers over to the Reins all that is ſuperfluous to be carried off through the Ureters or Piſs-veſſels. But yet thoſe Medicins which are prepared with volatile Salt, (becauſe they have particles that are ſomewhat ſtrong and elaſtical or ſprindgy) when they mend or rectifie the temper of the Bloud, diſpoſe that part of the *Serum*, that is ſuperfluous, for evacuation by Sweating ſometimes as well as by Piſſing. Now to this rank of Diureticks, not onely pure and ſheer volatile Salt, drawn out of Animals or Minerals by Diſtillation, but even the integral parts both of living and vegetable creatures (ſuch as the Powders and Extracts of Inſects and Vegetables that are ſharp) ought to be referred.

3. Forms or Receipts of Medicins that have Volatile Salt for their Foundation.

Powders.

Take of the ſalt of Amber, and of ſalt of Nitre, each ʒ ij. *make a Powder. The Doſe is* ℈ j. *to* ʒ ß. *in a convenient vehicle.*

Take of the Flower of Sal Armoniack, and of Mineral Chryſtal, each ʒ ij. *and mingle them. The Doſe is* ℈ j. *to* ʒ ß. *in a ſpoonful of compound Radiſh water. Give the Salt of Urin after the ſame manner.*

Take of the Powder of Bees ℈ j. *of Lovage ſeeds* ℈ ß. *make a Powder, and give it in a ſpoonful of diſtilled Water.*

Potions.

Take of the ſpirit of Urin from ℈ j. *to* ʒ ß. *of compound Radiſh water from* ʒ j. *to* ʒ j. ß. *of Juniper water* ʒ iij. *mingle them and make a Potion. You may give the ſpirit of Tartar after the ſame manner in a double quantity.*

Pills.

Take of Millepeds prepared ʒ ij. *of the Flower of Sal Armoniack* ʒ ß. *of Nutmegs pulverized* ʒ ß. *of Venice Turpentine a convenient quantity, and make them into Pills. Let the Patient take* iv. *twice a day.*

Take of the Powder of the Seeds of Burdock ʒ ij. *of wild Carret* ʒ j. *of the ſalt of Amber* ʒ j. *of Oil of Nutmegs* ℈ ß. *of Capivy Balſam a convenient quantity. Make a Maſs and form it into ſmall Pills, of which you may give* iv. *night and morning.*

A Decoction.

Take of the Roots of Chervil, Parſley, Fennel, Ringo, and Reſtharrow, each ʒ j. *of the Leaves of Saxifrage and Clivers, each one handful, of the Seeds of Hartwort and Grumwel each half an handful, of Juniper berries* ʒ vj. *boyl them in* iv. *Pints of Spring water till half be boyled away, and then put to it one pint of Rheniſh Wine, and of the beſt Honey* ʒ ij., *and ſo make an Apozeme or Decoction. The Doſe is* ʒ vj. *twice a day.*

A diſtilled water.

Take of freſh Millepeds two pints, of the Leaves of Clivers, Chervil, Saxifrage, and of Golden Rod, each two handfuls,, of wild Radiſh roots ʒ vj. *of Nutmeg* ʒ j. *of Juniper berries, of Seeds of wild Carret, each* ʒ ij. *cut them to pieces, bruiſe them and pour to them of Whey, made with White Wine* viij. *pints, diſtil them in the common veſſels and mingle all the liquor. The Doſe is* ʒ iv. *twice or thrice a day.*

Strainings.

Take of freſh Millepeds waſhed, from the number of 40. *to* 60. *of Nutmeg* ℈ ß. *which when you have bruiſed, pour to them of the diſtilled water of Saxifrage* ʒ iij. *Strain it and drink it.*

Take of the Leaves of Chervil, and Parſley of Macedonia, each three handfuls: bruiſe them, and pour to them of White Wine a pint and an half; then ſtrain it well, and keep it in a glaſſen Veſſel. The Doſe is ʒ iij. *twice a day.*

A Tincture.

Prepare a Tincture out of Millipeds, Bees, Graſſhoppers or dried Catharides, with the Tincture of the ſalt of Tartar. You may give it from 15 *or* 20 *drops to* 30, *in a convenient vehicle.*

4. That

4. That Nitre is a kind of Salt, is very manifeſt from the figure, colour, taſte, with other properties and accidents belonging to it. But yet this is different from all other ſorts of Salt, or any ſtate of ſaline particles, nor is it either acid, or fixed, or volatile, but as it were a mean betwixt both. It ſo far participates of volatile Salt, as that when it is made, it ought to be elixiviated, or prepared with a Lie, and joined to fixed Salt, that it may thereby gain a kind of concretion or bulkineſs. Moreover, When it is melted, if you put any Sulphur into it, it immediately takes fire and flies away: but it ſo far communicates with fixed Salt, that being melted in a crucible, it indures a long, and it may be, perpetual fuſion, without any conſiderable diminution of its parts or particles. Indeed it is Nitre onely, whereby all Plants flouriſh, all Animals live and breath, and wherewith all ſublunary fire is kindled and fomented or kept in; as I have ſhewed in another Treatiſe, which I have no neceſſity here to repeat. *Phar. Rat.* Part I. *Diureticks that are impregnated with a nitrous Salt.*

But as to what concerns our preſent buſineſs, it is ſufficiently known, that the Salt of Nitre cools the Bloud, and provokes Urin very ſtrongly: but the reaſon of both theſe effects is not ſo very evident: for Nitre is ſo far from containing in it ſuch cooling particles, that on the contrary, nothing is more fiery, as you may ſee in Gunpowder; and if you diſtil it, you would think a flame rather than a vapour or fume came forth into the Receiver: Beſides that, the *ſtagma* or diſtilled liquor that drops from it, burns and corrodes all things that come near it, juſt like to actual fire. Nor have we leſs reaſon to wonder how this Body, whoſe nature is ſo exceeding fiery, ſhould ſo dilute the bloud, and diſſolve or melt it into wateriſhneſs in order to provoke Urin. *The reaſons of its effects.*

Upon theſe things, that I may give you my conjectures, I ſay, that Nitre conduces to the production of thoſe effects in a double reſpect; to wit, both as it is a Salt, ſomewhat allied to fixed and volatile Salt, and alſo as it is a fiery body. As to the former, I have obſerved that Nitre (like fixed and volatile Salts) being put into Milk, doth either hinder or take off the curdling of it; and likewiſe that if you pour Bloud whileſt it is hot, upon this, as you do upon thoſe it will preſerve it from curdling or being diſcouloured. Wherefore ſeeing the particles of Nitre taken inwardly, do either keep the mixture of the Bloud entire or reſtore it, they conſequently will prevent or take off the meltings or curdlings thereof, from whence proceeds heat and difficulty of making water.

But furthermore Nitre, as it is a fiery body, if inwardly taken, will cool the Bloud when it is in an exceſſive heat, and provokes Urin; in as much as (which I intimated before) it augments, by coming in, the flame of the Bloud, which before was dim and mixed with ſmoakineſs, and making it more clear and pure, doth conſequently render it more gentle; and when by that means the Bloud (whileſt it burns more bright through the intermixture of the Nitre) is more looſened in its conſtitution, the ſerous particles are more eaſily extricated, or diſengaged from the thicker, and do more plentifully run away.

4. Receipts of Diureticks, that have Nitre for their foundation.

Take of Nitre prepared ℥ ij. *of Barley water, with the roots of Graſs and candid Ringo boyled in it, two Pints, of Syrup of Violets* ℥ ij. *mingle them. The Doſe is* ℥ iv. *twice a day.*

Take of Sal Prunella ℥ ij. *of white Sugar* ℈ j. *make a Powder, to be divided into ſix parts, whereof take one in any convenient liquor, thrice a day.* *Powders.*

Take of Sal Prunella ʒ iij. *of Salt of Amber* ℥ j. *and make a Powder. The Doſe is* ʒ ß. *thrice a day.*

Take of Sal Prunella, of Crabs Eyes, and of Salt of Wormwood, each ℥ ij. *mingle them The Doſe is* ℥ ß. *thrice a day.*

5. It is alſo very vulgarly known that ſome Powders of Shells and Stones, that are impregnated with an alchalized or petrifying Salt, do ſometimes provoke Urin. For to ſome that have been troubled with great Stranguries, or difficulty of Piſſing, the Powder of Egg ſhells, and of the Claws or Eyes of Crabs, hath been a preſent remedy. Of which if you inquire into the manner and reaſon of their operation, it is very manifeſt that ſuch Medicins do not diſſolve or ſenſibly precipitate the Bloud. Wherefore we muſt conclude, that theſe are ſometimes (upon a ſowre indiſpoſition of the Bloud and Humours) diuretical, or apt to provoke Piſs, in as much as they by *Diureticks impregnated with alchalized Salt.*

Phar. Rat. Part I.

their combination or ſticking together do bind and reſtrain the acid Salts, ſo that the Bloud, being freed from all fluxions and coagulations, ſucks back the extravaſated *Serum*, and tranſmits it to the Reins.

Their Forms or Receipts.

5. Receipts of Diuretick Medicins, that have Alchalized Salt for their foundation.

Take of the ſhells of Eggs powdered ℥ ß. to ℥ j. give it in a draught of White Wine, or Poſſet drink, or Diuretick Decoction, twice a day.

Take of the Powder of the Claws or Eyes of Crabs ℥ ij. of Salt of Amber, and of Nitre, each ℥ j. of Nutmeg ℥ ſ. make a Powder. The Doſe is ℥ ß. to ℈ ij. in a convenient vehicle. Or take the aforeſaid Powder with a convenient quantity of Venice Turpentine, and make it into ſmall Pills. The Doſe is iij, *or* iv. *night and morning.*

Diureticks that are ſulphureous and ſpirituous.

You may juſtly reckon among ſuch things as are Diuretical, not onely ſaline Bodies, but alſo ſome ſulphureous and ſpirituous ones too, in as much as they often produce the ſame effect. Many Gums, as eſpecially Turpentine, (and ſuch Medicins as are prepared out of them) Oils of Juniper, Nutmeg, Wax, and that which drops from other fat things, being taken inwardly, provoke Urin (in many People) very plentifully, which hath a ſmell like that of Violets. I have known in ſome hydropical and ſcorbutical perſons, that the ſpirit of Wine, and hot Waters, yea and generous Wine alſo, if largely drunk of, hath provoked Urin; of all which the reaſon is, becauſe when the Bloud is weak or ſowriſh, or, through the defect of fermentation, or the predominance of an acid and coagulating Salt, doth not circulate ſo briskly and equally as it ſhould do, ſo as to contain the ſuperfluous *Serum* within it, till it can deliver it over to the Reins, the aforeſaid Remedies (in as much as preſerve the mixture of the Bloud entire, or reſtore it when decaying) conduce very much to the provoking of Urin.

Their Receipts. Diſtilled Watrr.

Take of the freſh Berries of Ivy, Juniper, and Laurel, each half a pound, of the Seeds of wild Carret ℥ iv. of Nutmeg ℥ ij. After you have bruiſed them, put to them in a Glaſſen Retort, of the beſt Venice Turpentine one pint, of Spirit of Wine rectified four pints, diſtil them in an Oven of Sand with a moderate heat till they are dry, taking care that they burn not, and you will have a Spirit and an yellow Oil, which are both exceedingly Diuretick. The Doſe of the Spirit is from ℥ j. to ℥ ij. or iv. of the Oil ℈ ſ. to ℈ j. in a convenieut vehicle.

A Tincture.

To the dregs that are left behind in the Retort, pour of the Tincture of Salt of Tartar one pint; and let them digeſt cloſe in an Oven of Sand for ſeveral days, that the red Tincture may come forth; of which the doſe is from ℈ j. to ℈ ij. or ℥ j. in a convenient vehicle.

A Spirit and an Oil.

Take of prepared Millepeds ℥ iij. of Nutmeg ℥ j. bruiſe them, and pour to them of the pureſt ſpirit of Turpentine, and of the Tincture of Salt of Tartar, each ℥ vj. diſtil them with the gentle heat of a Bath, and you will have a Spirit, an Oil, and the deliquium or melting of the ſalt of Tartar, each of them impregnated with a notable diuretick quality.

The Reaſons of ſome Preparations.

1. *Sal Prunellæ, or Chryſtal Mineral, which is nothing elſe but purified Nitre.*

Sal Prunellæ.

Take of choice Nitre a convenient quantity, and diſſolve it in Spring or Rain water; boyl it a little, and lay it up in a deep glaſſen Veſſel, to chryſtallize, in a cold place: then pick out the whiteſt and moſt clear chryſtals onely, which you muſt again by often diſſolutions and chryſtallizations, reduce to the higheſt degree of purity; and they after that, being melted in a crucible and poured out into a ſilver Veſſel, will harden into very white ſtone. Of this, when pulverized, the Doſe is from ℈ j. to ℥ ſ. or ℈ ij. which cools the boyling of the Bloud, and provokes Urin.

The reaſon of it.

This Preparation is ſo ordered, that the nitrous particles, as much as is poſſible, may be ſeparated quite and clean from the fixed Salt, and harden into Chryſtals diſtinct by themſelves: for when the Nitre is firſt made out of the Earth, and drawn forth by a Lie, the particles thereof are ſo unapt to grow together, or chryſtallize, that

it

it is neceſſary for the nitrous Lie to be again elixiviated with aſhes, and impregnated with fixed Salt, to the end that the nitrous particles, being partly united to the Leyiſh ones, and partly, by the intervening of them, thruſt out of the pores of the Water, may gain a kind of concretion or hardneſs: wherefore ſeeing the Body or Salt of Nitre is formed in that manner, ſee that the particles of fixed Salt be, by frequent diſſolutions and chryſtallizations, purged away, as much as poſſible, to make it the purer for Phyſical uſes.

2. Spirit of Nitre.

Take of the pureſt Nitre ℔ j. *of Powder of Bricks* ℔ ij. *which when you have well pounded and mixed, put them into a glaſſen Retort, luted or into an earthen one, and diſtil them in a reverberating Oven with a fire gradually augmented. The red Fumes will make the Receiver glitter with a kind of flame colour, and when they are condenſed will make a diſtilled liquor which is acid and exceeding corroſive. The Doſe is* iv. *to* vj. *in a convenient vehicle.* *Spirit of Nitre.*

Although Nitre, mixed with Sulphur, is ſoon ſet on fire by the leaſt particle of igneous matter, and breaks out into flames; yet, being deſtitute of that, it may be melted in a crucible, or diſtilled in a Retort, without any burning at all. The Powder of Bricks is added to it, that when the Salts are melted by the fire, they may not mutually get hold of, and chain together each other, but being divided and ſeparated from one another, may, by the force of the fire, be driven forth from their ſubject. *The reaſon of it.*

Nitre, when melted, retaineth its inflamable quality; but the diſtilled liquor will ſooner put fire out than kindle it. For if at any time you put it among ſulphur, that mixture can very hardly, and not ſo ſoon as ſulphur, be kindled by it ſelf; the reaſon of which is, becauſe the nitrous Salt, having undergone a diſſolution, is quite altered from its natural ſtate, and gaineth much ſuch another ſowre temper, as other Salts that have ſuffered the like mutation; yea out of Sulphur there is drawn an acid *ſtagma* or liquor, that rather deſtroys than augments inflammations.

3. Spirit of Sea Salt.

Take of Sea Salt, diſſolved and powdered, ℔ j. *of Bricks coarſly pulverized* ℔ iij. *pound them together, and mix them: then put to them ſome good big Brick-bats to the quantity of* ℔ ß. *when they are well mixt and put into a ſtrong Retort, diſtil them with a fierce reverberating fire for* 24. *hours; rectifie the diſtilled liquor with the heat of Sand in a glaſſen Cucurbit, drawing off the phlegm or wateriſh part; and there will remain in the bottom a Spirit, of an yellow or greeniſh colour, that hath a ſmell and taſte very grateful.* *Spirit of Sea Salt.*

This Salt is very difficult to be driven or forced into a ſharp liquor, becauſe the particles thereof, more than any other ſaline ones that are in Minerals, to wit, in Vitriol, Nitre, Alum, *&c.* being moſt ſtrictly united, cannot eaſily be parted from each other, or ſeparated from the embraces of the Earth; wherefore when they are looſened by the fire, mingle with them the Powder of Bricks, in a threefold quantity, to keep them from running together; and beſides that, I thought fit to put between them good big pieces of Bricks, that the maſs that is to be diſtilled, being hollowed as it were with holes through it, might be every where penetrated or pierced by the fire. Yet notwithſtanding, as you diſtil them, the Salts being diſſolved by the fire, will very often run together, in ſo much that afterward that cannot be driven forth with any force of fire. *The reaſon of it.*

That it is ſo, is very plain, becauſe if by Art this union of the Salts among themſeves and with the Earth be broken off, they are eaſily forced into an acid *ſtagma*, or diſtilled liquor. For example; *A more compendious way.*

Take of the Spirit of Vitriol not rectified one pint, and in a glaſſen Retort, pour it into Sea Salt calcined and pulverized, and immediately diſtil it in Sand, the ſpirit of the Salt being expelled as it were by the other, will eaſily aſcend, whileſt the ſpirit of Vitriol ſtays in its room; that is, this ſpirit of Vitriol being more ponderous and ſtronger, and likewiſe bereft and covetous of an earthy habitation, drives the other out of its poſſeſſions, and at the ſame time invades them it ſelf.

4. Spirit of Piſs.

Take of the Piſs of a ſound man that drinks Wine, what quantity you think fit, and when you

Phar. Rat. Part I.

you have put it into a Cucurbit with a blind Still, let it rot in dung for a moneth; then diſtil it in Sand. The liquor diſtilled from it being rectified in a deep Cucurbit, affords a ſpirit and a volatile Salt.

This operation may be performed more compendiouſly, if you evaporate freſh Urin to a fourth part of what you firſt took, to wit, that when the phlegm is exhaled, the ſaline particles may more cloſely incorporate with the ſulphureous and earthy ones. To this thick compoſition (after you have put it into the Cucurbit) pour either a Lie made of Aſhes or Salt of Tartar, or the diſſolution of ſlacked Lime; and then putting on the Still, diſtil it in an Oven of Sand; and you will eaſily gain a Spirit, and a volatile Salt, which by rectification are purified and ſeparated.

The reaſon of it. The reaſon of theſe proceedings is, becauſe in that the Urin conſiſts of a double kind of Salt, that is to ſay, a nitrous and a volatile, together with a great deal of Sulphur and Earth, the particles of volatile Salt (whileſt the mixture remains entire) are ſo detained and ſtrictly compacted by the other ſaline ones, together with the reſt of the thicker elements, that the ſpirits cannot break forth, or be divided and ſeparated by the force of fire; but when by long rotting [in the dung] the mixtion of the liquor is looſened, the ſaline volatile particles, which at length do extricate or diſentangle themſelves from the reſt, aſcend firſt in the diſtillation. Moreover the ſame effect alſo doth eaſily enſue, when a fixed Salt that is different from the nitrous, is poured in; for whileſt the particles of the nitrous Salt are laid hold on by thoſe of the other Salt that is infuſed, the volatile Salt eſcaping out of its reſtraint, doth eaſily make its way and is gone. Hither you may refer what I ſhall hereafter ſay of the diſtillation of Sal Armoniack.

5. Tincture of Salt of Tartar.

Tincture of Tartar. *Take of the pureſt Salt of Tartar* ℥ vj. *melt it and let it remain in the crucible till it gain a blew, or almoſt a green colour; then, having pulverized it whileſt it grows hot, and put it into a ſtrong Matrace or Glaſs Still with a long neck, pour to it rectified ſpirit of Wine the depth of three or four fingers, and let it digeſt in an Oven of Sand upon a quick fire for ſeveral days, till the tincture be extracted. For by long digeſtion the ſpirit of Wine gains a ruddy colour, in as much as the particles of fixed Salt, being in ſome meaſure exalted, are united to the vinous ſulphur. In the mean while the remaining ſalt of Tartar, which is diluted with the phlegm of the Wine, ſinking down into Deliquium or Oil, and floating by it ſelf will ſeparate below; which is much better than the common Oil of Tartar, in that it participates of the vinous ſulphur; and in ſome caſes, where there is a neceſſity for a lixivial Diuretick, it is a very good Medicin. The Doſe is* ℈ j. *to* ℈ ij. *or* ʒ j. *The Tincture is given from* ʒ j. *to* ʒ j. ß. *or* ʒ ij.

The reaſon of it The tincture of Salt of Tartar, by reaſon of the union of the vinous ſalt and ſulphur, hath a very grateful ſmell and taſte. If you diſtil the liquor to an half, the remaining part will retain in it more ſalt and ſulphur, but little of the vinous ſpirit; and the ſpirit which is drawn off and poured to freſh ſalt of Tartar, if it be digeſted, will hardly gain a Tincture, in as much as it is void of ſulphur to unite with the ſalt.

Now indeed, that in the ſpirit of Wine, the ſulphureous part is diſtinct from the pirituous, I learned from this Experiment.

Sulphur or Oil of Wine. *Take of the ſharpeſt ſpirit of Vitriol half a pint, of ſpirit of Wine rectified, one pint; mingle them in a glaſſen Retort and diſtil them in an Oven of ſand, till the liquor (which at firſt ſeems homogeneous or of one nature) being drawn off, a deal of thick ſediment remains in the bottom: pour this ſpirit again to the* caput mortuum, *and ſo repeat the diſtillation with freſh matter two or three times; at laſt you ſhall have two diſtinct, unmingleable liquors; to wit, one acid-ſpiritous that ſinks downward, and the other very clear and oily that ſwims on the top; which, without doubt is the pure and mere ſulphureous part of the Wine, ſeparated by it ſelf, whileſt the ſpirituous part joins with the acid ſalt.*

6. Salt of Amber.

Salt of Amber *Take of the whiteſt Amber, pulverized* ℔ ß. *diſtil it in a glaſſen Retort either with a very ſtrong heat of ſand, or a weak heat of a reverberating Oven; firſt there will ariſe a phlegm and an yellow Oil with ſome quantity of ſpirit; then a volatile ſalt will*

will aſcend into the neck of the Retort and ſides of the Receiver; and laſt of all a black Oil will come forth before it aſcends: this muſt be taken out and the Receiver changed, leſt the Salt ſhould be polluted by it. *Phar. Rat.* Part I.

This Salt being at firſt white, and of a very grateful ſmell and taſte, unleſs it be kept in a veſſel very faſt ſtopped, becomes in a ſhort time yellow, and then grows red and ſtinks. The cauſe of which is, becauſe this Medicin contains in it much ſulphur; the particles whereof, as long as the ſalt predominates, being ſubdued and clogged with others, are altogether obſcured; yet afterward, when the compoſition of the mixed body is looſened, they get out, and ſhewing themſelves above the reſt, demonſtrate their excellency to ſeveral of our ſenſes. The Doſe of it is from ℈ß. to ℈j. The beſt way of keeping or giving this Salt of Amber is, if it be mingled with a double quantity of the pureſt Nitre. *The reaſon of it.*

CHAP. III.

Of exceſſive Piſſing, and the Remedy for it; particularly of the Diabetes [*or Piſſing Diſeaſe*] *into the Theory and Cure of which we here inquire.*

THe *Diabetes* was a Diſeaſe ſo rare among the Ancients, that many famous Phyſicians have not ſo much as mentioned it, and *Galen* never knew above two that were troubled with it; but in our Age, that is given ſo much to drinking, and eſpecially to guzzling of ſtrong Wine, we meet with very frequent, not to ſay daily examples and inſtances of this Diſtemper. But though it be familiar, and in its appearance well known among us, yet what are the cauſes and the true nature of it, we are almoſt wholly to ſeek. Upon which, that I may venture to philoſophize, or rather, give you my opinion, in the firſt place I ſhall lay down the deſcription of this Diſtemper in all its circumſtances, or the principal *phænomena* [or appearances] of it; and then I ſhall endeavour to find out, from what vitiated part or humour all thoſe ariſe. *The Diabetes was formerly rare, and is not yet well known.*

The *Diabetes*, ſo called from Διαβαίνω [*Diabaino*] *tranſeo* [to paſs through] is ſaid to be a ſwift paſſing of the potulent matter [or drink] or a great flux of Urin. Such as are troubled with this Diſtemper, piſs much more than they drink or take of liquid nutriment; and likewiſe they have a continual thirſt, a lingring Fever, and as it were an Hectick always upon them. But as to what ſeveral Authors ſay, that the Drink is little or nothing changed, there is no truth in their aſſertion: becauſe in all People (that I ever happened to know, and I believe it to be ſo in all) their Urin was very different not onely from the Drink that they took in, but alſo from any other humours that are uſually generated in our Bodies, being exceedingly ſweet, as if there had been Sugar or Honey in it. The occaſion of the aforeſaid errour (I ſuppoſe) was from the colour of the Urin, which always looks crude and waterish, as in thoſe that are troubled with the Green-ſickneſs or Dropſie. To find out the reaſons of theſe ſymptoms, let us enquire firſt, why the Urin is voided ſo copiouſly and ſo quickly, and then proceed to the remaining cauſes of this Diſtemper. *The deſcription of it.*

Whereas ſome aſſign, for the cauſe of a *Diabetes*, the attractive quality of the Reins, I do not like their reaſon; for the Bloud is not attracted to the Reins, but is driven thither by the motion of the heart. Nay farther, Neither doth the *Serum* ſeem to be drawn out of the Bloud whileſt it runs through them, or to be, as it were, milked out, but to be ſeparated partly by percolation, and partly by a kind of fuſion or precipitation, as I have formerly and clearly ſhewn. Wherefore I hold that a *Diabetes* is rather and more immediately a Diſtemper of the Bloud than of the Reins, and that it takes its original from thence, in as much as the maſs of Bloud doth as it were melt and is too copiouſly diſſolved into ſeroufneſs; which indeed is very manifeſt from that vaſt quantity and great augmentation of Urin, which cannot proceed but from the melting, as it were, and conſumption of the Bloud. And that is the reaſon alſo why the remaining part of the Bloud, when the *Serum* of it flows away ſo plentifully, grows much thicker and more apt to curdle, as you may conclude from the quickneſs and ſtrength of the Pulſe: for at that time the heart moves more readily, to keep the Bloud by an unuſual exagitation of it, from curdling. Moreover to continue the fluidity thereof, which is apt to be in great danger through the great expence of ſerous liquor, they uſe to drink great quantity of potulent matter by reaſon of their exceſſive thirſt, and likewiſe the humours that are got into the ſolid parts, are ſucked back by the *It doth not proceed from an attraction in the Reins.* *But rather from a fuſion in the Bloud.*

Phar. Rat. Part I.

the Bloud, yea the very *parenchyma* or ſtuffing of them, is melted to ſupply it; in ſo much that thoſe who are troubled with this Diſtemper, are very thirſty and conſume away for droughth in a ſhort time.

The immediate cauſe of it is chiefly in the Bloud.

That therefore I may venture to tell you the immediate cauſe and true nature of the *Diabetes*, I am inclined to believe that the temper or mixture of the Bloud is ſo looſened, and in a manner diſſolved, that the watery particles cannot be kept in by the thicker ones, but flying quickly out of their embraces, and being impregnated with ſalt ones, run out through the moſt open paſſages of the Reins. But in the mean time to dilute the Bloud, and keep it from curdling, other humours both from without and within too, are drawn to, and mingled with it, and the heart is put always into a far more violent motion.

Somtimes partly in the Reins.

Yet farther, I think that the Reins alſo, ſometimes are ſome part of the immediate cauſe, becauſe their ferment uſes oftentimes to be ſo vitiated, that it cannot keep the Bloud by the influx of its lixivial Salt in a due mixture and fluidity, in ſo much that the *Serum* is ſeparated from it by mere percolation; but it ſometimes happens, that the Bloud, whileſt it paſſeth through the Reins, is precipitated by an acid Salt that lodges there, (as it were by a kind of Rennet) into a plentiful quantity of *Serum*, which is immediately carried off by the Ureters. Hence you may obſerve that in many People, who are liable to the Stone in the Kidnies, that when the fit comes they make water clear and in great quantity. The reaſon of which is, becauſe the acid humour which is brought thither through the nervous paſſages, and cauſes the pain (as I have ſhewn elſewhere) diſſolves the Bloud that flows into the Reins, and cauſes a more copious flux of Urin for it.

But it is probable enough that copious piſſing proceeds in ſome meaſure from the ill conformation or make of the Reins; in as much as the lymphatick or water-pipes thereof are too wide and open, and do too eaſily receive the ſerous liquor, and ſwiftly tranſmit it without any let or ſtop, in ſo much that the greater part of it runneth out into urin. But though I grant that theſe Pipes or Paſſages are ſometimes, and eſpecially in thoſe that are troubled with the Stone, too wide, yet by that reaſon the Piſs ſhould come away rather bloudy than in too great quantity. And indeed I think that piſſing of Bloud principally proceedeth from ſuch a cauſe. Moreover when copious piſſing and piſſing of Bloud come together, I am of opinion that an ill temper of Bloud, and an ill make of the Reins do concur as cauſes of that effect; as I ſhall by and by ſhew you in a notable caſe of a perſon troubled with that Diſtemper.

This Diſtemper proceeds moſt commonly from the diſſolution of the Bloud.

In the mean time I do not queſtion but that the principal and moſt frequent cauſe of the *Diabetes* conſiſts in the Blouds mixture being too much looſened and diſſolved; as on the contrary, in like manner our piſſing little, and leſs than we ſhould do, depends oftentimes upon the conſtitution of the Bloud being too much bound, and as it were, locked up in the veſſels. And here it will be convenient to inquire whether the total ſuppreſſion of the urin doth not ſometimes proceed from ſuch a cauſe? For though it be vulgarly known, that the cauſe of a ſtrong and obſtinate Iſchury [or retention of the urin] which is very often ſeated below the Kidnies, doth altogether depend upon the total obſtruction of the urinary paſſages; and though when I my ſelf have opened many that have died of a total ſuppreſſion of the urin, I have found in them all, that the invincible cauſe of their death was the ſtopping of one Ureter, which a little before was wide open (the other being a long time before quite cloſed) by a ſtone newly got into it: Yet the learned Dr. *Riverius* tells us of two caſes, wherein two People that were troubled with a total Iſchury [or ſuppreſſion of urin] for ſeveral days, and were meerly cured by letting of Bloud; and therefore he aſcribes the cauſe of the Diſtemper to the emulgent veins being exceſſively diſtended, in ſo much that they could not contract themſelves to throw out the *Serum*, as we often ſee it is in the bladder of urin, which being very full, is not eaſily diſpoſed for diſcharging the Piſs. But indeed, though I believe his Stories, as I ought to do, yet I cannot think I ought to aſcent to his reaſon. For that which this excellent perſon aſſigns to them is not the office of the emulgent veſſels; for they are not Veins but Arteries, that conſtantly carry the *Serum* with the Bloud, without any danger of fulneſs or obſtinacy of the urin; and when the *Serum* doth not eaſily run out into the open paſſages, the reaſon ſeems to be, becauſe the maſs of Bloud being too cloſe and compact, doth not diſmiſs the watery liquor which is mixed ſo intimately with it, out of its embraces, without ſome difficulty.

Suppreſſion of the urin proceeds from the compactneſs of bloud.

It is confirmed by Anatomical Obſervations.

To this purpoſe I will tell you of an Anatomical obſervation lately made upon the body of the Reverend Biſhop of *Cheſter*. When that excellent perſon, who was long troubled with the Stone, at laſt died of a long ſuppreſſion of his urin, immediately

all

all People presumed that the cause of his death was a stoppage in his Ureters caused by a Stone or other gravelly matter; but having made a very strict inquiry into it by Anatomy, they could find no obstruction at all in those passages, nor any stoppage of the urin. Such another observation as this, which was not long ago made by himself, Dr. *Lower* told me of; that is to say, where a mortal Ischury had left no tracts at all of it self about the urinary passages: from whence a man may easily conjecture, that seeing the Reins also were sound and well, the cause of the Distemper consisted totally in the excessive concretion and compactness of the bloud.

The original cause of a Diabetes.

But to return thither from whence we digressed; Now that we have shewn you the immediate cause and true reason of a *Diabetes*, let us proceed to find out the procatarctical or more remote and original causes thereof. If therefore you enquire why the constitution of the Bloud grows so lax and dissolute, and apt to melt, as it were, into *Serum*, I say, that the fusion of this, just as of Milk, proceeds from the meeting and associating of several kinds of Salt in the mass of it, whereby the other particles, being freed from the saline ones (that separate them from each other, and keep them in a due mixture) divide themselves presently into several parties. Now if you inquire farther how those Salts (by whose private combination we suppose the Blouds mixture to be dissolved, and the fusion of it introduced) come thither; I need not trouble my self long to shew you: for it is very manifest that there are always naturally in the mass of Bloud both saline-fixed and volatile particles, to which if there be added an acid or fluid Salt in a good quantity, it will easily cause the aforesaid effect. Hence it is that Rhenish Wine, Cider, and all acid Liquors, if you drink them, cause a more plentiful evacuation by urin than ordinary; and therefore likewise it is, that in some valetudinary or sickly People, whose Bloud abounds with an acid Salt, all Medicins impregnated with fixed or volatile Salt are used to provoke urine. Nor doth this Distemper proceed onely from things that we take in, but very often also from humours generated within. You may observe, that a great many, who are subject to Convulsions, before and after their Fits, make a vast quantity of clear water; of which no doubt the cause is, for that the dregs, or refuse of the bloud and nervous juice which are gathered together in the solid parts, if at any time, after they are turned sowrish, they swell and flow back into the bloud, they cause a fusion or dissolution in it, and consequently a great flux of Urin. Wherefore seeing such a flux of the Urin is constant and habitual, nothing can be said more probably, than that the excrementitious humours which are carried out into the solid parts, and after they have contracted a sowerness there, return thence into the Bloud, dissolve the liquor of it into too great a quantity of *Serum*, and consequently cause such a continual and excessive evacuation.

As chiefly acid humours, that get into the Bloud, and fund or precipitate it like Milk.

Such acid humours proceed chiefly from the Nerves and the nervous parts.

But for a principal share in this malady, we may justly bring in the nervous juice; for I have elsewhere shewn that this same juice, if ever it degenerates from its right temper, becomes very malignant and hurtful not onely to other humours, but to the solid parts: and that is the reason that from the depravation of this, the mixture also of the Bloud is very much in danger to be perverted. But that the nervous juice it self is perverted, we may conclude, because in a *Diabetes* the animal spirits are exceeding fainty, and all nourishment is immediately frustrated.

Moreover, for an extraordinary confirmation of this opinion, I have observed in many People who have been subject to this disease by intervals, that a little before they fell into such a flux of urin, they felt flying, running pains through their whole Bodies, and corrugations, sometimes with dizziness or stinging, and other whiles with frequent contractions or convulsions, twingings of the tendons, and other disturbances and restlessness of the spirits; which was a certain sign that the liquor which moistened the nervous fibres, being degenerated from its temper, and filled with dregs, did irritate or provoke the spirits, and force them into disorders. And then afterward, when the recrements and superfluities of the nervous juice, having gained a fluidity, ran out into the mass of bloud and caused a *Diabetes*, the aforesaid symptoms ceased, but then there ensued a languishment in the spirits, and a weakness all over the body.

How a Diabetes and a Dropsie differ.

A *Diabetes* is commonly called *Hydrops ad matulam, i. e.* a Dropsie in the Chamber-pot, and some will needs have both those Distempers to be really the same, and to have the same causes and reason of their being, and that the symptoms in them are varied only according to the measure of evacuating the *Serum*; to wit, that the bloud in both Distempers alike being not able to contain its *Serum*, but forced to discharge it by the Arteries, in the one, poureth it forth into the habit of the body and cavities of the bowels; and in the other throws it out into the Reins, to be carried away in great quantity by the Ureters. But indeed, if the thing be more accurately weighed, you shall find a very notable difference between these two Distempers: For an *Anasarca*

Phar. Rat. Part I.

[or Dropſie that runs through the habit of the Body] oftentimes takes its original firſt from the Blouds being weak and too cold, which is the reaſon that it is not ſufficiently kindled and heated, ſo as to perfect aſſimilate and volatiliſe the chyle which continually comes into it, in ſuch a meaſure as that it may keep it within its embraces whileſt it circulates; but muſt of neceſſity ſpew it out in all places, together with the ſerous liquor, and leave it in the interſticies or diſtances between the Veſſels; and then after, when the Diſtemper grows ſtronger, the bloud becomes not onely weak by reaſon of crudities, but being degenerated in its temper, is liable to fluxions and coagulations, and conſequently begets ſerous humours, and that in a greater quantity, pouring them with extraordinary violence into parts that ought not to receive them. But on the contrary in a *Diabetes* the bloud is kindled, and heated enough at leaſt, yea many times too much; and concocts the chyle that comes into it very quickly, and beyond all meaſure: beſides that it melts, as it were, the ſolid parts, and ſucks in their meltings, carries them with it round through the veſſels, and digeſts them more than it ſhould do: but yet, when through the concurrence of the Salts, the compoſition of the Bloud is quite diſſolved and melted into *Serum*, ſuch portions of it as can get away, being ſeparated within the Reins, run out at the Ureters. If a Diſeaſe like to the *Diabetes*, though inverted (that is to ſay, in which the bloud being diſſolved into a ſerous matter poureth forth all its meltings into the whole Body) doth any where at all preſent it ſelf; without doubt it was formerly the epidemical Fever, commonly called the *Engliſh Sweat*; when the Bloud melting into a wateriſhneſs, threw out all Humours as well good as bad, even to the expence of the vital nutriment it ſelf, into the pores of the Body, to be by them diſcharged.

The evident cauſes of a Diabetes.

Thus much for the nature and cauſes of the Diſeaſe called *Diabetes*, that is to ſay, the immediate and original or more remote cauſes: as to the evident ones, to wit, the occaſions whence the acid juices that cauſe the fuſion or coagulation of the Bloud, are generated in our Bodies: theſe are of a different kind, and from a different origination. An ill ſort of Diet, and eſpecially a daily and immoderate drinking of Cider, Ale, or Wines that are acid; ſometimes alſo ſadneſs, or long ſorrow, as likewiſe convulſions, and other depreſſions and diſorders of the animal ſpirits are uſed to generate or foment this morbid diſpoſition. I knew a certain perſon who having uſed Rheniſh Wine for his ordinary drink twenty days together, contracted an incurable *Diabetes*; of which, notwithſtanding the advice of many excellent Doctors, and whatever Remedies they could uſe, he died in a Moneths time. I remember two Women, who being ſubject to convulſive and hypocondriacal Diſtempers, happened ever now and then to have a great flux of Urin, with languiſhing and conſumption of their fleſh.

The explication of Symptoms in a Diabetes. whence frequent and copious piſſing. whence a Fever with thirſt and conſuming drought.

Having already explained the Theory or ſpeculative part of this Diſeaſe, it ſtill remains that I give you the reaſons of the moſt notable ſymptoms in it. Now ſome of theſe I am of opinion are very plain from what I have ſaid; that is to ſay, why in a *Diabetes* the evacuation of the Urin is ſo ſwift and copious: but whereas the Parties troubled with this Diſtemper are feveriſh and very thirſty; the reaſon is partly becauſe the humours and juices wherewith not onely the bloud, but the ſolid parts are both moiſtned and refreſhed, are through a continual drain by Urin exceedingly exhauſted; whereupon the jaws are dry, and the heart burns extremely; and partly by the inſtinct of Nature the heart and lungs are forced into more rapid motions, that the bloud, being deprived of the *Serum* to dilute it, may be kept from coagulation or concretion, and continued in its due circulation.

Why the Piſs of thoſe that are ſick of this Diſeaſe is ſweet like Honey.

But it ſeems more hard to demonſtrate, why the Piſs of ſuch as are ſick of this Diſtemper, is ſo wonderful ſweet, or ſhould taſte like Honey; when rather on the other hand, if according to my hypotheſis, the diſſolution of the bloud, and (which is the conſequence of it) the flowing of the urin happens through the combinations of Salts, the liquor ſurely that were impregnated therewith ſhould be ſaltiſh more than ſweet. But to this I eaſily reply, and ſay, firſt that the Urin is deprived of any ſalt taſte, in as much as ſeveral Salts that are of a different nature are united in it. For this is evident from the manifold experiments among Chymiſts, that when Salts, that are of a different kind (as fixed or volatile) are mingled with an acid, the ſharpneſs of them both is rebated or loſt: wherefore we have no reaſon to wonder that the Urin of thoſe who are ſick of a Diabetes is not at all ſalt. But why it ſhould be ſo wonderfully ſweet, like Sugar or Honey, is a knot not eaſie to untie.

A body would think that this effect aroſe from hence; to wit, that not onely the freſh nutritive liquor, but alſo the diſſolutions of the ſolid parts were carried off along with the *Serum* that ran out through the Reins; wherefore it ſeems very probable that this ſweetneſs proceeds from thoſe rich juices being mixt with the Urin. But indeed from that mixture there cannot proceed an Honey taſte, but onely a gentle ſoft one like

like that of Milk or Fleſh Pottage: and likewiſe to this, which is not onely grateful, but in ſome meaſure poignant too, the ſaline ſharp particles, and the delicate ſmooth ſulphureous ones too (as I have elſewhere ſhewn) ought to concur. Wherefore as we juſtly refer or aſcribe Sugar and Honey to a concretion of Salt and Sulphur, ſo we may imagine, that the Urin in a Diabetes is ſo ſweet, becauſe ſome ſulphureous particles taken from the conſumption of the ſolid parts, grow to the Salts that are united in the *Serum*.

It proceedeth from a mixture of Salt and Sulphur.

As to its prognoſticks or fore-knowledge, this diſeaſe at firſt beginning is oftentimes eaſily cured; but when grown ſtrong upon a man, very ſeldom and with great difficulty; in as much as the temper of the Bloud, being a little looſened, is reduced without much ado, but when it is much diſſolved, ſo that moſt of its parts ſeparate from each other, it is hardly or never to be reſtored.

The fore-knowledge of this Diſtaſe.

But as to the Cure of it, it ſeems very difficult in this Diſtemper to point out the true way of curing it; for as much as the cauſe of it lies hid in ſuch obſcurity, and hath an original ſo very deep and remote. For as to the common opinion, that the Reins and other ſolid parts, which contain or tranſmit the *Serum* are in fault, in that they too ſuddenly let go that which is in them, and conſequently, that we ſhould chiefly and almoſt onely inſiſt upon things that are aſtringent; I ſay, that not onely Reaſon but Experience too, do both contradict this ſuppoſition and practice; becauſe few or none at all are cured by this Method; and it is highly improbable (not to ſay, impoſſible) that ſuch an exceſs of piſſing ſhould proceed from ſuch a cauſe.

Therefore in this Diſtemper, as in ſeveral others, there are three primary Indications or ways pointed out how to cure it; to wit, the Curatory, Preſervatory, and Vital. The firſt of theſe reſpecting the Diſeaſe, and endeavouring to reſtrain exceſſive Piſſing, cannot be performed without the ſecond, which aiming at the cauſe of the Diſtemper, ſtrives to preſerve or reſtore the due mixture or temper of the Bloud. Wherefore in the cure of this Diſtemper, the chief ways of perfecting it will be, to prevent the diſſolution of the Bloud, and to remove it, if in any meaſure already cauſed. Firſt the fuſion of the bloud is hindered, if ſo be that the thicker and more wateriſh parts thereof contain or keep in, and are mutually contained by each other, ſo that one part do not ſo continually and ſpeedily ſeparate from the reſt; which is brought to paſs by remedies that are commonly called *Thickning Medicins*; that is, ſuch whoſe very viſcous or clammy and glutinous particles, being admitted into the maſs of bloud, do obſtinately ſtick to the active corpuſcles thereof, and ſo ſeparating them from one another, are an hindrance to their floating, and mutually uniting among themſelves, or with the ſaline ones that are poured in from other parts. To this end Rice, White Starch, ſlimy Vegetables, and alſo Gums, aud ſome reſinous bodies are uſed to prove good in this Diſtemper. Secondly, To take off the diſſolution of the Bloud when it is in any meaſure cauſed, you ought to uſe ſuch Remedies as diſſolve concretions of the Salts, ſo that all the elementary particles that are in it, being again reſtored to their native circumſtances, may recover their former ſituations, and by that means renew the original temper of the Bloud. I formerly told you that this kind of effect is produced in Milk that is curdled by the addition of fixed, volatile, or nitrous Salt, and likewiſe by the infuſion of Spirit of Hartſhorn, Sal Armoniack, and the like. Of which (as I have there alſo intimated) this without doubt is the reaſon, that whileſt the ſaline-fixed, volatile, or nitrous particles, being put into the Milk in a good plentiful quantity, meet with the acid or precipitatory particles, and are united to them; the other ſaline ones, which before were bound, being now freed and ſcattered through the maſs of the liquor, may every way diſunite and ſeparate the ſulphureous and earthy ones that are united among themſelves, and conſequently, that all the particles being again equally mixed, may contein or keep in, and be contained by each other. How much the Bloud, that reſembles Milk, is altered by pouring ſalt diſtilled liquor into it when it is hot, I have there alſo declared by Experiments that I have cited. But for the Cure of a Diabetes, we do not eaſily, or inconſiderately give ſalt Medicins, becauſe by moſt men they are looked upon to be always Diuretical; though in the mean time neither reaſon nor experience contradict this method. For I many times in this Diſtemper have preſcribed the tincture of Antimony with good ſucceſs, and the Water of ſlacked Lime, with Shavings of Saxaphras, Aniſeeds, Raiſins, and Licoris, according to the common Receipt, is by ſome very highly commended.

Three Indications pointing to its cure.

The chief intentions of the Cure:

1. To hinder the fuſion of the Bloud.

2. To remove it when cauſed.

3. The Vital Indication is performed by thickning and moderately cooling Diet, and by Cordials that are temperate, and eſpecially by convenient and ſeaſonable hypnoticks or ſleeping Medicins, of which ſome of the chief ſorts and choiceſt Receipts are laid down in the following Chapter, and in the end of this, for a farewel, I thought

3. The Vital Indication.

Phar. Rat. Part I.

I thought fit to tell you the Story of a certain Nobleman that was ſick of this Diſtemper whileſt I firſt meditated upon, and afterward wrote this Diſcourſe.

A Story.

A certain noble Earl, renowned not onely for the ſplendour of his Birth, but for the extraordinary qualifications and endowments of his mind, being of a ſanguine temper, a florid complexion, and in the very vigour of his Age, (no body knows upon what occaſion) became much inclined to exceſſive Piſſing; and when for ſeveral Moneths he had been uſed ever now and then to make great quantities of Water, he at laſt (it ſeemed) fell into a Diabetes that was obſtinate, ſtrong, and almoſt deſperate. For beſides that in the ſpace of 24. hours he voided almoſt a Gallon and an half of limpid, clear and wonderful ſweet water, that taſted as if it had been mixed with Honey; he was likewiſe troubled with an extraordinary thirſt, and as it were, an Hectick Fever, with a mighty languiſhing of his Spirits, weakneſs in his limbs, and conſumption of his whole body.

When at this time I was ſent for to conſult with theſe excellent Phyſicians Dr. *Michlethwait*, and Dr. *Witherly*, they had preſcribed the following Remedies, by the uſe of which, he in a ſhort time, ſeemed to grow well again.

An inſtance of a Cure.

Take of the Tops of Cypreſs viij. *handfuls, of whites of Eggs beaten together, two pints, of Cinamon* ℥ ß. *when you have cut them ſmall, pour to them of new Milk* viij. *pints diſtil them in the common Inſtruments, taking care that it burn not: and let the Patient take* ℥ vj. *thrice a day.*

Take of Gum Arabick, and Gum dragant, each ℥ vj. *of Peneds* ℥ j. *make a Powder, and let him take about* ℥ j. *or* ℥ j. ß. *twice a day with* ℥ iij. *or* ℥ iv. *of diſtilled water.*

Take of Rhubarb pulverized, gr. xv. *of Cinamon* gr. vj. *make a Powder and let him take it in the morning, repeating it within* 6 *or* 7 *days.*

Take of Cowſlip water ℥ iij. *of Cinamon-barley water* ℥ ij. *of Syrup of Poppies* ℥ ß. *make a Potion, to be taken every night.*

His Diet was onely of Milk which he took ſometimes raw, and diluted either with diſtilled or Barley water, and ſometimes boiled with white Bread, or Barley, ſeveral times in a day. By the uſe of theſe things growing daily better and better, he ſeemed within a Moneth to be almoſt quite well: when he began to be pretty hearty, his Urin which was inſipid, did not much exceed the quantity of that liquid matter which he took in; and afterward growing ſomewhat ſaltiſh, it was leſs than what he drank, till at laſt by degrees recovering his uſual tenor of ſpirits and ſtrength, he returned to his former Diet.

The Relapſe of this Diſtemper.

But yet the diſpoſition to this Diſtemper did not ſo totally leave him, but that afterward, oftentimes, through diſorders in his Diet, and perhaps irregularities in the ſeaſons of the Year, being inclined to a relapſe, he made water at firſt in great quantity, and then clear and ſweet, with thirſtineſs, feveriſhneſs, and languiſhment of his ſpirits. But by the uſe of the ſame Medicins he was uſually cured again in a ſhort time. Not long ago, after a long interval of health, a little before he began to ſuffer his flux of Urin, he underwent great enormities and conſumptions in the nervous parts; that is to ſay, he felt drowzineſs and whimſey in his Brain, ſudden convulſions in his limbs, twinges of the tendons, and various runnings, as it were of a wind, to and fro. After which when the aforeſaid ſymptoms ſeemed to be removed by the uſe of proper Medicins, the Diabetes after its uſual manner (that is, when the matter flowed out of the fibres and ſolid parts into the Bloud, and from thence into the Reins and urinary paſſages) returned afreſh upon him.

About this time the aforeſaid Phyſicians being called to a conſultation preſcribed almoſt the ſame method and remedies as before, by the uſe of which, being in a few days ſomewhat better than before, they thought good to preſcribe to him water of ſlacked lime, to be taken thrice a day, by ℥ v. or vj. at a time; which remedy when he had uſed four days together, he made water very moderately, that was of a good colour, and ſomething ſaltiſh, and ſeemed in almoſt all other circumſtances, to be as well as ever he had been.

Phar. Rat. Part I.

CHAP. IV.

The ſeveral Sorts and Receipts of Medicins that ſtop exceſſive Piſſing.

THoſe Medicins that are properly called Aſtringents, that is to ſay, ſuch things as are auſtere, ſower, and ſtyptick or binding, which by wrinkling up the fibres of the bowels, and drawing them into a leſſer ſpace, rebate their expulſive and evacuating faculty, and conſequently hinder purging both upward and downward, though they are commonly preſcribed, yet they do little or nothing toward the reſtraining of Urin: for their virtue is of no force in the maſs of bloud, nor doth it at all reach the Reins or the Bladder. Wherefore in a *Diabetes* it is to no purpoſe that they preſcribe the Bark of Pomegranates, Balauſtians, Medlars, Roots of Tormentil, and the like; as Reaſon dictates this, ſo Experience confirms it. But the Remedies which are found to be of greateſt uſe in a *Diabetes*, and moſt exactly to ſquare with my Hypotheſis, are, as I formerly intimated, of a twofold kind; that is to ſay, firſt, ſuch as hinder the combinations of the Salts, and conſequently the fuſion of the bloud; of which ſort are thoſe that are commonly called *Thickeners*, and have viſcous and glutinous particles, which being admitted into the maſs of Bloud, ſtick faſt to the active particles thereof, and disjoin them, and keep them from uniting either among themſelves, or with the ſaline ones that flow from other parts. Secondly, Such as diſſolve the accretions or unions of the Salts, and conſequently reſtore the mixture of the Bloud; of which kind are thoſe ſaline parts, of another nature, which are apt to ſtick cloſe to the acid Salt, and by that means to ſeparate it from thoſe combinations that are made within the bloud; as are chiefly Medicins impregnated with fixed, and alſo with volatile and alchalized Salt. Beſides theſe two chief kinds of Iſchuretick Medicins, there remains another with a ſecondary ſort, to wit, Hypnoticks, or ſleepy Medicins; that is to ſay, ſuch as by putting a ſtop to the animal motion cauſe the affairs of living to be carried on much more ſedately, and conſequently with leſs fuſion of the bloud, or precipitation of the ſerous and nutritive humour. It now remains that I ſubjoin ſome ſelect Receipts of every ſort of theſe Medicins.

Aſtringents do no good in a Diabetes.

Three ways to cure it.

1. The firſt thing that the Phyſician aims at, that is to ſay, by thickening the bloud to take off, or to prevent the fuſion thereof, is attained in manner following. *For thickning the Bloud.*

Take of Gum Arabick, and Gum Dragant pulverized, each ℥ j. of Peneds ℥ ß. make a Powder, and divide it into 16 parts. Take one part thrice a day, diſſolving it in diſtilled water, or in the decoction of Comfrey roots, in Spring water, or in Milk. *A Powder.*

Take of reſumptive Electuary ℥ iij. of the Species of Gum Dragant cold, ℥ j. of red Coral prepared ℥ ij. Confection of Jacinth ℥ j. ß. of the Gelly of Vipers skins a convenient quantity; make an Electuary to be taken thrice in a day, the quantity of a Wallnut. *An Electuary.*

Take of the whiteſt Amber, Maſtich, and Olibanum pulverized, each ℥ j. of Pulvis Haly ℥ ij. of Balſam of Tolu ℥ ß. make a ſmall Powder; whereof the Doſe is ℥ ß. thrice or four times in a day. *A Powder.*

Take of the roots of greater Comfrey, and of Water Lillies, each ℥ iij. of Dates cut in pieces ℥ ij. of the Seeds of Mallows, Cotton, Plantaign, and Flea-wort, each ℥ ß. boyl them in Spring Water iv. *pints to an half; to the ſtraining of it put of the Syrup of Water Lillies ℥ ij. The Doſe is ℥* iv. *thrice a day.* *A Decoction.*

Take of the Decoction of Barley, with roots of Water Lillies one pint and half, of Sweet Almonds prepared ℥ j. ß. of Seeds of white Poppies, Purſley, and Lettice, each ℥ ß. make an Emulſion according to Art. The Doſe is ℥ iv. *thrice a day.* *An Emulſion.*

Take of the tops of Cypreſs m. vj. *of the leaves of Eſalarea* m. iv. *of the Flowers of Archangel or white Nettle, of Comfrey, and of Water Lillies, each* m iv. *of the roots of Water Lillies and Comfrey, each* ℔ ß. *of Mace ℥ j. when you have ſhreded them altogether very ſmall, pour to them of new Milk* viij. *pints; diſtil them in the common Veſſels. The Doſe is ℥* iv. *thrice a day, with the Powder or Electuary before preſcribed.* *A diſtilled water.*

Secondly,

Phar. Rat. Part I.

The reduction or fixing of the bloud.

Secondly, Although ſalt Medicins of every ſort and ſtate are looked upon to be diuretical, and every one of them in ſome caſes, as far as they diſſolve the bloud, and cauſe the ſerous parts of it more copiouſly to ſeparate, are in ſome meaſure really diuretical, for this reaſon, though the uſe of them in a *Diabetes* may be juſtly ſuſpected, yet upon the account of what I have before ſaid, to wit, that by meeting with the acid Salt (when it predominates in the bloud) they take off and prevent the fuſion and melting thereof, I do not at all queſtion, but that ſometimes they may be given with ſucceſs for the ſtopping of immoderate evacuations by Urin; and as ſoon as ever I have an opportunity, I am reſolved to trie the truth of this by a cautious experiment: and indeed that ſuch an experiment may be with ſafety made, is manifeſt enough from this, that I have heard for a certain of one who was cured of a *Diabetes* by an infuſion of ſlacked Lime. But becauſe thoſe ſaline Medicins (which we ſuppoſe do either take off, and as it were fetter the acid Salt) are impregnated with fixed, or volatile, or alchalized Salt, I will cite ſome Receipts of Ichuretick Medicins, in which each of theſe are the foundation.

Medicins impregnated with fixed Salt.

First therefore when fixed Salt by it ſelf, or joined with Sulphur, is required for the foundation.

Tinctures.

Take of the Tincture of Salt of Tartar, or the Diliquium of it, a convenient quantity; give it in a ſmall draught of the Decoction, or diſtilled Water juſt now preſcribed thrice a day.

Take of the Tincture of Antimony, and give it the ſame way thrice a day. I know by frequent experiments that the uſe of this is very advantageous in this Diſtemper.

Take of the Salt of Coral ℈j. *to be given in the ſame manner.*

An Infuſion.

Take of the infuſion of ſlacked Lime one pint. The Doſe is ʒiij. or ʒiv. *thrice a day, giving firſt of all a Doſe of the Electuary or Powder before preſcribed.*

An Electuary.

Take of Conſerve of the Flowers of Archangel, and the greater Comfrey ʒiv. *of the reddeſt Crocus of Iron* ʒß. *of Coral calcined to a whiteneß* ʒij. *of Syrup of Comfrey a convenient quantity: make an Electuary. The Doſe is* ʒij. *thrice a day.*

A Powder.

Take of Lapis Specularis calcined ʒj. *The Doſe is from* ʒß. *to* ʒj. *twice or thrice a day.*

Country men with this Medicin do very ſucceſsfully cure their Cattle that are troubled with piſſing of bloud.

Take of Coral calcined to a whiteneſs and pulverized ʒiij. *of Powder of Gum Arabick and Gum Dragant, each* ʒj. *make a Powder, and divide it into* 10. *parts, whereof take one, thrice a day in a convenient vehicle, to wit, the Decoction, or the Diſtilled Water.*

Take of the reddeſt Crocus of Iron ʒvj. *of Gum-lac. pulverized* ʒß. *of red Saunders* ʒj. *make a Powder, and divide it into* 20. *parts, of which take one thrice a day.*

A Decoction.

Take of Harts horn burnt and pulverized ʒß. *boil it in* iv. *pints of water wherein Iron is quenched till it waſte to half, then add at the laſt a cruſt of bread, and of the roots of the greater Comfrey, and of dried Water Lillies, each* ʒj. ß. *to the ſtraining whereof put of Sugar of Pearl* ʒij. *Let the Patient take* ʒiv. *thrice a day.*

Medicins impregnated with alchalized Salt.

2. Medicins impregnated with alchalized Salt, ſuch as Corals, Pearls, Cuttle bone, Harts horn, Ivory, Powders of Shells, and the like, are very commonly uſed, not onely againſt Rheumatical Diſtempers, but alſo in a *Diabetes*, and indeed according to my Hypotheſis, in as much as they receive the acid Salt which abounds in the bloud, and conſequently free the maſs of bloud from diſſolution; you may from them expect benefit, and that moſt commonly with ſucceſs.

A Powder.

Take of red Coral ground very ſmall, and of Cuttle bone, each ʒß. *of Harts horn philoſophically calcined* ʒiij. *of Pearl, Ivory, and Crabs Eyes, each* ʒj. *mingle them and make a Powder. The Doſe is* ʒß. *thrice a day in a convenient vehicle.*

Take

Take of the ſame Powder ʒ iij. *of the Species of Gum Dragant cold* ʒ ij. *of Sugar Candy* ʒ ij. *make a Powder, with a convenient quantity of the diſſolution of Gum Arabick, and make a Paſte. Form it into Trochies of the weight of* ʒ ß. *of which take* iij. *or* iv. *thrice or oftener in a day.*

Take of the ſame Powder ʒ iij. *of reſumptive Electuary* ʒ iv. *of the Conſerve of the Flowers of Water Lillies* ʒ iij. *of the Syrup of the ſame a convenient quantity, and make an Electuary. Let the Party take the quantity of a Cheſnut thrice a day, drinking thereupon a draught of the Apozeme or deſtilled Water before preſcribed.* *An Electuary.*

3. For the ſame reaſon that Medicins impregnated with fixed and alchalized Salt ſeemed good to cure a *Diabetes*, thoſe alſo that have volatile Salt in them may conduce to the ſame effect. For the latter as well as the former receive and ſeparate the acid Salt (whereby the bloud is diſſolved and melted into a ſeroufneſs) and conſequently the liquor thereof recovereth its due temperament. *Medicins impregnated with volatile Salt.*

Take of Tinctura Solaris with Sal Armoniack (prepared as I uſe eaſily to do it) ʒ j. *The Doſe is* 20. *drops thrice a day: Spirit of Bloud, Soot, Harts horn may alſo be tried in this Diſtemper.* *A Tincture.*

Take of the Salt of Amber ʒ j. *of the reddeſt Crocus of Iron* ʒ ij. *mingle them, and divide it into* 12. *parts. The Doſe is one part thrice a day.* *A Powder.*

As to the third ſort of Remedies againſt a *Diabetes*, that is, Hypnoticks; which by ſtopping the animal Spirits, retard the courſe of the bloud, and conſequently ſomewhat hinder the boyling and diſſolution thereof; I uſe in ſome caſes to preſcribe Diacodium, to be taken every Evening; and if at any time that doth not do the buſineſs, to give Liquid Laudanum, prepared with Quinces or tartarized, ſometimes every night, and ſometimes every other night with good ſucceſs. *Hypnoticks.*

Take of the Decoction of Barley, with ʒ ß. *of the roots of dried Comfrey* ʒ vj. *of white Poppy Seeds* ʒ ij. *of ſweet Almonds prepared in number* vj. *and make an Emulſion according to Art, to be taken each night when you go to bed.*

Take of the Magiſtral Water before preſcribed ʒ iij. *of the diſſolution of Gum dragant* ʒ ij. *of Diacodium* ʒ ß. *to* ʒ vj. *to be taken at night, when you go to ſleep.*

Take of the Conſerve of the Flowers of Water Lillies ʒ ij. *of Laudanum tartarized or prepared with Quinces* ℈ j. *of the Tincture of Saffron drops* vj. *make a Bolus, to be taken when you go to ſleep.*

SECT.

SECT. V.

CHAP. I.

Of Sweating and Medicins that cauſe evacuation thereby.

One way to take in, but many to let things out of the body.

FOr the nouriſhment of the Bodies of Animals, their food is taken in onely one way, that is through the mouth; but provident Nature hath made many outlets or ways for evacuations, through which the baſer parts of the nouriſhment or any diſagreeable particles, whether they come from without, or are generated within, are thrown forth. Indeed it was convenient that all the food ſhould enter at the ſame door; to wit, that it might be ſufficiently diſtinguiſhed and examined; for if there were many, or Back-doors that opened inward, there might poiſons eaſily creep in with the meat. Now, if againſt the intention of this ſingle avenew, any hoſtile matter gets in, or through the failure of good management within, be ingendered there, this cannot lie hid in any retiring room or corner, but that there are in that ſame place ſome loop-holes open for the diſcharging of it. For if any heterogeneous matter lodgeth in the firſt paſſages, it is voided by Vomits or Purging; but if it go further and mingle with the bloud or nervous liquor, or ſtick to the ſolid parts, it is immediately thrown out by Tranſpiration, and Sweat, or by Urin. Again, If Nature, as being ſlothful, or hindered, doth not carry off extraneous things of its own accord, or quickly, or in ſufficient quantity by theſe ways, then Phyſick ſupplies us with Remedies very neceſſary, to ſupply the defect or faults that are in the manner of evacuation or paſſages whereby it is, or ought to be performed. As therefore I have treated very largely in the former Chapters concerning Vomiting, Purging, and Piſſing, and ſhewn by what diſpoſitions of the Humours, Spirits, and Bowels, Medicins deſigned for thoſe ends produce their operations; ſo now in the next place I muſt explain to you, how and by what Medicins extraordinary Sweating, if there be at any time occaſion for it, is uſually provoked. Now for the better explication hereof, I muſt firſt declare to you what is the matter and true nature of Sweat, and in what, and how many manners Sweating oftentimes happeneth without Phyſick, through external accidents, or the inward commotions of the Humours or Spirits.

The reaſon of it is intimated.

Phyſick ſupplies the defect of natural evacuations.

How Sweating differs from Purging.

In Sweating, quite contrary to what it is in purging, the motion of evacuation tends from the firſt paſſages, and as it were the center of the body to the circumference; and in both theſe caſes the Arteries carry more to the places of evacuation than the veins bring back, whileſt in the mean time from places that are oppoſite to them, the veins bring back more than the Arteries carried thither. In a Purge, there is a greater burden impoſed upon the ſplanchnical or bowel Arteries and Veins too, that relate to the habit of the body: but it is quite contrary in Sweating; for in this caſe whileſt the Arteries carry the matter more than uſually toward the outſide of the body, the meſaraick veins carry away a greater quantity from the Bowels made for concoction, than the Arteries brought thither. So likewiſe in the other evacuation, whileſt the ſplanchnical Arteries pour more than ordinary into the bowels, the outward veins bring back more from the habit of the body than the Arteries leave there. Wherefore as both theſe evacuations are cauſed ſeveral ways, ſo, not leaſt of all in this manner; to wit, whileſt the Arteries that belong either to the Bowels, or to the habit of the body, are put upon more rapid motions than ordinary, a greater load of Humours will be thruſt into the Veins that are of the oppoſite ſide. How ſweating Medicins perform both theſe intentions I ſhall tell you by and by. In the mean while concerning Sweating in general, I ſhall obſerve, that Sweating, in reſpect of perſpiration, is juſt like a Lask in reſpect to the natural and ordinary way of evacuation; that is, it is onely a more ſwift and a ſtronger kind of perſpiration. For whenever the bloud boyling up more than ordinary, and being as it were put into a flame, doth more copiouſly emit or ſend forth its hot particles, thoſe particles conveying along with them certain parts of the *Serum* cauſe Sweat.

The matter of Sweat is either Elementary or Humoral.

1. What are the particles of the firſt.

The matter of Sweat may be called either Elementary or Humoral; and as to the former, that as well as Urin conſiſts of a moderate ſpirit, ſalt and ſulphur, a great quantity of ſerum, and a little earth. And that it is ſo, is eaſily gathered from the loſs of ſpirits in ſweating, the watery ſubſtance of this Excrement, the ſalt taſte, unctuouſ-

neſs

neſs and feculency thereof. For whileſt the bloud (in order to prolong the life of Animals) is continually kindled in the Lungs, and then breaking forth, as it were, into a flame, is hurried out of the heart through the Arteries into all parts certain ſubtile particles, that is to ſay, ſpirituous and ſulphureous ones, as being moſt apt to fly away, do in great plenty depart out of the liquor thereof, when rarefied and kindled; which particles flowing through the pores of the body, carry along with them many ſmall portions of the *Serum*, and ſome alſo of the other Humours at the ſame time. Now if theſe kind of *effluvia* or emanations are few, they fly away inſenſibly, and exhaling moderately, vaniſh into the Air, ſo as that you can hardly perceive them; but if they are more numerous and break forth in great quantity, they are condenſed or thickned into water, whileſt they ſcarce paſs through the pores of the skin, juſt as when vapours ſent forth from boyling water, moiſten the pot-lid. *Phar. Rat.* Part I.

What the ſecond conſiſts of.

2. The Humoral matter of the Sweat is ordinarily ſcarce any other than the ſerum of the bloud, to which ſometimes, if the evacuation that way be inordinate, there are added ſome portions of the nutritive and nervous juice, with other humours gathered out of the bowels, glandules and lymphick or watery veſſels, yea, and likewiſe the ſubſtance or meltings of the ſolid parts: but yet whatever it is, it is voided chiefly out of the Arteries, though I do not deny that beſides that, there does ſome of it come out of the nerves too; ſo alſo that out of the fibres and ſolid parts ſomething of an humour is attenuated by the force of the heat into a vapour, which upon the skin thickneth again into a moiſture. But notwithſtanding it is the bloud onely that by its heat makes any humour evaporate, and from its own boſom ſends forth the greateſt part of that which ſweats out.

Three things required in ſweating.

To the end that Sweat may break forth in great quantity and eaſily, theſe three things are requiſite; that is to ſay, Firſt, That the bloud, when boyling up more than ordinary, ſhould circulate more rapidly than it uſually doth: Secondly, That the watery part of it ſhould abound with many aqueous particles, and thoſe looſened, that is, apt to be ſeparated from the reſt of the liquor, and changed into a vapour. Thirdly and laſtly, that the pores of the whole body be ſet wide enough open.

The firſt, that the bloud circulate more ſwiftly than it uſes.

1. The reaſon of the firſt condition ſeems manifeſt enough; for unleſs the bloud circulate rapidly, and be carried through the Arteries in ſo great a quantity, as that what remains above that which the Veins bring back again, cannot be wholly received in the lymphick veſſels, or exhaled by inſenſible perſpiration, there will be nothing ſuperfluous, to tranſpire by ſweating; for the liquor of Sweat conſiſts of the ſuperfluous and rejectaneous matter of thoſe paſſages. But the bloud circulateth more rapidly, in order to the producing of Sweat; in as much as through the more frequent and vehement compreſſions of the heart, it is driven about with a greater force. Of which effect, though there are ſeveral manifeſt cauſes, they may all, or at leaſt the chiefeſt of them, be reduced to the two kinds following.

Which depends partly upon the bloud, and partly upon the animal ſpirits.

For the actuating and variouſly altering the motion of the heart, the efficient cauſe are the animal Spirits that flow to it from the Brain; but the final cauſe is the circulation of the bloud: for as upon that account the motion of it was firſt ordained, ſo according as the bloud ought to circulate, upon ſeveral occaſions, ſometimes ſwifter and ſometimes ſlower, fiercely or quietly, or any other way, the beating of the heart alſo is variouſly altered. Whenever therefore that is augmented or quickened ſo, as that it cauſes ſweating, it comes to paſs either through neceſſity or indigence of the bloud, or the inſtigation of the animal ſpirits.

How upon the bloud.

1. Whenever the bloud is heated, or kindled more than ordinary, it ought to be carried about more rapidly than is uſual, leſt it ſhould be choaked within the folds of the heart. Now of ſuch a boyling or exceſſive kindling thereof, there are many cauſes and occaſions. For the bloud ſometimes ſwells of its own accord, like Wines, by its own ſulphur which is too much elevated. Moreover when it is exceedingly toſſed or heated, and more than ordinarily kindled by hot things taken in at the mouth, through the ambient heat, a ſwifter motion of the body, ſhutting of the pores, or other occaſions, it requires to be carried about ſo rapidly, to the end that it may cauſe ſweating.

And how upon the animal ſpirits.

2. Sometimes the bloud, though quiet of it ſelf, is put into an Hydrotick effervеſcence or ſweating heat, by the inſtigation of the animal ſpirits. For in acute Pains, violent Paſſions, great ſtoppages of the natural or vital Functions, in the very agony or pangs of death, and other faintings or diſorders of the ſpirits, where the health of the body is in great danger, the ſenſitive ſoul (to keep the vital flame of the bloud from going out) puts the heart into a very rapid motion, whereby whileſt the bloud is driven about with greater violence, it alſo cauſes for the moſt part ſweating.

The ſecond thing required in order to cauſe ſweating is, that whileſt the bloud boyls

Phar. Rat. Part I.

up very exceedingly, or is kindled more than usually, and sends forth great quantities of *effluvia* or streams from it, its liquor should abound with a serous humour, which may be also apt to separate and exhale from the other part of its mass; for otherwise there will break forth onely a dry vapour as from boyling Oil (though in the heat of a Fever, or any other great heat) and not at all any sweat. But they whose bloud being full of *Serum*, if of a loose and somewhat dissolved constitution, are put into a sweat upon every the least occasion. But if the *Serum* be defective, or is not easily separated from the bloud, as being too compact, or through the feculency that is in it, very thick; though a burning Fever come upon him, and at the same time the strongest sweating Medicins are administred, the Party shall hardly sweat at all.

2. The second condition of Sweating is, that bloud be loose and dissolved.

3. The third condition is, that the pores be wide enough.

Thirdly to procure sweating the right way, it is requisite that when the bloud boyls, and is diluted with an aqueous humour, which is easily separable from it, the pores of the skin also should be wide and open enough; for unless the body be perspirable, it is in vain to attempt sweating. Some mens skins are very thick, and almost impenetrable, to which if the Winters cold comes, you may sooner draw water out of a pumice stone than out of their hides.

The causes of excessive Sweating are intimated.

So much for the chief requisites toward the cause of sweating, which as they are sometimes partly deficient, in so much that the sweat comes very hardly or not at all away; so sometimes through the excess of these requisites, as likewise through some other inordinacies in the humours or habit of the body, too frequent and copious sweating doth usually infest some persons, so far that the nutritive juice is no sooner conveyed into the bloud, but immediately all of it sweating forth with the serous liquor out at the pores of the skin, is turned to a moisture. The reason of which, if we inquire into, there are these three things chiefly, in some or all of which they seem most chiefly to consist.

1. Of which the first is, an ill temper of the bloud, or a weakness in it, &c.

1. Therefore a too excessive inclination to sweating arises sometimes because the bloud being vitiated in its temper, and made too weak, cannot assimilate the nutritive juice, which it receives out of the chyle: wherefore, as a Stomach, whose tone is relaxed, it is forced to vomit out the humour which is poured into it, as soon as it is full of it. Hence it is that most commonly nocturnal sweatings, which are very troublesome, succeed Fevers in the day time; in as much as that in these the mass of bloud (like sower Milk which being heated over the fire is dissolved and precipitated into a wheyishness of its own accord without any thing to turn it put in) is of so loose a constitution, that it is loosened in its mixture upon any light occasion. To which you may add, that the bloud being impoverished is not fully kindled, whereupon the crude juices, by how much the less they are consumed by efflagration, must of necessity break forth by sweat so much the more copiously whilest the bloud is put into a brisk motion.

2. An obstruction of the passage of the Serum the usual ways.

Secondly, It is not improbable, that an excessive inclination to sweating may depend in some measure upon this cause also; to wit, that either the veins or lymphæducts do not in all places discharge their duty as they ought to do. For if perchance the serous superfluities of the Arterial bloud, are not immediately taken out one way or other, they must of necessity be somewhere gathered together to a great fulness, and consequently, if they are not evacuated by sweat, must needs hinder the circulation of the bloud, and oftentimes cause a Dropsie.

The third is openness of the Pores.

Thirdly, If at any time, for the reasons aforesaid, the inclination to sweating grows strong upon a man, the same also is augmented, and frequent and copious sweats flow forth, if the pores and passages of the skin are wider than they use to be: which disposition sometimes is natural, and sometimes contracted by accident. I have known some mens bodies so pervious and open that they could not indure so much as the lightest blast of Air; who likewise through any violent motion, or heat of the Sun, Fire, or their Beds, would presently dissolve into a sweat.

The true nature and immediate cause of Sweat.

From these things (which are necessarily required for the causing of sweat, and make it excessive) thus laid down, it will be easie to collect what is both the true nature of Swear, and also the immediate cause of it: for both consist in this, that the bloud abounding with *Serum*, and being somewhat loosened in its constitution, whilest it is more rapidly carried about by the brisker pulsation or beating of the heart, and by that means more is carried forth through the Arteries, than that the bloudy part can be all strait brought back by the veins and the serous part discharged through the reins and lymphæducts, there is therefore a necessity that whatever *Serum* remains, impregnated also with other particles, should sweat out through the pores of the skin which are wide enough to admit it.

The remote causes of it.

As to other causes of sweating, to wit, the original, or remote, and the evident ones; those of the former sort respect either the mass of bloud, or the animal spirits. For

these

theſe being (as I formerly hinted) obnoxious to convulſive indiſpoſitions and other irregularities, do ſometimes of their own accord, or occaſionally put themſelves into exploſive and inordinate motions; whereby the heart alſo being exceedingly diſturbed, drives the bloud about with greater violence, and conſequently cauſes them to melt into ſweats. But the antecedent cauſe of ſpontaneous ſweating lies oftentimes in the maſs of bloud: for if at any time heterogeneous and foreign particles, or ſuch as are altogether diſagreeable, are gathered together to a fulneſs within the body of it, then finding it ſelf oppreſſed, it is preſently diſſolved, and boyls up, to ſeparate and throw out by way of ſweating whatever is troubleſom to it, together with the ſerous liquor. Which kind of Sweat, according as the peccant matter is eaſie, difficult, or impoſſible to be voided, is called either Critical (which is alſo more or leſs perfect) or ſymptomatical. Of theſe I have diſcourſed at large in my Treatiſe called *Puretologia* [or *A Diſcourſe of Fevers,*] ſo that I have no need to ſay any more in this place.

The evident cauſes of Sweat.

2. The evident cauſes of Sweat, that is, ſuch as without any original cauſe or phyſical Indication, cauſe ſweating very often, ſolitarily and by themſelves, being various and of divers kinds; to wit, ſuch things as are taken in at the mouth, things outwardly applied, too great a commotion in the mind or body, with many others; I have a mind in this place briefly to obſerve to you the chiefeſt of them, together with their diſtinct manners of working: which when you rightly underſtand, it will be the more eaſie to conceive how and with what difference the Medicins that are deſigned for this purpoſe cauſe that purgation by ſweat.

1. Commotions in the Body:

1. Firſt therefore Sweat is uſually produced by a more violent, laborious, and long motion of the body; as we ſee daily in Running, Dancing, carrying of Burdens, Drawing, and the like. The reaſon of which is, becauſe the muſcles of the whole body being violently exerciſed, compreſs the Veſſels that are between them, and conſequently put the bloud into a commotion, driving it rapidly to and fro; and ſeeing that by this means the veins are chiefly ſtraightned, the bloud glides the more eaſily through their cavities, which are ſtill wider and wider, and is much more ſwiftly carried toward the heart; and ſeeing the bloud in that manner being gathered to a great quantity within the right ſide of the heart, oppreſſeth, or almoſt choaks it, both the heart and lungs labour very vigorouſly with more frequent and ſtronger endeavours to drive the bloud about more rapidly, that ſo at laſt it being more inflamed within the heart; and conſequently rarefied and diſſolved, or looſened in its conſtitution, may exhale a great many more particles of heat, that is, of ſpirit and ſulphur; which conveying out along with them the ſerous parts, that (whileſt all the veſſels are ſo ſwollen) cannot be brought back again, make the Sweat. As in the body, ſo in the mind alſo, immoderate exerciſes cauſe ſweating.

Or in the Mind.

2. The ambient heat, or heat of the Air, &c.

2. The ambient heat [or heat that encompaſſeth them] as of the Sun, Fire, a Bath, an Hot-houſe, and the like, is apt to provoke ſweating; becauſe the hot particles that are conveyed into our bodies from without, and enter under the skin, do not onely open the pores and paſſages thereof, but alſo make the bloud to boyl, and bubble as Water doth over a fire; in ſo much that when the conſtitution thereof is looſened and rarefied the ſweaty vapours fly out in great quantities. Nor is it the external heat alone, but even our own, which being detained about the ſurface of that body, from whence it exhaled, cauſeth ſweat. For nothing is more uſual than for a man when he lies in bed, being covered with a great many cloths, to fall into a ſweat. The reaſon of which is plain enough, in as much as the vapours or breathings which juſt then come from him, and are reſtrained or kept in about the ſurface of his body, have the nature of a dry Bath.

3. Hindering of uſual Tranſpiration.

3. The hindering of uſual Tranſpiration doth ſometimes cauſe ſweating; and the reaſon of which is, becauſe the bloud being reſtrained from its free and uſual perſpiration, fermenteth more violently, like new Wine put up too cloſe in any veſſel; and conſequently being the more rarefied, and put into a great commotion through its more rapid circulation, muſt of neceſſity be diſſolved into Sweat. It was anciently a cuſtom among the *Iriſh* when they were ſick of any Fever, to wrap themſelves up in woollen clothes, moiſtned with cold Water, by which means great quantity of Sweat came from them, and oftentimes cured the Diſtemper. I have heard of ſuch an Experiment as this, that hath been tried upon our Country People with good ſucceſs.

4. Hot things taken inwardly.

4. Hot Meats inwardly taken, eſpecially ſuch as are ſeaſoned with Salt, Pepper, and Spices, and ſo alſo drinking of hot Waters, ſtrong Ale, and generous Wine, in as much as they either impregnate the bloud with active particles, which are like Spurs or Gladflies to it, or ſupply it when it is inflamed with Sulphur and ſuch combuſtible matter, which is like Oil to a Lamp, they cauſe a more copious perſpiration of the exhala-

Phar. Rat. Part I.

ble matter, and conſequently greater exſudations or ſweatings out of the ſuperfluous *Serum*.

The difference of Sweats.

So much of the Nature and Cauſes (as well conjunct as manifeſt) of Sweat. As to the differences of it, it uſes to be diſtinguiſhed ſeveral ways; to wit, that is either ſpontaneous or forced; either partial, or univerſal; either critical or ſymptomatical; the reaſons of all which are very manifeſt from what I have already ſaid.

The cauſes of a cold Sweat.

Moreover Sweat is either hot, of which I have treated hitherto; or actually cold, ſuch as is cauſed by a Panick fear, very ſharp pains, in a Lipothymie, or any ſudden fainting of the ſpirits, and in the pangs of death. The cauſe hereof ſeems to conſiſt in the whole Souls ſinking upon any ſudden and extraordinary paſſion, whereby it contracts its circumference; and conſequently, when the ſpirits are put into a conſternation, and the bloud retracted with the heat toward the heart, the outmoſt particles that flow out through the skin, being left or forſaken by thoſe that follow, and deſtitute of heat, are immediately condenſed into a cold vapour juſt as it uſually happens in Diſtillation. For if you reſtrain, or put out the fire on a ſudden, the hot exhalation, that fills the Still, will preſently turn to a Water.

How Sweating Medicins ought to be qualified.

From theſe things thus premiſed and demonſtrated, which are the chiefeſt requiſits to provoke ſweating, and the great occaſions, or ordinary accidents upon the account of which it is uſually excited; it will not be any difficult matter to ſhew you in what qualities and particles ſweating Medicins ought to excel, and after what manner they produce their effects. And firſt of all, as to their Virtues, Sweating things that are to be taken inward ought to be ſuch as may make the bloud boyl up more than ordinary, and by conſequence, evaporate; and likewiſe ſuch as may in ſome meaſure open and diſſolve the maſs thereof, which is oftentimes too compact and thick; ſo that the ſerous part thereof may the more eaſily ſeparate and run away; and at the ſame time may diſpoſe it when ſo ſeparated for evacuation by ſweating, rather than by urin or ſtool. Theſe are two things that are primary Requiſites or Indications to Sweating; for the right accompliſhing whereof, Diaphoreticks or ſweating Medicins of ſeveral kinds and operations are commonly uſed. As to the third Requiſit (which I mentioned before) to wit, the opening of the Pores, it is performed almoſt by outward Adminiſtrations onely; but after what manner, and how many ways it is uſually brought about, I ſhall ſhew hereafter. In the mean time, to ſpeak of Hidrotick or ſweating Medicins that are to be taken in at the mouth, I muſt firſt ſhew you, after what general manner ſuch Medicins work; then with what difference and particular kind of operation; and laſtly, by virtue of what qualities, in every kind, to wit, either of the whole mixture, or any one ſingle element, that is to ſay, a Spirit, Sulphur, or Salt, they exert their powers both in the bowels and in the humours, when they provoke Sweat.

The general reaſon of their operation.

1. Therefore as to the firſt, concerning ſweating Medicins in general, I obſerve that they conſiſt of ſuch particles, as being benign enough to the Stomach and Guts, do not cauſe in them any convulſion or motion to ſtool: and likewiſe that they cannot be ſubdued by them, or aſſimilated as food may be; but when they come into the ſtomach, immediately diſpoſe both the animal ſpirits and the bloud to ſweating. For ſome of them being drowned and diſſolved in the ſtomach, do preſently rouze and recreate the animal ſpirits that abound within the nervous fibres (out of which the inner coat is made) in ſo much that the ſubſtance of the whole ſenſitive ſoul being preſently erected, and expanded or ſpread to a larger circumference, makes the heart more vegete and active, and conſequently the bloud, which is rarefied and more inkindled, more rapidly to circulate, by which means it is put into a Sweat. Moreover, in the mean time the particles of the ſame Medicin convey themſelves alſo into the bloud that runs through the ſtomach-veſſels (which cover the nervous tunick or coat in great numbers) and force it (by putting it in a ferment and a ſudden heat) to make its way through the Veins toward the heart with far greater ſpeed than ordinary: into which when it comes with that violence, immediately the pulſe of the heart is augmented, and the whole maſs of bloud being rarefied and more inflamed, and at the ſame time diſturbed by the particles of the Medicin that are moſt intimately mixed with it, it is hurried on through the arteries with far greater ſpeed into all outward parts; where, ſeeing all its watery part cannot be brought back or received by the veins and other conveyances, it muſt of neceſſity come to paſs, that a great part of the ſerous humour be melted into Sweat. But the particles of the ſweating Medicin, being admitted, as is aforeſaid, into the bloud, do not onely ferment and diſturb the liquor thereof, but oftentimes alſo do ſo looſen and open the miſture of it, that the *Serum* and other dreggy parts of it are the more eaſily ſeparated and thrown off. But ſince this happens to fall out after a different manner, not onely according to the various con-

Phar. Rat. Part I.

conſtitution of the bloud, but the ſeveral operations or preparations of the Medicin, it ſeemeth worth our while in this place briefly to give you the various Indications when you ought to uſe ſweating Phyſick, and the different ways of proſecuting them, together with the reaſon of every one of them. But upon this ſubject you muſt firſt take notice, that ſweating Medicins are, in the ways of their operations, and the operation it ſelf very nearly allied to a great many Cordials (as they are commonly called) in ſo much that many of both ſorts are of the ſame or reciprocal uſe; and therefore ſeeing they differ chiefly in their greater or leſſer efficacy, as often as you have need to paſs from one kind to the other, it will be almoſt onely neceſſary to augment or diminiſh the Doſe, and to chuſe the moſt convenient times to give it in.

Sweating Medicins are like Cordials.

Therefore, as to the various kind and preparation of the matter out of which Hidrotick or ſweating Medicins are compounded, they are moſt commonly either the Integral or Elementary parts of ſome mixt body: that is, they are either natural bodies, that are given in their whole ſubſtance, either ſimple or extracted; as when the Leaves, Seeds, or Roots of Carduus, Contrayerva, Angelica, or the like, are taken in a Powder, Decoction, Conſerve, or Magiſtery: or elſe ſweating Medicins conſiſt of the particles of this or that Element, which are ſpirituous, ſulphureous, ſaline, ſimple, or any other that predominate therein: as if you extract out of Carduus, or any other body, whether Vegetable, Mineral, or Animal, a Salt, or Spirit, or Oil, and reduce it apart by it ſelf, or with other preparations, into the form of a Medicin. I ſhall briefly touch upon each, or at leaſt, the chiefeſt ſorts of them.

The matter of Hydroticks is either the integral parts of a mixt body;

Or Elementary.

I. *Diaphoreticks*, whoſe virtue conſiſts in the Integral particles of the whole concrete body, being unequally mingled, ſeem to excel in one particular Element, (that is, Salt) above all others, and to owe their virtue chiefly to that. But that Salt, upon which the Hydrotick or ſweating quality depends, comes in double capacity; for in ſome bodies it is volatile, ſharp, or bitter; and in others Alchaliſed, or in ſome meaſure fixed. 1. In the firſt rank are placed many Vegetables, which the Ancients counted Antidotes, as the Leaves of Scordium, Carduus, Scabious, and Vincetoricum, or Celandine, Marigold, and Camomile Flowers, Lagwort, Zedoary, and Galangal roots, &c. as alſo the Confections of Mithridate, Treacle, Diaſcordium, and likewiſe Decoctions of Guaicum, Box, and ſuch like. Which kind of Medicins, when taken into the Stomach and diſſolved, make a Tincture, whoſe particles (as being more hot than ordinary, and exotick or foreign) rouze up the animal ſpirits, whereby the heart being more vegetely actuated, drives about the bloud with a more rapid motion. Beſides which they get into the bloud that is in the ſtomach veſſels, and ferment it, and by that means, whileſt they cauſe it to be brought back to the heart by the veins in more than ordinary haſte, they are alſo the occaſion that it is driven forward ſo vehemently through the Arteries into the habit of the body, and cauſeth ſweating. 2. The other ſort of Diaphoreticks, or ſweating Medicins, which conſiſting of the integral parts of a mixt body, have an alchali Salt predominant in them, are Stones, and the bony or harder and ſhelly parts of Animals and Vegetables, as Bezoar, Pearl, Eyes and Claws of Crabs, and the like, whoſe Diaphoretick virtue proceeds moſt chiefly from an Alchali Salt; in as much as the particles thereof meeting ſometimes with an acid Salt, not onely in the bowels, but in the bloud too, and boyling up with it, do thereby cauſe the maſs of bloud to diſſolve, and the ſerous part thereof to ſeparate and melt into Sweat.

1. Thoſe of the former ſort.

How they operate.

II. *Hydrotick Medicins*, which after a Chymical reſolution of them, owe their virtue to Elementary particles, one way or other, being formed out of various ſubjects, and with different ways of preparation, are chiefly either ſpirituous, or ſaline, or both together united among themſelves, or with ſome ſmall number of ſulphureous particles. For thoſe that are meerly or for the moſt part ſulphureous, are leſs ſerviceable to this purpoſe; for ſuch being moſt commonly offenſive to the Bowels, do oftentimes cauſe nauſeouſneſs, and very frequently vomiting. Moreover ſuch as, through their great quantity of Sulphur are oily and fat, do not ſo eaſily inſinuate themſelves into the maſs of bloud. After what manner, and by what ſort of operation upon the ſpirits and the bloud, thoſe others cauſe ſweating, I ſhall enquire more particularly.

2. Hydroticks whoſe particles are Elementary, of what kind, and how many fold they are.

1. Spirituous ones.

1. And firſt to the ſpirituous ſort of them I refer hot Waters, and all kind of liquors that are impregnated with a Vinous ſpirit; ſuch as are Chymically diſtilled every where out of the Fruits of Vegetables, or their Juices ripened by fermentation, or diſſolved by putrefaction; ſuch as are Spirit of Wine, Cider, Ale, Juniper berries, Elder, Black Cherries, with many other things, which are commonly called ſpirits; and they are taken either plain and clear by themſelves, or being impregnated with the infuſion of other Simples, are again diſtilled, or given under the form of a Tincture.

Phar. Rat. Part I.

ſture. Theſe kind of Vinous liquors, being inwardly taken, cauſe ſweating, not onely in that they erect or raiſe the animal ſpirits, and put them into a greater expanſion (whereby the motion of the heart alſo is quickened) but likewiſe for that they put the bloud into a commotion and (juſt as when Oil is added to a flame) make it more hot and fiery. For the ſame reaſon, and upon the ſcore of the ſame manner of operation that theſe are called Diaphoreticks, they uſe alſo to be called Cardiacks or Cordials, if they are given in a leſſer doſe.

2. Salt outs.

2. For cauſing of Sweat there are Salt Preparations of ſeveral kinds and different qualities, which are uſually preſcribed, and that with good ſucceſs; which nevertheleſs do not (as the particles of the whole mixt body, or thoſe that are meerly ſpirituous) either diſturb the bloud through their heterogeneouſneſs [or being of another kind] or kindle it through their inflamableneſs [or being eaſily ſet on fire] but onely by acting upon the ſaline particles thereof; which whileſt they ſnatch into their embraces, they ſever them from their ſtrict union with others, ſo that the conſtitution of the bloud being looſened, and the Pulſe augmented, the ſuperfluous ſerous parts and other dregs, do the more eaſily ſeparate, and are carried off by Sweat. To this place you may refer (as I have before ſhewn concerning Piſſing Medicins, and likewiſe in Cordials, as ſhall hereafter appear) Salt of almoſt every kind, but eſpecially volatile, fluid, fixed, and nitrous Salt; out of which either ſeverally, or in compoſition with each other, Diaphoreticks of the chiefeſt note are made: which being inwardly taken and meeting with other Salts that abound both in the bowels and in the maſs of bloud, and drawing them from the embraces of the other particles, do open and rarifie the bloud, and conſequently diſpoſe it for evacuation by ſweat. We ſhall hereafter declare to you the chief ſorts of them, with their manner of operation; but in the mean while, ſeeing the ſame ſalt Medicins that uſe to be given for ſweating, are alſo commonly preſcribed to provoke Urin, and ſometimes for Cordials too, I muſt ſhew you with what preparation, and alſo with what requiſits we ought to proſecute this manner of evacuation by ſweat apart from thoſe other intentions.

How they work.

The ſeveral ſtates of their ſaline particles.

How Sweats ought to be adminiſtred.

And indeed we obſerve, that ſweating Medicins taken inwardly do ſeldom or never work of their own accord, as Vomits, and Purges, or Diureticks do; and beſides that, a man muſt always uſe great caution, and keep ones ſelf warm, to actuate the Medicin, and to determine that operation. Wherefore, from the time that the ſweating Medicin is given, the Patient is to be treated in that manner, to the end that not onely the Pores of his body may be opened, but alſo very much to quicken the pulſation of the heart. For theſe ends, let him be kept in a warm Bed, a Bath, or Hot-houſe, or exerciſed with a ſwifter or more laborious motion of his Body than uſual; all which, that it may the better ſucceed toward the provoking of Sweat, we muſt chuſe the moſt convenient time and ſubject, as oft as it is in our power; that is to ſay, when the bloud being in a good temper, or at leaſt, not a very bad one, doth both ſufficiently abound with ſerous humours, and is not too confuſed or diſturbed in its particles, but is inclined to open, and ſeparate, or be diſſolved into ſeveral parts. For in a cholerick temper, a thin and dry conſtitution, and in the midſt of a burning Fever, when all things are out of order and indigeſted, Diaphoreticks are oftentimes given in vain, or when they are not proper. Moreover as often as they ſeem to be uſeful, you muſt not give any kind of them indifferently; but according to the ſeveral conditions of the bloud, and the different predominancy of ſometimes this and ſometimes that Element therein, and the ſtates or qualifications of the Salts, you muſt make choice of ſuch and ſuch Medicins. To this purpoſe we ſhall in the next place tell you, with what caution, and in what forms they ought to be preſcribed.

Time and Subject muſt be choſen moſt convenient for ſweating.

CHAP.

Phar. Rat. Part I.

CHAP. II.

The Sorts and Receipts of Diaphoreticks [or Sweating Medicins] with the Reasons of some among them which are Chymical.

SEeing that Sudorifical or sweating Medicins are manifold and of different sorts, and use also to be variously ordered and reduced into Classes or ranks; I therefore thought fit in this place first of all to give you an account of, and distinguish the same both in their form or manner of making, and also as to the matter of which they are made. Now the most usual forms in which they are given, are 1. a Powder, 2. Chymical Liquors. 3. A Potion. 4. A Bolus. 5. A Diet. The matter of every one of these is either the integral parts of a whole mixt Body, or they are the elementary parts of some mixed Body resolved and taken in pieces by Chymistry: and those are either more simple (that is to say, either spirituous or saline (which latter are either volatile or fixed, or sower or nitrous) or the sudorifical particles, so divided and separated by Chymistry, are elementary ones compounded among themselves; to wit, spirituo-saline ones, and salino-sulphureous ones. Whilest we run over each of these sorts in order, we will adapt or fit, to every kind of matter, the more select forms of prescriptions. *What are the Forms of Diaphoretick Medicins.*

1. Diaphoreticks whose foundations are the integral parts of a mixt Body, and such wherein a sharp or volatile Salt predominateth, conduce oftentimes to the provocation of sweat upon this account; to wit, that their particles being admitted into the bloud (seeing they are unmingleable and untamable) disturb the mass thereof, divide it very much, and separate it as it were into small parcels; in so much that at last when the constitution of the bloud is very much loosened and put into a boyling heat, the serous superfluities, the dreggy parts and corruptions of the bloud are thrown out along with the particles of the Medicin, which are to be cast forth upon the score of their heterogeneousness [or being of another kind.] Those of this sort are used to be given under the form of a Powder, Bolus, Potion, and Diet, according to the following prescriptions. *Such as have the integral parts of a mixt body for their basis.*

The Receipts of them.

Powders.

Take of the dust of the roots of Contrayerva, Virginy-Creeper and Lagwort, each ℥j. *of Cochineel and Saffron, each* ℥ß. *make a Powder. The Dose is* ℥ß. *with a convenient vehicle.*

Take of the Powder of Vipers ℥j. *and give it in a convenient Liquor.*

Take of the Powder of Toads prepared ℥ß. *to* ℥j.

When Diaphoreticks ought to predominate with an alchali Salt alone, or mingled with the former;

Take of Eastern Bezoar ℈ß. *to* ℥ß. *and give it in a spoonful of distilled Water, or of any other vehicle.*

Take of the Powder of Crabs Claws compound. ℈j. *to* ℥ß. *and give it the same way.*

Make your Powder of Bezoar in this manner following:

Take of the Powder of the Roots of Contrayerva, and of Crabs Claws, simple, each ℥ij. *of Pearl, both sorts of Coral, of the whitest Amber, of Crabs Eyes, Harts horn, and Chrystal prepared, each* ℥j. *of Western Bezoar, and of Terra Lemnia, each* ℥ß. *of Cerusse of Antimony* ℥ij. *of Cochineel* ℥ß. *of Amber grise* ℥j. ß. *of Musk* ℥ß. *make a small Powder, and form it, with Gelly made of Vipers skins, into little Balls. The Dose is* ℈j. *to* ℥j.

Take of this Bezoar Powder ℈j. *of Toads prepared,* gr. vj. *make a Powder, and give it in a spoonful of Treacle water.*

2. Bolusses, the bases or foundations of which are the integral parts of a mixt Body, reduced into the form of a Confection, Extract, or Conserve. 2. *Bolusses.*

Take

Pharm. Rat. Part I.

Take of Mithridate ʒ ß. *to* ʒ j. *of Powder of Bezoar* ℈ j. *to* ʒ ß. *Syrup of the juice of Citron a convenient quantity; and make a Bolus. In place of the Mithridate you may put Treacle or Diascordium, or Confectio liberans de Hyazintho. So Bezoar pulverized, or Powder of the roots of Contrayerva, or of any other things like unto it, may supply the room of the Powder of Bezoar.*

Take of the Extract of Treacle ʒ ß. *to* ʒ j. *of the Powder of Bezoar* ℈ j. *and make a Bolus.*

Take of the Extract of Carduus ʒ ß. *of the Powder of Bezoar* ℈ j. *of Salt of Wormwood* gr. xv. *with a convenient quantity of Syrup made of the juice of Citron; and make a Bolus.*

3. Potions. 3. Potions whose Foundations are the common Decoctions of Vegetables, or Infusions and Tinctures.

A Decoction. *Take of the Roots of Lagwort* ʒ j. *of the Seed thereof* ʒ ij. *of Candied Ringo root* ʒ vj. *of Carduus seed* ʒ ij. *and boyl them in Spring water, one pint to half a pint, in the clear straining whereof take* ʒ ß. *or* ℈ ij. *of Mithridate, warm in bed.*

In like manner take the Leaves of Carduus, Marigold or Camomile Flowers, and boyl them in a convenient quantity of Posset drink. Of which give ʒ vj. *or* viij. *warm by it self, or with a Powder, a Confection, or any other Diaphoretick joined to it.*

Infusions and Tinctures. 4. Several sorts of Diaphoretical Infusions and Tinctures may be prepared by extracting the Vertues of simple Vegetables, and of Confections with Wine, Vinegar, or destilled Water: which being afterward strained and clarified by setling, are oftentimes very successfully given either by themselves or in composition with other liquors. Hither we ought to refer all Waters, Wines, and Venegars of Bezoar, prepared by Infusion, the Receipts whereof are very frequently met with among Authors. Moreover the Tinctures of Vegetables, that are very efficacious in a small Dose, are made in this manner following.

Chymical Tinctures. *Take of the roots of Contrayerva* ℔ j. *and when you have bruised it and put it into a Matrace, pour to it of spirit of Wine three pints. Let them digest to extract a Tincture, which you must strain, and let it evaporate in a Bath to the consistence or thickness of Honey. Keep the spirit which you first drew off, apart from the rest, and pour it again into the remaining part of it: and then again extract a Tincture: of which the Dose is* ʒ ß. *to* ʒ j. *in a convenient vehicle.*

5. Diets. 5. Diets, the bases or foundations whereof are Decoctions of Liquors, designed for the cure of the Pox, and some other chronical Distempers, deeply rooted in the bloud and humours.

For, to the curing of some Diseases very violent and frequent Sweating, that is, a long time together, and every day, is necessarily requisit: not onely to purge out the impurities and corruptions of the Bowels and Humours, but also totally to extinguish, or as it were, root out the morbifick tinctures, that are so deeply impressed upon them. To this end, it will not be enough to give a Sweating Powder or Bolus some few times, but a mans whole Diet ought to be directed to this end onely: wherefore all ones drink in such a case ought to be a Diaphoretick Decoction, after a Dose whereof taken in the morning, you must sweat plentifully either in a Bath or Hothouse. Then, when by this means both the pores of the skin are opened, and Nature also is inclined to an evacuation by Sweat, let the recrements of the bloud and nervous juice evaporate all the day after by transpiration, which must be still continued by the use of the same drink. By this method not onely the Pox is most safely and for the most part most certainly cured, but likewise other Herculean Distempers are sometimes happily healed.

Take of the shavings of Lignum Sanctum, or Guiacum ʒ iv. *of Sarsaparella* ʒ vj. *of China* ʒ ij. *of all kinds of Sanders, each* ʒ j. *of the shavings of Ivory, and of Harts horn, each* ʒ ß. *of Antimony pulverized and tied up* ʒ vj. *infuse them according to Art, and boyl them in* xvj. *pints of Spring water till half be boyled away; then strain it, and to the dregs of the Ingredients that remain, pour a like quantity of water, and make an Infusion and a Decoction till a third part be consumed, adding of Raisins* ℔ j. *of Licoris* ʒ j. *and keep the straining for your ordinary drink.*

In

In a cholerick temperament, and when the bloud is ſharp and hot, you muſt omit the Guiacum, increaſing the quantity of China and Sarſa. *Phar. Rat.* Part I.

Diaphoreticks that conſiſt of the integral part of a whole mixt body, and are eaſily got for the Poor, muſt be prepared according to the Receipts following. *Diaphoreticks that are eaſily got.*

In malignant Fevers. *Take of Conſerve of Allelujah* ℥ j. *and of Mithridate* ℈ ij. ß. *mingle them, and let the Patient take them, drinking thereupon a draught of Poſſet drink, with Cardus or Scordium Leaves, or Camomile, or Marigold Flowers boyled in it.*

Take of the roots of Virginy Creeper pulverized ℥ ß. *to* ℥ j. *and give it in a convenient vehicle.* Or, *Take of the roots of Lagwort pulverized* ℥ j. *after the ſame manner.*

In ordinary caſes give *the Decoction of Grumwel, roots of Lagwort, or Virginy Creeper, or roots and ſeeds of Burdock.* In the Pox, *The Decoction of Sopewort or Shavings of Box wood, and the like, may ſupply the place of the Decoction which is made of Woods that are of greater value.*

2. Sweating Medicins prepared out of the elementary parts of a mixt Body, have for their foundation either a Spirit or a Salt, ſometimes ſimple, and ſometimes joined with another Salt or with Sulphur. Spirituous Medicins muſt be preſcribed according to the Receipts following. *Forms of Chymical Diaphoreticks.*

1. *Spirit of Treacle camphorated* ℥ ß. *to* ℥ j. *or* ℥ j. ß. *may be given in a convenient vehicle.* *1 Such as have ſpirituous particles for their foundation.*

After the ſame manner alſo many other Spirits, diſtilled out of the juices of Vegetables that are ripened by fermentation, and appropriated to ſome certain Diſtempers, may be given to provoke Sweat at any time when it is proper: ſuch as are the ſpirit of black Cherries, of Elder, Ivy, and Juniper, berries, with many others. Spirit of Harts horn, Soot, Bloud, and the like, ought rather to be reckoned among the ſaline Medicins.

2. Diaphoreticks whoſe foundations are Spirits, with other elementary particles mixed among them, muſt be preſcribed in this manner; *2. Such as have ſpirituous particles united with others.*

Take of the ſimple mixture ℥ j. *and give it in a convenient vehicle.*

Hither alſo you may refer ſuch as conſiſt of a Spirit, fixed Salt, and Sulphur united: ſuch as are the Tincture of Salt of Tartar and Antimony, of which the Doſe is ℈ j. to ℈ ij. in another liquor. Moreover Diſtilled Waters, in which the ſpirituous particles are diluted with watery ones, are oftentimes uſed to be given to provoke ſweat with very good ſucceſs.

Take of the Roots of Lagwort, and Valerian, each ℥ ij. *of Zedoary, Contrayerva, or Drakes Root, and Virginy Creeper, each* ℥ j. ß. *of the Flowers of Lagwort or Butterbur* iv. *handfuls, of Saffron* ℥ ij. *to which when ſhreded and bruiſed pour* iv. *pints of Sherry Wine; diſtil them according to Art, and mingle all the liquor. The Doſe is* ℥ ij. ß. *to* ℥ iij. Or, *Take of the roots of Angelica, and Maſterwort, each* ℥ iv. *of Zedoary, Elicampane, Swallow wort, Gentian, and the leſſer Galingal, each* ℥ j. *of the tops of Carduus, Rue, and Angelica, each* iij. *handfuls, of the middle Bark of an Aſhtree* ℥ vj. *when you have ſhreded and bruiſed them, put to them of Mithridate, and Treacle of Andromachus, each* ℥ ij. *mingle them, and pour to it of generous Wine* vj. *pints, of diſtilled Vinegar* ij. *pints, diſtil them according to Art. The Doſe is* ℥ iij. *Diſtilled Waters.*

The Doſes of the aforeſaid Waters may be actuated by the addition of Chymical liquors or ſalts. Such Medicins as theſe that are impregnated with a vinous ſpirit are proper chiefly and almoſt onely for old men, and likewiſe for ſuch as are of a cold temper, and thoſe that are ſubject to a Palſie or Dropſie; but in an hot conſtitution, and when the Bowels burn, or the Bloud is in a feverish commotion, they uſually do more hurt than good, in as much as they inflame the former, and put the latter into an exceſſive effervescence.

Phar. Rat. Part I.

Diaphoreticks whoſe baſis is ſaline, as they are of ſeveral ſorts, to wit, (according as the ſalt is volatile, fixed, ſower, or nitrous, ſo they are) of a different uſe and operation; which is the reaſon that in ſome caſes one ſort, and in other caſes another ſort is more proper; as I obſerved before concerning Diureticks, or Piſſing Medicins.

3. Thoſe whoſe baſis is Salt.

1. Such as conſiſt of fixed or volatile Salt.

1. Fixed and volatile Salt are moſt proper for thoſe, whoſe Bloud abounds very much with a ſerous humour. So alſo, when the juice that moiſtens the bowels and the nerves, grows ſharp, (as it is uſual in thoſe that have the Dropſie, or an ill habit of body, and ſuch as are liable to convulſions) thoſe kind of Medicins are more ſucceſsfully uſed to provoke ſweating; but, when they meet with the acid-ſaline particles of the humours, and are united thereunto, they looſen the conſtitution of the Bloud, and likewiſe through the heterogeneouſneſs (or different ingredients) of the mixture, diſturb the maſs thereof, and therefore to the end that the ſerous parts of it may be the more eaſily ſeparated, and driven outward through the pores of the skin, thoſe Medicins are preſcribed in the form of a Powder, a Bolus, and a Liquor.

Their Forms or Receipts. Powders.

Take of the Flower of Sal Armoniack ℈ß. *of Chryſtal Mineral* gr.xv. *of Bezoar Powder* ℈j. *mingle them, and give it in a ſpoonful of Aqua Sudorifica or Sweating water.*

Take of Salt of Tartar ℈j. *of Ceruß of Antimony* gr. xxv. *and make a Powder, to be given the ſame way.*

Take of Bezoar Powder Mineral ℈j. *to* ʒß. *of Gaſcoign Powder* ℈j. *make a Powder, and give it in the ſame manner.*

Take of Ceruß of Antimony ℈j. *to* ʒß. *of the Flower of Sal Armoniack* ℈ß. *and make a Powder.*

2. Theſe Medicins may be given in the form of a Bolus, by mingling the aforeſaid Doſes with Treacle, Mithridate, or Diaſcordium, or with the Extract of Carduus, Gentian, or the like.

Boluſes.

Take of Bezoar Powder Mineral ℈j. *of Flower of Sal Armoniack* gr.vj. *and of Mithridate* ʒß. *make a Bolus.*

Take of Salt of Harts horn gr. viij. *of Bezoar Powder* gr.xv. *of Extract of Treacle* ℈j. *make a Bolus or* iij. *Pills.*

3. If it be more convenient to take them in the form of a Liquor.

Liquors.

Take of Spirit of Hartſhorn or Soot, or Sal Armoniack from xv. *to* xx. *drops, of Aqua Sudorifica* [*or Sweating water*] ʒj. *to* ʒiij. *make a potion, and let the Patient take it with caution, keeping within doors.*

Take of the Flower of Sal Armoniack ℈ß. *of Salt of Tartar* gr.xv. *of Aqua Sudorifica* ʒiij. *mingle them and make a draught.*

Such whoſe baſis is nitrous Salt.

4. Diaphoreticks that have a nitrous Salt for their baſis or foundation, are uſed with ſucceſs in almoſt the ſame caſes, as the former, which are compoſed of fixed and volatile Salt; in as much as they deſtroy the predominancy of the acid Salt, and ſo diſpoſe the mixture of the Bloud, that whileſt it boyls up, the *Serum* and dregs thereof may be the more eaſily ſeparated and carried off.

Take of Chryſtal Mineral ʒiij. *of Salt of Hartſhorn, or Soot, or Vipers* ʒj. *mingle them. The Doſe is from* ℈j. *to* ʒß. *in a convenient vehicle.*

Take of Sal Prunellæ ʒij. *of Bezoar Mineral Powder or of Ceruſs of Antimony* ʒj. *make a Powder. The Doſe is* ℈ij. *to* ʒj.

Thoſe whoſe baſis is an acid Salt.

5. Diaphoreticks whoſe baſis is an acid Salt, are of greateſt efficacy againſt the predominancy of fixed Salt and Sulphur: that is to ſay, When the maſs of bloud is too thick and tenacious by reaſon of the ſaline-fixed particles which are united with the ſulphu-

ſulphureous and earthy ones, ſo that it will not eaſily allow the ferous parts of it to be carried off by Sweat (as it uſually happens in continued Fevers and the Scurvy) an acid Salt, in the Medicin which is given, meeting with a fixed Salt in the body, and forcing it into its embraces, deſtroys the hurtful unions thereof, and conſequently looſens the boyling bloud, and diſpoſeth it for ſweating. *Phar. Rat.* Part I.

Take of Spirit of Tartar from ʒ ß. *to* ʒ j. *of Aqua Sudorifica* ℥ iij. *of the Flower of Sal Armoniack* ϑ ß. *mingle them.* *Potions.*

Take of the Simple Mixture ʒ ß. *to* ϑ ij. *and give it in a ſpoonful of Treacle or Bezoar water.*

Take of Bezoar Vinegar from ℥ ß. *to* ℥ j. *of Carduus water* ℥ ij. *of Plague water* ʒ vj. *mingle them and make a draught.*

Take of Spirit of Guiacum ʒ j. *of Aqua Sudorifica* ℥ iij. *mingle them and make a Potion.*

5. Some things that are meerly or for the moſt part ſulphureous are commonly reckoned among Sweating Medicins; as ſome natural Balſams, and others that are made, as alſo Chymical Oils, and eſpecially thoſe of Guiacum, Box, Camphire, Hartshorn and Soot; ſo likewiſe the roſinous Extracts of ponderous Woods, with many other things, which though by themſelves they are of little efficacy toward provoking of Sweat, yet when they are joined with other ſaline ingredients, I am of opinion that they are not altogether uſeleſs; in as much as in a cold and phlegmatick conſtitution, ſulphureo-ſaline things rarifie the bloud when it is too wateriſh, and diſpoſe it to a freer evaporation, as much as ſpirituous things do. *Sulphureous Diaphoreticks.*

Take of Balm of Gilead from vj. to xij. *drops, of water of Baum, or of Ground Ivy* ℥ iij. *of Aqua Sudorifica* ℥ ß. *and let the Patient take it every morning for ſeveral days together, to ſweat. It is proper for thoſe that are Pthiſical, or have Ulcers in their Reins.*

Upon the ſame account, but in a larger Doſe, you may give Balſam of Peru, and likewiſe Tincture of Balſam of Tolu, as alſo ſtillatitious Balſams compounded.

Take of Roſin of Guiacum pulverized ʒ ij. *of chymical Oil of the ſame* ϑ j. *of Bezoar Mineral and of Gum of Guiacum each* ʒ j. ß. *of Balſam of Peru, a convenient quantity: make a maß for Pills. The Doſe is from* ʒ ß. *to* ϑ ij. *drinking thereupon a Doſe of Aqua Sudorifica, or Decoction of the Woods.* *Pills.*

The Chymical preparations of ſome Diaphoreticks, with the reaſons why they are ſo made.

Bezoar Mineral.

Take of Butter of Antimony rectified ℥ iij. *pour to it drop by drop of the Spirit of Nitre, or Aqua Stygia an equal quantity; draw it off in the heat of Sand, and pour it thereunto again, adding of the ſame menſtruum freſh* ʒ j. *and draw it off again, repeating it three or four times. When you have taken the matter out and pulverized it, calcine it for an hour in a crucible; then ſweeten it by waſhing, and burning Spirit of Wine upon it for three or four times. The Doſe is from* ϑ j. *to* ʒ j. *The Preparation of Bezoarticum Minerale.*

In the preparation hereof it is worth our obſervation, that whileſt theſe exceeding ſharp liquors are put together, immediately the Salts meeting with each other, are ſtrictly united; in the mean time the ſulphureous particles which abound in it, being totally excluded and freed, fly away, and taking ſome ſaline particles along with them, cauſe a very offenſive heat and ſmoak, as if ſomething were actually a burning: then when theſe are driven away, the ſaline ones that are left behind, are more cloſely united with ſome earthy ones of the Antimony, and at laſt having undergone the fire, that the Emetick or vomiting Sulphur may totally exhale; and the corroſive ſharpneſs of the Salts be rebated, they make an excellent Diaphoretick; in as much as the different Salts in this Medicin, meet with the Salts in our Bodies, to which whileſt they are united, the union of the bloud and humours is diſſolved, ſo that the way whereby for *The reaſon of it.*

Phar. Rat. Part I.

the ſerous recrement to paſs out is wide enough; in the very ſame manner, as when Spirit of Nitre poured upon Butter of Antimony, or *Aqua Fortis* upon the filings of Iron, cauſeth a great ebullition or bubbling with heat and black fume; the reaſon of which is, becauſe the ſulphureous particles (whileſt the Salts unite) fly away in great quantity as from a kindled fire. And that actual flame is not cauſed in this caſe, the reaſon is, becauſe a great many ſalt particles ariſe with the ſulphureous ones, by which the ſulphureous ones are every where ſeparated from each other, leſt coming together they might take fire and flame.

Bezoar Mineral is ſaid to be made after a more compendious way, in this manner:

You muſt precipitate Butter of Antimony infuſed in Spring water, into a white Powder, called Mercurius Vitæ: *which being dried, you muſt put by little and little into Salt of Nitre, melted in a crucible, and let them flow together for a quarter of an hour. After that, when the Nitre is diſſolved by frequent pouring Spring water upon it, a white and fixed chalk will remain. Which nevertheleſs, though it be uſed for a Diaphoretick, differs very much from the Bezoar Mineral, becauſe in it the Salts of the menſtruums, upon which the virtue of the Medicin very much depends, are almoſt quite waſhed away: Beſides that comes nearer to the nature of Ceruß of Antimony, or rather ſeems to be the ſame thing with it.*

2. Diaphoretick Antimony.

Antimony Diaphoretick.

Calcine your Antimony twice or thrice, with an equal quantity of Nitre, then melting it in a crucible, either let it run for ſome time, or throwing in a coal, let it make a noiſe till ſuch time as the Sulphur being quite ſpent, a calx remains, conſiſting in a manner onely of Salt and Earth, and impregnated with fiery particles: which, when it is ſweetened (as the way is) with frequent waſhing, becomes a meer Caput mortuum, *or inſipid Earth.*

The reaſon of it.

And although it be ſtiled by the name of a Diaphoretick, yet I know not to which of its particles that virtue can be attributed; and I have often in vain expected ſuch an effect from this Medicin. It is indeed often uſed with good ſucceſs to ſtop fluxes of the *Serum* or the Bloud; becauſe this Earth being bereft of its proper Salts, imbibes other ſtrange ſorts of acid Salts, which it by chance meets with in our bodies; the like operation to which *Crocus Martis* ſeems to have (being prepared by a reverberating fire) and from the like cauſe, as I have elſewhere hinted to you.

Ceruſs of Antimony.

Ceruſs of Antimony, prepared out of the purer part thereof, that is to ſay, Regulus calcined with Nitre, is onely the purer or more clarified calx of it. In the preparation whereof you add Tartar, becauſe the Regulus hath but very little Sulphur (without which Nitre will not burn) in it; wherefore, for the better performance of the calcination, it is neceſſary to make an addition of Tartar, which abounds with ſulphureous particles.

3. Flower of Sal Armoniack.

Flower of Sal Armoniack.

Take of Sal Armoniack pulverized ℔ j. *of filings of Iron* ʒ xij. *which having pounded and mingled, diſtil them in a Retort with a large neck, increaſing the fire of the Reverberator by degrees: an yellowiſh liquor, which is the Spirit of Salt, will drop out into the Receiver, and the Flower will be ſublimed partly into the ſides thereof, and partly into the neck of the Retort, which being gathered together, may be kept in a Glaſs for your uſe. The Doſe is from* gr. v. *to* xv.

The variation of this method.

This operation is performed by mingling Sal Armoniack with waſhed Colcothar, as alſo with the Calx or Salt of Tartar. The reaſon of which mixture is this; firſt, to keep the Sal Armoniack from fuſion or running. Secondly, That when the Particles of the more fixed Salt adhere or ſtick to the Iron, Colcothar, or Calx of Tartar, the volatile parts of them being free from reſtraint, may eaſily aſcend. And thirdly that the Flower, whileſt it aſcends, may carry along with it ſomething of another body, to wit, of Mars, Venus, or Salt of Tartar, and be impregnated with the virtue of it. When the ſublimation is performed with Iron or Calx of Tartar, there are Tinctures drawn out of each *Caput mortuum*, (with Spirit of Wine) which are of no ſmall uſe.

4. Spi-

Phar. Rat
Part I.

4. Spirit of Sal Armoniack.

Take of Tartar calcined with Nitre, and of Sal Armoniack, each ℔ iij. *and when you have pulverized them ſeverally, mingle them and put them into a large Cucurbit,, pouring to them of Spring water* vj. *or* viij. *Pints, and diſtil them in an Oven of Sand. The Spirit will ariſe with the gentleſt heat, pure, and very penetrating, without any burning: which if you rectifie it in a deep Cucurbit, a moſt pure volatile Salt will aſcend into the Alembick.*

4. Spirit of Sal Armoniack.

The reaſon of this procedure is this: The Sal Armoniack conſiſts of a volatile ſalt made out of Soot, Piſs, and Sea-Salt; all which uniting, whileſt they are ſublimated, the ſalinovolatile particles being totally freed from the ſulphureous ones, that uſed to ſtick to them, are ſo fixed and ſetled by the Sea-ſalt ones, that they cannot fly away. But as ſoon as ever this Bond is diſſolved; that is to ſay, when this compound Salt, being diſſolved in water, is intimately mixed with the ſalt of Tartar, the particles of Sea-ſalt ſtick cloſe to the ſaline-fixed ones of the Tartar; and conſequently the volatile ones being diſmiſſed from their embraces, and ready to fly away, do very eaſily ariſe; but whereas the ſpirit diſtilled from Sal Armoniack hath no offenſive ſmell, as liquors drawn from Soot or Urin have, the reaſon is, becauſe in that compoſition the volatile Salt, by the intervening of the Sea-ſalt, is altogether deprived of any ſulphureous particles; which, when Soot or Piſs are diſtilled by themſelves, ſtick faſt to the volatile Salt (as appears very plainly from the ill odour of them both) and likewiſe becauſe the liquors diſtilled from thoſe bodies, being firſt clear and limpid, grow afterward of an yellow colour, and become at laſt red, and black, and opacous or dark; to wit, in as much as the ſulphureous particles being firſt ſubdued and hid by the ſaline ones, get by degrees their liberty, ſhew themſelves and predominate over all the reſt.

The reaſon of the operation.

The Spirit of Sal Armoniack hath no Sulphur in it as that of Harts horn, &c. hath.

But in that compoſition of Sal Armoniack, that the particles of Sea-ſalt, of Piſs and of Soot drive away the ſulphureous part and fix the volatile Salt, is very manifeſt even from this Experiment alſo, which the famous *Zwelferus* found out for the fixing of volatile Salt. For Example:

And why.

Take of the volatile Salt of Vipers, Piſs, or Harts horn, as much as you think good; which when you have put into a Cucurbit with a ſtreight, and ſaving one little hole, a cloſe orifice, pour into it drop by drop the ſpirit of Sea-ſalt to the height of two or three fingers, till all the Salt be diſſolved: then filtrate the diſſolution, and draw it off in a cucurbit, till it be dry. There will remain in the bottom a Salt of a good ſmell, ſomewhat acid, and of a ſalt taſte; the uſe whereof is very much cried up in ſeveral Diſtempers.

In this caſe I have tried and found yet farther, that if you would recover your volatile Salt, you muſt put Salt of Tartar to it, and ſublimate it in a Glaſs; from whence there will ariſe a moſt pure volatile Salt. In this manner you may ſo rectifie Spirit of Soot, of Harts horn and Bloud, that when their ſulphur is quite driven away, they may become more grateful and leſs corruptible Remedies.

The Spirit of Sal Armoniack may alſo be diſtilled many other ways, to wit, if you mingle the diſſolution of that Salt with a Lie of fixed Salt, or of ſlacked Lime in an equal proportion; for by this and perhaps ſome other means, whileſt the particles of Sea-ſalt contract new confederacies, the former aſſociates fly away. So it is alſo in the diſtilling of Piſs, as is ſhewn in its proper place.

That Spirit is diſtilled with ſlacked Lime and Lie of aſhes

5. Spirit of Soot, Harts horn, &c.

Take of heavy Soot that comes from burnt wood, and ſhines with a blackneſs like Pitch, a convenient quantity, ſo as to fill an earthen Retort above half full; then having fitted thereunto a large Receiver, begin the diſtillation with a reverberating fire, increaſed by degrees to a moderate heat; there will in a ſhort time ariſe a ſpirit in a white fume, and then an yellow Oil with a volatile Salt, and laſtly a blackiſh Oil. Gather the Salt by it ſelf and rectifie the reſt of the liquor when it is ſeparated from the black Oil by filtration, diſtilling it in a Balneum Mariæ, or bath of ſand, twice or thrice: ſo alſo when you have rectified the volatile Salt in a deep cucurbit, and purified it, keep it for your uſe. The Doſe is of the Spirit from xij. *to* xx. *drops, and of the Salt from* vj. *to* xij. *or* xv. gr.

5. Spirit of Soot, Harts horn, &c.

Small

Phar. Rat. Part I.

Small pieces or ſhavings of Harts horn may be diſtilled either the ſame way, with mere fire, or in a glaſs Retort and an Oven of Sand. So alſo out of a Skull, Bones, and Bloud, you may draw a Spirit, with a volatile Salt and a ſtinking Oil.

6. Spirits and Roſinous Extracts of Guiacum, Box, and other ponderous Woods.

6. Spirits of Guiacum, Box, and the like.

That theſe kinds of Woods are duly numbred among ſuch things as provoke Sweat, is plain from this, that ſudorifical decoctions are made chiefly of them. The Hydrotick [or ſweat-cauſing] virtue of them ſeems to conſiſt in not onely a ſaline, but a ſulphureous principle; for theſe Bodies are abundantly filled with ſuch kind of particles. Wherefore beſides the common manner of preparing them, by infuſion and boyling, their active principles of Salt and Sulphur are ſeverally drawn forth by a chymical reſolution, and being reduced into peculiar concretions, that is to ſay, either a Spirit, an Oil, or a Roſin, make very fine, pleaſant, and efficacious Diaphoreticks, or Sweating Medicins.

1. The Spirit and Oil are prepared in this manner.

Take of the ſawed duſt of Guiacum wood ℔ ij. *and diſtil it with a reverberating fire, or in an Oven of Sand with a ſtrong heat, there will come forth a ſharp, and ſomewhat acid liquor, and an oil that is yellow and black: ſeparate the latter and rectifie the reſt in a cucurbit, you will have a ſpirit that will be clear and ſharp to the ſmell, as alſo an yellow and ponderous oil, which will ſettle in the bottom of the watery Liquor. The Doſe of the Spirit is from* ʒ ß. *to* ʒ j. ß. *and of the Oil from* vj. *to* xv. *drops in a convenient vehicle.*

The reaſon of it.

Both Medicins are Diaphoretical, and are uſed with ſucceſs in a Dropſie, the Scurvey, and the Pox. Without doubt the ſaline part of this Body, which is partly fluid, and partly volatile, together with the phlegm, makes up the Spirit ſo called; and the more pure ſulphureous part, the yellow Oil, which beſides that, through the quantity of ſalt that ſticks to it, is heavy and ſinks: Yea ſome ſulphureous particles ſtick faſt to the acid ſharp ſpirit or diſtilled liquor, in ſo much that it always ſtinks, and ſoon loſing its clearneſs, degenerates to an yellow or a red colour. The black Oil conſiſts of a ſalt and ſulphur that is thick, that is to ſay, mingled with a quantity of earth. In Guiacum the ſaline Element is, moſt part of it, elevated beyond fixedneſs, into a ſtate of fluidity and volatileneſs; which is the reaſon that a Lie made of the aſhes thereof, affordeth leſs Salt. It is quite otherwiſe in Tartar, whereof onely ſome of the ſaline parts are in a fluour, and a ſtate of volatility, but moſt of them remain fixed.

7. Roſin of Guiacum.

7. Roſin of Guiacum.

Roſin of Guiacum is prepared after the ſame manner ar Roſin of Scammony or Jalap, that is to ſay, the Tincture is extracted with ſpirit of Wine, and then it is drawn off to the one half; and by pouring water into the cucurbit, the Roſin will deſcend in great quantity, which being dried and pulverized, may be given from ϑ j. to ʒ ß. with other Sudorificks in a ſolid Form.

The reaſon of it.

That this Roſin is the ſulphureous part of the Guiacum is manifeſt from this; that after the extraction of it, if you diſtil the remaining Magma [or dreggy part that is left] in a Retort with the heat of Sand, or Fire onely, you will have a phlegm and an acid liquor in the uſual proportion. Wherefore from this chymical reſolution [or taking to pieces] of this Wood, we may conclude that the chymical Elements (in the ſame number, and juſt ſo qualified, as I have elſewhere aſſerted) are in mixed Bodies, and that they are not onely ſeemingly produced by the operation it ſelf, as ſome men ſay.

8. Spirit of Tartar.

8. Spirit of Tartar.

Take of choice white Tartar that ſhines, waſhed and dried (or rather as Zwelfer *preſcribes diſſolved, and once chryſtallized)* ℔ iv. *diſtil it in a Retort with a large Receiver, increaſing the fire gradually, till the fumes are quite gone. You will have a phlegm, a ſpirit, an yellow and a black Oil; which laſt you muſt ſeparate; then put the remaining liquor into a glaſſen cucurbit, and rectifie it twice or thrice with the heat of Sand, abſtracting every time onely a third part. The Doſe is, of the Spirit, from* ʒ ß. *to* ʒ j.

and

and of the Oil ℈ ß *to* ℈ j. *which in a prepared Body provokes Sweat very powerfully.* *Pharm. Rat.* Part I.

The reason of the Preparation.

The Geneſis [or generation] and Analyſis [or reſolution] of Tartar cannot in this place be with convenience fully diſcovered to you, becauſe they deſerve much conſideration; but that I may briefly touch upon the Anatomy of it, this body conſiſts of a great deal of Salt (the moſt part of whoſe particles are in a ſtate of fixedneſs, and ſome in a ſtate of fluidity and volatileneſs) much ſulphur, a little ſpirit, with an indifferent quantity of phlegm and earth. In the diſtillation the volatile ſalt aſcending with the ſpirit, makes the liquor ſomewhat ſharp and poignant; which is alſo, by reaſon of the great quantity of fluid ſalt and ſulphur, in ſome ſmall meaſure acid and ſtinks ſo abominably, that it ſcarce gains a good ſmell by any rectification. As to the contents of this Stagma or diſtilled liquor, it doth not much differ from the product of Guiacum, unleſs in this, that the ſpirit is leſs acid, and doth not ſo readily diſſolve Corals, and ſhelly ſubſtances: but there is a vaſt difference between the *caput mortuum* of this and that, for as much as out of the aſhes of Guiacum you can draw, with a Lie, but very little fixed ſalt, and out of the Calx of Tartar a great deal. The reaſon of which is manifeſt from what I have already ſaid.

CHAP. III.

Of exceſſive or depraved Sweating, and the Cure for it.

SEeing our life is in a continual flux, therefore as we ought perpetually to make new additions to our bodies, ſo we muſt take away and carry off the old and effete matter. Wherefore, for the conſtant removing of all ſuperfluous or incongruous particles, there are many ways of evacuating and purging; in the performing whereof, notwithſtanding Nature oftentimes knows no meaſure, and either makes a ſtop on this ſide, or goes beyond what is moſt convenient. How thoſe evacuations (that lead from the circumference or outward circuit of the body inwards, and carry things off by a kind of particular Sink or common Shore) are to be moderated, or corrected as often as they offend either in exceſs or defect, I have ſhewn you before. The Rule of Method now requires, that I give you alſo directions how to cure Sweating (which is an evacuation very general and diffuſive, tending from the centre toward the circumference) when it is exceſſive or depraved.

And indeed that ſuch a Diſtemper as this doth oftentimes happen, is very obvious to common obſervation. For nothing is more uſual, than for ſome People that are ſick of a Conſumption or Scurvy, and others that recover at laſt with much ado, out of lingring Fevers; nay, ſome that have no other diſtemper, nor any evident cauſe for it, to be always ſubject to daily, and oftentimes very exceſſive Sweats. Therefore, concerning exceſſive Sweating, let us firſt enquire how many ways, and from what cauſes ſuch an evacuation may ariſe; and then ſhew what remedies, and what methods of Adminiſtration are moſt proper in ſuch caſes.

Exceſſive ſweating is a Diſtemper too frequent.

As to the firſt of theſe, frequent and immoderate Sweating is ſometimes the ſymptom of ſome other preſent diſeaſe; for in a Conſumption and the Scurvey (as I have already told you) this is familiar: the reaſon of which is, becauſe when the Bloud, being either defiled with ſome impure and infectious matter, or in an ill temper, cannot rightly concoct and aſſimilate the nutritive juice that is perpetually poured into the maſs thereof, it ſeparates the ſame, which is ſtill degenerous, and often gathered to a fulneſs with other recrements thereof, and throws it forth by Sweat.

Sometimes it is the ſymptom of another diſeaſe.

The cure of this Sweating depends altogether upon the removal of that diſtemper whereof it is the ſymptom; and in the mean time concerning that, as to what belongs to the regulation of our diet, we may take a very uſeful and neceſſary obſervation from this ſymptom; that is to ſay, that when nocturnal and exceſſive Sweats attend that ſort of Diſtempers, you muſt uſe a Diet of very thin Food, to wit, Milk, Water-gruel, Barly-Broth and the like (whoſe gentle and ſoft particles the maſs of bloud may bear) and not by any means of Fleſh or ſtronger meats.

2. Exceſſive Sweating is ſometimes the effect of another Diſtemper that is gone and paſt, as when it ſucceeds lingring Fevers: for it very frequently happens, that burning

2. It is alſo ſometimes the effect of another diſeaſe.

Phar. Rat. Part I.

burning Fevers end in ſweating evacuations (as when an hot Summer ends in a rainy Autumn) ſo that ſcarce any one recovers from that tedious diſtemper without this indiſpoſition left behind it; which yet in ſome People is moderate and eaſily to be cured, but in others more grievous and no leſs troubleſom than that diſeaſe, of which it was the off-ſpring. I knew a young man, who after having been ſick of a Quartan Ague for ten Moneths, when he grew well again, and began to miſs his Fits, melted each day into ſuch exceſſive ſweats, that he was fain to change his ſhirt and the ſheets which were wet quite through (as if they had been dipped in Water) three times every night. By reaſon of this evacuation, which continued ſo for ſeveral weeks, his fleſh was ſo conſumed, and his ſtrength ſo exhauſted, that he was reduced to the thinneſs of a Skeleton. This perſon, when he had uſed ſeveral remedies without any great benefit, at laſt by drinking of Aſſes Milk night and morning, and uſing for the reſt a Diet of Cows Milk, in a ſhort time recovered.

The reaſon of it. In ſuch caſes as theſe the bloud perpetually rejecting its contents [or that which is in it] and as it were vomiting it out by the mouths of the Arteries, doth not onely immediately caſt forth the chyle that is poured into it out of the Bowels, but likewiſe ſucking back both the nervous juice, and the ſubſtance or parenchyma of the ſolid parts for its own nouriſhment, it preſently nauſeates all that, as well as the nutritive liquor, and expells them through the pores of the skin.

The cauſe of exceſſive Sweating. Partly from the ill temper of the bloud. The chiefeſt cauſe of this Diſtemper ſeems to conſiſt in an ill temper and weakneſs of the bloud; in as much as the liquor of it, like ſower Milk, is continually apt to diſſolve and be precipitated into a ſerous nature; which is the reaſon that not onely its own corruptions, but alſo all other humours that flow into it from other parts, if they cannot be aſſimilated, are preſently ſeparated, and ſeeing the pores of the skin are very wide, are carried off by ſweating, rather than any other way of evacuation. But whereas the bloud is diſpoſed for fluidity or diſſolution ſo much, the reaſon is many times, from the predominancy of the fluid or acid Salt (at in ſower Milk) in the maſs of it. But ſometimes the nervous juice degenerating into a ſharpneſs, is rather and more in the fault; for thereby the acid dreggy parts of it, being remanded or ſent back into the bloud, diſſolve the maſs of it and precipitate it into a ſerous humour: and from ſuch a cauſe I ſuppoſe the *Diabetes* and Engliſh ſweating (as they called it, becauſe it was peculiar to this Nation) had their originals.

Partly from want of heat in it. Such exceſſive ſweating as this, doth not proceed onely from the vitiation of the temper and fermentation of the bloud, but ſometimes uſes to ariſe from a depraved heat therein. How the bloud, which boyls up in a Fever through exceſs of Sulphur, breaks out now and then into ſweats, I have ſhewn you before: but this ſymptome ſometimes happeneth as much through the defect of Sulphur. For if at any time the Bloud being impoveriſhed and made more watery, is leſs heated, for that reaſon, whenever it is forced into a more rapid motion than ordinary, through external heat or agitation of the body, the ſerous parts of it muſt of neceſſity (if they cannot be conſumed with heat, or exhale inſenſibly) be diſſolved into ſweat. Sulphur is lacking in the bloud, either becauſe it is conſumed, as after lingring Fevers, or becauſe through ſcarcity of nutriment, there is not a ſufficient quantity generated. This latter cauſe you may obſerve not onely in many men (who either having wanted proviſions, or having uſed a Lenten Diet, after hard running or walking, fall preſently into a ſweat) but alſo very ſignally in ſome Beaſts, which when they are fed with freſh Graſs or Hay, ſweat very much, and quickly tire upon any labour.

The Cure of it; which is performed by doing three things. As to the cure of exceſſive ſweating, which ariſes from the aforeſaid cauſes and occaſions, the means to remedy it will be chiefly theſe three; to wit, Firſt to remove or amend the ill temperature or weakneſs of the humours. Secondly, A little to conſtrain or cloſe the pores of the skin which are too wide. And thirdly, To draw the Serum and watery recrements of the bloud toward the Reins.

1. The firſt Indication. To take away the ill temper of the humours. 1. The firſt is performed by ſuch remedies as deſtroy the predominancy of the acid Salt in the bloud or nervous juice; and alſo ſuch as promote the exaltation of the Sulphur if perchance it be deficient. To which ends antiſcorbutical, chalybeate, and all Medicins that are prepared with volatile, nitrous, and alchalized Salt, are oftentimes uſeful; of each whereof I will here add ſome Receipts.

Take of Conſerve of the Flowers of Succory and Fumitary, each ℥ ij. of Powder of Ivory, of Harts horn, and of prepared Coral, each ℥ j. of Pearls ℥ ß. of Species Diarrhod. Abbatis ℥ j. of Lignum Aloes, yellow and red Sanders, each ℥ ß. of Sal Prunellæ ℈ iv. with a ſufficient quantity of Syrup of Fumitary: Make a Confection, and let the Patient take

take the quantity of a Wallnut at Evening and in the Morning early, drinking thereupon either of the following Julap or of diſtilled water ℥iij. *Phar. Rat.* Part I.

Take of the Water of Fumitary and plain Wallnuts, each ℥ vj. *of Snails and of Worms, each* ℥ j. *of Sugar* ʒ vj. *mingle them and make a Julap.* *A Julap.*

Take of the Tops of Beech, Tamariſk, and Cypreſs, each iv. *handfulls, of Myrtle* ij. *handfulls, of the Leaves of Watercreſſes, Brooklime, of Maudlin, of St. Johns wort, Harts Tongue, and Pauls Betony, each* iij. *handfulls, with the outward rinds of* 12. *Oranges, which when you have cut in pieces and bruiſed, pour to them of Mum* viij. *pints, diſtilling it in the common Veſſels, and mingle the whole liquor, and ſweeten it at your pleaſure. The Doſe is* ℥ iij. *twice a day.* *A diſtilled water.*

Take of the leaves of Piſſabed, Water Creſſes, Plantaign, and Brooklime, each iij. *handfulls, bruiſe them, and pour to them of the diſtilled Water juſt now preſcribed one pint, ſtrain them hard. The Doſe is from* ℥ iij. *to* iv. *in the morning at* 9 *of the Clock, and at* 5 *in the afternoon.* *An Expreſſion or ſqueezing out of a liquor.*

According to this method in a languidneſs of the ſtrength, and nocturnal ſweats after long Fevers do I uſe to preſcribe; and if theſe remedies have not a good effect, then I am fain to proceed to Chalybeate or Steel Medicins. *Chalybeates or Steel Medicins.*

Take of Syrup of Steel ℥ vj. *and let the Patient take one ſpoonful in the morning and at* 5 *of the Clock in the afternoon with* ℥ iij. *of the Water before preſcribed.* *A Syrup.*

Take of the Powder of Ivory, and of prepared Coral, each ʒ ij. *of Crocus of Iron, and of Salt of Steel, each* ʒj. ℈. *make a Powder. The Doſe is* ʒ ℈. *twice a day, with* ℥iij. *of the ſame diſtilled Water.* *A Powder.*

Take of the Tincture of Salt of Tartar ℥ j. *The Doſe is from* 20 *to* 30 *drops twice a day with the diſtilled Water.* *Tinctures.*

After the ſame manner you may give Tinctures drawn out of Coral, and likewiſe out of Gums and Balſams. Moreover in theſe caſes Spirit of Hatts horn, of Piſs or Soot are oftentimes given with ſucceſs.

The ſecond intention far the curing of exceſſive ſweats, conſiſts in a due conſtitution of the pores, and is performed for the moſt part by exteriour adminiſtrations; to which end you muſt uſe to anoint the whole body with Oil of Almonds, Palm Oil, Ointment made of Orange Flowers and the like; and wear linnen that is moiſtned with theſe things. Sometimes Bathing in cold Water, or in a River, and ſometimes change of Air is good. Concerning the uſe of all which (ſince they are vulgarly known) I ſhall not need in this place to preſcribe a particular Rule. *The ſecond Intention conſiſts in the alteration of the pores*

But here it ſeems neceſſary to ſay ſomething concerning a certain troubleſome Diſtemper, tending toward exceſſive Sweating, or at leaſt immoderate Tranſpiration. I have often obſerved that ſome men have had the pores (or inſtruments of Tranſpiration) in their bodies ſo diſpoſed, that they were injured by nothing more, than by the unuſual approach of the Air; in ſo much that though they were well looked, luſty men, had a good appetite, ſlept well, were ſtrong in their limbs, and ſeemed every way healthful, yet they could not endure even the leaſt breath of the open air or wind, but they preſently felt the greateſt diſturbance in their ſpirits, a faintneſs in all their faculties, and an indiſpoſition in their whole bodies; which kind of diſorder, though it be ſo ſlightly contracted, they do not either quickly or eaſily ſhake off, but recover themſelves to their former ſtate onely by length of time; and ſuch as are inclined to this Diſtemper fear the air more than others do fire or water. Hence ſome of them dare not venture to go out of doors, whileſt others living in a cloſe Chamber, will not ſuffer either the door or window to be opened, and if perchance a ſmall blaſt get in through any by-hole, they preſently are very ſenſible of it, and ſuffer for it. I have known ſome that upon ſuch an occaſion have been kept in their Beds for ſeveral Moneths. I remember a Schoolmaſter who was an healthy ſtrong man, that for above ten years never went out of his Chamber, nor could be brought to it by any temptation or perſuaſions: and when after that, the houſe falling on fire, he was dragged out by force, he was dangerouſly ill from that time for ſeveral Moneths, without any other hurt, or ailment. Others are afraid to walk or ſtand upon a Court or Pave- *Of that Diſtemper, which is commonly called An aptneſs to catch cold.*

Phar. Rat. Part. I.

ment laid with Stone, Earth, or Bricks, as being uſed to get great injury thereby. Many other ſuch like caſes as theſe happen, which are attended with this infelicity alſo, that few pity ſuch as are ſo indiſpoſed, and do not think them to be really ſick ſave onely in their fanſie.

The reaſon is inquired into.

That therefore we may a little inquire into the nature of this Diſtemper; I do not think that theſe people complain of nothing at all, but without doubt they do feel a kind of pain or indiſpoſition, which is inflicted upon them either by the cold which they take, or the alteration of their way of tranſpiring: but to know certainly what it is, and wherein the reaſon of it conſiſts, we muſt firſt of all conſider, after what ordinary manner the particles of the ambient [or encompaſſing] air work upon the pores of our bodies, and affect their ſubjects, to wit, the animal Spirits, which are diffuſed about the ſurface of our bodies. For it is manifeſt that the animal Spirits, as being of an ethereal nature or conſtitution, are very much refreſhed by the congenerous particles of air or light (ſo they come proportionably to them) and are moved to a pleaſant kind of expanſion [or breadthening of themſelves.] So likewiſe the bloud, whilſt in its circuit it paſſes through the outward borders of the body, doth there as it doth in the parts about the heart, not onely exhale its fuliginous parts through the mouths of the arteries, but alſo receives a nitrous matter to keep in the flame thereof, through the cavities of the veins. In order to theſe benefits of the bloud and animal ſpirits, the pores of the skin ought to be rightly faſhioned, and opened in ſuch manner, as that the particles of air and light, being a little rarified, may ſtrike againſt the outmoſt ſurface of both thoſe ſubſtances in a moderate quantity and with a gentle fall. For otherwiſe, if the approach of the agent to the one or other of thoſe patients, or to both of them together, be diſproportionate, immediately diſturbances ariſe in this or that, or in both parts of the ſoul together. For if the ſpirits that are outward, are either weak, infirm, and ſoon ſcattered in themſelves, or expoſed to the open and ſharp air, by reaſon that the pores are too wide, it often happens that they are put into flights and diſtractions upon every ſlight occaſion; in ſo much that the party hath pains, convulſions, or weakneſs, not onely in ſeveral places about the outward parts of his body; but oftentimes taking cold (as they call it) is attended with a faintineſs of the whole ſoul, which is not ſoon nor eaſily relieved. And indeed hence it is, that the aforeſaid diſorders in Tranſpiration do chiefly ariſe, in as much as the ſenſitive Soul, being not either ſtrong enough, or not well guarded, is too much expoſed to the injuries of the external air; and conſequently upon the briſker appulſe thereof, is diſturbed either in this or that part, or in its whole ſubſtance at once, and forced into diſorders which are not eaſily allayed. Moreover hence alſo it is, that the flamy part of the ſoul is uſually affected and diſturbed by conſent no leſs than in it ſelf, through the diſproportionate acceſſion of the Air. For the nervous fibres and branches being contracted into wrinklings and convulſions, do variouſly bind the bloud veſſels, which are tied about by them, ſo that the bloud is put into inordinate floatings. And beſides that, the maſs of bloud of it ſelf ſuffers very much for the faults of depraved Tranſpiration both in its heat and temperature. In reſpect of the former, the vital flame, which ſhines about the ſurface of the body is uſually forced by any hard or ſharp blaſt upon it to twinkle or tremble and divers inequalities, whereby the whole ſoul is ſhockt. And then it is well known that the mixture of the bloud is not in more danger from any thing than from a vitiated tranſpiration: for from hence proceed thoſe diſſolutions and precipitations of the Serum in the maſs thereof, by which Catarrhs, Coughs, Aſthmatick, Nephritick, and Athritick Fits are cauſed.

How the Bloud and Spirits are affected by the Ambient Air.

The aforeſaid Symptoms proceed from their being affected.

From what I have ſaid it will be eaſie to ſhew you the true nature, with the cauſes and cure of the Diſtemper, which we now treat of. For when any one contracts a pain or a numneſs, or a palſie on the ſudden in any member, through the approach of cold or the open Air, the reaſon of it is, becauſe the animal ſpirits that abound in the membranous fibres, being ſmitten and put to flight, are driven into diſtractions; and if, beſides that, there happen upon ſuch an occaſion a languiſhment in the whole body, and a weakneſs in the parts, not onely one party of the ſpirits, but the whole ſubſtance, or the ſenſitive ſoul in general, ſeems to ſuffer for it. Which being ſmitten and thereby contracted and ſhortned into a leſſer compaſs, ſinks within the organs of the body, and ſuffers the faculties thereof to grow lank or ſlack. But, more then all this, if any one that is careleſly expoſed to the Air, happens in a ſhort time to have a ſwelling, Inflammation, Tooth-ach, Catarrh, Cough, or Pleuriſie, or if a Chilneſs comes upon him, attended preſently with a Feveriſh heat or burning, it is a ſign that the bloud no leſs than the animal ſpirits is affected by the diſproportionate appulſe of the Air, and conſequently that the liquor thereof being either diſturbed in its motion or heating, is diſpoſed toward feveriſh ebullitions, or being diſſolved in its mixture, is forced to va-

rious

rious fuſions and precipitations of the ſerous liquor. It would be in this place a vaſt and a painful work to deſcribe all thoſe diſtempers, which ſometimes owe their original to ſuch a cauſe. Hence oftentimes comes the Headach, ſwimming in the brain, Drowzineſs, Catarrhs, Inflammation in the Eyes, the Quinzy, Blear-eyedneſs, the Cough, Vomiting, Looſneſs, and a thouſand other Maladies, in ſo much that the Vulgar uſe to reduce the evident cauſes of almoſt all Diſeaſes to theſe two heads, to wit, Hard drinking over night, and catching cold.

The Original of this Diſeaſe conſiſts,

I have hitherto deſcribed the formal reaſon, and conjunct cauſes of Perſpiration; but as to the procatarctical or prediſpoſing cauſe of it, by reaſon whereof ſome are more apt to catch cold than other ſome, I affirm, that this conſiſts either in the vitiation of the animal ſpirits, or of the Bloud, or Pores, that is to ſay, of one or more of them together.

Partly in the Spirits;

1. The animal ſpirits are ſometimes in fault, becauſe being very weak, they cannot endure any hard or rough thing that is outwardly applied to them, but are immediately upon the appulſe of the open air, put into flights and diſtractions; as many People after long ſickneſs are afraid to ſtay in the air, and as ſoon as they go out of doors, many times fall into relapſes. Moreover the Spirits ſometimes incline to that diſorder in Sweating, in as much as being degenerated, and having gained a ſharp and reſtleſs nature, they are put into diſorders upon every approach of the air. Wherefore thoſe who grow hypochondriacal by reaſon of their ſpirits being ſo diſpoſed, are likewiſe obnoxious to the diſtemper which I have deſcribed, and are diſturbed with cold upon every ſlight occaſion.

Partly in the Bloud.

2. The Bloud diſpoſes us to the habit of a depraved Tranſpiration upon a double account; to wit, both in reſpect of its temperament, and the mixture of it. As to the latter, the conſtitution of the bloud is oftentimes ſo looſe and diſſolute, that it is altered upon every little occaſion (and eſpecially by the appulſe of the cold or humid air) into fluxions and precipitations of the Serum; in ſo much that thoſe who have ſuch bloud, dare not by any means to go abroad, or ſcarce ſo much as even to look out at their Windows. But the maſs of Bloud being often hot and very vaporous in its temperament, exhales ſuch particles as are exceſſive ſharp and penetrating; by which whileſt the Pores of the skin are too much opened and made wider, not onely the ſpirits, but the vital flame are expoſed, more than they ought to be, to the injuries of the open air and the wind.

3. An ill conſtitution of the Pores.

Thirdly, An ill conſtitution of the Pores, proceeding either from ſickneſs or otherwiſe, or which is natural and inbred, inclines very much to this habit of depraved ſweating. For if thoſe paſſages are too wide, and almoſt always gaping, the bloud and ſpirits are not ſufficiently guarded in the whole or certain parts, againſt the appulſe of the external air. Such a wideneſs of the Pores is in ſome men inbred and natural, as in thoſe that have a ſoft and looſe skin; their skin is commonly thin and very porous. It alſo is uſually contracted by ſeveral ſorts of accidents: as, after a ſweating Diet continued for a long time, and likewiſe after frequent ſweats, that uſe to break forth about the declinations of Fevers, the Pores of the skin being a long time extended and widened, gape a good while after, and continue more open almoſt always.

The Cure of it.

This Malady, though it do not threaten death, yet becauſe it renders a mans life very uneaſie, or altogether uſeleſs, it very well deſerves a Cure; in order whereunto three things are moſt chiefly to be taken care of; to wit, firſt, that the weakneſs or dejections, or depauperations of the ſpirits and the bloud be remedied. Secondly, The ill temper of them both (if any ſuch thing there is) be removed. Thirdly, That you cauſe a due conformation of the Pores.

1. The firſt Intention is the corroborating of the ſpirits.

1. The main matter in this affair, is to look after the firſt intention, as far as that concerns the corroboration of the animal ſpirits, or the enlarging of the whole ſenſitive ſoul: for unleſs you can perſuade the Patients to take courage ſo far as tō attempt going out of doors, exerciſing their utmoſt ſtrength, and accuſtoming their nature to aſpire unto things that are more difficult every day than other, all Medicins are in vain; upon which account they will want good Diet and cheerful company, as much as Phyſick; that the quantity of animal ſpirits may be daily renewed and augmented, and more than that, receive new ſtrength from repeated and greater attempts: to wihch ends generous Wines, and delicate Victuals, in moderate quantity, are very conducive. And again, They muſt lay aſide all ſtudy and care (whereby the ſoul is depreſſed) and ſpend their time in ſport and recreations, or moderate exerciſes. By ſuch a kind of life as this, rightly mannaged, as the animal ſpirits are very much refreſhed, ſo the decays and impoveriſhments of the Bloud, are reſtored.

Phar. Rat. Part I. For the ſame ends alſo the following Medicins may be given with good ſucceſs.

A Spirit. *Take of Succinum Ammoniacum, a convenient quantity, and let the Patient take from* XV. *to* XX. *drops, at night and early in the morning, in a ſpoonful of the following diſtilled Water, drinking upon it* IX. *ſpoonfuls of the ſame.*

A Diſtilled Water. *Take of the Leaves of Sage, Roſemary, Time, Savory, Murjoram, and Coaſtmarry, each* iv. *handfuls, of the Roots of Angelica and Maſterwort, each* ℥ vj. *of Zedoary, the leſſer Galingal, Sweet Cane and Orice, each* ℥ j. ß. *of Cubebs* ℥ j. ß. *of Nutmegs, Cloves, and Cinnamon, each* ℥ j. *the outward rind of* xij. *Oranges and* vj. *Limons, cut them, bruiſe them, and pour to them of White Wine and Canary, each* iv. *pints. Diſtil them in the common Inſtruments: mingle all the liquor and ſweeten it with Sugar of Pearl. In the diſtilling of it hang in the top of the Limbeck a little bag of* ℈ j. *of Amber griſe, and* ℈ ß. *of Muſk.*

A Tincture. *Take of the Tincture of Antimony or Balſam of Tolu* ℥ j. *and let the Patient take from* XV. *to* XX. *drops in the morning at nine of the Clock, and five in the afternoon, in a ſpoonful of the Water preſcribed, drinking thereupon* ℥ iij. *of the ſame, or rather in the morning let him drink upon it a draught of Tea, or Coffee, or Chocolate made with the Decoction of Sage.*

A little before Dinner let him take a draught of Sherry.

When you have uſed theſe Medicins for ſome time, and have a mind to leave them off, take theſe that follow in their ſtead.

In the room of the Spirit take a Doſe of the following Electuary every night and morning, with the deſtilled Water, or Viper Wine.

An Electuary. *Take of the rind of Citron wet preſerved* ℥ j. ß. *of Myrabolans preſerved* ℥ j. *of Nutmeg and preſerved Ginger, each* ℥ ß. *of the Confection of Jacinth and Alchermes, each* ℥ iij. *of Pearl prepared, and of red Coral prepared, each* ℥ j. ß. *with Syrup of the juice of Chermes: and make an Electuary.*

Phyſick Ale. For your ordinary Drink take Phyſick Ale, prepared in manner following; that is to ſay, into a Veſſel of iv. Gallons put the following Bag:

Take an old Cock half boyled and cut into ſmall pieces, and of the Leaves of Sage and Harts tongue dried, each ij. *handfuls, Dates ſhredded in number* vj. *of the ſhavings of Saſſafras* ℥ ij. *ſtred them and bruiſe them, and then mix them, and make a Bag, to be put in after the Ale hath done working.*

2. *The ſecond Intention.* 2. The ſecond intention, that undertakes to mend the ill temper or depraved nature of the ſpirits and the bloud, is performed by the ſame remedies, which are proper in the hypochondriacal and melancholy Diſtemper; wherefore from the Cure of thoſe Diſeaſes, which I have formerly ſet forth, the Forms of their Preſcriptions may be made uſe of in this place.

3. *The third Intention, which is, the alteration of the Pores.* 3. As to the third Intention, which inſtructs us in the due Method of uſing Cloths, Air, Fire, and Food, for the regulation of the Pores, it doth not much concern a Phyſician. For the Parties affected, meaſuring themſelves and their ſtrength according to their own imagination, put on ſuch Cloths, keep themſelves cloſe up in their Chambers, lie in Bed, and ſit by the Fire, even as long or as much as they pleaſe, never hearking to the adviſe either of Friends or Doctors. Whatever other People tell them concerning thoſe things, they for the moſt part reject in confidence of their own experience, and the good or hurt which they have found. The onely counſel that they moſt commonly uſe to take, and is moſt helpful, is this, that they ought to change the Air and the Soil where they live, which oftentimes alters their minds alſo. For let them be never ſo impriſoned in their Houſes or cloſe Chambers, yet when they go into foreign Countries, where they breath in hotter and more ſerene Air, it is hardly credible how ſoon they recover. So much of depraved or perverted Tranſpiration; the Theory of which Diſtemper, I therefore delivered the more fully, becauſe it is left untouched by others: Now let us return thither, from whence we digreſſed, and treat of exceſſive Sweating.

There

There remains ſtill another ſort of this Diſtemper, called immoderate Sweating, which is, not as the former, an effect or ſymptom of any preſent or paſt Diſeaſe; but is at the very firſt beginning either a Diſeaſe by it ſelf, or the Parent of ſome morbid Diſtemper. To the former of which belongs chiefly that peſtilent Sweating, which was heretofore amongſt our Countrymen, and therefore through the whole World called by the name of *The Engliſh Sweat*; into the cauſe of which we will by and by inquire. But to ſay nothing here of the bloud, black, or blue fœtid, or ſweet Sweat, (of which good Authors make mention, and of ſome whereof we have now and then made obſervation) I have often taken notice, that ſome People have fallen into an habit of ſweating, without any manifeſt cauſe; and then that the evacuation being daily augmented, hath increaſed many times to great exceſs; in ſo much, that the moiſture (of the whole Body ſeemed to be poured forth into Sweat. And indeed it is no wonder that this Diſtemper, when it is once begun, ſhould daily augment; for thoſe that ſweat much or often, are very thirſty, and conſequently drink to exceſs, and ſo the more they drink the more they ſweat: by which means theſe two do mutually take the turns of the Cauſe and the Effect, and by a long ſeries produce one another. There lives yet in this Kingdom a noble Lady, famous for her extraordinary, or rather ſtupendous ſweating theſe many years laſt paſt, who every night doth not onely wet, or rather deluge her Linen and all the cloths about the Bed, but likewiſe puts a Baſin under her thighs, into which ſeveral ounces, nay according to the vulgar relation, ſeveral pounds of meer Sweat drop from her; and in the mean time ſhe is forced by her continual urgent thirſt, to drink more than ordinary, whereby as her ſtrength is reſtored, ſo her ſweating is prolonged. I had the ſtory of this ſtrange indiſpoſition, not onely from other perſons of good credit, but from the Ladies own mouth, though I never was conſulted in order to the recovery of her health. But ſhe took ſeveral remedies from ſeveral Phyſicians, tried many methods concerning Diet, and the regulation of the Six Non-naturals, drank Waters of almoſt every kind, and tried the Air of foreign Countries, eſpecially of *France*; but notwithſtanding all this, the Noble Lady is ſtill troubled with this extraordinary dropping. Now ſeeing I have yet known nothing of what happened about the beginning, progreſs, and alteration of this Diſtemper, or what was obſervable concerning thoſe things that gave her eaſe or pain, and that I had the honour only once to ſee, and talk with her no more than juſt *en paſſant*, it will not be eaſie for me to give you the reaſon of this caſe: but however I may be allowed to gueſs, that in this, as in other inſtances of Nature, the *Serum* of the Bloud being apt to ſeparate too eaſily, left the ordinary paſſages of evacuation through the reins, lymphæducts, and other ways, and having firſt occaſionally begun to go this way through the pores of the skin, and afterward facilitated its motion by a kind of habit, affected, and conſtantly obſerved the ſame; to which perhaps we may add, that the predominancy of the fluid Salt in the bloud and nervous juice, cauſeth a continual fuſion of the Bloud, and a plentiful ſeparation of the *Serum*. To cure this Diſtemper, now ſince it is confirmed by a long habit, and that the œconomy of Nature alſo is quite inverted by it, I cannot tell whether any Medicins or Method of Phyſick would do any good upon her. For my part, I did not think fit to propoſe any to her, when I had formerly the opportunity to ſpeak with her. If that great Remedy for a vitiated Tranſpiration, to wit, Change of Air, be repeated, I would have her go no more to *France*, but *Denmark* or *Swedeland*.

The third ſort of ſweating, which is a Diſeaſe of it ſelf.

A notable Story of it.

The reaſon of it.

It would be pertinent in this place to treat a little concerning *the Engliſh Sweat*, which was formerly ſo rife, not onely among our Countrymen at home, but alſo abroad, and that in a very fatal degree. But yet ſeeing this Diſtemper hath not been known within an Age laſt paſt, and we cannot know the nature of it but by the Writings of others, I muſt not contrive any Hypotheſis concerning the nature and cauſes thereof, but onely after the Story, which I take of it out of Authors, lay before you my own Conjectures.

Of the Engliſh Sweat.

The *Engliſh Sweat* began in the year 1485. about the beginning of the Month *Auguſt*, and continued to the end of *October*; and though *Semmertus* ſaith that this Malady was from that time 40 years familiar and continually in this Country, yet our Countrymen, both Phyſicians and Hiſtorians, who lived either at that time or near it, obſerved that it had perfect and great intervals: and when it returned only four times in the ſpace of 66 years, to wit, in the year 1506. 1517. 1528. 1551. it raged ſcarce ever above 6 months, and ſometimes was gone in 3 months time, and that there was always a very wet ſeaſon before it came. But every year that it was rife, it deſtroyed a vaſt number of men in all places, in ſo much that when and whereever it reigned, a third part of the People were miſſing in a ſhort time. So great was the malignity thereof, that as ſoon as it invaded any City, it would every day ſeize upon five or ſix hundred perſons, and of

The Story of it.

thoſe

Phar. Rat. Part I.

thoſe that were ſick at firſt, ſcarce the hundredth man eſcaped. I thought good here to inſert that compendious and methodical deſcription of this Diſeaſe which *Sennertus* hath given us, and which is alſo conſonant to that of our own Authors. Thoſe that were ſeized with this Diſtemper, were preſently weakened without any Bubo, Carbuncles, Breaking out, or Languidneſs, and fainted in their Spirits with extreme feebleneſs in their limbs, reſtleſsneſs, heart-burning, head-ach, frequent, quick, and unequal pulſes, with very great palpitation of the heart; but they flowed with perpetual and copious Sweating, which was not ended before the Diſtemper was over, which happened within 24 hours. For thoſe that did not provoke Sweat, nor uſe Cordials, and thoſe that endured heat more impatiently and caught cold, they all died ſuddenly within 24 hours. But afterward when the nature of this Diſtemper was known, and that it did People good to provoke Sweat and uſe Cordials to fortifie themſelves, fewer died of it. [*Sen. of Fevers* b.4.ch.15.] Concerning the Cure of it *Polydore Virgil* writes ſomewhat more accurately. After many Experiments and Obſervations made by the ſick, from things that were helpful and hurtful, it came to paſs at laſt, that they found out a preſent remedy for each perſon, which was this. If any man were taken with Sweating in the day time, that he ſhould forthwith go to bed in his cloths; if in the night and in bed, then that he ſhould lie ſtill, and not ſtir out of the place for four and twenty hours together; and that in the mean time he ſhould ſo load himſelf with cloths, as not to provoke the Sweat very ſtrongly, but let it drop gently from him of its own accord; that he ſhould eat nothing, if he could endure to abſtain ſo long; nor drink more of his uſual warmed liquor, than was moderately enough to quench his thirſt. But all the while that he was about this Cure, he ſhould take care not to put ſo much as his hand or his foot out of the Bed to cool or refreſh them, which to do is mortal. Others ſay, that all that ſpace of a night and a day, the Party was totally to abſtain from ſleeping. This Diſtemper, becauſe it uſually ended, after ſo ſhort a time, in life or death, was called by many Phyſicians, *Febris Ephemera*, or a Fever of a days continuance. Thoſe that recovered of this peſtilent ſweating, after they had continued for a time well, fell many of them into it a ſecond, and ſome of them alſo a third time.

The Deſcription of it out of Sennertus.

The Cure of it is deſcribed out of Polydore Virgil.

From theſe appearances, that we may preſume to give you the reaſon of this dire Diſtemper, in the firſt place we may gueſs, that the formal reaſon, and likewiſe the conjunct cauſe of that peſtilent ſweating conſiſted in this, that the Bloud being infected by meeting with ſome malignant or venomous matter, and conſequently thereupon diſſolved in its temperament, and melted into *Serum*, was immediately put into a ſweat, (as being the univerſal, and alſo the moſt copious way of evacuation) in order to expel that virulent mixture; by which evacuation, if perchance it happened that all the venomous particles were ſtraight carried off, the Diſtemper ended in a ſhort time with health, but otherwiſe very often with death.

The reaſon of it inquired into.

But here I muſt in order make inquiry, whether that malignant matter was firſt generated in the Bloud, or whether it flowed into it from other parts? If you ſay the former, you muſt ſuppoſe that the maſs of Bloud, as in the Plague, had contracted a putrefactive quality by the malignant conſtitution of the ſeaſon and the Air; which afterward, either of its own accord, in as much as it was raiſed to a fulneſs, or by contagion, did, as it had been ſet on fire, break forth into a dangerous, and oftentimes corruptive ſwelling. But that which makes me not believe it to be ſo in this malignant Sweating, is this above all other things, that no ſigns appeared either before, or after, or in the fit of the Blouds being corruptive or much vitiated. For beſides that this Fever is not very high, nor attended with Spots, Breakings out, Buboes, and other ſigns of the Blouds being venomed or in a great heat, it alſo is over in a night and a day; which ſcarce ever uſes to happen in Diſtempers that are deeply rooted within the maſs of Bloud.

The primary cauſe of it.

Wherefore I am rather inclined to think that the original cauſe of this Diſtemper, being firſt founded in the nervous liquor, is from thence communicated to the bloud, whileſt the tragedy of this malignant ſweating is tranſacted. For I ſuppoſe that the aforeſaid liquor, which moiſteneth all the fibres in the whole Body, and is the vehicle of the animal ſpirits in all parts, is degenerated, through the unſeaſonableneſs of the year, from its due craſis, that is to ſay, from its ſpirituo-ſaline volatile nature, toward a ſower, or other more vitiated, and at laſt, malignant quality; and when it comes to that ſtate of depravation, that either of its own accord, through fulneſs, or being ſtirred up by the ferment of the contagion, it begins to ſwell, or diſſolve, being forced out of thoſe irritated parts, and flowing into the maſs of Bloud, it preſently poiſons it throughout, relaxeth the conſtitution of it, and puts it into a moſt exceſſive heat, or boyling, in order to expel and throw that off. Hence plenteous Sweats (becauſe this

In the nervous liquor.

this is not onely the nigheſt but the largeſt way of evacuation) break forth; by which extreme endeavour of Nature, if perchance it ſo happen that all the poiſon is remanded out of the bloud into the habit of the Body, and that thence it be quite caſt out by an univerſal and ſometime continued Sweat, health in a ſhort time appears, like Sun-ſhine after Clouds are totally diſperſed; but if the venomous particles are not ſuddenly nor altogether routed by that fermentation and endeavour to ſeparate them, into which the Bloud is put, in order to expel the malignant matter, the maſs of Bloud becomes, not onely by being deprived of its *Serum*, but vitiated, and overpowered in its Nature, unable any longer to prolong, or keep in the vital flame.

The reaſons of the ſymptoms.

From hence it will be no hard matter to aſſign what are the cauſes of its Symptoms, and the reaſons of the empirical or quack Cure thereof. For whereas when the Diſeaſe was upon them, or about the firſt approach of it, before the Fever ſeemed to be kindled, immediately an unuſual languiſhing, a faintneſs of the ſpirits, a great weakneſs in the limbs, an headach, palpitation of the heart with frequent, quick, and unequal pulſes, and other indiſpoſitions in the nerves did afflict the perſons that were ſick of it, it was a ſign that the nervous parts were affected or put out of order before the bloud, and that from them the malady derived its original.

2. Whereas plentiful Sweat (which was not onely ſymptomatical, but ſometimes alſo critical) ariſes about the beginning of this Fever, quite contrary to what it doth in moſt others, the reaſon is, becauſe the morbifick liquor which flowes out of the nervous fibres and other parts into the maſs of bloud, is thence immediately thrown back upon its very firſt arrival, nor is it permitted to ſtay any conſiderable time in the bloud, or to be intimately mingled therewith. For when a man is not very well, the nervous liquor ſcarce ever agrees with the bloud; wherefore if at any time that flows into this, it is preſently forced out again, and being, before it is infected with the leyiſh tincture, ſent away through the reins, it cauſeth a flux of clear Urin; which I have often obſerved to happen in convulſive Diſtempers. But if the nervous liquor being degenerated or depraved, flows back continually into the Bloud, it produces ſometimes an unbloudy Flux or Dyſentery (ſuch as I before deſcribed) and ſometimes a Diabetes, as I ſhewed you in the foregoing Diſcourſe. But I have formerly evinced that cancrous ſtrumous, ſchirrhous, and other ill tumours do ariſe by reaſon of the leſſer and more private ſtetlings or ſtagnations of the ſame humour. Now in the Diſtemper, of which we at preſent treat, that nervous liquor, if it be very malignant and peſtilent, it poiſons the Bloud at the firſt touch, and diſſolveth it into a *Serum* which muſt be immediately carried off by Sweat; for otherwiſe if it be ſuffered to ſtay ſome hours in the maſs of Bloud, to circulate, and be intimately commixt with it, it totally corrupts, and plainly mortifies the ſame: hence in that method of curing it, found out by frequent experiments, they take ſuch diligent care, that upon the firſt approach of the Diſtemper, the Parties that are troubled with it are the ſame moment (without ſtaying to pluck off their cloths, or to go into bed) covered all over with the Bed-cloths and compoſed to ſweat, continuing thereupon an equal ſweat through their whole Body, for 24 hours; in ſo much that in the mean time they are not ſuffered to ſtir hand nor foot, or to take either meat, or ſleep; that is, they do nothing at all, to make that peſtilent liquor mix either in greater quantity or more intimately with the Bloud, or to hinder the ſudden and total excluſion thereof. Now if ſuch ſudden, plenteous and equal ſweating cauſed by the inſtinct of Nature and regulated by Phyſick, be continued ſo long, that all the venom exhales through the pores of the skin, the Patients perfectly recover without breakings out in the skin, a lingring Fever, long weakneſs, nightly ſweats, and other conſequences of vitiated Blood. But in as much as the nervous liquor, after its corruptions are ſo purged forth, is apt again in the ſame manner to be depraved, and after that, being diſturbed through fulneſs or contagion, to flow back out of the nervous parts into the Bloud, and to envenom that likewiſe, it therefore happened, that ſome men after they were perfectly well, were ſeized by the ſame Diſtemper a ſecond, yea ſometimes a third time. It will not be neceſſary here to ſubjoin any forms of Preſcriptions in this caſe, becauſe the whole buſineſs of the Cure depends for the moſt part upon a right ordering of the Patient. Beſides it would be very abſurd to preſcribe a remedy or a method to cure a Diſeaſe that is ſo unuſual among us, and which we hope will never return again; or if perchance it doth hereafter come upon us again, it is uncertain, whether we ought to obſerve the ſame rules in curing of it.

An unbloudy Dyſentery and a Diabetes proceed from the ſame cauſe as this Diſeaſe does.

Phar. Rat. Part I.

SECT. VI.

CHAP. I.

Of Cordials and Antidotes.

Cordials and Antidotes have been always of the most common use.

IN the ancient way of Practice among Physicians, and even to this day, according to the vulgar and empirical Method, which Women and Quacks take, the Medicins called Cordials and Antidotes have been almost of the most common use and greatest esteem. The Simples of them are very numerous, their Compositions add bulk to all the Dispensatories both Ancient and Modern, and fill almost every page: But as to the reasons of their effects and manner of operation, to wit, upon what kind of particles their virtue depends, and how they exert their power upon the heart or bloud, or spirits, or other humours; upon this subject, I say, I find nothing said any where, either by Physicians or Philosophers, that may satisfie a mind desirous to know the truth. For the explication of the virtues of Cordials, they do not insist, as in other parts of practical Physick, upon their manifest and sensible qualities, but have recourse to occult and specifick actions, yea to those of the whole substance: When in the mean time, if you consider the thing aright, and dive into the genuine and true reason of it, it will be very evident, that the very notion of Cordial remedy goes altogether upon false ground, and is a Vulgar Errour.

Their common Attributts.

Such Remedies are called Cordials, as by any means relieve the Heart [which in Latine is *Cor*] when it is out of order; wherefore they are said, by many Authors, one extraordinarily to comfort the heart, another to preserve the heart from all putrefaction, and others also to support the heart when it is weak or oppressed, to heal the trembling or faintness thereof, and to keep it from corruption. Moreover because in the Plague, the small Pox, and malignant Fevers, the heart is supposed to be seized or beset with poison or malignity, the remedies therefore that are usually good in those Distempers, are not onely called Cordials, but Antidotes also.

Whence Remedies that preserve Life are called Cordials.

This opinion concerning both Cordials and Antidotes, seems to have sprung from that ancient supposition, which even to this day obtains among the Vulgar, to wit, that the heart is the fountain of all life and heat, and consequently that our health or death depends upon the immediate well or ill being thereof: and hence it is that whatsoever refreshes the soul, and makes us vivid and chearful, are believed to do so by being benign and kind to the heart; and on the contrary, other things are thought to cause sadness and melancholy, so far as they are enemies and disagreable to it.

But indeed, seeing I have elsewhere shewn at large, that the subject of Life is not the heart by any means, but chiefly, and almost only the Bloud, and that the very Soul it self (upon whose existence and action in the Body the Life depends) is founded partly in the Bloud, and partly in the animal Spirits, it will easily follow, that the Remedies which preserve the Life entire, or restore it when decaying, respect these parts of the Soul, to wit, the Bloud and animal Spirits, rather and more immediately than the Heart. For this is not so noble and principal an Entral as it is commonly said to be; but a meer muscle, consisting onely of Flesh and Tendons, as the rest do, and serving for the driving of the Bloud about: but as often as it is defective, or fails in the right performance of this duty, this doth not happen properly through its own fault, but the irregularity either of the Bloud or animal Spirits whereby it is actuated.

They do not act properly upon the Heart;

But upon the Bloud and animal Spirits.

Wherefore that the reasons and manner of operation of those Medicins, which are called Cordials, may appear to us, we must consider these two things; to wit, First how many, and what ways most chiefly, the Bloud, when it is disordered either in its heat, or mixture, and oftentimes in great danger, requires medicinal supplies to preserve or mend its constitution. Secondly, How either through defect or errour in the vital functions the Heart is hindered, or perverted from its due motion, and therefore such Medicins are proper, as may augment the quantity of Spirits, and put them into a better temper.

How upon the Bloud.

As to the first, The Bloud, in respect of its heat, is either deficient or excessive; and in both cases different sorts of Medicins, to wit, hot or cold ones, (which are like Oil or Water) are required; and therefore they are commonly called Cordials,

dials, though they do not at all affect the Heart. For though, after taking of them, the motion of the Heart is oftentimes altered, and therefore the Pulse immediately grows more swift or slow, more strong or weak; yet this is because the motion of the Heart, depending altogether upon the influx of the animal spirits (by a wonderful consent and sympathy between both parts of the Soul) is exactly proportioned to the heat of the Bloud: wherefore as the Bloud increases or remits its effervescence or boyling, by Medicins taken in, immediately the animal Spirits that agitate the Heart, submitting very readily to the condition of it, make the Heart beat faster or slower; and then if the train of animal spirits be affected by the same Medicin, the Pulse thereby is made more or less strong or vehement; when in the mean time the virtue of that Medicin comes to the heart it self, no more than to the hands or feet, or any other muscle. Wherefore that we may rightly settle the first rank of Cordials, whereby the enormities or irregularities of the Bloud are healed, we must consider how many, and which ways the liquor of it, both as to its heat and temperature, is usually perverted or depraved, and after that, what kind of Remedies, commonly accounted Cordials, are requisit for the several Distempers thereof.

The Bloud is faulty in its heat and temperature.

First therefore, the Bloud sometimes is not hot enough, nor doth it circulate vigorously, as you may observe in many languishing People; that is to say, such as have been long sick, or suffered any great loss of Bloud, or other immoderate evacuations, or are worn out with age, whose Pulse is weak, their limbs infirm, and their extreme parts cold and pale: the reason of all which is, because the Bloud, when the sulphureous particles are too much consumed, and depressed, is become almost vapid and spiritless; and consequently it is heated in the Lungs very sparingly and weakly; to which oftentimes as an addition, it happens that the vital functions growing weak, the heart which wants a more full influence of the animal spirits, doth not sufficiently exagitate the Bloud so as to put it into a more vegete effervescence or brisk heat.

1. *How it becomes less hot than it should be.*

The Remedies that are to be used in this case, are generous Wines, hot Waters, or gentler liquors distilled with Spices, Powders, Species, and Aromatical Confections; Oils and Spirits chymically prepared; Tinctures, Elixirs, and other things impregnated with sulphureous and spirituous particles, such as may put the Bloud into a greater motion, and render it more inflamable and turgid or swelling: and seeing the same things do at the same time exsuscitate or rouze and comfort the animal spirits, they therefore make the heart beat more vegete and strongly. The Receipts of these shall be added in the end of this Chapter.

What Remedies are proper.

Secondly, Oftentimes the Bloud, by reason that the sulphureous particles of it are too loose, and put into an effervescence, is kindled more than it should be, and scattereth an extraordinary and very offensive heat over the whole Body: wherefore to the end, that being so very much rarefied and inflamed, it may be kept within its vessels, and at the same time cooled, the heart beating vehemently and swiftly, drives about the bloud with great labour and pains: and therefore in this case Cordials which are cold and attemperative (to reduce and allay the fervour of the Bloud, and at the same time gently to refresh the animal spirits, that they may perform the task of life which is now more difficult) are most proper; to which ends Distilled Waters of Burrage, Balm, Cowslip-flowers, Marigolds, the rind of a whole Citron, and likewise Syrups and Conserves made of the Flowers and Leaves of such vegetables, the juice of Sorrel, a Citron, Oranges, Chrystal Mineral, and the like, use to be looked upon as good for it; to which Opiates oftentimes are added with success; for when the violence of the hearts motion is somewhat rebated, the bloud more easily and the sooner remits its effervescence or boyling heat.

2. *And what also when it is too hot.*

These are the more simple Cordials, which are designed onely for one intention, to wit, the increasing or diminishing of the blouds heat. But besides this, the bloud uses also to be depraved, and divers ways perverted not onely in its heat, but also in its temper or mixture: Though Cordials are not presently requisit upon every disorder of it, but onely in those which being caused by Fevers, and also very sudden and violent, threaten the corruption of the whole mass of bloud.

2. *The Bloud being vitiated in its temper or mixture requires Cordials onely in Fevers, and then,*

1. The Bloud, when it boils up in a feverish indisposition, is in danger, as to its temper these two ways: that is to say, either the bond of mixture is too strict, and consequently all the particles are so complicated among themselves, and mutually fastened, that the nourishment cannot by any means be distangled, or separated from the excrement, and the thin part from the thick; as it happens in some continued and putrid Fevers; which though they are little or not at all malignant, yet because they can have no judgment made upon them by Sweat or Transpiration, they sometimes end in death. Wherefore in this case you must use such Cordials as loosen and open the Constitu-

It is either too strict and close in its constitution,

Phar. Rat. Part I.

tion of the Bloud, ſo that the ſerous liquor with the other recrements, may ſeparate and be carried off from the body of the reſt.

Or too loſe.

2. The temper of the Bloud is in danger alſo another, and that a quite contrary way, to be ſubverted in Fevers, and conſequently Cordial Remedies of another nature, to wit, Antidotes [or Medicins given againſt corruption, or venom] are moſt proper. For it often happens that the conſtitution thereof is too much looſened, and divided as to its temperature, by heterogeneous or foreign particles, which are either generated within it ſelf, or flow into it from other parts, in ſo much that when the common bond of mixture is diſſolved, it all diſunites into ſeveral parcels; and then the portions of coagulated, or extravaſated, and ſtagnant Bloud which are ſetled here and there, putrifie and are corrupted; and at length the whole maſs of Bloud is ſo far vitiated, that it is no longer fit to keep in the vital flame, or to convey the animal ſpirits gently into the Brain: whereupon at that time all the vital functions muſt of neceſſity decay, and at laſt life it ſelf be extinguiſhed.

What remedies this latter fault requires.

In this caſe the Cordials, which are moſt requiſit, muſt conſiſt of ſuch particles, as being tranſmitted into the Bloud, and circulating along with it, may be untameable all the way, but at the ſame time, benign: upon which account, whileſt they get into all the pores and paſſages of the Bloud, they do in all places diſturb the other malignant particles, force them from their combinations, and at laſt either ſubdue or drive them out. And when by that means the Bloud being delivered from that venomous mixture, and alſo freed from all private coagulations, is again divided into ſmall elementary particles, it recovers its former, and in a ſhort time, an healthful mixture.

To wit, Antidotes.

Now that you may the better underſtand how Antidotes preſerve the Bloud and other juices of our Bodies from peſtilent Infections, and recover them from corruption when they are already touched therewith; you muſt conſider how other liquors that are ſubject to putrefaction, may be long preſerved, or being ſeized by it, may be again reſtored. To which end you may obſerve of Ale, that though in its own nature it be apt quickly to grow ſower, yet by boyling of Hops in it, you may make it keep a great while: yea, that common Water, though it would otherwiſe putrefie in a ſhort time, yet by boyling or infuſing of bitter Vegetables in it (ſuch as Antidotes alſo are) it continues for a long time untainted: again, that ſome juices of herbs, and ſeveral other liquors, which are already corrupted, if they are ſmoaked with burning of ſulphur over them, recover their former vigour: ſo alſo that Wines, Ale, and other ſorts of Drink, which are almoſt vapid and ſpiritleſs, do oftentimes revive again by a fermentation newly put into them. The reaſon of all which is, becauſe, ſeeing the corruption of every thing conſiſts in the diſſolution of the elementary particles, and their mutual departure from each other, what ever keeps them ſtill in motion and perfect mixture, when they tend toward flight and confuſion, keeps that body yet tite and whole. Moreover, whatever forces the Elements when they are diſſolved from each other, and would mutually depart, to a freſh union, and ſtirs them up to a new fermentation, drives away all putrefaction from the body, though it were begun in it, and gives it again a firm conſtitution. All the Vulgar know that ſuch alterations as theſe, and ſuch recoveries from corruption are cauſed with liquors prepared by Art. And indeed Antidotes ſeem to have the ſame effect in the Plague as in malignant Diſeaſes. For they being often taken, in as much as they continually ſtir the Bloud and force it to an higher fermentation (notwithſtanding the influence of the noxious corruptive particles) keep the mixture of it entire; yea after the malignity is impreſſed upon it, and that the temper of the Bloud, in manner aforeſaid, begins to be relaxed and diſſolved, thoſe kind of Remedies, being given till they promote Sweating, do oftentimes deaden the force or impreſſions of the peſtilential malignity, in as much as they digeſt the putrefactions of the contagion received, and introduce a fermentation oppoſite to that other corruptive quality. The ſorts and forms of theſe Antidotal Medicins ſhall be laid down hereafter.

What Cordials are moſt proper when the temper of the bloud is too cloſe.

In the mean time, as to thoſe other Cordials, by which the conſtitution of the Bloud when it boyls up, is relaxed from its extraordinary cloſeneſs, and opened to free the feveriſh matter and other recrements thereof; to give you a more ſatisfactory account of their virtues and the manner of their operations, we ſhould refer to this head what formerly hath been ſaid concerning the effects of Diureticks and Diaphoreticks. For thoſe Medicins are very nearly related to ſome Cordials, yea they are ſometimes of common and mutual uſe; in as much as the craſis or mixture of the Bloud, when vitiated, cannot ſometimes be relieved, unleſs you firſt looſen the temper of it, and make way for the ſerous liquor to be carried off through the reins or pores of the skin. All theſe ends of Phyſick are chiefly obtained by ſalt Medicins. For, as I have formerly

often

often obſerved, the opening of all bodies, whether liquid or ſolid, is for the moſt part performed by a ſaline Key.

How the curdling of Milk and reducing it from that ſtate, or the hindering of it is brought to paſs by the various infuſions of ſalt bodies, and how much reſemblance it bears to the bloud, I have declared by Experiments in the Chapter of Piſſing, or concerning Diuretick Medicins: and as it is in Milk or fluid Bloud, ſo alſo it is with the moſt fixed Metals and other Minerals. For almoſt all concretions or combinations in Bodies proceed from a Salt of one kind, as the diſſolution of them doth from ſome one of another kind, which forces the firſt Salt into its embraces, and then the precipitation is cauſed by a Salt of a different nature, which deſtroys the union of the two former; all which I have ſo clearly and fully explained above, that there is no need in this place to repeat it. Wherefore, that we reckon ſaline Medicins among Cordials as well as Diureticks and Diaphoreticks, the reaſon is the ſame in all: all that I have now to do, is briefly to lay down the chiefeſt ſorts of this kind, that belong to that Head, together with the manner and reaſon of their operations.

They are moſt commonly ſalt ones, and that of different ſorts.

1. Now therefore in the firſt rank, ſuch Cordials as are impregnated with volatile Salt preſent themſelves, and eaſily bear the Bell away from moſt others, as Spirit of Harts horn, Bloud, Sal Armoniack compounded, to wit, with diſtilled Amber, Treacle, Roots of Virginia Creeper, and other Antidotes; as alſo (that which was the onely and univerſal Medicin of a Doctor of Phyſick that turned Quack) the Spirit of Sculls dug out of Graves. Hither alſo we ought to refer the Salt of Vipers, and likewiſe Powder of Toads cloſe calcined (which I formerly, in a peſtilential Fever which was Epidemical at *Oxford*, in the Year 1643. knew to be famous and very good) with many other things. This kind of Remedies have recalled many people from the very jaws of death, and indeed do often afford help upon a different and manifold account; that is to ſay, firſt of all, in that they meet with either a fixed or acid Salt, which they force into their embraces, and thereby open the maſs of Bloud which is too much thickened and bound together by the feveriſh efferveſcence thereof, in ſo much that they promote the ſeparation and expulſion of the morbifick matter; and then again, in regard that they relieve and comfort the animal ſpirits, and rouze them, when they are ſluggiſh, to the diſcharging of their duty; to which you may add as a third virtue of them, that in malignant Fevers theſe Medicins ſubdue the venomous particles of the morbifick matter, and very frequently deſtroy them.

1. Cordials impregnated with volatile Salt.

2. The ſecond place among ſaline Cordials is juſtly due to Remedies that are impregnated with Alchaliſate or petrifying Salt; for theſe are commonly reckoned the moſt famous of that kind. Among which you may count *Lapis Bezoar* or the Bezoar Stone, Pearls, Corals, the Bone in a Stags heart, and horn of the ſame Creature, Powder of Ivory, Eyes and Claws of Crabs, and other Powders both of Stones and Shells, which common experience tells us, are oftentimes given to ſick folks with good ſucceſs, and the reaſon why they are an help in ſuch caſes, ſeems to conſiſt in this, that the particles in the Alchali Salt in the Medicin meet with the particles of acid Salt in our bodies, and forthwith mixing very intimately with them, muſt conſequently deſtroy their violent motions, and all other hurtful combinations. To this Claſs of Cordials are duly referred Bole Armeniack, Terra Sigillata of *Lemnos*, and other Chalky ſubſtances alſo; but yet not for that reaſon, becauſe they ſuccour the heart when it is oppreſſed (as it is commonly believed) but for as much as they deſtroy the predominancies of acid or fixed Salts, either in the Bowels or the maſs of Bloud, and immediately allay or correct the enormities by them produced.

2. Such as are impregnated with an Alchali, or petrifying Salt.

3. If I ſhould exclude ſowriſh Medicins, or ſuch as are impregnated with a fluid Salt, from this rank of Cordial Medicins, the Authority of almoſt all Phyſicians, but eſpecially the Ancients, would riſe up againſt me. For theſe are by many Doctors reckoned extraordinary Antidotes againſt the Plague or peſtilential Diſtempers. For the Cure of malignant Fevers, Vinegar of Treacle and of Bezoar are mightily commended; yea they put either Vinegar or ſomething like it, into Waters which they diſtil for that uſe. For the ſame reaſon Spirit of Vitriol, Juice of Citron, of Allelujah, or Wood Sorrel, of Pomegranates, with many other things of the ſame ſort, are reckoned among the number of Cordials; and indeed there is great reaſon they ſhould be ſo, becauſe they are the beſt diſſolvers of fixed Salt and aduſt Sulphur when they combine together and ſubdue their violent qualities, which is the reaſon that in malignant Fevers the coagulations and extravaſations of the bloud that uſe then to happen, are oftentimes prevented or cured by this kind of Remedies.

3. Such as have in them a fluid or a ſower Salt.

4. For the ſame or the like reaſons that the aforeſaid Salt Bodies are numbred among Cordials, or Ingredients of ſuch Compoſitions, you may add to that kind of Medicins ſuch alſo as have a fixed Salt for their baſis or foundation. For ſeeing there

4. Such as have fixed Salt in them.

Phar. Rat. Part I.

are ſeveral ſorts of Salts generated in our bodies, and that they frequently paſs from one ſtate to another; hence it is, that upon what occaſion ſoever we ought not to give ſalt Medicins of any one, but of ſeveral kinds. How, and by what means ſuch things as are impregnated with a fixed or lixivial Salt, do either deſtroy or correct the enormities of the acid Salt which is in our Bowels or our Bloud, I have ſhewed you before.

5 Such as have a Nitrous Salt in them.

5. The nitrous Salt is very juſtly reckoned among the number of Cordials, as being ſuch a thing, that unleſs the particles thereof are breathed in along with the common air, the life of Animals cannot ſubſiſt: but this taken in at the mouth is looked upon as a famous Antipyreuticon, or Antidote againſt heat, in that it quenches thirſt, and mightily aſſwageth the feveriſh heat; which notwithſtanding it doth, not onely by preſerving the mixture of the Bloud, but alſo by promoting the accenſion or kindling thereof. I have elſewhere ſhown you, that nitrous particles as well as ſulphureous ones, are requiſit for the production of flame, and that the more plentifully they are adminiſtred ſo much the clearer and brisker it burns. Wherefore when the matter, which for the moſt part conſiſteth of Sulphur mingled with Salt and Earth, is kindled and gives but a glimmering ſhine obſcured with Smoak and Soot, if you put nitre to it, it will immediately grow bright and clear. So I am of opinion it is in Fevers, when the Bloud being filled with aduſt feculencies ſmoaks with a ſuffocating heat rather than burns out, if you take nitrous particles into your mouth and tranſmit them into your Bloud, they will preſently make it burn clearer, and conſequently more kindly; in ſo much that when the conſtitution thereof is more open, not onely the ſerous, but alſo the fuliginous recrements thereof do more freely make their paſſage out. Wherefore my Lord *Bacon* rightly obſerves that the particles of Nitre not onely that are taken into the ſtomach, but ſuch alſo as are breathed in with the common air, do very much conduce not onely to preſerve but to prolong our lives.

Theſe are the chief ſorts of Cordial Medicins, whoſe operation is deſigned moſt peculiarly upon the maſs of Bloud, the conſtitution of which (when it is either too cloſe, and thickened with long concoction) they do ſomewhat diſſolve and open, to make way for the morbifick matter; or they recover the Bloud from putrefaction, when it is diſſolved by any heterogeneous or malignant mixture, and divided into portions that are envenomed, and conſequently obnoxious to corruptive ſtagnations and coagulations; in as much as the particles of thoſe antidotal Cordials, being tranſmitted into the Bloud, and confounded with it in the circulation thereof, (yet ſeeing they are not aſſimilated or ſubdued by it) do ſet upon the venomous particles on every ſide, and either ſubdue them or drive them forth; ſo that the maſs of Bloud being freed from all malignity, and extricated from every kind of coagulation, doth in a ſhort time recover its former temper. Both theſe ſorts of Medicins (in as much as they preſerve the Bloud from corruption or extinction) are commonly called *Cardiaca, i. e.* Cordials, but are more properly named *Vitalia*, Vitals, or the Preſervers of Life.

The aforeſaid Remedies are more properly called Vitals.

How, when they are taken into the ſtomach, they preſently operate upon the Bloud.

But if it be further inquired, how either theſe or thoſe, when taken into the ſtomach, transfer their operations ſo ſuddenly, and almoſt entirely into the Bloud, without any notable action or paſſion cauſed in that ſame part; I ſay firſt of all, that ſuch Medicins do not at all oppoſe, but very well agree with the animal ſpirits; wherefore they do not irritate or provoke the nervous fibres of the ſtomach either to a ſenſe of pain, or any expulſive motion; but they rather excite the ſpirits that are in them to a kind of exultation and complacency, by the propagation of which, the whole ſoul is preſently expanded into a greater breadth. And then again ſecondly, The paſſage out of the ſtomach into the bloud is not, as it was formerly ſuppoſed, ſo long, or extended through ſo many turnings, as that we need fear leſt the virtue of the Medicin ſhould be loſt by the way, but immediately it is tranſmitted from theſe into thoſe quarters. For as I formerly obſerved, there are an innumerable company of bloud veſſels which cover the inner coat of the ſtomach, in ſo much that not onely purging Phyſick, but any other Medicins that are deſigned to work upon the heart, or brain, yea upon the outmoſt part or ſurface of the body, begin their operation upon the bloud, even before they are got out of the ſtomach.

The ſecond ſort of Cordials, that reſpect the animal ſpirits.

So much of Cordials, as they are commonly called, ſo far as they reſtore or reduce the bloud to a better temper, when either in its heat or mixture (the one or both together) it is depraved. Whoſe operation and virtue ſince it affords comfort to the life of man when it is in danger, they may (as I intimated to you) be more properly called Vitals. But beſides this, there are ſome Medicins that go by the name of Cordials, in as much as they firſt and more immediately exert their operations upon the animal Spirits, and thereby raiſe, invigorate and compoſe either ſome portion of the ſenſitive ſoul, and the whole ſubſtance of it, when it is too much contracted, depreſſed,

or

or otherwiſe put into diſorder. And indeed ſuch Remedies as theſe do in ſome meaſure affect even the heart it ſelf, though more remotely. For when by giving of them the whole ſenſitive Soul is raiſed, and expanded into a greater breadth, the ſpirits alſo which are deſigned for the heart, flow into it more copiouſly, and put it into a briſker motion; and conſequently the Pulſe, which was before but weak and languiſhing, immediately beats ſtronger, and the Bloud is driven about with greater force. Theſe kind of Medicins, which are not without ſome good reaſon taken for Cordials, do not much differ, as to their matter, from thoſe other Vital Compoſitions which chiefly reſpect the Bloud; yea, ſomethings are common to both kinds. As to the ways of their working, theſe laſt may be well enough reduced to two Heads, and in as much as they are either ſmooth, or rough and harſh, they attain the ſame end; that is, they either raiſe and comfort the animal Spirits by ſoothing, and as it were gently and ſoftly touching or ſtroaking of them, or by vexing and provoking them as it were with Spurs and Goads, they force them into more rapid, and ſometimes more regular motions.

They are of two kinds.

The Cordials of the firſt ſort, as ſoon as they are down in the ſtomach, yea ſometimes by then they are got into the mouth, exert their operations, and with a grateful influence refreſh and recruit the ſpirits that inhabit in the firſt paſſages, and as it were in the Portico of the Body; and ſo by the continuity of them, the ſame exultation is ſucceſſively propagated into other ſpirits, and then into others, till in a ſhort time it paſſes through the whole ſubſtance of the ſenſitive Soul; in ſo much as not onely the Brain, but the Heart being refreſhed with a fuller influx of Spirits that do as it were leap for joy, perform their ſeveral functions and offices much more vegete and chearfully. To this end (if you take care not to put the bloud into too violent a motion) the Waters commonly called Cordials, do conduce, being diſtilled with Wine, or Vinous ſpirits, and with Spices; as likewiſe Preparations made with Musk and Ambergriſe. So alſo Aromatick Powders mixed with them. Moreover to this place belong Magiſteries and Tinctures of Coral and Pearl, together with Elixirs, and a great many more of the ſame ſort, that have a grateful taſte or ſmell. Hence alſo all ſweet ſmelling things, and things that are pleaſant to the ſight, are numbred among Cordials, in that they refreſh the animal ſpirits: for whatſoever kindly affects and delights the ſpirits that rule in any organ of ſenſe, immediately raiſe and enlarge the whole Soul. In the mean time other Cordials of this rank ſeem firſt to work upon the Brain, without any great diſturbance to the ſpirits that are planted in the entrance of the body, yea without ſcarce ſo much as making the firſt paſſages and the maſs of bloud in any manner ſenſible of their preſence. Of which ſort are ſome of thoſe Medicins that are called Cephalicks, which though they are not ſo grateful to the palate or ſtomach, and ſcarce put the bloud upon a fermentation, or into any violent motion; yet they clear the Brain, and ſharpen and corroborate the animal Spirits which are the Inhabitants of it. Of this nature ſeem to be Sage, Betony, Roſemary, Vervene, and many other things.

1. *Such as are ſmooth, and gentle to the ſpirits.*

How they work upon the Bowels or Senſes.

Or laſtly on the Brain.

2. Some other Medicins and kinds of Adminiſtrations (which may very well be reckoned among Cordials) work after a manner very different, and do a man good upon a quite contrary reaſon; that is, they do not kindly treat the animal ſpirits, and make them expand themſelves equally, but they rather provoke them, and force them to run out extravagantly, and throw themſelves to and fro; and that upon this ſcore, to wit, that whereas before they were out of order, and being diſperſed unequally, did flow in ſome places thicker and in others thinner, and conſequently intermitted ſome part of their functions, and eſpecially within the Brain or Heart, or performed them very irregularly, at that time the beſt remedy is to diſturb and put them into a greater commotion by an ungrateful Medicin: for by that means they, (as if they were rouzed up by laſhing, or being whipt, forſake their former diſorders, and return of their own accord into their regular motions. For ſo it is uſual in Faintings, Swoonings, oppreſſion of the Heart, or Convulſions, yea in almoſt all other failuers, languiſhments, or irregularities, to give the Parties concerned either Spirit of Harts horn, Soot, Sal Armoniack, Tincture of Caſtor, or Aſa Fœtida, with other liquors; to hold theſe things and the like, as eſpecially volatile Salts, and chymical Oils that will burn; and in ſudden faintings of the Soul, it may be convenient to ſprinkle cold water in the Parties face, to pluck him by the noſe, to ſhake him violently, and ſometimes to hit him a cuff on the ear. Such Adminiſtrations as theſe give the Patient eaſe, in as much as they rouze the animal Spirits when they are oppreſſed or diſtracted, or doing ought that is foreign to their proper office, and command them when they are thereby expanded, and as it were ſet in Battalia to return to their ſeveral former duties. But whereas ſome People think that help proceeds from this, that the Bloud being

2. *Or theſe Cordials are rough and provocative.*

Which reduce the ſpirits to order, by, as it were laſhing of them.

Phar. Rat. Part I.

being hindered ſomewhere in its courſe, and eſpecially when it ſtagnates in the heart, begets the aforeſaid maladies, and is by thoſe Remedies and manners of Adminiſtrations reſtored to its proper motion; I ſay, that the cauſe and cure of all thoſe indiſpoſitions, depends but ſecondarily and not immediately upon the Bloud, but that originally not onely the ſtagnation of the bloud proceeds from the hearts animal motions being hindered, but alſo that the impediments of the former, are not to be removed but by the reſtitution of the latter. Having now recounted to you the ſeveral ſorts of Medicins that are commonly taken for Cordials, and the ways and reaſons of their operating upon the Bloud or Spirits, or upon both together, which (I ſuppoſe) I have rightly laid down, I muſt in the next place ſubjoin ſome ſelect Forms or Receipts of them, appropriated to the ſeveral ends of Phyſick aforeſaid.

CHAP. II.

The ſeveral Sorts and Receipts of Cordials.

Such Cordials as increaſe the heat of the bloud.

SInce the Medicins that are commonly taken for Cordials have been diſtinguiſhed into two kinds, to wit, one ſort, that chiefly and more immediately work upon the Bloud, and others that do the ſame upon the animal Spirits; in the firſt rank of them that are deſigned for regulating the heat of the Bloud, I have placed ſuch as force the liquor thereof, when it is too cold, or ſlow in its motion, to run higher, and by increaſing or exalting the ſulphureous particles to a greater quantity and degree, make it burn, as it were, and flame, ſuch as are generous Wines, hot Diſtilled-compound Waters, Spirit and Tincture of Saffron, Elixir Vitæ of Quercetan, Tincture of Salt of Tartar, of Steel, and other things that are filled chiefly with Spirit and Sulphur in great quantity; of which People may take ſometimes one ſort, and ſometimes another, even as the Patient pleaſes. Whenever a languiſhment and fainting of the Spirits, with great oppreſſion of the Heart afflicts a man, by reaſon that the Bloud is too much inflamed, and conſequently is exceſſively crowded, and almoſt ſtagnates in the Heart, in this caſe Aqua Mirabilis, Cinamon, Clove and Wormwood Water compound. and likewiſe ſuch as is diſtilled from Orange Peel with Wine, is very good; to which ſome-

A notable abuſe of theſe Medicins.

times you may add a Doſe of ſome Spirit, Elixir, or Tincture.

But here you muſt uſe great care and caution, leſt you indulge your ſelf too often to theſe kinds of Cordials. For I have known a great many men and women of good faſhion, who by the too frequent uſe of them, have contracted ſuch an ill habit, that they have been forced ſeveral times in a day to drink a ſmall draught or a dram either of generous Wine, ſome Spirits or ſtrong Waters; and then daily to increaſe, and often to repeat the Doſes of the ſame liquors (for Nature having been uſed a little while to extraordinaries, doth not continue long ſatisfied with the ſame quantity) in ſo much that at laſt their ſtomach can endure or digeſt nothing of a moderate nature, but ſtill deſires things that are ſtronger and hotter. But their other entrals, and eſpecially their Liver are ſo dried and roaſted with it, that there is a diminution in their ſtock of Bloud which is depraved in its temper alſo, and a diſtempered ill habit of body, or ſhortneſs of Life hath been the conſequence of it.

Divers and ſundry are the occaſions upon which many People are induced to this ill habit of ſipping Cordial Liquors. For beſides ſudden languiſhments, proceeding perchance from great ſorrow, hard labour, exceſſive ſweatings, or acute pains; if at any time ſuch food as is diſagreable, creates a diſturbance or nauſeouſneſs in the ſtomach, or that through a convulſive indiſpoſition, a man ſeems to be in danger of Swooning, or having his ſenſes taken from him (and for many other reaſons) it is uſual for the Party to drink Vinous Spirits, or *Aquæ Vitæ* [*i.e.* Water of Life] though it is improperly ſo called. And then after thoſe ſorts of Cordials having been for ſome time taken, begin to be agreable and delightful, the maſs of Bloud being ſomewhat more largely expanded and put into a greater heat, cauſes the ſubſtance of the whole Soul to be extended and excited into a kind of joy and triumph; which when it ſinks again, the Soul being mindful of that complacency which it received, and not content with its preſent ſtate or condition, longs for the ſame again, and immediately covets once more to take the like pleaſure. Wherefore upon every diſorder of the body or mind, as ſoon as the ſpirits begin a little to faint, forthwith, for the raiſing of them, a draught of Cordial muſt be had, and if it be at hand, is certainly

ſwal-

ſwallowed; and ſo through the frequent and uſeleſs ſpreading or hoiſting of the Souls Sails, the Fabrick of the Body, like that of a Ship, is weakened. Nor doth this evil cuſtom prevail upon Gluttons and Drunkards onely, but ſometimes Learned men, and very pretty ingenious women, to improve their fanſie, and put themſelves in a chearful humour, do, by frequent ſipping of Spirits and hot Waters, impair and oftentimes totally deſtroy their own health. I ſhall not need to add in this place the common and vulgar Receipts of this kind of Cordials; it ſeems ſufficient that I have hinted to you the abuſes of them.

2. *Such as allay the exceſſive heat of the Bloud.*

In the ſecond Claſs of Cordials I placed ſuch as do ſomewhat allay the exceſſive efferveſcence of the bloud, and do a little reſtrain and temper the immoderate heat thereof, as Diſtilled Waters, acid and nitrous Medicins, &c.

Julaps.

Take of Water of Wood Sorrel, a whole Citron, and Strawberries, each ℥ iv. *of Syrup of the Juice of Citron* ℥ j. *of Pearl pulverized* ʒ j. *make a Julap. The Doſe is* ℥ ij. *thrice or four times a day.*

Take of Water of Sweet Apples, and of Raſpberries, each ℥ vj. *of Syrup of Violets* ℥ j. *Spirit of Vitriol* xij. *drops, and make a Julap.*

Take of Spring Water a pint and an half, of Limon juice ℥ ij. *of Sugar* ℥ j. ß. *make a Potion, of which you may take, when you pleaſe* ℥ iij.

An Apozeme.

Take of Graſs Roots ℥ iij. *of Candied Ringo* ℥ vj. *two Apples ſliced (or of Corins* ℥ ij. *of the ſhavings of Ivory and Harts horn, each* ʒ ij. *of the Leaves of Wood Sorrel one handful; boyl them in Spring water, three pints to two. To the ſtraining thereof, when it is clariſied add of Sal Prunella* ʒ j. ß. *of Syrup of Violets* ℥ j. ß. *make an Apozeme; of which the Doſe is* ℥ iij. *or* iv. *thrice a day.*

Take of Conſerve of Red Roſes vitriolated ℥ iv. *of Sprint water* ij. *pints, diſſolve it cloſe and hot, and then ſtrain it. The Doſe is* ℥ iij. *when you pleaſe.*

A Confection.

Take of the Conſerve of Barberies, and of the rob of Raſpberries, each ℥ j. ß. *of Pearl prepared* ʒ ß. *of the Confection of Jacinth* ʒ j. *of Syrup of Citron juice a convenient quantity. Make a Confection, of which the Doſe is* ʒ ß. *thrice a day.*

3. *Cordials that open the conſtitution of the Bloud whileſt it boyls up and is too cloſe.*

The third ſort of Cordials affords us ſuch kind of Medicins, as being deſigned againſt the diſorders of the bloud when it is very hot, do unlock and open the conſtitution of it when it is ſtrict and cloſe, in order to the ſeparating and carrying off of its recrements or dreggy parts. Now as theſe are chiefly and almoſt onely ſaline, ſo alſo, according to the manifold ſtate of thoſe ſaline particles of which they conſiſt, they are of ſeveral ſorts; though for the moſt part the ground or baſis of them is either a volatile or alchalized, or acid, fixed or nitrous Salt. Of each of theſe kinds I will give you ſome Receipts.

1. *Of that ſort whoſe ground is a volatile Salt.*

In the firſt place Cordials that are impregnated with volatile Salt, are uſually given not onely in Fevers with reſpect to the Bloud, but alſo in fainting Fits and ſudden languiſhings in reſpect to the animal ſpirits, and that with ſucceſs according to the Preſcriptions following.

Spirits.

Take of Spirit of Harts horn xv. *or* xx. *drops, of Treacle water* ʒ ij. *and give it in a ſpoon, drinking thereupon a ſmall draught of proper liquor.* In the ſame manner you muſt give Spirit of Bloud, of Dead mens Skull, Soot, or Spirit of Sal Armoniack compounded.

Powders.

Take of Salt of Vipers ʒ j. *of Chryſtal Mineral* ʒ ij. *of Powder of Claws compound.* ʒ j. ß. *mingle them and make a Powder, of which the Doſe is* ʒ ß. *to* ℈ ij. *in a ſpoonful of Cordial Julap, drinking upon it a ſmall draught of the ſame.*

Take of the Flower of Sal Armoniack ℈ ß. *of Bezoar Mineral* ℈ j. *make a Powder and give it in a ſpoonful of proper liquor.*

2. *Thoſe whoſe ground is an Alchali Salt.*

Secondly, Thoſe are looked upon by the Vulgar to be the beſt Cordials that are, whoſe ground is an Alchalized or a petrifying Salt; as firſt of all, Eaſtern Bezoar, Pearl, Coral, and other Powders of Shells and Stones.

Take

Phar. Rat. Part I.

Take of Gaſcoign Powder, or of Claws compounded ℈j. *to* ʒß. *and give it in a ſpoonful of Cordial Julap, drinking upon it of the ſame liquor* ʒ ij.

Take of Eaſtern Bezoar gr. vj. *to* xx. *and give it the ſame way.*

Take of the Powder of Claws and Eyes of Crabs, each ʒ j. *of Pearl and Coral, both prepared, each* ℈ iv. *of both ſorts of Bezoar, each* ʒ ß. *of the beſt Bole Armeniack, of Aurum Diaphoreticum, each* ℈ ij. *of Bezoar Mineral* ʒ j. *mingle it and make a Cordial Powder. The Doſe is* ℈ j. *to* ℈ ij. *or* ʒ j. *in a convenient vehicle.*

Which are moſt proper in Pleuriſies,

In Pleuriſies the following preparations are looked upon as the moſt proper Cordials, in as much as by deſtroying the predominancies of the acid Salt they take off, or prevent the coagulations and extravaſations of the Bloud.

Take of the Powder of Boars Tusk ʒß. *to* ʒ j. *of Chryſtal Mineral* ℈ j. *of Powder of the Flower of Rhead Poppy* ℈ß. *make a Powder to be taken in any ſort of Liquor.* In the ſame manner you may give Powder of Crabs Eyes and of the jaw of the Pike Fiſh.

3. Nitrous Cordials.

3. To this place belong alſo Preparations of Nitre, which are often given with ſucceſs in Fevers, according to the Receipts following.

Take of Chryſtal Mineral ℈ j. *of the volatile Salt of Harts horn from* gr. iij. *to* vj. *mingle them and make a Powder; which you may give in a ſpoonful of Cordial Julap.*

Take of Chryſtal Mineral, and Antimonium Diaphoreticum, or Sweat-cauſing Antimony each ℈ j. *of Bezoar Powder* ℈ß. *make a Powder, and give it the ſame way.*

4. Cordials whoſe ground is an acid Salt.

4. Medicins whoſe baſis is a fluid or ſoweriſh Sal, is given in Fevers to open or looſen the conſtitution of the Bloud, according to the Forms following.

Take of Spirit of Vitriol drops, from iv. *to* vj. *of Carduus Water* ʒ iij. *of Treacle Water* ʒ ij. *of Syrup of Citron juice* ʒ iij. *of Pearl* ℈ ß. *make a draught, to be taken twice or thrice a day.* After the ſame manner take Spirit of Salt or Nitre. To the ſame end you may take *Cherbet* made of Limons diſſolved in Spring Water, and likewiſe that divine Drink, called *Potus divinus Palmarii.*

Take of the Powder of Harts horn calcined, or Antimony Diaphoretick ʒ iij. *of ſpirit of Vitriol or of Salt* ʒ j. *pound them in a Mortar of Glaſs and dry them. The Doſe is* ℈ j. *to* ʒ ß. *in a ſpoonful of Cordial Julap.*

Such as have fixed Salt in them.

5. The fixed or lixivial Salts of Herbs are oftentimes ingredients in the Compoſitions of Antidotes. And ſo likewiſe Medicins whoſe Baſes or Grounds they are, in as much as they are reckoned great enemies to Fevers, ought alſo to be numbered among Cordials. For example ſake I propoſe to you that common Medicin;

Take of the Salt of Wormwood ℈ j. *of Carduus water* ʒ iij. *of ſpirit of Vitriol or Oil of Sulphur* ℈ j. *of Syrup of Violets* ʒ iij. *make a draught to be taken two or three hours before the Fit.*

Take of the Water of a whole Citron and of Wood Sorrel, each half a pound, of the Salt of Tartar ʒ j. ß. *of Limon juice* ʒ ij. *of Sugar* ʒ ß. *mingle them and make a Julap, which you make uſe of in continued Fevers, that make no remiſſions. The Doſe is* ʒ iij. *twice a day.*

The laſt Claſs of Cordials, and truly in ſome reſpect the chiefeſt, is due to Antidotes, in as much as they are moſt vital. Of theſe there are ſo many ſorts and Receipts abroad in the World, that if I ſhould recount them every one, or but the beſt of them onely, this Work would grow to a vaſt Volume. Of ſuch Medicins as theſe there are many and great Treatiſes extant, and therefore we ought to be ſomewhat more brief upon this ſubject. Since therefore Antidotes are either Preſervatives or Curers, I will give you in the firſt place ſuch ſelect Remedies as are to be uſed whileſt a man is yet in health againſt the contagion of any Peſtilence or Malignity whatever, omitting in the mean while what is uſually preſcribed concerning the Cures and alteration

teration cauſed by the ambient or common Air; and then in the ſecond place I will lay before you choice Forms of Preſcriptions, which are to be uſed after the Contagion hath ſeized you. *Phar. Rat.* Part I.

1. Antidotes for preſerving of Health. 1. *Preſervatives.*

Take of the Conſerve of the Leaves of Rue ℥ iv. *of Mithridate, and Confectio liberans, each* ℥ j. *of Confection of Jacinth* ℥ ij. *of Salt of Wormwood* ʒ ij. ſ. *of red Pulvis Pannonicus* ℥ ſs. *of Bezoar Vinegar a convenient quantity. Make an Electuary. The Doſe is the quantity of a Cheſnut thrice a day.* *An Eletuary.*

Take of the Powder of the Roots of Virginy Creeper, of Contrayerva, choice Zedoary and Species Liberans,, each ʒ ij. *of Camphire* ℈ ij. *of Sugar diſſolved in Bezoar Vinegar, and made into Tablets* ℥ vj. *according to Art, and make the weight of each Tablet to be* ʒ ſs. *Let the Patient eat one or two ſeveral times in a day.*

Take of the Roots of Virginy Creeper ℥ iij. *and boyl them in three pints of Spring Water till half be conſumed; to the ſtraining of which add of the beſt Honey* ℥ ij. *of Treacle of Andromachus* ℥ j. *diſſolve it hot and cloſe and ſtrain it. The Doſe is two or three ſpoonfuls three or four times in a day.* *An Apozem.*

Take of the Flower of Brimſtone ℥ iv. *and let it melt in an earthen Pot, then put into it by ſpoonfuls* ℥ iv. *of the Salt of Wormwood, ſtirring them together, till ſuch time as the whole maſs grows red. Then add of the Powder of Aloes, Myrrhe, and Olibanum, each* ʒ j. *of Saffron* ʒ ß. *and ſtir them again for a quarter of an hour, till they are incorporated. Then when the maß is cold, and you have put it into a Glaſs Veſſel, let it melt into an Oil that will ſhine and be as pleaſant to the ſight as a Ruby. The Doſe is* x. *or* xx. *drops in* ℥ j. ß. *or* ℥ ij. *of Bezoar Water twice a day.* *Elixirs.*

Or elſe to the aforeſaid Powder pour ſpirit of Wine (rectified upon the Roots of Contrayerva, or Drakes Root and Virginy Creeper) to the depth of iij. *fingers, and take out a Tincture, of which the Doſe is* xx. *or* xxx. *drops in a convenient vehicle.*

Or take of the ſame Powder ℥ ß. *and pour to it two pints of generous Wine, diſſolve it cloſe and hot. The Doſe is a ſpoonful twice or thrice a day.*

2. After the Party is infected and the temper is vitiated and begins to corrupt, you muſt uſe the ſame ſort of Remedies ſtill, though in a greater Doſe, and oftener; yea, many times not onely Vinegars, but the fixed Salts of Herbs are joined with Antidotes to good purpoſe; in that by them the curdlings of the Bloud are diſſolved, and then, when the heterogeneous particles are evaporated, and the reſt forced back into their due mixture, the liquor of it at laſt recovers and retaineth its former condition. To theſe ends, though there are an innumerable company of Medicins in many Phyſick Books, yet I ſhall propoſe but onely one or two in this place. 2. *Curers.*

Curing Antidotes.

Take of Bezoar Water ℥ ij. ß. *of Bezoar Vinegar* ℥ ß. *of Treacle of Andromachus* ʒ j. *mingle them by ſhaking them together in a Glaß, and make a draught, which let the Party take and ſweat upon it.* *A Draught.*

Take of Gaſcoign Powder, Roots of Contrayerva, and Virginy Creeper, each ℈ j. *to* xxv. gr. *make a Powder, and give it in a ſpoonful of Treacle Water, drinking thereupon a ſmall draught of the ſame, or of Cordial Julap.* *Powders.*

Take of the Powder of Toads prepared, of Powder of Claws compound. each ʒ ß. *and make a Powder, to be given in the ſame manner.*

Take of Bezoar Mineral ʒ ß. *of Treacle of Andromachus* ʒ j. *of Camphire* gr. vj. *of Bezoar Vinegar as much as you think fit, and make a Bolus, to be taken the ſame way.* *A Bolus.*

Take of Water of Wood Sorrel, and Dragons wort, each ℥ iv. *of Scordium compounded* ℥ ij. *of Treacle and Bezoar Water, each* ℥ j. *of Pearl pulverized* ʒ j. *of Syrup of Clove-* *A Julap.*

Phar. Rat. Part I.

gilliflowers (or made of the juice of Citron) ℥ ij. *of Spirit of Vitriol* xij. *drops, and make a Julap. The Dose is* ℥ iij. *several times a day, sometimes by it self, and sometimes with other Medicins.*

CHAP. III.

Of Indispositions in the Heart, and their Cures.

Indispositions in the Heart are,

NOw I have given you an account of Cordial Medicins, as they are vulgarly, though improperly called, I come next in order to treat of Indispositions in the Heart, whereby that part is really and truly afflicted, and consequently requires true Cordial Remedies or Hearts-ease. And first you must understand, that under that name of *Passio Cardiaca* [or an Indisposition in the Heart] two Distempers, somewhat different one from another, are usually signified; that is to say, a Tremour or Trembling of the Heart, and the Palpitation or Beating thereof: in both which Diseases the motion of the Heart, or the Pulse seems to be inordinate, and in some measure convulsive; but the inordinacy of the former consisteth in the quickness of its vibrations or pulsings, and of the latter in the vehemency or violence of them. I shall inquire first into the reason of this latter, and then endeavour to lay down the Theory of the other, and at length the Cure of them both.

Either a trembling, or the beating of it.

The Description of the latter.

The Palpitation of the Heart is sometimes so vehement and excessive, that it may not only be very plainly perceived by the touch, but also seen by the Eyes, yea, often heard at some distance. Besides which, it is reported by very credible Authors, that by the violent beating of the Heart, and its knocking against them, the ribs have been sometimes broken, or (in younger people) that they have been driven outward, and remained protuberant, or in a Bump.

The cause of it is inquired into.

But this motion, though it be perceptible to so many senses, yet it is not yet manifest to reason, what part is so moved, that by each pulse thereof it makes the left side of the breast to start out. I suppose all men, as well learned as unlearned, do unanimously agree, that the part so moved and strongly beaten, is the very Heart it self; but I ask them, whether the whole Body of the Heart, or onely some part of it throbs in that nature, transgressing the usual sphere of its vibration? If they say, the whole body of it is so moved, I would have them assign, whether this be performed in the Systole or Diastole, that is, the Contraction or Dilatation of it. Surely not the former; because whilest the Heart is contracted, it is plain to the very eye-sight, that the bulk of it is diminished in all its parts; nor can it be any more in its Diastole, because in that state the Heart returns onely to its natural and ordinary situation and bigness, and remains therein for some small time. Hence, seeing the Heart, according to the Laws of its own vibration, though never so much increased or heightned, cannot beat and throb so outwardly (which appears farther also, because in a fit of the Fever, when it beats most vehemently it doth not leap outward and knock against the ribs) I formerly suspected that, during this disturbance, it was in a convulsive motion, quite contrary to the ordinary pulsation, whereby the Heart, like a member that is in a convulsive agitation, is totally raised altogether and moved out of its place. But when I understood the doctrine of the Nerves more fully, I presently receded from that opinion, because it is certain that the Heart cannot be raised or carried any way whatever, by any other muscle besides its own proper moving fibres. Wherefore when I considered of this matter more seriously, at last it came into my mind, that whilest the heart is contracted, to exclude or press the bloud out of its cavities, and the point as well as sides thereof fall in and are drawn nearer to each other, yet if all the bloud cannot immediately at every systole or contraction be clearly thrown out and discharged, it must of necessity follow, that the roots of the vessels, being filled to the heighth, and very much extended, will leap up and throb with some kind of violence, and then, through the reverberation which is here made, that the whole frame of the Heart will be very much shaken.

It proceeds sometimes from the hindrance of the bloud, flowing into the Arteries.

And indeed, that this Distemper arises sometimes from such a cause, I saw it lately confirmed from an Anatomical observation. A famous and pious Divine, when he had lived a good while subject to the Palpitation of the Heart for several fits which came sometimes of themselves, and sometimes occasionally, at last began to be afflicted with

Phar. Rat. Part I.

with it continually, day and night, and had a difficulty of breathing beſides; and after that in a few Moneths, being as it were worn away by the conſtancy of ſo very troubleſome a Diſtemper, he died. When his body was opened, the right ſide of his Heart appeared immediately ſwelled with congealed bloud, the auricle [or ear] whereof being likewiſe augmented to a vaſt extent, contained in it a great quantity of grumous or thick gore. The reaſon why theſe things were ſo, appeared preſently; to wit, becauſe the Lungs being very much obſtructed, and ſtuffed with black, extravaſated, and every way ſtagnant bloud, could not admit all that bloud which was continually to be diſcharged out of that ventricle or cavity; whereupon, whileſt the Heart, which endeavoured all that it could to make a total excluſion of it, at every ſyſtole or contraction, is drawn together inwardly at the cone or tip, and in the middle, and is diminiſhed in its bigneſs, the baſis or bottom of it being very full, ſtruts out by reaſon of the bloud which is gathered there, or ſticks, or is reverberated [*i. e.* beaten back] in its paſſage, and being more tumid [or ſwollen] through the bulk of the auricle, beats more ſtrongly, and raiſes it ſelf outward.

It ariſes alſo from other cauſes.

But to ſay the truth, it is not onely from this cauſe that the Palpitation of the Heart proceeds, becauſe that Diſtemper is not always conſtant and perpetual, but for the moſt part wandering and uncertain, infeſting the Heart by fits, and then again either of its own accord or by the uſe of Remedies it ceaſes. Moreover it often invades ſome perſons, whoſe Lungs are ſound enough and free from all conſumptiveneſs.

And yet, although this Diſeaſe may ariſe from divers cauſes, yet in all of them I am of opinion that it takes the ſame way ſtill in affecting the parts. For it ſeems to me that the heart onely beats, in as much as upon the ſyſtole or contraction thereof, whileſt the cone [or point] and ſides are drawn together and ſtraitned, the baſe [or bottom] of it, together with the roots of the veſſels, is enlarged and ſwells, by reaſon that the bloud is gathered there, and ſticks, or is repurcuſſed [*i. e.* beaten back] in ſome meaſure. Now that the courſe of the bloud in this place is ſomewhat hindered or rebated, is manifeſt from this, that whileſt the heart beats vehemently and very ſtrongly in the ſide, the Artery in the Wriſt moſt commonly pulſeth very languidly and weakly, as conveying but a very ſmall rivelet or ſtream of bloud. Since therefore the conjunct or immediate cauſe and true reaſon of this Diſeaſe, conſiſts altogether in a ſtoppage and gathering of the bloud about the baſe or bottom of the heart and the roots of the veſſels, our buſineſs is next to enquire how many ways, and by what other cauſes that kind of Diſeaſe is uſually produced.

This Diſtemper depends oftentimes upon the indiſpoſition of the Bloud and the Veſſels belonging to the Heart.

Upon this occaſion, that we may not much blame the fleſhy part of the heart, nor the proper moving fibres thereof, this defect ſeems chiefly and for the moſt part to be imputed to the bloud, or the veſſels joined to the heart. The reaſon of the former is ſufficiently manifeſt, for as much as thoſe who have watery bloud, that is leſs apt to boyl up and be inflamed, as Virgins that are troubled with the Greenſickneſs, and Men or Women that have an ill habit of body, are for the moſt part found to be ſubject to this Diſeaſe, and are almoſt conſtantly uſed to feel the ſhock of it from any extraordinary quick motion of the body. The reaſon of which is, becauſe the bloud, when it conſiſts of dull and unactive particles, is not freely and nimbly thrown out of the cavities of the heart, but oftentimes ſtays and ſtagnates in them; and therefore whenſoever the heart through any motion of the body is filled more plentifully with them, ſo that the whole quantity that is in it cannot be diſcharged at every ſyſtole or contraction, it labours with the greateſt force imaginable, till it caſts it into its own baſe, and the roots of the veſſels, and ſcarce any farther; where when it is gathered together, and making ſome little ſtay, cauſeth the containing parts to ſwell, it produceth the *Paſſio Cardiaca* [or Indiſpoſition of the heart] with difficulty of breathing beſides.

The reaſon of the former.

2. In the other caſe, either the veſſels are obſtructed, or convulſions.

But furthermore, this Diſeaſe of the Heart doth many times happen to ſome perſons that have very hot bloud, which is apt enough to be heated or put into a ferment. For to a great many people that are very ſubject to the Hypochondriack Diſtemper, Fits of the Mother, or other convulſive Maladies, this evil is frequent and familiar; wherefore in theſe caſes, we may juſtly ſuſpect that the Arteries joining to the heart are in the fault. By what means the obſtruction of them, hindering the free flowing of the bloud out of the heart, produces the palpitation thereof, the Story juſt now cited, doth manifeſtly declare: and beſides that, the ſhutting or filling of thoſe veſſels, cauſed ſeveral other ways, may produce the ſame effect. I knew an old man that was uſed for many years to drink ſtrong, old Beer, as alſo Wine, and oftentimes underwent the pain of the aforeſaid Diſtemper: which perſon afterward dying of a mortification in his Stomach, with continual vomiting, languiſhment of his ſpirits, and other ſymptoms; I opened his body, and found the body or trunk of the great Ar-

An Example of the former.

Phar. Rat. Part I.

tery juſt without the heart as hard as any bone, or rather any ſtone, and the ſides of it very much compreſſed, in ſo much that there being onely a crevice left, the bloud could hardly flow forth with half the torrent that it ſhould have done. And therefore juſtly aſcribed the palpitation of his heart, wherewith he was frequently troubled, to this cauſe. But it is probable that this indiſpoſition doth ſometimes proceed from the bloud that thickneth in the cavities of the heart and the veſſels thereunto appertaining, and hardeneth, as it were into fleſhy bits.

And the divers kinds of it are noted.

How the Palpitation of the Heart is a convulſive.

But beſides all this, ſeeing the palpitation of the heart is oftentimes accompanied with other convulſive Diſtempers, as I juſt now hinted, we may likewiſe ſuſpect that the cauſe thereof is ſometimes meerly convulſive. I formerly (in my Book called *Neurologia*, [or a Treatiſe of the Nerves]) demonſtrated from Anatomical Obſervations, that a vaſt number of Nerves and nervous fibres did embrace and encompaſs the trunks of the arteries in many places, and eſpecially about the bottom of the heart; the uſe and actions whereof I thought were of that nature, that the different boylings, fluxes, and refluxes of the bloud, yea ſometimes alſo the ſtagnations of it, which are uſually cauſed by the vehement paſſions of anger, fear, joy, ſadneſs, and other indiſpoſitions, may thereby be brought to paſs, ſo far forth as thoſe ſmall lines or cords of Nerves do variouſly ſtreighten, compreſs, or it may be, ſometimes quite ſhut theſe bloud-carrying veſſels. Moreover it is not very improbable that the fits of Palpitation in the heart do ſometimes ariſe from thoſe veſſels being in a convulſion, and ſomewhat too long ſtreightned, ſo that they hinder the free diſcharge of the bloud out of the heart. Indeed I impute (and that upon good ground too) not onely this but alſo thoſe other diſeaſes of the heart to ſuch a cauſe: but as to the manner of bringing it to paſs, I think I ought a little to recede from that opinion. For when I had more exactly weighed the uſes and actions of the Nerves, I found at laſt that neither they, nor their branches did either draw or ſtreighten the parts one jot, but that this whole affair was performed altogether by the fleſhy fibres, and that the nerves did onely convey freſh ſupplies of ſpirits and inſtincts or inclinations to the performing of new motions, into theſe moving parts: in the ſame manner as they do to the membranous fibres, in order to the perception which is in them.

To what end ſo many nerves are inſerted into the coats of the Arteries.

An Artery is endued with moving fibres.

Whileſt therefore I ſeriouſly inquired for what uſes ſo many nerves as are diſſeminated through the coats of the veſſels, ſhould ſerve; at laſt I found that thoſe Arteries contract and extend themſelves by their own ſtrength, as well as other parts about the heart, and that for the performing of their motion both natural and forced, not onely ſupplies of ſpirits, but the cauſes of their inclinations to move, were brought into them by thoſe nerves. For it is plain from Anatomical Obſervations, that the middlemoſt coat of every Artery, is manifeſtly muſcular, and conſiſts throughout of fleſhy fibres, ſuch as thoſe are in the Stomach, Guts, and ſome other entrals. Which annular fibres, encompaſſing the body or trunk of the Artery on every ſide, as it were, with a thick row of ſmall hairs, have, without queſtion, their Syſtole and Diaſtole, or Contractions and Extenſions, as much as the heart it ſelf. Wherefore it is altogether neceſſary, that whilſt the fibres of the Heart, and then theſe of the Arteries are ſucceſſively and regularly contracted, the bloud be rapidly driven from one part into another. Where fore it is not for nothing that ſome Phyſicians have attributed to the Arteries alſo a pulſifick faculty, or power to cauſe a pulſe: for it is very improbable that the circulation of the bloud is performed by the mere impulſe of the heart, as it were from a Syringe. How much more likely is it that an artery, being in ſome meaſure contracted after every wave of bloud, doth through its whole paſſage, puſh it ſtill onward through leſſer rivelets, and more contracted ſpaces? According to this ordinary way of driving the bloud about in equal proportion, the Arteries ſeem to have their conſtant turns of Syſtole and Diaſtole, or Contractions and Dilatations. Which though they are very ſwift and quicker than the twinkling of ones eye, yet they are performed ſucceſſively through all the parts of the arterial Pipe or Conduit. But ſeeing that we obſerve the equal courſe of the bloud to be diverſly interrupted and diſturbed according to the force of ſuch and ſuch indiſpoſitions, it muſt neceſſarily follow, that it proceeds from this alone, that the Arteries (by reaſon of the inſtinct which is conveyed into the moving fibres through the nerves) being ſuddenly in ſeveral places ſtreightned, do either ſtop and reſtrain the current of the bloud, or puſh it forward more impetuouſly. In fear, ſudden grief, ſhame, love, and other Paſſions, which cauſe a great conſternation or confuſion in the mind, it is probable that the trunk of the Aorta is ſo contracted and ſtreightned by thoſe fibres which are ſuddenly and long compreſſed, that the bloud guſhes out of the cavity of the heart with great difficulty, and that but in ſmall portions. Wherefore from the gathering and ſtagnation of it therein, great diſturbance and oppreſſion doth preſently proceed; and then after that, if upon this ſtoppage of the

And is moved like other muſcles, or the heart it ſelf.

And is often troubled with convulſions.

Whence the Palpitation of the Heart often ariſes.

the bloud there ſucceed a ſtrong and vehement pulſation of the heart to throw it out, it will of neceſſity follow, that by reaſon of the bloud which at every ſyſtole or contraction is caſt out into the baſis of the heart, and there repelled, thoſe parts muſt be very much diſtended, and conſequently muſt cauſe the palpitation of the heart. *Phar. Rat. Part I.*

Why this Diſeaſe is familiar to hypochondriacal People.

But as vehement paſſions of the Mind produce this diſtemper in moſt people, ſo Hypochondriacal perſons, and ſuch as are inclined to convulſions, feel the torment of it upon every light occaſion, yea ſometimes without any manifeſt cauſe. For thoſe in whom the Bowel nerves, and thoſe of the heart, are uſually beſet with morbifick [or diſeaſed matter] in ſo much that ſuch matter being moved through fulneſs or irritation, puts the ſpirits that inhabit thoſe parts and the parts adjacent very commonly into convulſions and inordinate contractions, it frequently happens, by reaſon that the nerves which are inſerted into the roots of the Heart-arteries, are affected by ſuch a cauſe, that the fibres alſo of theſe veſſels being put into convulſions and contracted, as I have told you, produce the palpitation of the heart. How the nerves of the heart are irritated or diſturbed by a near or remote cauſe, or by the morbifick matter that ſettles either in the head, near the original of the nerves, or in the parts about the heart or Hypochondria, and are put in ſeveral kinds of convulſions, I have elſewhere ſhewn; from whence the cauſes of the palpitation thereof, as often as it is convulſive, may be deduced.

The Cure of it.

As to the Cure of this Diſeaſe, ſeeing the Cauſes of it are many and various, the Cure thereof ought likewiſe to be performed different ways. For as to what ſome people ſay, that thoſe kinds of Remedies which being vulgarly called Cordials, are ſaid to refreſh the heart, and to afford ſtrength to it when it is out of order, are good in all theſe caſes, is not onely contrary to reaſon, but common experience alſo. Since therefore I have formerly declared, that the palpitation of the heart proceedeth either from the ill temper of the bloud, or indiſpoſition of the arteries belonging thereunto, and that I have touched upon both the ſeveral ways of their affecting the parts, it now remains, that I accommodate or apply to every ſort of this Diſtemper a proper Method of Phyſick, together with ſelect Receipts of Medicins.

By what means it is performed when the bloud is in fault.

1. Firſt therefore, if at any time this Diſeaſe proceeds from the illneſs of the bloud, the way to cure it will be chiefly to exalt or raiſe the bloud, which is too watery, and unapt to be heated, or put into a ferment, to a better temper, and to relieve or augment the active principles of it, which are depreſſed or weakened; to which end ſpirituous and ſalt Medicins of all ſorts, as alſo ſulphureous and eſpecially chalybeate ones, do conduce. Beſides which you may refer to this place ſuch remedies as are uſually preſcribed in the Greenſickneſs, Leucophlegmatia [or a Dropſie, cauſed by abundance of white phlegm] and the colder ſort of Scurvey.

An Electuary.

Take of Conſerve of Roman Wormwood, of the yellow rind of Oranges and Limons, each ℥ ij. *of Winters Bark pulverized* 3 ij. *of Species Diacurcumæ* ℥ j. *of Steel prepared with Sulphur* 3 iij. *of Salt of Wormwood* ℥ j. ℈. *with a convenient quantity of Syrup of Citron rind, and make an Electuary. The Doſe is the quantity of a Nutmeg in the morning and at 5 of the Clock in the afternoon, drinking thereupon of the following Julap* ℥ iij. *and walk about.*

A Julap.

Take of the Water of Cuckow-pintle Leaves one pint, and of Penny-royal, and Hyſſop, each ℥ iv. *of Water of Worms and of Snails, and of Aqua Mirabilis, each* ℥ j. *of Sugar* ℥ j. *mingle them and make a Julap.*

A Tincture.

Take of the Tincture of Antimony ℥ j. *The Doſe is from* 20 *to* 25 *drops twice a day, with the ſame Julap.*

To this place alſo may be referred the *Tincture or Syrup of Steel*, as likewiſe the *Elixir Proprietatis*, with many other Medicins.

How this Diſtemper, when it ariſeth from an obſtruction, ought to be dealt withal.

Secondly, The palpitation of the Heart ariſeth more frequent and much ſtronger from the Arteries thereunto belonging, which are indiſpoſed; and then their fault is either an Obſtruction or Convulſiveneſs.

The former of theſe two Diſtempers is moſt commonly continual, and many times incurable; but eſpecially if it be cauſed by a conſumption in the Lungs, or from the roots of the Arteries being half filled up or compreſſed by a ſmall bony ſwelling or excreſcence. Which ſort of cauſes, if at any time they happen to be ſuch, and can be perfectly extinguiſhed, it would be in vain to endeavour the removal of them; but

Phar. Rat. Part I.

but rather take care onely that eaſe be given to the Patient by ſleepy Medicins, and his life preſerved, though in miſery, a little longer.

But it is not improbable (as I juſt now hinted) that the Arteries may be for a great part filled up ſometimes by a polypous or corrupt matter that ſettles there, and is uſually generated within the cavity of the heart, and conſequently the free and total diſcharge of the bloud out of it hindered. But as I think the way to diſtinguiſh when it is ſo, is very difficult, ſo the cure of it is no leſs rare and unuſual. When you have any ſuſpition of ſuch a thing, ſaline Medicins ſeem to be of moſt uſe, and among them, ſuch chiefly as are impregnated with volatile or acid Salt: but you muſt not uſe them both together, but ſome time before try the latter, and then (if they do not do the buſineſs) apply the former.

Medicins made with volatile Salt.

Take of the Spirit of Sal Armeniack compounded, viz. *diſtilled with Woodlice, or other things that are good againſt an Aſthma* [*a Diſeaſe in the Lungs that ſtops the breath*] ℥ iij. *The Doſe is from* 15 *to* 20 *Drops thrice a day, with a Julap or Diſtilled Water that is proper. In the ſame manner you may try Spirit of Harts horn, Soot, Bloud, and Sculls.*

Such as have acid Salt for their ground or baſis.

Take of Sea Salt or Vitriol diſtilled, and often cohobated or rediſtilled with ſpirit of Wine impregnated with Pneumonick herbs [*or herbs good for the Lungs*] ℥ iij. *The Doſe is from* 15 *to* 20 *drops the ſame way. For theſe uſes Spirit of Tartar, of Guiacum, and of Box, are uſually prepared.*

The Cure of this Diſeaſe when it ariſes from convulſions in the Arteries.

3. The Palpitation of the Heart is oftentimes a convulſive Indiſpoſition, and is uſually produced from the like cauſe and manner of illneſs as other hypochondriacal or aſthmatical maladies are. The Cure whereof ought alſo to be attempted by Remedies that are good againſt Convulſions: but you muſt take care to make choice of them with ſome diſtinction, according as the Diſeaſe happens, either in an hot or a cold temperament of body.

In reſpect to the former, the following Medicins may be taken.

A Spirit.

Take of Spirit of Amber Armoniack ℥ iij. *The Doſe is from* 15 *to* 20 *drops twice a day, in the Julap, or diſtilled Water that is appropriated to it. In the ſame manner you may give Tincture of Tartar, Steel, or Antimony, at ſeveral times.*

Of the trembling of the Heart.

How the trembling of the Heart differs from the Palpitation of it.

The trembling of the Heart (which goes alſo under the name of the *Paſſio Cardiaca* [or Indiſpoſition of the Heart] is a diſtinct, nay a quite different Diſeaſe from the Palpitation of it. For in that, the fleſhy or moving fibres of the heart it ſelf onely ſeem to be affected, nor doth the cauſe of the Diſeaſe lie in the Bloud or the Arteries belonging to the Heart, as in this other Malady [of the Palpitation] it doth.

The Deſcription of it.

The trembling of the heart may be very well deſcribed to be a Convulſive twinging, or rather trepidation of the fleſh thereof; whereby the motive fibres make very quick, but abrupt, and as it were half turns of their ſyſtoles and diaſtoles, or contractions and dilatations, with great ſpeed, but contracted onely half way; ſo that the Bloud cannot be brought into the cavities of the heart, or carried out of them, but by exceeding ſmall portions.

The reaſon of this depends upon the doctrin of the Muſcles.

Seeing this Diſeaſe is a convulſive motion of a certain muſcle, to wit, the Heart, for the more full underſtanding of it we ſhould refer to this place all that I have elſewhere diſcourſed concerning the Motion of Muſcles, and likewiſe what I have ſaid of Convulſive Diſtempers. Nor will I be tedious in repetitions; onely obſerve in

The ſum of it.

one word, that every muſcle conſiſts of two tendons and a fleſhy belly; and that the contraction thereof is performed by the animal ſpirits leaping forth from the fibres of both thoſe tendons into the fleſhy ones, which whileſt they blow up, or inflate, and tumifie [or make to ſwell] they thereby ſhorten and contract them; but when that motion is over, the ſpirits return into the tendons, and the fleſhy fibres are relaxed, or ſlackened again.

Since the moving faculty is twofold, to wit, either voluntary, or meerly natural, in the former I obſerve that the ſpirits are called forth out of the tendons into the fleſhy fibres by the command of the Appetite, and that they remain within them in action, till by its order they are diſmiſſed; and then that they return into the tendons and are at quiet, till they are again commanded forth; ſo that the times of their motion and

and reſt are unequal, uncertain, and variouſly determined, according to our pleaſure.

In the mere natural way it is quite otherwiſe; for the animal Spirits are diſcharged out of the tendons into the fleſhy parts with a perpetual or conſtant reciprocation [or motion to and fro] and having made a ſhort contraction in them, flow back immediately out of theſe into thoſe, and ſo on the contrary: after which manner the heart it ſelf, the Arteries and Organs [or inſtruments] of reſpiration, yea the fleſhy fibres of the Stomach and the Guts alſo, (unleſs their objects are otherwiſe determined) are agitated [or moved] by perpetual Syſtoles and Diaſtoles [or Contractions and Dilatations.]

According to theſe ordinary courſes are the actions of both thoſe moving faculties performed. Which notwithſtanding, according as the animal Spirits, that are executors of ſuch motions, ſtand variouſly affected, are uſually perverted or diſturbed in ſeveral manners. For it is ſufficiently evident, that the inſtinct of every contractive motion, which is to be performed by any muſcle, is conveyed by the nerves from the Brain in general, or the Cerebellum [the hinder part of the Brain] according to the command of the appetite, or the neceſſity of nature; that is to ſay, the animal Spirits that are within the paſſages of the nerves, being excited according to the impreſſion made upon them from the head, and moved in their whole train, do preſently rouze up the others that inhabit in the tendons, and put them into the like motion; after the ſame manner almoſt, as if a man ſhould ſet fire to ſeveral heaps of Gunpowder at a diſtance with a lighted match. As long therefore as thoſe ſpirits, both at their original, to wit, within the Brain, and alſo in their conveyances, to wit, in the paſſages of the nerves, as likewiſe at the end, where they are planted within the tendons, are regular and orderly; the firſt of them form the inſtinct of [or inclination to] each motion; the ſecond convey it, and the third at laſt put it in execution: but if the ſpirits that are deſigned for motion, are preternaturally [or unuſually] affected in any part, and forced into diſorders, immediately thereupon convulſive motions are raiſed in the reſpective members or muſcles. After what manner through any morbifick cauſe, Convulſions happen near the original of the nerves in the head; and in what manner alſo, through its being ſetled within the nervous paſſages, they are cauſed elſewhere, I have at large declared in another place; that is to ſay, in as much as the ſpirits that flow within the nerves being irritated or diſturbed by ſome preternatural and vehement cauſe (and pierced as it were, or ſtung by a Breez or Gadfly, whileſt they run ſwiftly into theſe or thoſe parts) carry unnatural and falſe ſignals of ſuch motions, as are to be performed, it muſt of neceſſity follow, that there will happen contractions, or violent and convulſive diſtentions in ſome or others of the muſcles, or membranes. I have clearly laid down the ſeveral ſorts and true natures of theſe kinds of Indiſpoſitions in my Book called *Spaſmologia* [or a Treatiſe of Convulſions]; but yet, having there permitted ſomething that makes for our preſent purpoſe, I do here further obſerve, that there are other ſorts of Convulſions, which without any preſent or great indiſpoſition of the Brain or Nerves, ariſe chiefly and almoſt onely from the faultineſs of the animal ſpirits that are inhabitants in the very tendons themſelves.

The convulſive motions of Muſcles are explained,

And diſtinguiſhed.

Some private convulſions belonging to the Muſcles onely.

Of this ſingular, and as it were private Indiſpoſition, there are two ſorts that offer themſelves to our obſervation. The one is commonly known, wherein the ſpirits oftentimes without any command [from the appetite] guſh out of the tendons, and blowing up the fleſhy fibres ſtrongly, and with ſome diſturbance, do not quickly or eaſily retire. The other, though leſs notable, yet is frequently ſeen; that is to ſay, that in which the ſpirits of the muſcles cannot remain long either within the tendons or within the fleſh, but being exceſſively diſquieted, make excurſions and incurſions to and fro out of the one into the others, and contrariwiſe, very frequently, but weakly ſtill, and in diſorder, even againſt the inclination of the Appetite, or of Nature. Concerning theſe Convulſive Indiſpoſitions (becauſe as yet they remain almoſt untouched by moſt other Phyſicians, and the knowledge of them conduces very much to the explication of the Nature and Cauſes of the *Paſſio Cardiaca* [or Indiſpoſition of the Heart], I think it worth while here to ſubjoin ſome few words, though it be foreign to my deſign, and as it were, a digreſſion [*i.e.* going out of the way.]

Two ſorts of them.

The firſt Indiſpoſition of theſe two, which in Greek is properly called Τέτανος (and is uſually both in ours and the French Tongue, known by the name of the *Cramp*) ariſes moſt commonly from this, that the animal Spirits without any bidding, as it were, flow out of the tendons (one or both together) of their own accord into the belly of the muſcle, whence they do not commonly with any ſpeed return, but ſtaying a long time within the fleſh, blow up [or inflate] them very exceſſively, and make them extraordinary con-

Thar. Rat. Part I.

contractive; and then ſeeing the other muſcles do not either give way to theſe, or conſpire with them in their contraction, the part grows ſtiff, ſtrained with the greateſt pain that can be. The cauſe of this is a certain heterogeneous or ſtrange flatulent kind of matter, which deſcending through the nervous paſſages, together with the juice thereof, into the muſcles, and ſticking to the ſpirits, makes them elaſtical or ſpringy, and at the ſame time obſtinate too; in ſo much that they cannot be contained within the tendinous fibres, but deſiring greater ſpace to move, run out into the fleſh, and remain there till the tumour or ſwelling of them is allayed.

The latter is a kind of Trepidation in a Muſcle.

2. To that latter ſort of Convulſive Motion properly belongs the Paſſion or Trembling of the Heart. And to this place you may refer that Indiſpoſition which is vulgarly known, and familiar to a great many People; to wit, that ſometimes they feel very frequent and equal ſhootings or trepidations of any muſcle, ſuppoſe in the Lip, Cheek, Eyes, and other members: which when they have laſted perchance for two or three minutes, ceaſe of themſelves. It is not long ago ſince I was adviſed with, by Letters ſent hither out of *France*, in the caſe of a certain perſon of quality, whoſe Muſcles were all almoſt perpetually throughout his whole body in ſuch a trembling condition; in ſo much that the outward part of his fleſh leaped up, as it were, on every ſide, and did exactly imitate the vibrations or pulſes of the heart.

The true reaſon of it.

The true nature of theſe Indiſpoſitions as well as of the Trembling in the heart, ſeemeth to conſiſt in this, that the animal Spirits belonging to any muſcle, being diſturbed, and as it were, ſet on gadding, guſh forth continually out of the tendons into the fleſh, and then return, perpetually repeating their excurſions and incurſions to and fro; in the mean time when they go forth with onely ſmall forces, ſo as not fully to blow up the fibres, and that they ſtay but a very ſmall while in them, they cauſe endeavours to move, which though they are extraordinary frequent, yet they are but weak and very little; in ſo much that the members and limbs are not moved from place to place, but the muſcles being ſo perpetually agitated, and the heart, whileſt the trembling thereof remains, though it be ſwiftly concuſſed or ſhaken, yet can ſcarcely or not at all drive about the bloud; as plainly appears from the ſmalneſs, and as it were, trembling of the Pulſe, and a faintneſs in all the parts.

Their Cauſes.

As to the cauſes of theſe Diſtempers, that is to ſay, the conjunct or immediate and the original cauſes from whence the ſpirits in the muſcles grow ſo unſteddy, or gain that deſultory [or unconſtant] quality, it ſeems, that ſome heterogeneous and elaſtical matter that is tranſmitted through the Brain and the nervous paſſages, is at laſt diſcharged into the muſcles and their tendinous extremities; where, growing or ſticking preſently to the ſpirits, it irritates them exceedingly, and ſets them as it were a madding, ſo that they cannot reſt in any one place, but run to and fro continually, and in the mean time either omit, or do not ſtrenuouſly perform their due offices.

It is not rightly imputed to the Spleen.

The cauſe of the Trembling in the Heart, is commonly imputed to the Spleen; for it is commonly ſuppoſed, that from this the Entrals being obſtructed, or otherwiſe out of order, ill vapours are raiſed to the Heart; which ſmiting of it, compel it to ſhake and tremble in that manner, yea make it ſtiff, as it were, with cold. The belief, or at leaſt the probability of this opinion is built upon this, that hypochondriacal (or which is almoſt the ſame thing, ſplenetick) perſons are very ſubject to this Diſeaſe of the Heart. What and how great the influence of the Spleen is upon the Heart, I have formerly and largely declared. From which, and partly from what I have juſt now ſaid, it ſufficiently appears, that that opinion, though never ſo commonly received, concerning the Hearts being affected or diſturbed by vapours, is a trifling one, and altogether erroneous. But whereas thoſe that are taken commonly for ſplenetick and likewiſe hyſterical people, are ſo commonly troubled with the trembling of the Heart, the cauſe is from that great affinity and intimate communication which there is between the bowel nerves and thoſe of the Heart; in ſo much that not onely the diſturbance of one part makes the other ſympathize or conſent with it, but if at any time the convulſive matter gets into the branches of the nerves that belong to the Spleen or Bowels of the loweſt Belly, it ſeldom happens but that it ſeizes alſo upon the nerves belonging to the Heart.

The Heart is not diſturbed by Vapours.

The Cure.

As to the way of curing this Trembling in the Heart, ſince it is a Diſtemper meerly convulſive, for that reaſon, not cordial Remedies, but rather cephalick ones (or ſuch as affect the head and nerves) are moſt proper; which notwithſtanding ought to be either hotter or colder, or ſometimes of one and ſometimes of another nature, according to the temper and conſtitution of the Patient. To make ſhort of the matter, ſeeing three ſorts of Remedies are uſually moſt beneficial in this Diſtemper, to wit, ſuch as are made of Shells, of Steel, or impregnated with volatile Salt, I will lay down in this place ſome Receipts, and the ways to uſe each of them.

First

First therefore when you have made proviſion by ſuch things as purge the whole body, and made a choice of ſuch Phyſick as ſeems of moſt uſe to you, preſcribe in manner following. *Phar. Rat.* Part I.

Take of Coral prepared and of Pearl, each ʒ ij. *of both ſorts of Bezoar, each* ʒ ß. *of the whiteſt Amber* ℈ ij. *of Ambergriſe* ℈ j. *make a Powder. The Doſe is* ʒ ß. *twice or thrice a day, with Diſtilled Water, or the Julap appropriated for it.* — *Powders.*

Take of Powder of Claws compounded ʒ ij. *of Powder of the roots of the male Pæony, and of dead mans Scull prepared, each* ʒ j. *of the Flowers of the male Peony and of Lilly of the Valley, each* ʒ ß. *make a Powder, to be taken the ſame way.*

Take of Ivory and red Coral pulverized, each ʒ iij. *of Species Diambræ* ʒ j. *of the whiteſt Sugar diſſolved in a convenient quantity of Orange-flower Water, and baked into Tablets* ʒ vij. *Make, according to Art, the weight of each Tablet* ʒ ß. *and let the Party eat one or two ſeveral times in a day, when he will.* — *Tablets.*

Take of the Conſerve of Flowers of Lilly of the Valley ʒ vj. *of Powder of Coral prepared, of Pearl, Ivory, and Crabs eyes, each* ʒ j. ß. *of Vitriol of Mars* ʒ j. *a convenient quantity of Syrup of Coral, and make an Electuary. The Doſe is from* ʒ j. *to* ʒ ij. *twice a day, drinking thereupon a draught of the following Julap.* — *An Electuary.*

Take of Orange-flower Water, and of a whole Citron, each ʒ vj. *of the rinds of Oranges, diſtilled with Wine* ʒ ij. *of Sugar* ʒ ß. *and make a Julap.* — *A Julap.*

Take of my Syrup of Steel ʒ vj. *The Doſe is one ſpoonful in the morning, and at five of the Clock in the afternoon, with* ʒ ij. *of the preſcribed Julap, without the Sugar, or with diſtilled Water.* — *Syrup.*

Take of the Powder of Ivory and Coral, each ʒ ij. ß. *of Species Diambræ* ʒ j. *of Salt of Steel* ʒ ij. *of Sugar* ʒ viij. *of Ambergriſe diſſolved* ℈ ß. *and make the weight of each Tablet* ʒ ß. *The Doſe is* ʒ iij. *or* iv. *twice a day.* — *Tablets.*

Take of freſh Strawberries viij. *pints, the outward rinds of* 12 *Oranges, of the filing of new Iron* ℔ ß. *and when you have bruiſed them together, pour to them of white Wine* viij. *pints. Take of ſpirit of Harts horn, or Bloud, or the like, ʒ iij. *The Doſe is* 20 *drops twice a day, with a convenient vehicle.* — *A Spirit.*

Take of the Flower of Sal Armoniack, and of Coral prepared, each ʒ ij. *The Doſe is* ℈ j. *twice a day.* — *Powders.*

Take of Chryſtal Mineral ʒ ij. *of Salt of Amber* ʒ j. *of Salt of Harts horn* ℈ j. *mingle them. The Doſe is from* xv. *to* xx. gr. *twice a day with Diſtilled Water.*

Of an intermitting Pulſe, or ſuch a Pulſe as beats ſometimes, and then leaves off.

Among the Diſtempers of the Heart may be reckoned alſo an Intermitting Pulſe, and that very reaſonably; becauſe in this Malady, or at leaſt in ſome ſort of it, the Heart it ſelf is put into a diſorder, though in a manner ſomewhat different from what it is in the palpitation or trembling of it: for in theſe it is ill and irregular in reſpect of its motion, but in that it labours even in its reſt: for this ſometimes is twice as long, as according to its ordinary courſe it uſes to be.

Concerning this Diſtemper we muſt firſt diſtinguiſh; becauſe there are (if I am not much miſtaken) too different reaſons of it. For though ſometimes the Pulſe intermitteth, becauſe the Heart, for that time, ceaſes to move; yet furthermore you may perceive by your feeling that the Pulſe ſeems ſometimes in the wriſt to intermit, whileſt the Heart may be felt to beat very ſwiftly and inceſſantly in the Breaſt; as is evident in the trembling of it. The reaſon of which I take to be, becauſe when that Diſtemper of the Heart comes upon it, there is but a very ſmall portion of the Bloud is thrown forth into the Aorta at every Syſtole or Contraction. Wherefore when that is emptied and grows lank, as wanting its due meaſure which it ſhould drive *Two ſorts of intermitting Pulſes.* *The firſt, which happens by default of the Aorta.*

Phar. Rat. Part I.

forward, left it ſhould trouble it ſelf too often to no purpoſe, it ſometimes intermits its contraction. This ſeems juſt like the disburdening, or (as the Seamen ſay) unlivering of a Ship; for when the Commodities in the Cargo are with difficulty and very hardly unloaded, the Porters that are to carry them away, eſcape ſome turns of going to and fro. Moreover in malignant or mortal Fevers, if the Pulſe at any time be thick and weak, it likewiſe now and then intermits. The reaſon of which is, not that the heart ſometimes ceaſes to move, (for even at that time eſpecially it labours continually) but for as much as the bloud is not poured forth in a ſufficient quantity into the Aorta, that Artery wanting work enough to imploy it, is ſometimes idle.

The ſecond, which proceeds from the heart it ſelf.

But beſides this, the Pulſe ſometimes intermits, becauſe the contraction of the heart it ſelf is for ſuch a time ſuſpended, and the pauſe or reſt of it is twice as long as it ſhould be; which any man may eaſily perceive either in himſelf or any other perſon, by laying his hand upon his own or their Breaſt, yea thoſe that are troubled with it, are very ſenſible in themſelves, by the pain and oppreſſion of their breaſt, how often the heart ceaſes to move. Beſides, this Diſtemper doth not commonly invade your languiſhing, dying, or dangerouſly ſick People, ſo much as it does thoſe that are very hearty, and for the moſt part well in health: wherefore it ought not always (according to the vulgar opinion) to be taken for a Diſeaſe, or a very dangerous and fatal Symptom. Thoſe that are ſubject to this Diſtemper are uſually troubled alſo with a Dizzineſs, Headach, or Convulſions. But this defect of the Heart is in its nature very various; for the periods of its intermiſſions are ſometimes certain, and determined to ſome one beat of the Pulſe (ſuppoſe) the third, fourth, fifth, or any other, ſooner or later; and ſometimes they are uncertain and fleeting, ſo that the ceſſation happens one while after fewer, and another time after more pulſations. The vibrations of the Artery whileſt they are continued, are ſtrong and brisk enough, and are for the moſt part equal; but ſometimes the firſt beat after the intermiſſion is the greateſt, that which is next, a little leſſer, and ſo they grow leſs and leſs inſenſibly, till the intermiſſion comes again; and then afterwards, a great beat at the beginning deſcends, as it were, by ſteps into a ceſſation again.

But is not always an ill token.

Several ſorts of it.

I have known ſome People that (as far as I could perceive by my obſervation) had an intermitting Pulſe continually, in ſo much that whenſoever I touched the Artery, I found it ſo, and yet in the mean time they ſeemed healthful enough, and complained of no other ailment: but I have obſerved ſome others that had a Pulſe, more ſlow than uſual, and intermitting, onely when a grievous Headach or ſome great pain in that part was either upon them or a coming.

The cauſe of it.

From hence I ſuppoſe it is manifeſt, that the cauſe or true reaſon of the Diſtemper juſt deſcribed, depends not upon the mixture or temper of the bloud, but onely upon the irregular conveyance of the animal Spirits out of the Brain into the Nerves belonging to the Heart, and thence into the tendons thereof. For we may well ſuppoſe, when thoſe nerves are ſomewhat obſtructed, that the animal Spirits do not come down with ſo full a tide or ſtream as they ſhould do, into the tendons of this Muſcle; wherefore when the ſtock of them is ſomewhat deficient, the motion of the heart ceaſes ever and anon for one beat, till the ſupplies of ſpirits being reinforced, its action may be renewed: ſo I have ſeen a Mill that was driven about with a ſmall ſtream, when the Water falls ſometimes and is almoſt exhauſted, ſtop for a little while; and then again, when the ſtream riſes, immediately repeat its rounds, and go again.

The way to know, when it is coming.

Thoſe whoſe pulſe, though in it ſelf great and ſtrong enough, is uſed to intermit, are not onely ſubject to Headachs and Dizzineſs, but moſt commonly to the *Incubus* or Nightmare [a Diſeaſe ſo called] and ſometimes alſo to the Apoplexy. For if it happen, that the Nerves belonging to the Heart, which before hand are not open and free enough, are afterward wholly obſtructed or ſtopped up, it follows of conſequence, that the heart (which is the chief agent) being rendered immoveable, that the fabrick of an animate Body muſt wholly ceaſe to move, and for that reaſon, to live.

The Cure of it.

Though this Diſtemper hath oftentimes no preſent inconvenience or danger in it, and therefore doth ſtand in need of too ſpeedy a Cure; yet for preſervations ſake, and to prevent worſe Diſtempers, ſome Remedies and a Method ought to be uſed in order to its Cure, at leaſt it will be convenient that in all the remaining part of a mans life, he take a care to keep a regular way of Diet: and beſides that, ſome ſmall courſe of Phyſick, which muſt be conſtantly obſerved in the Autumn, is very requiſit: that is to ſay, that as much as is poſſible, all the Seeds of Diſeaſes that are ſown in the Brain, or apt to be generated there, muſt be removed or prevented. To this end I refer you to that cautionary Method, with the Remedies againſt the aſſaults of an Apoplexy, which I have elſewhere preſcribed.

The

Phar. Rat. Part I.

The Anatomical Deſcription of an Artery.

Becauſe I have formerly told you that ſome Diſtempers, commonly taken for Indiſpoſitions of the Heart, proceed rather from the Arteries than the Hearts being affected; and that the diſorders of the bloud, which are uſually cauſed upon the diſturbances of mind, ariſe from the irregular contraction of thoſe veſſels; I therefore in this place think it ſuitable and worth the while to give you a brief Anatomical Deſcription not onely of Arteries in general, but eſpecially of thoſe that belong more immediately to the Heart, together with their uſes and offices; and that the rather, becauſe though the Ancient Phyſicians have diſcourſed very largely upon theſe veſſels, yet the New or Modern Doctors, attributing the whole circulation of the Bloud in a manner onely to the heart, have been very little concerned about the Arteries.

The coats of an Artery according to Gallen.

Firſt therefore, to recount to you what the Ancients have ſaid, *Galen* in his Seventh Book of Anatomy *Chap.* 5. ſays that every Artery conſiſts of two coats, to which (ſays he) we may add a third and a fourth. Again in his Third Book of Natural Faculties, *Chap.* 11. he ſaith, that Arteries have coats, as the Stomach hath, and that the inner coat hath long and oblique fibres, but the outward coat tranſverſe ones. How and with what agreement to his words the thing appears to my obſervation, I ſhall now briefly ſhew you.

The way to go about it.

To perform this enterprize aright, take out a portion of the great Artery or the Aorta either of a Man or an Ox, which when you have drawn upon a ſtick (upon which it may be kept at full ſtretch) dip it ſeveral times in boyling hot water, ſo the tunicks or coats and fibres being ſomewhat contracted and more ſwollen, may be the better diſtinguiſhed and plucked aſunder; then, when you have made a ſeparation of them with a knife, you will ſee four ſeveral coats. The outmoſt of them being thin and nervous ſerves for a covering to the whole veſſel, and hath on its outſide many nervy branches, that creep about it every way; but in the inner ſurface it is covered with a texture or web, as it were, of all ſorts, but eſpecially bloud-veſſels, reſembling a Net, and very thick all over. The Arteries aſcending originally from the *Vaſa Coronaria*, and then on every ſide from the trunk of the Aorta and the branches thereof, are ramified [or branched] in this coat, together with the veins that are ſent forth from the *Vena Cava*, and the arms or branches of it. Moreover the ſprouts of the Nerves which meet with them both are variouſly complicated; and by that means, being all woven, one in another, they make a kind of Net, which covers the Pipe of the Artery all over; out of which exceeding ſmall ſprouts, of each kind of Veſſels, are propagated into the other coats of the great Arteries that lie under.

It hath four coats.

The deſcription of the outmoſt and inmoſt.

The ſecond is glandulous.

2. After this Net-like coat comes another, which is glandulous, or rather that other ſticks cloſe to this which lies upon it. This membrane being all over full of ſmall white glandules, is juſt of the ſame nature as the inner glandulous coat of the Stomach and Guts, which lies under the hairy veil, on the backſide of which there is alſo a plat or complication of Nerves in form of a Net.

The third is fibrous and muſcular.

3. In the third place there is a muſcular or fibrous Coat; that is to ſay, which is made of tranſverſe or annular fibres joined very cloſe together. Theſe fibres being fleſhy and deſigned for motion, encompaſs the body of the Artery, not in a ſingle and thin row, as they are laid in the Vein-coat, but in a kind of heap, placed one upon another, they make a very thick skin. The heaps or ranks of them, in a par-boyled Artery, may be very eaſily ſeparated, and plucked from each other; and they ſeem (juſt like thoſe of the Stomach and Guts, that I formerly deſcribed) fleſhy and deſigned for motion.

The fourth is nervous and hath ſtrait fibres.

The fourth and inner coat of an Artery, which inveſteth the hollow of it, and covers the coat that lies under it, is thin and almoſt onely membranous. The ſmall fibres of it being nervous and ſtretched out lengthwiſe, cut the annular fibres at right angles, and I ſuppoſe that theſe are the ſtraight fibres, of which *Galen* and other Anatomiſts ſo often make mention: but thoſe that they call oblique ones, I am of opinion were onely imaginary, becauſe we cannot find them any where in this veſſel. But it is evident that this errour is very common among ſome Phyſicians, to aſſign, in moſt of the *Viſcera* or Entrals and membranous parts, ſtrait, tranſverſe, and oblique fibres, out of a falſe ſuppoſition, that in every one of them there was an attractive, retentive, and expulſive faculty, and that the fibres of thoſe three ſeveral ſorts did perform theſe three offices; all which, to any one, that narrowly looks into it, will appear to be falſly concluded and ſaid *gratis*. In the mean time I ſo far agree with *Galen*, that I acknowledge, there are four coats in an Artery, and that they are in this veſſel juſt as they are in the ſtomach; except onely that in the *Viſcera* or Entrals, the Net-like

Phar. Rat. Part I.

complication of Veſſels, together with the glandulous coat, is placed under the fibrous or muſcular coat, but in the artery above it.

The uſe of the Coats.

So much for the make of an Artery in general and the conſtitutive parts thereof: as to their offices, it ſeems to me, that the muſcular coat, which is furniſhed with fleſhy, round fibres, is of moſt principal uſe and operation. For this, as I hinted before, obeying the motion of the heart, in driving the bloud about, obſerves its conſtant turns of Syſtole and Diaſtole, or Contraction and Dilatation; for whileſt the fleſhy fibres of it are ſucceſſively and with wonderful celerity compreſſed behind the ſtream of the Bloud, the courſe thereof muſt of neceſſity be moſt rapidly performed, from the heart to the ends of the Arteries.

It is fibrous, that it may make its Syſtole and Diaſtole.

The other coats are made for the uſe of this.

As for the other coats and the veſſels diſtributed about them, they ſeem all to be deſigned for the ſole convenience and uſe of the muſcular coat. For firſt the nerves and their branches, being diſſeminated all over the trunk of the Aorta and the greater arms thereof, appear on the outſide, and according to their uſual manner, carry ſupplies of ſpirits into the fleſhy and moving fibres that are under, whereby to make them able to undergo the task of their Contractions or Syſtoles; and likewiſe convey to them the inſtincts or impreſſions of ſympathetical contractions, as I before demonſtrated. Then the leſſer arteries (which are the next in order) that cover the inner ſurface of the outmoſt coat very thick, perform a double duty toward the muſcular coat that lies under them, as other arteries do to other muſcles and ſolid parts: that is to ſay, they convey and bring the nutritive juice wherewith they are nouriſhed and grow, and the elaſtical particles for the continual ſupply of the ſpirits; and then the veins, which are yoke-fellows to the arteries, carry back all the bloud that is not beſtowed another way.

But whereas theſe bloud veſſels which are planted without the muſcular coat, and complicated one among another, make up a net-like Plat or Web, from which there go only very ſmall and ſlender ſprouts (as it is alſo in the Stomach and Guts) though in moſt other muſcles theſe veſſels are interwoven with the fleſhy fibres, and therefore make them look red; the reaſon of this difference ſeems to be, becauſe it is convenient that the bloud-veſſels ſhould be placed a little apart from the moving fibres of the Aorta and the Viſcera, at ſome ſmall diſtance, leſt peradventure the bloud running through them too copiouſly, ſhould be ſometime or other obſtructed, and thereby cauſe an inflammation, or an abſceſs, which is preſent death. Wherefore for the greater ſecurity againſt ſuch an accident, the glandulous coat ſticks always faſt to the net-like complication of thoſe veſſels; to the end, that the ſuperfluous ſeroſities [or ſerous, wheyiſh parts] which come out of the Nerves as well as Arteries, and are not immediately carried back by the veins, may be preſently received in thoſe innumerable glandules, and kept there till they are returned into the bloud, leſt they ſhould run into the moving fibres and put them into convulſions.

The uſe of the glandulous coat.

In an artery the Plat of Veſſels above the muſcular coat is otherwiſe than in the Viſcera or Entrals; and the reaſon of it.

But whereas the net-like Plat or complication of the veſſels and the glandulous coat that ſticks to it, is in the Aorta, placed above the muſcular coat, and in the Viſcera, below it; the reaſon, if I miſtake not, is this, to wit, that thoſe little veſſels which ought to ſupply bloud and juice very gently and moderately, may be removed to a diſtance from the heat and violence of that bloudy torrent within the Aorta, as much as poſſible. But in the Stomach and the Guts, there is a neceſſity for the aforeſaid heat of the bloud, in order to the right performance of the offices of concoction.

The uſe of the inward coat.

The inward coat of the Aorta that inveſteth the cavity thereof, ſeems chiefly to be deſigned for theſe uſes, to wit, to cover the channel of bloud on the inſide, and bound the other parts of this veſſel: but beſides that, it will be neceſſary to grant that it hath ſomething of ſenſe, and perchance of motion too. For being furniſhed with nervous fibres, it is affected like the cavity of the heart, by the bloud that paſſeth through it; and therefore according to the perception of this part, the muſcular coat is put upon quicker or ſlower, equal or unequal motions of ſyſtole and diaſtole. Moreover this coat hath, near the heart, for the ſpace of about two inches ſtrait or larger fibres that run lengthwiſe, and are as it were fleſhy, in ſo much that I ſuppoſe, in this place, the Artery (in order to a greater impulſe or forcing of the bloud) is compreſſed and ſtreightned behind the ſtream of bloud, not onely in breadth, but (as it is in the heart) that at every ſyſtole it is ſomewhat contracted and ſhortened in its length too.

I could add in this place a great deal more, no leſs profitable than pleaſant, concerning the ſtructure and uſes of this Veſſel; for every part or portion of an animate body, though never ſo little, affords ſuch fruitful and copious contemplation, that the Theory or Speculation of any one of them, if fully attended unto, would fill many pages, yea a whole volume. If I ſhould go on in this Digreſſion, I ſhould Treat in the

the next place concerning a Vein; but omitting the conſideration of that (ſeeing it makes little or nothing toward the explication of the reaſon of Phyſick or Pharmacy) let us paſs on to the other ſort of Medicins, called *Hypnoticks*, [or ſleepy Medicins.] *Phar. Rat.* Part I.

SECT. VII.

CHAP. I.

Of Opiates, or ſuch Medicins as make a Man ſleep.

AFter Medicins that are Cordials, Hypnoticks [or ſleepy Medicins] ſucceed according to the order of Method. For Sleep, when it comes upon one moderately and ſeaſonably, is in it ſelf the moſt cordial remedy. But this diſpoſition [to ſleep] is not uſed to overtake a man either always when, nor as it ought to do, but oftentimes diſorders us either by its unwelcome preſence, or by its too long abſence. By the right rule of Nature, Sleep and Watching ought, like *Caſtor* and *Pollux*, to give place to each other, and change turns, according to the juſt limits of their reign. This viciſſitude, as long as it is well obſerved, conduces very much not onely to the preſervation of health, but to the improvement of the faculties of our minds. But if the dominion of either be too long continued, it thereupon immediately ceaſes to be poſſible, *ut ſit mens ſana in corpore ſano, i.e.* for our mind and body to be both in health. Through immoderate ſleep, all the faculties both our natural and animal functions grow very dull, in ſo much that thereby a man becomes more fit for his Grave than Humane ſociety. On the contrary, long watching waſteth the ſtrength of a man, and either weakeneth or perverteth the powers of Life. Wherefore among ſuch Remedies as are ſuitable to our wants, the wiſe Creator hath abundantly provided for our neceſſities; to wit, that it ſhould be in our own power to cauſe or repel ſleep or watchfulneſs as often as we think it convenient; or if they be offenſive at any time either in defect or exceſs, to moderate them. What Medicins (and by what manners of operation in humane bodies, they) uſe to procure theſe wiſhed effects, lies now upon me to ſhew you; and firſt of all, I ſhall ſpeak of Opiates, or ſuch Medicins as cauſe ſleep.

The viciſſitude of Sleep and Watching is neceſſary to the preſervation of health.

That you may the better underſtand what Hypnotick or ſleepy Medicins do, and with what kind of operation upon the brain, animal ſpirits, and other parts, they procure ſleep, I ſhould repeat in this place, what I have elſewhere at large diſcourſed concerning the nature, ſubject, cauſes, and effects of ſleep. For I have demonſtrated the immediate ſubject of ſleep are the animal ſpirits, not all of them, but onely ſuch as inhabit the Brain and the Nerves, which are an appendage to it: that is to ſay, thoſe which perform the duties of all the ſenſes, and every ſort of ſpontaneous or voluntary motion; always excepting thoſe that ſerve onely to execute the neceſſary orders of meer Nature and Life.

In my Treatiſe of the Brain.

Having therefore premiſed theſe things, we muſt enquire concerning Opiates, firſt of all how they work upon the animal ſpirits, ſo that by the influence, as it were, of ſuch a Medicin, they immediately ſink and lie down, as if they were bound in Fetters, neglectful of their ſeveral offices. Secondly, We muſt ſhew in what part ſleepy Medicins begin their operation; that is to ſay, whether in the Stomach, or the Brain, or whether they do it together, or ſucceſſively in both. Thirdly, We muſt determine how far Opiates extend their operations, whether to the ſpirits of the Brain onely, and thoſe that are inhabitants of its appendages as being the onely ones that are capable of natural ſleep; or whether they reach alſo to others belonging to the Cerebellum [or hinder part of the Brain] and thoſe that rule in thoſe Regions. Fourthly and laſtly, It will be worth our while to add ſome notable effects and accidents, together with the natural account of Hypnoticks.

There are four things to be inquired into, concerning the nature of Opiates.

1. As to the firſt of theſe, that is to ſay, that it may appear how Opiates work upon the animal ſpirits whileſt they lay them to ſleep, I have given my opinion largely in another place; and I have reaſon to believe, that they do not exert their force, by raiſing vapours into the head, nor opening the pores of the Brain, in order to admit any vaporous or otherwiſe ſoporiferous matter, but onely by deadning or defeating

1. How Opiates work upon the animal ſpirits.

ſome

Phar. Rat. Part I.

ſome of the animal ſpirits, ſo that the reſt, being either in a conſternation, or forced inward, or at leaſt recalled from their uſual efflux [*i. e.* flowing out] into the nervous parts, may forſake their functions, or for a time remit their labour. Now that it is ſo is very evident, becauſe Narcoticks [or drowzy Phyſick] if taken in a Doſe too big, are mortal, for as much as in ſo great a quantity they overpower the ſpirits, and make it impoſſible for the vital functions to be performed. But when they are given in a due quantity, and with all circumſtances accordingly, they reſtrain the exceſſes of the ſenſitive ſoul, in as much as that they conquer and ſubdue ſome of the animal ſpirits, and totally deſtroy the reſt: by which means the ſoul being more contracted, and retiring, as it were, into it ſelf, lies down in quiet, juſt almoſt in the ſame manner as throwing Water upon a Fire that breaks vehemently out, immediately beats down the aſpiring flame, and brings it within moderate bounds.

In what ſort of particles their virtue conſiſteth

But if it be inquired farther, in what ſort of matter, and how diſpoſed, the Narcotick virtue of a Medicin conſiſts? No manifeſt quality, in this caſe, as of cold, heat, or any other kind, muſt be pretended; nor ought we preſently to fly to I know not what occult ones. A man may ſuppoſe, that Opiates conſiſt of ſuch particles as are moſt diſagreeable to the animal ſpirits, and are extinguiſhers or rather poiſons to them. It will not be eaſie to determine of what nature, or make, the contrary particles of both ſorts are, becauſe they are not perceptible to ſenſe, nor does the analogy or proportion of particles ſo oppoſite appear in any other ſubjects. But (that we venture to gueſs) I am of opinion, that ſeeing the animal ſpirits are very ſubtle bodies, compoſed of a ſpirit and a volatile ſalt, both joined together and highly exalted, the Opiates, on the contrary, are made of a ſtinking ſulphur, that is, of ſulphur united with fixed ſalt and earthy matter, raiſed to a violent degree; which kind of compoſitions, it is well known, are ſuch great enemies to the ſubtle texture of the animal ſpirits, that ſometimes at a diſtance, by meer emanations that flow out of them, though not perceivable to the ſmell, they overpower them; but their particles (when they are inwardly taken) being diffuſed through the bloud and nervous juice, poiſon, and as it were, defeat or ſlay ſome troops of the animal forces where ever they meet them. But in what places this is chiefly and primarily performed, comes now in the next place to be the ſubject of our enquiry.

In what places Opiates work primarily and chiefly.

2. When I formerly treated of Sleep, I ſhewed that this diſpoſition, according to the ordinary courſe of Nature, begins from the *Cortex* or outſide of the Brain; that is, that the ſpirits which inhabit there and keep guard, as it were, in the outmoſt confines of it, do firſt retire, and laying down their Arms, lie idle; and then immediately that all the reſt, who have the ſame leiſure, do in like manner reſt themſelves and fall aſleep.

Firſt, In the Cortex, or outpart of the brain

Thoſe firſt ſpirits, when they are going to reſt, forſake their ſtations, and either becauſe they are wearied, and weakned as to their forces, ſpontaneouſly relinquiſh their Poſts till ſuch time as they are recruited; or becauſe they are beaten thence, or becauſe they are enticed inwardly by ſome allurement. The firſt of theſe happens ordinarily every day, through the influx or inundation of the nervous juice and ſometimes of the ſerous liquor. For thoſe humours being poured out of the bloud (when it is full) which runs through the outmoſt borders of the Brain into the cortical or exteriour part thereof, fill all the pores and paſſages, and conſequently reſtrain the ſpirits, and hinder them of their free expanſion, whereby they grow watchful. The reaſons why, and the manner how all theſe things come to paſs, I have already declared at large, in another Treatiſe: from which, when they are well conſidered, it will be rational to ſuppoſe, that the particles of every Opiate, after it is taken, when they are tranſmitted into the bloud, and have circulated with it, do exert their drowſie quality moſt chiefly upon the *Cortex* [or, as it were, the Bark of the Brain,] that is to ſay, that they in this place meet with the firſt party of animal ſpirits, and that they defeat, or rather deſtroy a great many of them that are in the forlorn hope; by which means afterward the remaining ſpirits of the ſame troop, being now grown weaker, retreat, and ſeeing their emanation is ſtopt, fly back toward the middle of the Brain; and whileſt theſe thus withdraw themſelves from the Battle and march off, all the reſt that are placed in the organs of ſenſe, as it were in ſo many Watch-Towers, having loſt their recruits, ſtrait follow them, and leaving their Guard, retire to take their reſt.

When they kill the outmoſt ſpirits, they make the next to them retire.

They leſſen or recall the afflux of them to the nervous parts.

In this manner the particles of Opiates cauſe ſleep, in as much as they defeat and deſtroy ſome animal ſpirits that ſtand in the front of the Battle, near the cortex of the Brain, and by that means repel all that are near them, putting them ſo to flight, that the influx of them into the ſenſes is ſuſpended: but by what means, and that ſometimes in ſo ſhort a time (as now and then it falls out) to wit, preſently after the Medicin

dicin is taken, and ſcarce yet diſſolved in the ſtomach, ſleep creeps upon a man (ſince one would think it ſhould require ſome time for the ſleepy particles to be conveyed from the ſtomach to the bloud, and afterward by way of that into the brain) is not eaſie to determine. To this I anſwer, Firſt, That the way from the ſtomach through the bloud to the forepart of the head is eaſie enough, and may be gone over in a little time; but beſides that, I am induced to think, that Opiates ſometimes, by working more immediately upon the ſtomach, and by the meer contact thereof, before they have any commerce with the bloud, do in ſome meaſure invite us to ſleep. Among the evident cauſes of this effect I have elſewhere juſtly aſſigned, oppreſſion of the ſtomach: For how many are there that grow immediately aſleepy by eating groſs meats that are hard of concoction and diſturb or over-burden the ſtomach? The reaſon of which ſeems to be, that ſeeing there is a very near relation and intimate ſympathy between the ſpirits of the ſtomach and thoſe of the brain, in ſo much that each of them mutually bear the afflictions and misfortunes of the other (which is eaſie enough to be made out by many and many inſtances) from hence it eaſily comes to paſs, that through the extreme oppreſſion of thoſe ſpirits which preſide in the ſtomach (in that they are hindred, and as it were repelled from their free expanſion) immediately the ſubſtance of the whole ſoul (and eſpecially that moſt principal part which governs the brain) is at the ſame time contracted, furls its ſails and ſubmits it ſelf wholly to the yoke of ſleep. How much more reaſon have we to ſuppoſe, that when ever the ſpirits of the ſtomach, imbibing the opiate juice, are poiſoned and deſtroyed in great numbers, that immediately all thoſe which keep guard about the Brain, are quite defeated, and oppreſſed with ſleep, which is not onely the image of death, but ſometimes alſo the ſame thing as death it ſelf? Indeed I have elſewhere related a ſtory concerning ſuch an effect as this from the taking of *Opium*, which is very true, though very ſtrange; that is, of a certain ſtrong man pretty well in health, who having taken too great a doſe of *Laudanum*, to eaſe him of the pain of the Colick, complained immediately of an intolerable oppreſſion in his ſtomach, and a dizzineſs or drowſineſs, and within twenty four hours died; nor did he fall into any ſleep before he took his laſt.

Phar. Rat. Part I.

The reaſon of it.

Theſe are the chiefeſt and moſt uſual places (that is to ſay, the Stomach and the cortex of the Brain) in which Opiates, by exerciſing their virtues begin or end their invitations to ſleep. But beſides theſe, it is apparent from common obſervation, that when they are given ſeveral other ways, they imprint a kind of drowſineſs upon the whole ſenſitive ſoul, or upon ſome portion of it, which is naturally and ordinarily capable of ſleep. A plaiſter of *Opium* applied to the forehead, and likewiſe a Cliſter impregnated with the diſſolution of it, cauſe ſleep. The like effect ſome have found, to their ſorrow, by putting it into an hollow tooth or into their noſtrils; ſo that it is evident, this Medicin, when ever it can be admitted to the animal ſpirits, deſtroys the next of them that come to hand by mere contact: and that ſometimes to ſuch a degree, that there enſues upon it a contraction or dejection of the whole ſoul (which is as it were put into a commotion) and an eclipſe or fainting of all the principal faculties: not but that it is alſo very likely that ſome particles of the *Opium* are conveyed out of thoſe places through the bloud into the cortex of the brain.

3. Having already pointed out the Arms of Opiates, by which they execute their baneful effects, and the Scenes where they primarily or chiefly act their Tragedies; it comes next before us, to inquire concerning the ſphere of their activity; that is to ſay, upon what particles or parts of our bodies they work, and how far they extend their virtues into them. For what hath been ſaid it is plain enough that they work upon the animal ſpirits; but the queſtion is, whether they do not alſo reach the bloud and other humours? Indeed the very ſmall doſe in which they are given, makes me think the bloud is not tainted by them: for from the littleneſs of that, it ſeems to me very improbable, that the whole maſs of bloud ſhould be poiſoned, or corrupted; and likewiſe becauſe Narcoticks (though frequently adminiſtred, cauſe no ſuch marks or ſtings in the ſkin or entrals, as are uſually ſeen when the bloud is any way venomed. Moreover thoſe people who make *Opium* ſo familiar to them that it doth not hurt their animal ſpirits, though they take it daily, and in great quantities, feel no diſtemperature in their bloud. But in the mean time, we muſt not imagine that the particles of *Opium* are agreeable to the bloud, and aſſimilated by it, but rather that they are heterogeneous altogether, and unmingleable; wherefore they no ſooner get into the maſs thereof, but they are preſently expelled by it again; and thence being partly poured into the cortex of the Brain, cauſe ſleep; and partly being caſt forth through the pores of the ſkin, produce ſweating, and many times a very troubleſom itching, as I have obſerved in many caſes. As to other humours, truly there is no reaſon to think that

3. How far the virtue of Opiates is extended, and into what parts.

They do not poiſon the bloud, as they do the ſpirits.

Phar. Rat. Part I.

that Opiates leave any ſtain upon the *Serum*, the nervous liquor or the nutritive juice; in ſo much that their virtue and operation ſeems to reſpect the animal ſpirits onely.

Opiates work chiefly upon the animal ſpirits.

But yet they do not affect all the animal ſpirits alike; but Opiates given in a moderate doſe, do primarily operate upon thoſe ſpirits onely, to which the priviledges of natural and ordinary ſleep are allowed, not ſo much as touching or moleſting any of the reſt. Wherefore when a man takes *Laudanum*, it binds both his inward and his outward ſenſes, though in the mean while pulſation, reſpiration, and all the duties of concoction and ſeparation are performed after the uſual rate; and after a certain ſpace of time, the ſpirits of the ſort aforeſaid, when their forces are recruited, rouze up themſelves again, and ſhaking off the chains of ſleep, return of their own accord to their wonted watch and ward.

Sometimes their force reaches the Cerebellum, or hinder part of the brain.

But if an opiate Medicin be ſtronger than it ſhould be, it doth not onely lay fetters, wherewith they are a long time ſhakled, upon the ſpirits which inhabit the brain and the appendages thereof, but it alſo extends its drowſie powers into the other Territory of Lifes Dominions; ſo that after a larger doſe of it than ordinary, the appetite is moſt commonly rebated, reſpiration very much ſtreitned and rendred not onely difficult, but alſo unequal, nay ſometimes alſo the motion of the very heart is ſo far impaired, that immediately the pulſe grows weaker, with a cold ſweat, and a dulneſs, or a kind of faintneſs in all the faculties, in ſo much that ſuch a Medicin is ſometimes attended with a perpetual ſleep; the reaſon of which is, becauſe the poiſon of the *Opium* being diffuſed a great way, gets into the Globe of the *Cerebellum*, and deſtroying or ſubduing the ſpirits that inhabit there in great numbers, cauſes the motion of the heart firſt to grow weaker, and after that, quite to ceaſe; ſo that the vital flame is thereby extinguiſhed.

4. The good or bad effects of Opiates.

Having premiſed theſe things concerning the nature, the manner of operation, and the ſubjects of opiate Medicins, together with their limits and ſphere of Activity, I muſt now at laſt recount to you the effects and principal accidents, both good and bad, that uſually attended the uſe thereof; and then give you ſome cautions touching the right method of Hypnotick Phyſick. Firſt, Therefore let us ſee, in what manner and in what caſes theſe opiate Medicins are commonly beneficial.

1. The good reſpect either the Spirits or the Bloud and Humours.

The good or emolument that is uſually procured by the uſe of Opiates, belongs either to the animal ſpirits, or to the bloud and humours: of which the firſt are affected primarily and more immediately, but the two laſt onely ſecondarily, and by mediation of the former.

They are good for the Spirits in reſpect to ſenſe and motion.
To both in a different kind.

Whenever the animal ſpirits, being excited above meaſure, act either too much, or irregularly in the diſcharge of their ſeveral offices; Narcoticks given in due time, afford very frequently great aſſiſtance toward the allaying of their fury and diſorders. Now ſuch exorbitancies in them as ſhew when Opiates are proper, reſpect either Senſe or Motion. The former of which functions being twofold, the greateſt exceſſes of the internal ſenſes, are Watching, and being Mad or Delicious; but the indiſpoſition of the outward ſenſes, that moſt requires this kind of Phyſick, is Pain. Inequality, or irregularities of motions, which are to be reduced by Narcoticks, are firſt of all a violent pulſe, convulſions in the heart or bowels, and likewiſe the exceſſive and impetuous evacuations of the latter. So many there are, and ſuch different caſes, wherein, whileſt the animal ſpirits, like wild Horſes, run up and down, or leap over their bounds, they ought to be reſtrained or reduced by Opiates, as with a bridle. Several inſtances of each whereof, together with the manner, how they are prepared, and the reaſons of their operations, I ſhall here briefly ſubjoin.

In reſpect of the inward ſenſes, to watching.

1. Firſt therefore Opiates are neceſſarily and moſt properly uſed in caſe of Wakefulneſs; in as much as Sleep, which is a ſtate quite contrary to it, and conſequently cures it. How many ways and by what means watching is uſually cauſed, and continues long upon a man, I have lately declared at large in a Treatiſe which I have written; in all which caſes, ſeeing the animal ſpirits, being too wild and much diſturbed, exert or ſhew themſelves more briskly than they ſhould do, bloating and irradiating [or enlightening] not onely the organs of ſenſe, but eſpecially the outmoſt borders of the Brain in all parts; the particles of *Opium* being tranſmitted hither by conveyance of the bloud, do preſently deſtroy or ſubdue the animal ſpirits that keep guard in the front of the Army, in ſo much that all the reſt that are neareſt to them, being forced inward are put to the ſtand, and much reſtrained from flowing all around into every part; whereupon immediately all the outward ſpirits that inhabit the organs or inſtruments of any ſpontaneous ſenſe or motion, being bereft of the influx of thoſe in the Head-quarters, forſake their Guard alſo, and retiring inward, lie down and reſt themſelves.

And 2. Madneſs.

Secondly in Delirious caſes, Opiates are oftentimes uſed with good ſucceſs (though other-

otherwhiles they rather do miſchief, as I ſhall hereafter declare) the reaſon of which is, that when the ſpirits, being too much excited, and as it were, ſet a madding, within the Brain, can eaſily leap over the uſual and trodden paths of their conſtant journies; then a Narcotick Medicin arriving at the borders of the Brain, reſtrains thoſe exceſſes, which are uſually as apt as Hounds to run beyond their ſcent, and for a time hinders them from all motion; ſo that many times when they move afreſh, they return to their former tracts and perform their wonted functions very well. *Phar. Rat.* Part I.

Thirdly, *Opium* is always reckoned of moſt excellent uſe to allay all ſorts of pain, whereupon it is juſtly called *Nepenthe*, and is a remedy really divine. And truly we cannot ſufficiently admire, how, when any bowel or member is under any ſignal and intolerable torture or pain, this Medicin, like a Charm, gives the Party immediate relief and eaſe, yea ſometimes without ſleep, or at leaſt before it comes upon him. But that, which is yet more wonderful, is, that as long as the particles of *Opium* continue to work and exert their Narcotick power, yea ſometimes alſo when the ſleep is over, there remains in the part affected, the greateſt alleviation and freedom from pain. But afterward when the force of the Medicin is ſpent, the torments preſently return, nor do they abate of their cruelty, unleſs they are again inchanted by the ſame Medicin. *In reſpect of the external ſenſe, for pain.*

Whileſt I inquire into the reaſon of this I cannot eaſily find out in what part a pain-removing Medicin [called an Anodynous Medicin] chiefly operates and exerteth its virtue, whileſt without ſleep, or when that is over, it alleviateth pains, and for a certain time gives a man perfect eaſe: that is to ſay, Whether the Narcotick power of it be laid out upon the part tormented, or upon the common organ of ſenſe, or upon the whole ſenſitive ſoul. The reaſon of the difference between the parts propoſed, is becauſe pain cauſed in one place is felt in another, and the effect of it is diffuſed through the whole ſoul. The continuance of it conſiſteth in this, that the nervous fibres are very much irritated and pluckt from each other, by ſome incongruous and very diſproportionate matter, in ſo much that the ſpirits which are in them, are immediately diſtracted, and being forced from their equal expanſion, are put into a confuſion. But the ſenſe of pain is cauſed from this, that the diſturbance of thoſe ſpirits being conveyed by a kind of undulation [or waving, as water doth when you throw a ſtone into it] through the nerves to the common ſenſe, to wit, the *Corpora ſtriata* [parts ſo called from their being ſtreaked] moves the ſpirits that inhabit there, into the like diſtraction; which ſort of commotion, proceeding farther into the *Cerebellum*, ſtirs up the imagination, and thence immediately returning, diffuſeth, or ſpreadeth a diſturbance or inquietude through the whole ſubſtance of the ſpirits. Since therefore Pain is a malady of ſo large an extent, and of ſo different a nature, we ought to inquire what ſphere of activity Anodynous [or pain-removing] Medicins have. *How Opiates remove pains without ſleep, or after it.*

Concerning this there is no room to doubt, but that whenever after the taking of *Opium* Sleep is firſt brought upon a man, he is conſequently free from all pain; for then an ἀναλγησία [or freedom from pain] immediately enſueth as the effect of it; in as much as thoſe ſpirits alſo which actuate the common ſenſe are bound up with them that inhabit the Brain; and conſequently, though the tormented part be never ſo provoked, all ſenſe of pain is obſtructed; but whereas when the Patient awakes and remaining ſo, performs ſome animal functions very briskly without any pain, for ſo many hours after he hath taken the Opium, and that when the force of the Medicin is quite ſpent, immediately the ſame torture returns upon him, this ſeems a queſtion for *Oedipus* or *Apollo* himſelf to reſolve.

For the ſolution whereof, we cannot ſay the ſpirits of the part affected, and thoſe that reſide in the common ſenſe; that is to ſay, that the one or the other, or both of them together, are bound by the Anodynous Medicin. For it is not credible, that the particles of the Opium do ſo penetrate and deeply enter into the brain and nerves, that when they have paſſed through that without hurting of it, they ſhould deſcend in ſo ſhort a time to the utmoſt borders thereof; nor can we imagine that the ſpirits which reſide in the *Corpora ſtriata* (ſeeing that when the Party is awake, he continues for ſome time without pain) and are awakened to receive any impreſſions of other ſenſibles, grow deaf onely to the approaches which are made from the part that is in pain. Since therefore this freedom from pain after ſleep is over, ought not to be referred either to the part affected, nor to the common ſenſes being ſtupified by the Opium, let us ſee how the reaſon of it may be deduced from a kind of Narcotick indiſpoſition of the whole ſenſitive ſoul. Now that will eaſily appear, when we have premiſed theſe two things. *The reaſon of it.*

Firſt, That it is neceſſary to the creating or continuance of any pain, that a plen- *It conſiſts in theſe 2 things.*

Pharm. Rat. Part I.

tiful quantity of ſpirits flow ſtill in the part affected; for the heat of ſuch ſpirits, whileſt they riot there, their diſtraction and the mutual ſtriking of ſome againſt others, are the very immediate cauſe of ſuch a troubleſom perception as is called *Pain*; wherefore if by the ſtreightning of the nerves the afflux of ſpirits to the part that is grieved, cannot be hindered or much diminiſhed, the pain muſt of neceſſity ceaſe, becauſe the ſpirits being bereft of freſh ſupplies and ſuccours, will lie ſo thin and ſcattered in the fibres, that they can ſcarce touch one another, at leaſt they will not at all break out into fury and indignation.

1. There is required to make pain, a copious flowing of the ſpirits to the part affected.

2. which Opiates hinder.

Secondly, That deſtitution or withdrawing of the ſpirits which is here required, and cannot be procured by no other means or endeavour, is often and uſually produced by Opium. For from the particles of this Medicin beſetting the borders of the Brain, not onely ſome of the outmoſt ſpirits, which are as it were, fore-runners or Scouts (as they call them) are deſtroyed, but the firſt ſources of them within the body of the Brain and Cerebellum, and their efflux thence into the nerves, are preſently very much ſuppreſſed; in ſo much that during the operation of the Opium, they are diſcharged much more ſparingly and minutely into the heart, bowels, and all other parts. Hence it is that the pulſe and the reſpiration remit ſomewhat of their vehemency and quickneſs, and ſometimes on a ſudden the one becomes weak and the other difficult, and many times alſo an unuſual languiſhing and dulneſs ſeizes all the limbs and joints. Moreover, hence it is that the *viſcera* or Bowels, which before were put into convulſions, either of an expulſive nature (that is to ſay, by Vomiting or Stool), or of a painful nature (as in the Colick and Stone in the Kidnies) lay aſide their diſorders: to wit, for this reaſon, becauſe that whileſt the ſupplemental and recruiting bands of ſpirits in the part affected are deficient, thoſe few that ſurvive, have no longer leiſure for tumult and rage: but on the contrary, in order to their being altogether quiet and ſafe, they lie ſtill: but then afterward when the particles of Opium are blown off and ſcattered, and the ſtock of ſpirits in the Brain, and their emanation thence into the nervous parts, is renewed, ſo that they flow down again with a full ſtream to the parts affected, and fill their fibres, immediately the ſame convulſions or pains return by reaſon that the ſpirits are again increaſed and provoked, as they were before.

For the ſame reaſon Opiates remove Convulſions.

No queſtion, but according to this manner of operation, and according to the reaſon juſt now aſſigned, Opiates moſt commonly allay the greateſt pains, and give a man eaſe, either with or without ſleep, yea and continue it for ſome certain time even when that is over: which ſpace or interval being paſt, the pains immediately return, and are in a ſhort time increaſed to their wonted ſharpneſs. This kind of effect wrought by Narcoticks, which is vulgarly known in the cure of the Scorbutick Colick, ſeems like ſome Exorciſm or Charm; in as much as the pain, like a Dæmon or evil Spirit, cannot be bound but for a certain time, and then begins to play its pranks and rage again. Among thoſe painful maladies for which Opium is a cure, the Gout and Stone in the Bladder are juſtly numbred in this place. For in gouty pains that Anodynous Medicin affords many times extraordinary help, and ſuch as is almoſt divine. The latter of theſe diſeaſes, ſeeing it rages cruelly in old men, and cannot be cured by cutting, admits of no other remedy but Narcoticks for its relief. Whereupon I have perſuaded ſome perſons to a conſtant and daily uſe of *Laudanum* or *Diacodium*; which they have done with great eaſe to their life, and ſuffered no injury by it, though they have daily increaſed the doſe of it, and riſen to a great quantity. So much for the means of healing or helping, which Opium uſually furniſhes, in order to the regulation of the ſenſitive faculties: let us ſee at laſt how much this *Panacea* [i.e. all-healing Medicin] conduces to the allaying or curing the irregularities of animal motions.

They are good in the Gout and Stone.

2. The immoderateneſs or irregularity of the moving faculty, for the right compoſing whereof, the uſe of Opiates is proper, reſpect moſt principally the Heart and Bowels, (for Convulſions about the head or limbs do not ſo neceſſarily require this kind of Phyſick) to the firſt of which we muſt refer the Pulſe and Reſpiration, as often as either of them is more quick or vehement than it ſhould be. For ſeeing that in Fevers, the motions of the heart and lungs, growing more vigorous, drive the bloud about very rapidly, in ſo much that it is exceſſively perverted both in the heat and temper of it, and cannot diſcharge its dreggy parts which are ſo intimately mixt with it, the force of thoſe parts is ſomewhat rebated by giving of a Narcotick; ſo that the bloud circulates gently and temperately, diffuſeth it ſelf with leſs heat, and being diſſolved in its conſtitution, caſteth forth its ſerum and impurities by Sweat and Urin. Opiates extenuate and depreſs the actions of Pulſation and Reſpiration, for that they in ſome meaſure ſtop the flux or emanation of the animal ſpirits in the Cerebellum, and

2. How Opiates cure the irregularities of motion.

1. They diminiſh the vehemency of the Pulſe and of Reſpiration.

and diminiſh the ſtream of them from thence into the nerves deſigned for the heart; which if it be done to exceſs, there enſues upon it a great dejection of the vital faculties, which ſometimes proves mortal. *Phar. Rat.* Part I.

They regulate the diſorders of Reſpiration.

Reſpiration (not onely as it is vehement, but alſo) ſometimes as it is interrupted, convulſive, or otherwiſe in ſeveral manners irregular, doth frequently require Narcotick Medicins; which are uſually good, above all other Remedies, in Coughs that are vehement, or very frequent and continually troubleſom to a body. But in fits of the Aſthma, wherein through the great pains and labour which the organs are put to, the Patients ſeem to be even in the very pangs of death, a doſe of a good Opiate, like ſome Divinity, makes all things preſently ſerene and calm. Of which the reaſon is, that in thoſe Maladies, where any thing that is troubleſom beſets the moſt vital parts, the ſpirits that reſide in them being exceedingly provoked, break out into outragious diſorders, and by over-acting their parts, diſturb and pervert the whole ſtate of things; wherefore, when after you have taken a Narcotick, and bereft thoſe furious ſpirits of their ſupplies, they are preſently extenuated, and being as it were deſtitute of all ſuccours, lay aſide their inordinate practices. Moreover, Narcotick Phyſick ſeems no leſs neceſſary againſt the immoderate or convulſive motions of the Bowels, to wit, of the Stomach and Guts; for it is uſed oftentimes to give very great eaſe in extraordinary vomiting, and exceſſive or violent purging. Dyſenterical Maladies [or fluxes] can ſcarce be cured without Opium; not becauſe this Medicin fixeth juices and humours that bubble and are irregular, but it ſtops the expulſive convulſions of the fibres, and that partly within the cavities of the Bowels themſelves, by ſtupifying the ſpirits which reſide there with its meer contact, and partly by ſuppreſſing the ſpirits within the Cerebellum, which would flow thence into thoſe parts; of whoſe ſuccours they being deſtitute, do eaſily relinquiſh their convulſive motions. I could upon this occaſion recount to you either the convulſions or pains of other parts, which are uſually allayed or removed by Opium; but I have already ſaid enough of the operation and effects of this Anodynous Medicin, which are exerted primarily and chiefly upon the animal ſpirits; let us therefore next enquire, what power and alterative force it hath upon the bloud and humours.

How Opiates work upon the bloud.

Now that Opiates operate upon the bloud and humors of our bodies, and do reſtrain their diſorders, there is ſcarce any one of the Vulgar but knows, and is ſatisfied. In Catarrhs and Defluxions of all ſorts we fly many times to theſe as the laſt *Aſylum* or Refuge. Theſe very powerfully ſtop all bloudy evacuations, as alſo thoſe of the Serum, which, when at any time they are exceſſive and colliquative [or of a diſſolving nature] they reſtrain or reduce. They repreſs the immoderate ebullition of the bloud when it is in a feveriſh heat, and take off the exceſſive inflammation thereof. In fine, they moſt ſucceſsfully allay all waves and ſtorms raiſed in our bodies, upon almoſt what account ſoever, and oftentimes reſtore to the bloud, when it is diſturbed, a ſerene and quiet temper.

Though theſe kinds of effects are in a great meaſure produced by mediation of the affections of the animal ſpirits (as I have formerly hinted) for in as much as the nervous fibres being inordinately contracted, diſturb the bloud and humours, and force them to ſeveral fluctuations and exundations [*i. e.* floatings and overflowings] for that reaſon the ſuppreſſion of thoſe Spaſms by Opiates, makes the Sea of them calm again) yet it ſeems probable alſo, that the Opiate particles, whileſt they are confounded with the bloud, create in the liquor thereof ſome kind of alterations by their meer mixture. For I told you before, that they are altogether heterogeneous, immiſcible [or unmingleable] and likewiſe untameable: and therefore ſeeing they appear to be not all enemies or injurious to the liquor of it, they may in ſome ſenſe be taken for Antidotes; that is to ſay, ſuch ſort of Antidotes, as being mixed with the bloud, paſs through the maſs thereof quickly, and almoſt untouched, and in their journey make way for the ſerum, and other recrements or malignant impurities that are cloſely ſhut and bound up with it to go out, yea drive them forth before them, by opening all the pores and avenues. Whereupon it is not altogether without reaſon, that Opium is an ingredient in the compoſitions of the chiefeſt Antidotes, as Treacle, Mithridate, and Diaſcordium, as if it were a reſiſter of venomous humours.

How the Opiate particles work upon the bloud.

Indeed that the particles of Opium, when a man hath ſwallowed it, is ſoon tranſmitted into the bloud, and quickly paſſeth through the maſs thereof, appears from this, that they immediately after the Medicin is taken, being carried up into the Brain, procure ſleep, and give a man eaſe from pain. And beſides that, it is evident from common experience, that they (where they are agreeable) provoke Sweats and bring away Urin, in ſo much that theſe effects are commonly reckoned among the Virtues of Opium. Moreover that the particles thereof are not venomous to the bloud, but

They ſoon paſs through the bloud.

Phar. Rat. Part I.

rather Antidotal is collected from this, that in the Plague, Small Pox, and malignant Fevers, yea in any other Fevers *Laudanum* is given many times with great ſucceſs. In the mean while I do not well underſtand thoſe qualities which ſome men attribute to this Medicin, that is to ſay, of fixing and thickening the bloud; unleſs perchance it be ſaid to do ſo, in as much as that by opening the conſtitution thereof, it cauſeth the ſerous part of it to be copiouſly ſeparated and carried off, ſo that the liquor which remains grows thereby more compact and thick.

And therefore are called Antidotes.

They cauſe Sweat and Urin.

A notable Hiſtory of their Efficacy.

For as I have found by frequent obſervation, that Opiate Medicins do diſſolve the bloud, and ſometimes, like Antidotes, moſt powerfully provoke Sweat and Urin, ſo from the following Story (which I add here for to ſum up all) I will make it as plainly out to all the World. I was formerly conſulted upon the ſcore of a Gentleman who was very much diſordered in his body, and troubled with nocturnal pains which proceeded from the Pox (which was either very illy or not at all cured in him) to whom I preſcribed many things, but all in vain; becauſe he being very much averſe to Phyſick, would take ſcarce any thing elſe except a doſe of *Laudanum*, which I gave him once or twice a Week to alleviate his pains. In a ſhort time growing hydropical, he ſwelled with an *Aſcites* [a Dropſie that makes the belly ſwell like a Bottle] and likewiſe with an *Anaſarca* [a Dropſie that affects all the fleſh] to that degree, that he could hardly turn himſelf from one ſide to the other without the help of Servants. When he was in this condition, I being ſent for to him again, and finding him averſe to the Rules of Phyſick, did all that could be done; and that was onely to give him warning of his death, which was not far off, and certainly to be expected, that he might compoſe and fit himſelf for Eternity. He, being not much troubled at what I ſaid, deſired me very earneſtly, that in order to his dying ſo much the more eaſily, he might take my *Laudanum*, which I had permitted him to take before in a ſmall quantity, when he pleaſed, or at leaſt every night; which having with ſome admonitions granted him, I went away, and as I thought, bid him the laſt farewel. Afterward he took that Medicin daily, and as daily increaſed the Doſe, ſo that in a ſhort time he had conſumed an incredible quantity of it. By uſing this onely Medicin conſtantly, he grew better and better every day, and within a Moneths time was ſo well, that being free from all ſwellings and pains, he had a good ſtomach, and walked abroad. By the daily uſe of this Opiate, his Diſtemper, which troubled him very much before, left him; and being every night diſſolved into a great Sweat, he alſo made a vaſt quantity of Urin. I could here tell you likewiſe of many other cures of Diſeaſes that were thought paſt cure, which were performed by the help of Opium alone; but becauſe it would be tedious, and ſomewhat beſide my purpoſe, I therefore ſhall onely add in this place one or two, which are in ſhort theſe.

The ſecond Story.

About three years ago, a noble Lady, after an Autumnal Fever, fell into a ſevere Colick, with vomiting, and ſharp pains, that afflicted her Bowels and Limbs moſt miſerably. Remedies of all ſorts, both outward and inward, though applied for ſeveral Weeks with great care, did her no good at all; but the poor Lady within 20 days was reduced to ſuch a languiſhment and extenuation or thinneſs of Body, that there was but very little or hardly any hopes of her recovery: for being confined to her Bed, and almoſt always without ſleep, ſhe was troubled with a conſtant pain or ſickneſs in her ſtomach, throwing up all ſhe ſwallowed, whether Phyſick or food, by vomit, and likewiſe ſhe underwent almoſt continual torment and pains about her belly and loins, as alſo ſometimes in her head and limbs. Being ſent for to her, I tried many ſorts of Medicins, but nothing agreed with her except a Doſe of *Liquid Laudanum*; which I ventured to give her to alleviate her pains, at firſt onely twice a Week, and that not without fear and caution. She at laſt deſired that ſhe might take that Medicin every other, and after that every night continually. So having uſed daily without any damage, ſhe gained in the night time ſound ſleep and pleaſant, and in the day time a freedom from pain and a good ſtomach; and by that means gathering up her crums again, ſhe began to riſe out of Bed, and daily to eat good meals; but then ſhe could and had a deſire to take other Medicins, till at laſt ſhe was quite well again.

The third Story.

Nor did a very fine Woman, who for many years was ſubject ever and anon to pains of the Colick, any leſs cry up and celebrate the praiſes of this divine Medicin. For whenſoever ſhe was ſick of that Diſtemper, and was in moſt miſerable torment, ſhe could not be relieved by any other Medicin except Opium: wherefore ſhe took a Doſe of it every night, till ſuch time as the morbifick or diſeaſed matter being quite ſpent, ſhe at length became free from all trouble and pain.

CHAP.

Phar. Rat. Part I.

CHAP. II.

Of the Injuries and Inconveniences of Opium; *to which are added Cautions concerning the Use thereof.*

HItherto I have shewn you the good effects, and as it were, the Angelical face of Opium, together with the manner and reasons of its operation. But if you look upon the other side of it, (as when you turn the reverse of a Coin) it will appear altogether like a Devil; and therein we shall discover no less hurt, and ill effects, than we did good ones in the former. For there is so much poison in this All-healing Medicin, that we ought not to be by any means secure or confident in the frequent and familiar use of it. Wherefore we ought to be admonished as well concerning the loss as the profit that accrues from it, so that we (like those that go a Voyage to Sea, when we understand on both sides, what Ports we may touch at, and what Rocks we must avoid) may incur the less danger.

How many and what ways Opium useth to hurt us.

I have by the sad experience of some People, found that the use of Opium sometimes is noxious, and of ill consequence; in as much as some men immediately after the taking of it, have fallen into an everlasting sleep, and others by an excessive or unseasonable Dose of it, have either shortened their lives, or made them ever after troublesom and unhappy by the hurt it hath done to their principal faculties. Instances and examples of this kind are every where to be met with from the practice of Quacks and Empericks. I remember some that by swallowing a Pill of *Laudanum*, have presently been put into so profound a sleep, that they could never be wakened. They lived indeed for three or four days, and were pretty well, as to their pulse, breathing, and warmth, but were not to be recovered by any remedies or tortures to their senses, or made to awake. Yet I have observed some others, who having taken Opium, have slept but moderately, yea sometimes very little or scarce at all; but as to their pulse, respiration, and heat, they have been immediately worse: for they used presently after the taking of this medicin, to languish, and thereupon more and more to fail of breath; nor could their strength be repaired by any Cordials, but they fainted and died insensibly. I have elsewhere told you a Story of a strong man, who was killed with Opium, having no sleep before that which was his last, that is to say, Death came it self upon him. He complained as soon as he had taken the Medicin, of an extraordinary oppression and cold at his stomach, and by and by was taken with an excessive languidness, together with a dejection of all his spirits, and a chilness in his extreme parts, [the Feet, Hands, &c.] and within four hours, complaining often that his eyes grew dim and were quite blinded, he expired.

The poison works first upon the Brain, and then upon the Cerebellum, or binder part of the Brain.

For hence it is easily gathered, that Opium doth not destroy life onely one way, and that the same still, but that it hath two principal methods at least by which it kills men. The reason of one consists in this, that the particles of the Medicin taken, do first and more immediately affect the Brain; and of the other, that they do in the same nature work upon the Cerebellum. As to this latter the business is thus: if, after the Medicin is taken, it happen perchance, that the circuit of the Cerebellum be so beset by the Narcotick particles, that the outmost spirits being immediately extinguished, the afflux of the inward ones toward the heart, be diminished, and so by degrees cut off; it will of necessity follow, that the Heart and all the instruments of Respiration, will first grow fainty in the discharge of their vital functions, and by that means totally cease from their labour, though in the mean time the Patients awake, and are free from all drowsiness, well enough in their senses, and very lively as long as they live. But if the opiate particles break in first, and with a full force upon the borders of the Brain, and set upon the inhabitants of that chiefly, in so much that having presently conquered the outmost spirits, they put all the inward ones that are in the middle of it, into a consternation, and so far suppress them that they cannot rise again to rally their forces a second time, then immediately a deep sleep, or an invincible and perpetual slumber ensues, though the pulse in the mean while, and the respiration continue for some time in their due state.

Besides these kinds of destructive Tragedies which Opium upon several occasions acts upon the life of man, this Medicin hath likewise many other ways of doing hurt, whereby it oftentimes is injurious to some private function or part of the body. It would be tedious to reckon up all the sorts of lesser evils, which Narcoticks are at any time the cause of, and therefore in this place I shall onely tell you what maladies happen

Phar. Ra. Part I.

happen in the head, what in the Breaſt, and alſo what in the lower belly, by the improper and unſeaſonable uſe thereof.

It is hurtful to the Head, the Breaſt, and the Belly.

1. As to the firſt, it is very vulgarly known that the principal functions of the ſoul, to wit, Memory, Diſcourſe, and ſharpneſs of Wit, are oftentimes very much impaired by Narcoticks. The frequent uſe of them in many men weakens the memory. I knew a certain perſon, who by taking an extraordinary doſe of *Laudanum* when he was in a Fever, quite loſt that faculty; and after ſeveral Weeks, when the uſe of it began to return, he remembred onely ſuch things as he had done within a particular ſpace of time, but nothing of what he had before and after tranſacted. I know that ſome have contracted, by taking this Medicin, a dulneſs or ſtupidity of mind, and others grown mad. Hence it is (ſaith *Freitagius*) that whereas *Proſper Alpinus* and *Bellonius* tells us, that the *Ægyptians* and *Turks* eat Opium, to make them chearful, bold, and inclined to Venery, yet they add, that the devourers of Opium, though they ſeem to be in good health, and not at all injured by the uſe of it, yet that they are thereby rendered more frigid and their functions or faculties are much the worſe for it, that they appear moſt commonly as if they were drunk and dull; that they become heavy, ſtupid and out of order, that ſometimes they affirm a thing, and in the ſame breath deny it; ſo that they are cautious who they talk or converſe with: and that it is alſo become a jear, not unlike a reproach among them, which they caſt upon one another, *Thou haſt eaten Opium*, juſt as when our Countrymen upbraid a man with being drunk or dozed. *Freitagius* in his Book of *Opium*, *ch.* 3. The reaſon of this is plain enough, from what I have already ſaid, to wit, that Opium produces the effects now mentioned, in that it firſt and moſt principally ſtrikes at the Brain: and whileſt that there it deſtroys, or conquers ſome animal ſpirits, it prevents many others from their uſual ways of emanation, and draws them into by-paſſages. But whereas Opium is devoured by the *Turks* (and I may ſay alſo by ſome of our Countrymen too, that are fortified, and have gained a kind of Armour againſt the poiſon of it, by long uſage) in great quantity, and that without any damage, or at leaſt without any hazard to their lives; the reaſon is, becauſe the particles thereof, though at firſt they are hurtful and venomous to the ſpirits, yet by frequent uſe they at laſt grow more agreeable and familiar, as we obſerve of the ſmoak of Tobacco taken into ones mouth through a Pipe; for though at firſt for ſome days it uſually brings a giddineſs, and oftentimes a vomiting or purging, yea a cold ſweat upon us, with trembling and frequent fainting of the ſpirits, yet at length we take it undiſturbed, nay with great delight. But for as much as Opium, in a large Doſe, puts ſuch confidence and reſolution into them, that they go to battle without any dread, the reaſon ſeems to be, becauſe that Medicin by ſtupifying the ſpirits in ſome meaſure ſtounds them, ſo that they endure the encounter of all ſenſible, though never ſo terrible things. Laſtly, Whereas it is ſaid that Opiates provoke Luſt, when on the contrary they ſhould ſeem rather to ſuppreſs and tame that appetite, by extinguiſhing the ſpirits, I ſay (if it really have that effect) that the ſeminal or generative moiſture and the ſpirits that flow therein, do not deſcend from the Brain, but are poured immediately into the ſpermatick Veſſels; and therefore in as much as Opiates either hinder or diminiſh the generation of the ſpirits within the Brain, they perhaps make them run more plentifully into the inſtruments of propagation.

How Opium works upon the Turks.

2. what hurt Opium doth to the Breaſt.

2. That Opiates are ſometimes enemies to the Heart and the Breaſt is manifeſt from this, that they depreſs and diminiſh the Pulſe and Reſpiration, yea ſometimes alſo (as I have ſhewn before) cauſe to grow weak and by degrees quite to ceaſe. Wherefore in Fevers, when the bloud being extraordinarily depraved, ſeems like to have no *Criſis* [judgment to be made upon it] or at leaſt not a good one, and that at the ſame time it ſupplies but very few ſpirits, and thoſe weak too, to the animal forces, Narcoticks are moſt commonly, and almoſt continually hurtful, and as it were poiſon. For though in the Plague, and in malignant Fevers, as long as the Pulſe and the Breath is ſtrong, *Treacle*, *Mithridate*, and *Diaſcordium*, yea and *Laudanum* are many times given with good ſucceſs; yet if at any time in thoſe Diſeaſes, and in other Fevers that are not very malignant, the vital functions languiſh, we ought to uſe thoſe famous Antidotes very ſparingly, but ſtronger Opiates not at all. Moreover in a painful Cough, a Conſumption, Pleuriſie, Empyema, [an ulceration in the Lungs] and other pectoral Diſtempers, that is to ſay, in all, wherein Nature is inclined ſuddenly to evacuate that which is troubleſom and oppreſſeth the Breaſt, and takes a great deal of pains to do it, and that at the ſame time the inſtruments of breathing being deſtitute of a ſufficient quantity of ſpirits, grow weak, and perform their task with labour and difficulty, a man ought to abſtain from Opium as much as from the rankeſt poiſon: for in ſuch a caſe Narcoticks increaſe and fix the weight that ſhould be removed, diminiſhing the ſtrength of thoſe parts which ought to throw it off.

3. That

3. That Opiates work upon the Bowels ordained for concoction, and other parts of the lower belly, giving them many times extraordinary eaſe in ſeveral reſpects, I have ſhewed you before, but that they are not always ſo amicable and kind to this region, but that they ſometimes do it great heart, is equally eaſie to prove. For Narcoticks, often taken, are very injurious to that principal faculty, to wit, the deſire of Food, or the Appetite, upon which all nouriſhment and the very root of life depends; in that they very much rebate, and many times totally deſtroy it. For when the ſpirits that inhabit the inner coat of the ſtomach, are ſtupified or deadened by the opiate particles, ſo that thoſe nervous fibres, though never ſo empty, are no more ſhrivelled or wrinkled up, then all deſire of Food ceaſes, nor do we care to eat; but if meat be offered to our ſtomach, it is immediately thrown back again, becauſe it is not a delight but a trouble to it. Moreover for the ſame reaſon the concoctive power of the ſtomach is often weakened, and the expulſive motions both of that and the Guts grow dull. For it is a common obſervation, that ſlow concoction, and dulneſs or difficulty of evacuation are the familiar and uſual effects of Opiate Medicins. *Phar. Rat.* Part I. 3. *And what to the Belly.*

From hence it will be no hard task to give you ſome Phyſical Rules and Cautions concerning the right uſe of Opiate Medicins; which may be done by obſerving theſe four things: that is to ſay, before you give a Narcotick Medicin, you muſt conſider: *Phyſical cautions concerning the uſe of Opium.*

1. What the Patients Conſtitution is.
2. What Diſtemper he hath.
3. In what condition the animal ſpirits are, in reſpect both of the Animal and Vital Functions. And
4. In what ſtate the Bloud and Humours are.

1. As to the firſt, when an Hypnotick is proper, have a care that the temperament of the Patient, his habit or indiſpoſition of body, or his way and courſe of living do not forbid the uſe of it. For example, Thoſe that are of a middling ſtature, and a firm ſquare body, whoſe bloud is hot, and their aſpect lively and ſharp, endure this Medicin beſt, and many times take it with good ſucceſs; but will uſe it yet with more ſecurity, if they have formerly been accuſtomed to it: on the other hand it is not ſo convenient, yea ſometimes it is very ill for them that are either too fat or very lean; and likewiſe for ſuch as have ſpirits of a thinner compoſition, which may be eaſily diſſipated, or being of a cold conſtitution, have ſoft, lank fleſh, and alſo ſuch as being naturally of a dull, indocile complexion, are in themſelves heavy and ſleepy Fellows; for to ſuch this makes an addition by increaſing the weight of other things, if they have never tried this ſort of Phyſick. 1. *In reſpect of the Patients conſtitution.*

2. The nature of the Diſtemper is ſometimes of great moment for or againſt Opiates. In light caſes (according to *Septalius*) that Phyſician is a ſneaking Fool that draweth them into practice. But in ſome great caſes they are either forbidden or very much ſuſpected. In the Palſie, Swimming of the Brain, Nightmare, Apoplexy, and alſo in the Orthopnæa [a Diſeaſe when a man cannot breath unleſs he ſits upright] a Dropſie in the Breaſt or Belly, upon a Numneſs or trembling in the Limbs, in very malignant Fevers, and in the Fits of intermitting Fevers, or the criſis of others, Narcoticks are moſt commonly forbidden. Moreover in a Cough, attended with a great deal of thick ſpittle or phlegm, in an Aſthma, and all other pectoral Diſtempers, accompanied with oppreſſion of the Lungs, in the Fits of the Mother, and other convulſive Maladies, they ought not to be given but very ſeldom, and that not without caution, and the advice of a good Phyſician. But in a grievous Headach, Catarrhs, the Colick, Pleuriſie, ordinary Fevers, Vomiting, the Flux, in Fits of the Stone in the Kidnies, the Gout, and all Pains, Opiate Medicins are not onely allowed of, but we fly to them as divine, and all-healing Remedies. 2. *In reſpect of the Diſtemper.*

3. But whenever ſuch Medicins are propoſed, or fall under our deliberation, we muſt likewiſe conſider, in what tenor and condition the animal ſpirits that preſide in each part are; for if through the ſmalneſs of their number, or being oppreſſed, they are already weakened, and do not ſufficiently diſplay their ſails, they ought not certainly to be any more diminiſhed or conſternated by ſuch a Medicin. Wherefore whileſt the animal faculties, either as to ſenſe, or diſcourſe, are not in good plight, or do not exert themſelves ſo nimbly as they ſhould do; or when the Pulſe or Reſpiration are either too weak or too quick, or more ſlow than ordinary, o. ſtopped and unequal; or laſtly, when the limbs and moving parts are ſeized with a numneſs and weakneſs, attended with an unuſual languiſhing, we muſt altogether omit all Hypnotick or ſleeping Phyſick. But we will ſtick to put it in practice, whenever it is proper 3. *In reſpect of the animal ſpirits.*

in

Phar. Rat. Part I.

in greater caſes, and that at the ſame time the animal ſpirits, in theſe and other reſpects are ſtrong enough, or when they are too much expanded or raiſed above meaſure, and grow wild.

4. In reſpect of the Bloud and Humours.

4. In the mean time the ſtate of the Bloud and Humours is not to be neglected; for ſometimes the bad or unequal temper of theſe forbids all Opiates whatſoever, or permits them to be taken but ſparingly, and with a kind of reſtriction. The Bloud prohibits the uſe of them, as it offends either in quantity, quality, or temper. As to the former, the bloudy liquor is either too much or too little, and in both reſpects excludeth all Narcotick Medicins. For firſt of all, if at any time the bloud being too turgent [or ſwelling] in quantity, and at the ſame time bubbles up through any feveriſh heat, diſtending the veſſels to a great extremity, and thereupon the heart endeavours with all its ſtrength to drive it about as ſwift as poſſibly it can (leſt it ſhould ſtagnate, or overflow in any part) repeating the turns of Syſtole and Diaſtole with all ſpeed, then certainly to give a Narcotick, whereby to hinder the labour and laſt endeavours of the heart, which are ſo neceſſary for the preſervation of life, would be the part of a Poiſoner, rather than a Phyſician. Wherefore in a *Plethora* [or fulneſs of bloud] bloud-letting ought always to go before the uſe of Opium. Secondly, Nor is there leſs danger in Opiates, when they are given upon a defect or want of bloud, as after great hæmorrhages [fluxes of bloud] long faſting, or a great fit of ſickneſs: for when the ſtream of the bloud is very ſmall, and by reaſon of its ſmalneſs is ſcarce continued, the heart endeavours to drive it about very ſwiftly, and with double diligence, leſt the courſe of it ſhould be interrupted, and it ſhould ceaſe to flow. Hence it is obvious to conceive what great hurt Opiates do, which put a ſtop or a ſcatch to this motion of the heart, that is at that time ſo neceſſary. Indeed this ſeems to be the reaſon, that we forbid Women to ſleep ſoon after they are brought to Bed, and that they bleed very plentifully, as we do any body elſe, after a great loſs or extraordinary fluxes of bloud, leſt the ſpirits being recalled whileſt the Parties ſleep, ſhould forſake the heart, and leave it deſtitute of power to drive about the ſtream of bloud which is then diminiſhed. Moreover ſometimes the Bloud being diſordered in its quality, or (to ſpeak more properly) in its *Craſis* [or temper] forbids the uſe of Opiates; for whileſt in an ill habit of Body or a Fever, the Bloud being very full of dregs, ought to be agitated and driven more ſwiftly about with a greater impulſe of the heart, that the heterogeneous particles may be ſubdued and quickly evaporate, the operation of a Narcotick intervening, ſtops the motion of the heart, and conſequently retardeth, and ſometimes fruſtrates the purification of the Bloud.

As for other recrementitious humours, that are uſually gathered in the ſtomach and guts they likewiſe ought to be purged out and carried away by Vomit or by Stool, before the Opiate be given: for otherwiſe they will fix and ſtick there more ſtiff than ever. For the fibres of the bowels being ſtupified by the Medicin, are not irritated as before, nor do they eaſily put themſelves into, or nimbly perform expulſive convulſions, in order to the diſcharge of thoſe recrements or dregs: wherefore if any thing be to be thrown out, it muſt be done before the Narcotick Medicin be taken.

CHAP. III.

The ſeveral ſorts, Preparations and Receipts of Opiates.

NOw that I have delivered to you the Doctrine of Narcotick Phyſick in general, and ſufficiently explained the Reaſons and ways of its operation, my next buſineſs is to recount, and particularly to conſider thoſe Medicins that are endued with ſuch a quality, both Simples and Compounds, and ſo to make a kind of Opiological Treatiſe of it.

The diſtinction of Anodynous Medicins.

Firſt therefore, According to the Method obſerved by moſt Authors, I thought it proper in this place to diſtinguiſh ſuch Remedies as are called *Anodyna* [Medicins to remove Pain] into two Claſſes, that is to ſay, as they are ſtronger or weaker. For ſome of them being meerly Narcotick, do not onely force ſleep preternaturally, but when occaſion requires, procure a freedom from pain and a numneſs, and being unduely given, many times death it ſelf. But there are other Medicins ſaid to be of this kind, in as much as when the ſpirits are heated and in diſorder, they entice and kindly compoſe them to reſt, not by deſtroying or ſtupifying, but onely by mollifying and ſoothing of them.

1. The Roll or Catalogue of all Narcoticks.

1. To the former ſort of theſe (which are the onely ones properly called Narcoticks or Opiates) we uſually refer Poppy both white and red; and ſome other more venomous things, which for that reaſon are not to be preſcribed. But of ſome of them that are not ſo unwholſome, the Roots, Leaves, Flowers, Seeds, and thick Juices, are frequently uſed, and (as I have before ſhewn) are often taken with the greateſt ſucceſs. But ſeeing each of them have ſome poiſon mixed with them, therefore you muſt not preſcribe ſometimes one ſort and ſometimes another indifferently, as in the other parts of practical Phyſick, but trie only ſuch things as are moſt ſafe and approved by long experience. Hence cuſtom hath at laſt ſo far obtained upon us (from which we may not recede without hazard of mens lives) that Poppy and the Preparations thereof, are the baſis or complement of almoſt all Opiate Medicins. The Seeds of Henbane and the roots and juice of Cynogloſs or Dogs Tongue, are ingredients in the compoſitions of ſome Hypnoticks; but yet whenever we have a deſire effectually and ſafely to provoke ſleep, the whole force of the Medicin is placed in Opium or Diacodium. I ſhall not need in this place to deſcribe white Poppy, out of which theſe are made, nor the extraction of the Opiate Juice, or to give you the Compoſition of that Syrup, becauſe all this is done at large in the Botanical and Antidotary Books [or Books that treat of Plants and Antidotes] both of the Ancient and Modern Doctors. As to what remains therefore, and makes moſt to our purpoſe, I will endeavour to ſhew you the elementary parts of Opium, and from thence demonſtrate the virtues of both that and Diacodium, with the reaſons why they intoxicate.

White Poppy.

The Nature and Parts of Opium.

The body of Opium may be examined and diſtinguiſhed, as to its conſtitutive parts, better when it is entire and untouched, than when it is Chymically taken in pieces: For if it be diſtilled by fire, then through the plenty of impure ſulphur that is in it, it burns horridly, and at the ſame time ſends forth a very noiſom ſtink. But yet it is obvious to ſenſe that there are abundance of ſulphureous particles in this body; which alſo its naſty ſtinking ſmell and inflamableneſs do manifeſtly declare. And though it be equally certain that there are ſaline particles joined with this ſulphur, and conſequently that this body conſiſts chiefly of theſe two together, with ſome ſmall quantity of Earth; yet of what nature, and in what ſtate that Salt is, I cannot poſitively tell,; onely I can gueſs by the effects of it, that this ſulphur-ſaline body is altogether contrary and deſtructive to the texture of animal ſpirits, which is ſpirituous and ſalino-volatile. And indeed a man may gather from many inſtances that the Narcotick virtue lies in the ſulphur joined with the ſharp or aculeate ſalt, from whence it hath its ſtinking ſmell: For of this nature are white Poppy, Mandrake, Henbane, and Tobacco, and other Opiates, all which have an ill ſmell, almoſt like one another, which is very offenſive to our ſpirits whileſt we ſmell it. Moreover according as the animal ſpirits in ſeveral bodies are of a ſomewhat different texture, therefore Opiates work more virulently and ſtrongly in ſome than in others. *Turks* and *Egyptians*, whoſe ſpirits are more fixed and leſs volatile as being generated out of adult bloud, eat Opium without any danger, at leaſt without hazard of their lives; not ſo of *Europeans*, who have more pure and ſubtile ſpirits. Dogs eat Opium in a great quantity without any ſleep or danger of death. A very ſmall doſe of it kills a Cat imme-

In what the Power of Opium conſiſts.

It doth not work the ſame way in all.

It doth not hurt a Dog, as it doth a Cat or a Man.

Phar. Rat. Part I.

immediately, becauſe the ſpirits of that Creature being very ſalino-volatile, cannot by any means endure the Narcotick ſulphur. And hence it is, that one drop of the Oil of Tobacco, put upon the end of this Animals tongue immediately creates Convulſions and a dizzineſs in it, which are attended with preſent death. I once ſaw ʒ ij. of Opium put into a piece of Bread and given to a Cur-dog; and a little while after growing very ſick he became dull or rather ſtupid, and by his difficulty and ſtriving to breath, ſeemed to be juſt a dying; but afterward within half an hour, he eaſed himſelf in great quantity with the naſtieſt ſtink that I ever yet ſmelt, and immediately grew well and luſty. Now that ſo great a quantity of Opium did not hurt this Creature, the reaſon proceeded from the extraordinary acid ferment of his ſtomach, whereby the ſulphureous particles of the Narcotick might be rebated and in ſome meaſure ſubdued; and ſo this ſulphur being very much diſſolved by the acid menſtruum in his ſtomach, his excrement came forth very fœtid or ſtinking. For we may obſerve of other bodies, that whileſt an acid works upon a ſulphureous body, it cauſes an ungrateful ſmell: For ſo it is when *Aqua ſtygia*, or ſpirit of Vitriol, is poured upon the filings of Iron. So alſo when ſpirit of Vinegar is put to a Lie made with Antimony; and I could tell you a great many other things of this ſort. But yet we muſt not deny but that the particles of the Opium do work upon the ſpirits of the Dog, which notwithſtanding reſiſt the Narcotick poiſon more ſtoutly than either thoſe of a Man, or other four-legged Animals; as appears by the Story which I juſt now told you: for that though a dulneſs, difficulty and ſtraitneſs of breath began to ariſe, by reaſon that the ſpirits of the brain were affected or overpowered with a drowſie quality, thoſe ſymptoms immediately vaniſhed as ſoon as the Narcotick matter was thrown off by purging. Moreover I knew the truth of this opinion ſtill more confirmed by an Anatomical Experiment. Many years ago I ſaw about three ounces of the Tincture of Opium, made very ſtrong in Canary Wine, and transfuſed into the jugular vein of a live dog. When his vein was cloſed, the Dog ran about as he uſed to do, ſeeming to be little or not at all affected with it: but after a quarter of an hour, he began to be a little dozed, to nod his head, and at laſt to fall aſleep: but we having no mind he ſhould, when we had hindered him for ſome time from it by beating, threatning him, and trying to make him run, at laſt by that means his ſleepy inclination was quite off of him, and he became very ſound and lively. From whence it is apparent, that the poiſon of Opium is either ſo far ſubdued within the bowels of concoction by their ferments, or reſiſted by the animal ſpirits themſelves, that it is not always alike in all Creatures, either ſleepy or mortal.

Some inſtances of it.

As to the heads of white Poppy, with the ſeeds of which Diacodium is made, and likewiſe Decoctions, Emulſions, and other ſleepy Confections, it is evident that theſe are much leſs impregnated with Narcotick ſulphur than the concrete juice of Opium; and that what there is in them of that kind, is much more pure and innocent. Wherefore we very often give Remedies compounded of theſe with a great deal more ſecurity. For we muſt not go ſo high as Laudanum, unleſs when through the vehemency of the ſymptoms, Diacodiate Medicins will not do the work. Moreover ſince theſe have leſs virulency in them, they do not want much preparation, but may be put to a phyſical uſe after plain boiling, infuſion, or expreſſion, or ſqueezing. But Opium is ſeldom preſcribed alone and by it ſelf, but uſeth to be corrected and compounded with various and different Preparations, that it may be made an Anodynon, ſafe enough to be taken.

Diacodiates.

The Preparation of Opium.

The Preparation of Opium is either Simple or with Diſſolvers and Correctors joined to it. The manner of the former conſiſteth chiefly in this, that the maſs of it being cut into ſeveral ſmall pieces like Dice, it be expoſed to the heat of the Fire or the Sun ſo long, till the Narcotick ſulphur being partly evaporated, that which remains becomes friable [or fit to be rubbed in pieces] and leſs offenſive to the noſe; which Preparation of it is uſually put in practice before moſt others. For whether we would make a Tincture, Extract, or Confection of Opium, it is firſt dried and reduced into a Powder by this precedent means. Moreover to this you muſt refer the ſmoaking of it with ſulphur, in the ſame manner as we tame Scammony: for an acid vapour aſcending from common ſulphur, whileſt it flames, doth much ſubdue or weaken the virulency of both the other ſulphurs, both the Purging and the Narcotick or ſleepy.

The Opiates of the Ancients.

There are many and very different Preparations with their adjuncts, or rather compoſitions of Opium; whereof ſome have been more uſual and famous among the Modern Phyſicians. But the Opiates of the Ancients which were moſt noted are *Pilula de Cynogloſſo* [Pill of Dogs-tongue] *Requies Nicolai*, and *Philonium*, of which laſt there are four ſorts, to wit, *Romanum*, and *Perſicum*, (the uſe of which is in ſome meaſure retained even to this day) and likewiſe *Philonium Galeni*, and *Philonium Meſuæ*.

The

The Deſcriptions of all theſe are common enough to be ſeen in moſt Antidotaries [or Books of Antidotes] ſo that I need not here to repeat them. The reaſon of theſe very Anodynous compoſitions, though it ſtands upon a falſe foundation, yet in another reſpect it is found to be good enough. For upon a falſe ſuppoſition that Opium is cold in the fourth degree, many things which are hot in the ſame degree, as wild Pellitory, Euphorbium, white Pepper, and the like, are added to the *Philonia*, which have in them a great quantity of it. But they do not ſubdue the Narcotick ſulphur of the Opium and rebate its virulency, becauſe their heat oppoſeth thats coldneſs (for indeed it is not cold, but rather hot) but thoſe ſharp bodies, by being full of volatile ſalt, are the cauſe of ſuch an effect.

Laudana, or Opiates invented by the Modern Doctors.

The Opiates of the Modern Doctors, upon account of the laudableneſs of ſuch a Medicin, are vulgarly called *Laudana*; and ſome alſo becauſe they remove Pain, call them *Nepenthes*. When theſe were firſt found out *Renodæus* complained very ingeniouſly, That there were a company of Quacks ſtarted up, who in ſtead of the known Pills, called *Pilulæ de Cynogloſſo*, give us a Confection of *Opium*, which they call *Laudanum*, wherewith they promiſe not onely to procure ſleep, but to cure all Diſeaſes. The Quacks (ſaith he) give ſuch an Encomium of this Medicin, that there is no Emperick, no dull Piſs-Doctor, no nor any pitiful Barber but profeſſeth himſelf a *Laudaniſt*, or an Admirer of *Laudanum*. Without doubt this Cuſtom, though the worſt that is, and moſt pernicious to humane life, is not yet laid down. For there are yet among us not a Troop or Company, but rather a Swarm of Pretenders to Phyſick; whereof each one brags of his peculiar Laudanum, which they give in every Diſtemper, or any ſtate of a Diſtemper without any conſideration; and if perchance it happen that the Patient ſleeps and wakes again, immediately they triumph and claim ſome token of preheminence, when oftentimes they deſerve a Gallows more than any thing elſe, in as much as when the Pulſe and Breath is dejected by an Opiate unſeaſonably adminiſtred, many times all hopes of a Criſis or a Cure are gone: wherefore whoſoever values their life, ought to be admoniſhed to have a ſpecial care of thoſe unskilful Laudaniſts.

Nor ought the uſe of Opiates onely, but much more the Invention and Preparation of them be denied to Empericks and Quacks: for it is the work of a good and learned Phyſician ſo to temper poiſons, that they may not prove a Venome but an Antidote. Wherefore *Laudana*, which were found out by none but skilful perſons who had long experience of them, ought onely to be admitted into practice; of which ſort there is enough already received and approved on, ſo that there needs no new ones to be daily added. The ancient *Laudana* invented by *Paracelſus*, *Crollius*, *Quercetan*, *Hartman*, and other famous Chymiſts, and deſcribed alſo in moſt *Pharmacopœias* [Books ſhewing how to make Medicins] are compounded onely under the form of an Extract; in all which for a foundation there is the tincture of Opium drawn forth with a fit menſtruum; to which are added other Tinctures, as of Saffron, Caſtor, (which *Guianerus* calls the *Bezoar of Opium*) of Species Diambræ, and the like; and ſo when they are all mixed together, diſtil them in a Bath, ſo that the menſtruum being evaporated, the remainder be reduced to the conſiſtence of Honey; and in fine, for the compleating of it, put into Magiſteries, pretious Powders, Chymical Oils, and other things that are reckoned Cordials: and when the Medicin is thus made up, it is moſt commonly given in the form of a Pill.

Laudana in the form of an Extract.

Though theſe kind of *Laudana* ſeem efficacious enough, and elegantly made up, yet the Modern Phyſicians have ſomewhat altered the forms and made the conſiſtence of them liquid, that they may be the better taken in any liquor. To which you may add, that whereas an Opiate Pill (which was no leſs famous for doing hurt than good) was a terrour to ſome People, a Doſe of Liquid Laudanum may be better concealed (if it be neceſſary, and the Patient be averſe to it) and when it is poured into other liquor, may go for a Cordial rather than a ſleeping Medicin. And indeed ſick People ſometimes are too cautious as well as too careleſs in the uſe of Opiates, and therefore, as in one caſe they ought to be admoniſhed, ſo in another they ſhould be cheated and deceived. For the making of liquid as well as ſolid *Laudanum*, you muſt extract the tinctures of Opium and its adjuncts ſeverally, in the ſame manner; which having afterwards mixed all together, and drawn off the menſtruums to the one half, there will remain a Medicin which is of a ſhining red colour, the Doſe whereof is from ℈ß. to ℈j.

Liquid Laudanum.

Concerning theſe *Laudana* of both kinds, it is of greateſt moment with what menſtruum the Tincture of Opium is extracted; in ſo much that this is grown to be a great controverſie among ſome Chymiſts of no ſmall account, whileſt ſome of them ſuppoſing it to be cold, uſe ſpirit of Wine; and others on the contrary, to abate the heat of the Opium, diſſolve it in ſpirit of Vinegar, or juice of Citron: now indeed

What is the beſt menſtruum to make Laudanum with.

Phar. Rat. Part I.

each menſtruum is agreeable enough, and one almoſt as good as the other, ſo it be reduced to an Extract; but if you give it in a liquid form, there is no better diſſolver of Opium than ſpirit of Wine, impregnated with ſalt of Tartar volatilized. For this moſt readily diſſolves the maſs thereof, receives a Tincture that ſhines like a Ruby; beſides which, it ſomewhat ſubdues the Narcotick ſulphur, and takes off its noiſome ſmell: for to ſay truth, ſalt of Tartar is the beſt correcter of, or rather Antidote againſt Opium. Hence that ſame Empericks Opiate Pill, in which ſalt of Tartar mingled with Oil of Turpentine is the diſſolver of the Opium, is reckoned very good: to which Compoſition they add Powder of white Hellebore, but not for any other reaſon, I ſuppoſe, than becauſe ſome men maintain a Paradox [a poſition againſt common reaſon] and ſay that Venoms when they are tamed become the beſt Medicins.

The Laudanum of Helmont.

For ſome few Years laſt paſt the uſe of a kind of Liquid Laudanum hath been frequent; of which *Helmont* is commonly ſaid to be the Author. It hath for its menſtruum [or diſſolver] the Juice of Quinces put into a fermentation by the Yiſt of Ale: with which a deep tincture both of Opium and Saffron is extracted, which being ſtrained and aromatized, is drawn off in a Bath to the one half; then part of the remainder is kept for uſe, and is this Liquid Laudanum: of which the Doſe is from 15 to 20 drops. The other part by further Diſtillation, is reduced into the form of Pills, and given from gr. j. to ij. I have given that liquid Opiate, in dyſenterical caſes, oftentimes with great ſucceſs. But my Liquid Laudanum (which I moſt commonly uſe) hath for its menſtruum, the Tincture of ſalt of Tartar raiſed to the higheſt redneſs by long digeſtion: and ſince the Tincture of Opium extracted by this is the ground of the Medicin, for a Complement I add Saffron, Caſtor, Cloves, and Lignum Aloes: of this the Doſe is from 15 to 25 grains.

2. Red Poppy and the Preparations of it.

2. After white Poppy and the opiate Preparations thereof, I come next to tell you of wild or Erratick Poppy, which hath, no queſtion, a kind of hypnotick or ſleepy quality in it, but much more mild and benign than that other; wherefore in ſome caſes it is very ſuitable, and we may be more ſecure in the uſe of it. For this there is a Syrup and a Diſtilled Water prepared, and to be had in Apothecaries ſhops, which are often given with ſucceſs in moſt continued Fevers, and are ſuppoſed to be helpful in the Pleuriſie by a kind of ſpecifick virtue, which they have, becauſe they remove pains, and by ſtopping the Pulſe in ſome meaſure, depreſs or cool the feveriſh boyling of the bloud. Moreover out of the Flowers hereof, infuſed in ſpirit of Wine, you may draw a Tincture, which among Empericks and good Women is a famous Medicin, and ſaid to be good againſt a Surfeit by hard drinking. Of which this ſeems to be the reaſon, becauſe the ſpirit of Wine keeps all that is in the ſtomach from putrifaction, and the Narcotick quality of the Flowers prevents the Fever which is coming upon a man.

Cynogloſs and its Preparations.

3. Having done with the Medicins made of Poppy, Mandragoras, or Mandrake, Henbane, Cynogloſs or Dogs tongue, and Tobacco, come in the rank of Narcoticks, next before us. Of the two former of which, becauſe they are ſcarce ever received into the practice of Phyſick (except the ſeeds of Henbane); I need not make many words, but Cynogloſs, becauſe it breaths, as it were, a ſoporiferous ſmell or flavour, doth openly profeſs its Narcotick nature, and by the beauty of its form, doth as it were, invite us to take it up. For it is a very fine Plant, with ſoft leaves, of a pleaſant green colour, and is crowned with delicate purple flowers. The Powder of the roots thereof is an impediment of, and gives denomination to that ancient and famous Opiate called *Pillulæ de Cynogloſſo.* The Juice of the whole Plant (gathered about the beginning of the Spring) being ſqueezed out and depurated by cloſe and hot digeſtion, and then decanted from the dregs, gives you a clear liquor, which is ſhiningred like a Ruby. This may be uſed either as a Menſtruum to compound other Narcotick Confections, or an Hypnotick [or ſleepy] Syrup is prepared out of it. Or laſtly, being gently evaporated, it is reduced into an Extract, out of which, as out of Opium, Tinctures and Extracts are made with convenient Menſtruums [or Diſſolvers.]

Tobacco.

Tobacco brings up the Rere of Narcotick Medicins, and juſtly claims a place among them. For though it be no ingredient in their Compoſitions, yet the ſmoak of it taken through a Pipe, produces many times the ſame effect as they do. Yea, which is more to be admired, it doth not onely procure ſleep alone, but ſometimes alſo the contrary of it, which is watchfulneſs. I need not trouble my ſelf to tell you the original or uſage of this invention, which is ſo commonly known and practiſed by men and women of all ſexes, ages, and conditions. The reaſon why I put it in the number of Opiates is, becauſe it works almoſt the ſame effect among our Countrymen, as Opium doth among the Turks: for both of them diſpoſe men to do or ſuffer any thing (by affecting the animal ſpirits with a kind of unuſual motion, and rendering them as it were aſtounded) without any great ſenſe of pain or wearineſs. Wherefore

to

to the ſmoak of Tobacco taken in at the mouth, according to the common cuſtom, they aſcribe not onely many, but different, yea contrary virtues and effects, that are repugnant one to another. For it is vulgarly ſaid to heat us when we are cold and chill, and to cool us when we are hot; to procure or prevent ſleeping; and likewiſe to ſatisfie or excite hunger and thirſt: the reaſon of all which, conſiſts in this, that the animal ſpirits being gently agitated, and as it were put into a kind of Dance by this exhilarating fume, are totally deaf to the moleſtations of any troubleſome object; yea, whatſoever of difficulty they have to do or ſuffer, they perform inſenſibly and without any diſturbance. Whereupon the uſe of Tobacco is not onely good, but almoſt neceſſary for Souldiers and Seamen, where it agrees with them, in as much as it makes them both undaunted in all dangers, and able to endure hunger, cold, and labour. But that this ſmoak is very Narcotick and injurious to the ſpirits (before it grows familiar to them by long uſage) is manifeſt from this, becauſe when they firſt attempt to take it, there is hardly any one but ſuffers very great diſturbances in their Brain and Nerves. For when a man is inciated in this dry kind of drinking, he is immediately taken with a ſwimming and a cloudineſs in his Brains, which is often attended with vomiting and purging; their feet fail them, their hands tremble, and their tongue ſtammers, or talks idly. Many times alſo a cold ſweat and terrible fainting fits enſue thereupon, the cauſe of all which is, for that the animal ſpirits, being as it were intoxicated by the Narcotick ſulphur, are in their whole Government very much diſtracted, and forced into diſorders: nor onely at the firſt or ſecond bout, but from the beginning it is many times a long while before the ſmoak of Tobacco can be taken without great confuſion in the ſpirits. But as ſoon as that cuſtom is become uſual and familiar to a man, it likewiſe grows very grateful, and affects the animal ſpirits with ſo much pleaſure, that ſome men had rather abſtain from meat or drink than from the uſe thereof. The reaſon of which is, becauſe this ſmoaking doth gently raiſe, and as it were tickle the animal ſpirits whenever they are dull and ſluggiſh, and puts them into pleaſant expanſive motions, with which they are recruited and refreſhed in a wonderful manner, as after drinking of Wine.

Phar. Rat. Part I.

The effects of ſmoaking it.

And the reaſons of it.

So much for the principal Narcoticks with their Preparations, and the manner of uſing them, who belong all to the family of Vegetables. But leſt it ſhould be thought that Minerals are of no effect in this caſe, ſome men will tell you, that even out of thoſe harder bodies they have prepared moſt excellent Opiates, without any Opium at all in them. *Quercetan* preſcribes the making of a certain *Nepenthe* [Pain-removing Medicin] (which is very efficacious to allay and take off all pains and languiſhings) out of the Narcotick ſulphur of Vitriol, and Oil of Sol and Luna [*i.e.* Gold and Silver] with Tincture of Coral, and other famous Cordials: of which Medicin I am ſo far from admiring the Virtues, that I rather think, that either there are no ſuch metallick ſulphur and Oils at all, or that they are of little or no force. Therefore contemning thoſe things, and returning to the genuine and real Narcoticks, I will for a farewel, ſubjoin ſome forms of them, which I will likewiſe digeſt into ſeveral Claſſes or Orders, according as the Opiates have for their ground either the Syrup or Diſtilled Water of red Poppy, or Diacodium, or Laudanum in an Extract or Liquid, or Pills of Storax or Cynogloſs, or a Philonium.

The grounds of Narcoticks.

Take of red Poppy Water, and Cowſlip Water, each ℥ vj. *of Syrup of Rhead Poppy* ℥ ij. *of Sal Prunella* ʒ ß. *mingle them and make a Julap. The Doſe is* ℥ iij. *or* iv. *thrice a day, in a Pleuriſie, Pains and Watchings, without any Fever or manifeſt cauſe.*

1. *Water and Syrup of Rhead Poppy.*

Take of Poppy Water ℥ iv. *to* vj. *and let it be taken ſometimes by it ſelf twice or thrice a day for the ſame intentions.*

Take of Diacodium from ℥ ß. *to* ℥ vj. *of Cowſlip Water* ℥ iij. *of Treacle Water* ℥ iij. *and make a Potion.*

Potions.

Take of Cardus Water ℥ iij. *of Diacodium* ℥ ß. *of Spirit of Harts horn, from* ℈ ß. *to* ℈ j *and make a draught to provoke ſleep and ſweating.*

Take of Diaſcordium ʒ ß. *of Gaſcoign Powder* ℈ j. *of Diacodium* ʒ ij. *mingle it, and let the Party take it in a ſpoon.*

Take of Diacodium ℥ iij. *of Snail Water* ℥ j. *and mingle them. It is good in a Cough and Phthiſick. The Doſe is one ſpoonful when you go to Bed, and if need be, repeat it after midnight.*

Take

Phar. Rat. Part I.

Take of London *Laudanum* gr. j. *of Powder of Claws compounded* ℈ß. *to* ℈ j. *with a convenient quantity of Syrup of Clove-gilliflowers. Make* 3 *Pills to be taken when you go to Bed.*

2. *Laudanum extracted. Pills.*

Take of Laudanum gr. j. *of Pilulæ ſtomachicæ cum gummi* ℥ß, *make* iv. *Pills, to be taken when you go to Bed, for the Colick.*

A Bolus.

Take of Laudanum gr. j. *to* gr. j. ß. *of Diaſcordium* ℈ j. *make a Bolus. In the room of the Diaſcordium you may put Confection of Alchermes, or of Jacinth.*

A Draught.

Take of Laudanum gr. j. *diſſolved in a ſpoonful of Treacle water, and put to it of Cowſlip water* ℥ ij. *make a draught.*

3. *Liquid Laudanum tartarized.*

Take of my Liquid Laudanum tartarized xx. *drops, and give it in a ſpoonful of Aqua Mirabilis or Cinamon water, or any other that is fitting. It is good in pains of the Colick, Stone, or Gout.*

Take of Species Hieræ ℥ß. *of the ſame Laudanum* xx. *drops, and make* iv. *Pills, to be taken when you go to Bed to purge, and likewiſe to allay pains in the Colick.*

4. *Liquid Laudanum prepared with Quinces.*

Take of Liquid Laudanum prepared with Quinces, from xv. *to* xx. *drops, and give it in a ſpoonful of ſmall Cinamon water, in dyſenterical Diſeaſes.*

Take of the Conſerve of red Roſes ℥j. *of Treacle of Andremachus and the Confection of Jacinth, each* ℥ij. *of red Pulvis Pannonicus* ℥j. *of Laudanum prepared with Quinces* ℥ij. *of Syrup of Coral, a convenient quantity, make a Confection. The Doſe is* ℥j. *every four or five hours, in a very bloudy Dyſentery* [*or Flux*] *with gripings.*

5. *Pills of Storax.*

Take of Pil. de Styr. [*or Pill of Storax*] gr. v. *to* vj. *of Lac Sulph.* ℈ß. *of Oil of Aniſe ſeeds* j. *drop, of Balſam of Peru a convenient quantity, make* iv. *Pills to be taken in a Cough, Aſthma, &c.*

And of Cynogloſs.

Take of Pills of Cynogloſs gr. vj. *to* viij. *make* 2 *Pills to be taken at bed time for the ſame end.*

6. *Philonium.*

Take of Philonium Rom. ℈j. *to* ℈ij. *of Conſerve of Clove-gilliflowers* ℥ ß. *mingle them; make a Bolus to be taken when you go to Bed. It is good for the Colick, in a cold temperament.*

After Narcotick remedies, which I have now ſufficiently expoſed to their view, I ſhould in the next place ſay ſomething of Medicins that are meerly Anodynous; that is to ſay, ſuch as gently quiet and compoſe the animal ſpirits when they are any way diſturbed, or in an heat, not by ſubduing or ſtupifying, but onely by mollifying and ſoothing of them. But the *An* of theſe (*i.e.* whether there are any ſuch in nature or no?) ought firſt to appear, before we form a Diſcourſe of the *Non* [*i. e.* why they are ſo.] For beſides that Fomentations, Pultiſes, and Ointments outwardly applied, and Clyſters injected into the Guts do ſometimes allay pain, I know no other effect that is performed by thoſe meerly Anodynous Medicins, at leaſt when they are taken in at the mouth. Wherefore I do not think it worth while to frame any reaſons for ſuch, becauſe we cannot at all rely upon them for procuring of ſleep, or eaſing of pain, when it is very ſharp upon us.

Medicins that hinder ſleep.

But ſeeing we have hitherto diſcourſed ſo largely of Opiates, with their Preparations, and the ways how they work, according to the former method, I ſhould now in order ſpeak of ſuch Medicins as are contrary to them, or Anthypnoticks; that is to ſay, ſuch as by keeping ſleep off, when it comes too faſt upon us, make us watchful; if I had not formerly performed this task in almoſt all particulars, in a Diſcourſe concerning the Brain (where I treat of the Lethargy and other ſleepy Diſtempers, with their Remedies) ſo that there is no need for me in this place to repeat the ſame thing over again.

Coffee, and its Effects.

But ſince in that Book, and alſo in other places, I have made frequent mention of a certain liquor called Coffee, which is very effectual for the expelling of drowſineſs, I do not think it altogether improper to add ſeme few words more in this place concerning that Drink with its effects, and the reaſons of its operations, which I have hinted elſewhere. It would be beſides our purpoſe here to diſcourſe of the ancient and common uſe of it, now among the Turks, and formerly among the Arabians and other Eaſtern Nations; but ſeeing that this Drink hath been uſed even by our Country-men too, for ſome years laſt paſt, and almoſt every body knows by experience what great virtue it hath in driving away drowſineſs, therefore let us now inquire into the reaſons

The reaſon of it.

of this ſo well known and tried effect. The reaſon of this I have told you in the Chapter

Chapter *De Pervigilio* [of Watching] consists in this, that the Coffee insinuates adust particles (wherewith you may know by smelling as well as tasting, that it abounds) immediately into the bloud, and then into the nervous juice; which particles do by their disagreeableness, and also by their restlessness, not onely keep the pores of the outward Brain still open, but likewise give such spurrs and provocations to the spirits, (which are disengaged for all bonds of drowsiness besides) as may excite them still to perform their offices: for to procure sleep these two things are necessarily required, of which sometimes the one and sometimes the other is most effectual: that is to say, all the pores and passages of the outward Brain or the Cortex of it, must be very much stuffed and filled with a Liquor that distills as it were from the bloud, and flows into those parts, and by that means be closed up; and then afterward to produce that effect, it is necessary that the animal spirits being excluded out of those pores and passages, and also many times clogged with nutritive and serous particles, should betake themselves towards the middle of the Brain and lie idle. In these Preparatives to sleeping, there is not always one and the same order. For sometimes the animal spirits do first and of their own accord forsake those places, whilest the nervous juice immediately runs into them when they are emptied; and sometimes the nervous humour that flows thither with the serum in great plenty, gets into those passages first, driving the spirits out of them even against their inclinations, and forcing them inward. *Phar. Rat:* Part I.

But the operation of Coffee seems contrary to both these effects: For immediately after the drinking of it, the adust particles, which are extraordinary active and nimble, being conveyed into the bloud, do somewhat dissolve the liquor of it, and separate the serous part toward the reins and into the habit of the body; and then those particles coming to the Brain, do very easily open the pores of it, and keep them also by their restlessness very wide. Afterward being joined to the spirits, they strip them of all other particles that either oppress or are nutritive, and consequently put them, being now light and volatile, into several motions, and cause them to be expanded through the whole circuit of the Brain, which is freed from all oppletion [fulness] and obstruction.

Its conveniences and inconveniences.

But in the mean while, when the spirits being exercised in this manner continually and indefatigably, are deprived of the access and assimilation of the nervous juice, their forces are not sufficiently and in the usual manner recruited. Indeed the old Spirits are made more active and nimble, but the supplies of new ones are diminished. So that it appears from hence, that this drink though very common in use, and in some cases very beneficial, and extraordinary physical, yet in some others perhaps is noxious or less wholsome. And that it is so, not onely reason but daily and common observation tells us, in as much as Coffee-drinkers, that take it to excess, become many times lean Fellows, and subject to the Palsie as also averse to, or unfit for Venery. The former effect is so frequent and well known, that I have for that reason alone forbidden a great many to drink Coffee, because it makes them grow lean.

It makes People lean, and Paralytick, &c.

For seeing the bloud, by the daily and too frequent use thereof, becomes sharp and more heated or dried, it is therefore less able to nourish. But as to the indispositions of the Brain and Nerves, I think I sometimes prescribe this Drink, for the curing of them, as much as any man: for I use to send some of my Patients to the Coffee-houses rather than to the Apothecaries shops.

Indeed in most diseases and maladies of the Head, as the Head-ach, Swimming, Lethargy, Catarrhs, and the like, where there is a moist Brain, but a dulness and numness of the animal spirits, joined with a full habit of Body, a cold or not an hot constitution and watery bloud, Coffee is taken many times with great success: for being daily drank, it wonderfully clarifies and illustrates or purges the Brain, and dispels all the clouds from off every function whatsoever: but on the contrary, such People as are thin, cholerick, or melancholick, and have sharp and hot bloud, an hot brain, and their animal spirits too much disturbed and discomposed, ought altogether to abstain from this kind of Liquor; because it the more perverts both the spirits and humours, rendering them unfit and unable for any functions whatsoever. For I have observed many People that have had no great plenty of spirits, and likewise such as were subject to the Headach, Swimming in the Brains, Palpitation of the Heart, and trembling or numbness in the limbs, that have immediately been the worse for drinking of Coffee, in those respects, and have thereupon presently felt an unusual languishing in their whole Body.

THE END.

PHARMACEUTICE RATIONALIS:

OR, THE

OPERATIONS OF MEDICINES IN Humane Bodies.

The Second Part.

With Copper Plates describing the several Parts treated of in this Volume.

By *THO. WILLIS*, M. D. and *Sedley* Professor in the University of *OXFORD.*

LONDON,

Printed for *Thomas Dring, Charles Harper,* Booksellers in *Fleet-street,* and *John Leigh* at *Stationers*-Hall, 1684.

THE PREFACE TO THE READER.

SInce first I began to consider the Operations of Medicines in humane Bodies, and their manner of working, and for some time meditating upon the entire Subject, at length published an Essay of the Rational Curatory part; I became affected with so vehement a desire of farther prosecuting that Speculation, that in all spare hours, (to wit, as frequently as I might be vacant from my practice) I could hardly intend or admit thoughts of any other thing: And that not so much that I might please others, as by often turning in my mind, and writing my Meditations of this Subject, I might be better instructed to prescribe to my Patients. For certainly the not duely weighing the Reasons by which Medicines operate, renders all Physick to be Empirical, and to be governed rather by Chance or Fortune than by Advice; and it frequently comes to pass, that a Medicine rashly administred, is but casting a Die for a Mans life. Wherefore, that I might satisfie my self, and practise Physick (as is usually said) with a safe Conscience, it pleased me to bestow more labour in the search of the true Reasons of physical Energies and Efficacies. And because in this Treatise, we chiefly consider Medicines, respecting certain private parts or Regions of the body, and their proper Diseases, therefore we have endeavoured in the first place to perform these three things; *viz.* First that a most accurate Anatomical Description might be given of the parts, (if not already extant) whose Distempers and Remedies are treated of, as to the Fabrick and uses of all their Vessels. Wherefore, turning over the Breast and Lungs, and most diligently viewing their inward recesses and aparuments, what thing soever observable either the Ancients or Moderns have published about these, and whatsoever further by Knife or Microscope we have detected, we have here set forth. In which task, as formerly in some others of the same nature more exactly done, I must confess I owe much to the sedulous labour of my most learned Friend Dr. *Edmund King*, and

to his most dexterous Dissections. And really I esteem it so necessary to lay the History of the Parts, as a foundation to our Rational Curatory Method, that without it I did believe the whole Superstructure would be meerly phantastical and altogether unstable, or at least unprofitable. For surely, either to practise Physick, or demonstrate its Operations on humane Bodies, without an exact knowledge of the parts and passages, on which, and by which they work, would seem equally absurd, as if a Philosopher ignorant of Mechanical affairs, should go about to unfold and explicate the Artifice and cunning Workmanship of a Clock moving of it self, according to the Theory of Natural Motion delivered by *Aristotle*. Wherefore we have view'd with most exact diligence, in the first place, the Subjects of Physick, or the places of Operation in our Bodies, as the Circuit in which we are to move. Then secondly we have not been less solicitous, that according to the Phænomena of all parts lately detected by Anatomical observation, the true and real Hypotheses of Diseases should be built, whereof we have designed the Remedies; that not still persisting in the thread-bare paths of Ancient Physick, by a certain blind and implicite obsequiousness, after the manner of Beasts, according to the proverb, to be only guided by our Ancestors footsteps; but deriving the Causes and formal Reasons of Diseases from their very Springs, we every where endeavour to shew, from what Disposition of Blood and Humours, from what affection of Animal Spirits, from what habitude of Fibres, and of other solid parts, every Disease proceeds. And these things so premised, and laid instead of a solid Foundation, at length in the third place, that the structure of our Curatory method being rightly compacted, may happily rise up and firmly consist, we have gathered together most of the Medicines respecting most of the private parts and regions of the body, and the peculiar Distempers thereof, *viz.* both Simple and Compound, both Old and New, both Dogmatical and Empirical, gathered out of the Physick-books of every Age, as also those chiefly celebrated by Quacks and Nurses; more choice forms of all which, or at the least the chief of them and manner of using, we have aptly assign'd, and annex'd the reasons as to the Preparations, as also the Operations and Effects of them. But that all is not comprehended in this Tract that was omitted in the former, which yet I had hoped might have been, happens from the plenty of matter, and the bulk of the work encreasing upon our hands: For assuredly, it is more than the task of one Man or Generation, to exhibit a compleat Curatory Method, and absolute in all points. For if this Disquisition were more fully instituted as to its Latitude, not only all the *Materia*

teria Medica (which is almoſt infinite) but alſo the whole Body of Phyſick offers it ſelf. Wherefore theſe our Attempts court not the name of Treatiſes, but of Eſſays. Truly it will not be needful for many Phyſicians, eſpecially thoſe who neglect the Phænomena of Nature, being intent only on their Practice and Gain, to be learned about the Reaſons of all Remedies: but to the genuine Sons of Art, this will be of value, if not to direct, at leaſt to incite them to the Knowledge and ſerious weighing always of thoſe things they take in hand. And if theſe ſmall endeavours ſhall inſtigate others better to poliſh that Study, whatſoever Reviling I may reap from the malevolent and envious, it ſhall never repent me of my labour. For when I ſhall be well conſcious to my ſelf, that I have not ſuffered my Faculties although ſmall (as the Talent entruſted with me by God Almighty) to periſh through ſloth, nor ſuffered them to be buryed in the earth, but that they may be rendred with ſome Intereſt beſide the Principal, it will much pleaſe me, nay, I ſhall ſeriouſly rejoyce and triumph.

POST-

POSTSCRIPT.

While these were Printing, the most sad message arrives, that the Author, most worthy of Immortality, oppressed by the irresistible assault of a Pleurisie, is departed from among the Living; neither did the Arts profit their Master, which did all others. The Reader will pardon us, if we for a little space celebrate the Funeral of so Sacred a Memory, nor esteem it superfluous to hear in a few words, what manner of person he was who wrote such things: yea he will rejoyce to understand that he was equally Good as Learned, that he also exercised himself in the Practice of Piety, who was most conversant in that in Physick.

The matter requires a just Commentary, but we shall briefly propound what at first came into our sudden thought, while our mind was surprized with so unexpected an Accident.

Extracted from an honest Family, he had a Father educated in ingenuous Studies, who after he had gone Master of Arts in the University of Oxford, *being taken with the retiredness of the Countrey, repaired to a Possession he had near the same City, and solely attended his Domestick Affairs, and maintenance of his Family: being enough deserving of the World, who begat such a Son. But He, the Civil War raging, being snatcht away by the Contagion of a Camp-Feaver, left his Son an Orphan, near about twenty years of age, placing the first Rudiments of his Studies in* Christ-Church; *who being called to take on him the care of an Inheritance, for some time remained in the Countrey, but harrased by the Incursions of the Rebels, who were possessed of a Garrison strong enough Five miles from thence, and every where Plundering, he betook himself again to* Oxford, *being the Tents of the King as well as the Muses; where listing himself a Souldier in the University Legions, he received Pay for some years; until the Cause of the Best Prince being overcome,* Cromwell's *Tyranny afforded to this wretched Nation a Peace more cruel than any War. From thence, the Church being trampled on, and Divinity together with Divines suppressed, he applyed himself to the study of Physick, in which, in a short time he made eminent progress. In the mean time being nevertheless addicted to the study of Piety, (whereof it was a considerable demonstration, that when the Liturgy of the Church of* England *was thrust out of the Church, and none could be present scot-free at those holy Offices after the ancient manner) he entertained Religion then a Fugitive; and allotting part of his House for Holy uses, brought it so to pass, that Assemblies, and Publick Prayers, and other Offices of Piety were constantly performed according to the Rites of the Church of* England. *In the mean time he writ and published those most excellent Tracts by which he first became known to the World,* viz. *Of* Fermentation, *of* Feavers, and of Urines.

At

At length the King reſtored, and acceſs opened to Univerſity Degrees and publick Employs, he proceeded Doctor, and was publickly declared Profeſſor of Natural Philoſophy, which Profeſſion he did adorn with the higheſt praiſe; Moreover, his Anatomy of the Brain, *and his Treatiſe of the* Scurvy, *and of* Convulſions, *were publiſhed.*

But about the Year 1667. *being called to* London *to practiſe Phyſick, it is incredible to relate, how ſoon, and with how great Commendations he grew famous, eſpecially being ſo compoſed by Nature and Cuſtom, that he could not recommend himſelf by words compoſed to deceive, or the cunning Arts of Mountebanks. But though he ſpent whole days and nights in care of the Sick, he was yet at leiſure to adorn his Art by compoſing Books, from whence among a thouſand Interruptions he publiſhed theſe Treatiſes, of* the Accenſion of the Blood, *and of* Muſcular Motion, *of* the Soul of Brutes, *of* the Diſeaſes of the Brain, *and the firſt part of his* Pharmaceutice Rationalis, *and at length the* other *which we now preſent. All which, with the Author's Animadverſions, and writings unpubliſhed, being collected into one Volume, and committed to the care of the moſt faithful Apothecary Mr.* J. Hemming, *we hope ſome time to print here.*

Moreover, the ſame care for Divine Worſhip was ſtill impreſſed on this moſt Pious Soul; and ſince he could not be preſent, by reaſon of Employ, at the Canonical Hours at the Publick Devotion in the Pariſh Church where he dwelt, he procured the Sacred Offices of the Church to be there celebrated early in the Morning and late in the Evening, and for the moſt part was conſtant at them, whatever Buſineſs was repugnant. And ſeeing this Inſtitution profitable to many in the Neighbourhood, who were likewiſe all day detained about Commerce and Trades, he endowed a Prieſt with a fit Salary at his Death, to diſcharge that Function for ever.

But ſmall was this proof of his excellent Pious temper. Although no Perſon more frugal and attentive to his employ, yet none more munificent, denying all things to himſelf, yet denying nothing to the Poor and helpleſs. Beſides what beſtowed with his own hands, he provided Almſgivers and Diſpenſers of his Charity every where in the City, Countrey, and in the Univerſity. I ſpeak what I know by frequent experiment; one might eaſier have received from him, for a fit object of Charity, an hundred Crowns, than have extorted as many farthings from moſt others. And though any one might juſtly impute the large Revenues he acquired, to his indefatigable Diligence and conſtant Frugality, yet I believe it rather to proceed from his bountiful Largeſſes. and the Divine benediction thereon. From the beginning of his Youth to the laſt period of his life, he was Maſter of no ſumm of Money which he accounted his own, until he had conſecrated ſome conſiderable Portion of it to God and the Poor: and when a few days before his laſt, which I muſt ever lament, we conferr'd together, (as if he had foreknown his approaching Death, and being more ſolicitous about the Poor than his own Off-ſpring,) he diligently adviſed about ſtating theſe Accompts.

I omit here to decipher, how undisturbed he was in Adversity, and how temperate in Prosperity; how modest in the highest Fame for his Learning; when unworthily provok'd, how prone to forgive Injuries; how faithful to his Prince to his death; how obedient to the oppressed Church; how candid and ingenuous in the Profession of his Art; how indefatigable his Studies, how sparing in his Speech, and how much a Christian in the whole state of his Life. To finish all which according to his deserts, is not the work of one hour or Paragraph. In short, he was constantly exercised in Prayers, Studies, Labours, Almes, and Watchings; at length being near Fifty seven years of Age, in the beginning of November *he seemed troubled with a Cough (now the Epidemical Disease of the time) which (while it was thought light and inconsiderable) suddenly passed into a Pleurisie and Peripneumonia. And when this most expert Person was not relieved by frequent Bleeding and diligent taking of Remedies, himself perceived the Period of his Life to approach, (his Friends hoping better;) and after three days his Houshold affairs being settled, and having taken the* Viaticum *of the* Holy Eucharist, *and being received into the Peace of the Church, he commended his pious Soul to God, having his senses entire to the last breath, and finisht his most exemplary Life with the like Death.*

THE

THE SECOND PART OF *PHARMACEUTICE RATIONALIS*, OR OF THE OPERATIONS OF MEDICINES IN HUMANE BODIES.

SECT. I.

Of the Medicines of the Thorax.

CHAP. I.

Of the Organs of Breathing and their Uſe.

IN the former Treatiſe having eſſayed to explain the reaſons of every Medicine, for the moſt part we have toucht only upon general Medicines, namely which excite ſome Evacuation, or recreate and reſtore the fainting Spirits, or calm thoſe which are too much raging and unquiet: But moreover there are many other Remedies, and thoſe of ſeveral ſorts, which are ſuppoſed to have reſpect to ſome peculiar part of the Body, or ſome particular Diſeaſe, and to be appropriated to thoſe ends by a certain kind of ſpecific virtue or operation. Now as concerning both the *ὅτι* and *διότι* of theſe, at leaſt the chief of them, *viz.* whether it be really ſo, and for what reaſon it comes to paſs to be ſo, it ſeems now worthy to be inquired into: And firſt of all we will treat of the Medicines of the *Thorax*, *viz.* thoſe that are wont to be preſcribed againſt the Cough, Phthiſic, Catarrh, Aſthma, Dyſpnœa, and other Diſeaſes of the Breaſt. *The Author's purpoſe in the preſent work.*

But ſince the reaſons as well of theſe Diſeaſes as of medicinal Operations in healing them ſeem very abſtruſe and moſt difficult to declare: therefore before I enter upon this task, ſomething ought to be premiſed about the parts themſelves, as well touching their uſes and ordinary actions, as their ſickneſſes or preternatural affects. As to the firſt, the parts of the *Thorax* are either principal, as the Heart and Lungs, with the Veſſels appendent unto them; or ſubſervient, as the membranes and Muſcles, with the Diaphragma; as likewiſe the Ribs, with the Vertebra's; then Pneumonic Veſſels, with the nervous Fibres and Glandules. The conſideration of the Heart and its Veſſels doth not properly belong to this place, becauſe not ſo much the ſickneſſes of the Breaſt alone as the general ſickneſſes of the whole body are uſually reckoned amongſt its paſſions. Whereas therefore the remedies appointed to cure the diſeaſes of that region, have ſpecial reſpect to the Lungs, and to the other *The parts of the Thorax.*

PHAR. Part. II.

Organs of breathing ſerving them; therefore firſt we will deſcribe the fabrick and uſe of theſe parts, then their diſeaſes afterwards, together with the method of cure and remedies; and laſtly endeavour to add the reaſons of all theſe.

The ſubſtance of the Lungs altogether membranous.

The ſubſtance of the Lungs was always accounted by the Ancients, and moſtly hitherto by modern Authors for fleſh and a Parenchyma, like the frame of the other bowels; which notwithſtanding was accounted lighter and ſpongeous (for as much as it was apt to be diſtended much by air pufft in, and to float upon waters.) Moreover, whereas the Lungs taken out of an Embryo look red, and ſink in water; and the Lungs of ſome grown perſons being boiled, appear compact enough and more ſolid, almoſt no man doubted but they conſiſted really of fleſh: Lately the renowned *Malpighius*, a moſt diligent Searcher of Nature, found theſe parts to be altogether excarneous, and meerly membranous: "and therefore he judges the bulk of "the Lungs, if the Nerves and certain Veſſels be ſeparated with the branches of the "*Trachea*, to be a certain heap of little Bladders, and thoſe ſmall Bladders every "where ſtretched out and ſinuous, to obtain ſuch poſition and knitting together, "that an entrance lies open into them from the *Aſpera Arteria*, and ſo from one "into another, until at length they all end in the Membrane incloſing the Lungs. "And truly that it is ſo, he makes clear to ſenſe by an Experiment. For let a Lung "be taken out hot, and let water be ſo often caſt by a Syringe into the Pneumatic Ar-"tery, as till the whole frame appear ſomewhat white, and almoſt tranſparent, the "blood being clean waſhed out; afterward this water being squeezed out by preſ-"ſing, and the air let in by the Wind-pipe, and pen'd in, let the Lung ſo filled be "dryed: and it does not only, whilſt expoſed to the light, outwardly ſhew tranſpa-"rent little Bladders; but being inwardly cut, it preſents a white heap of little "Bladders to the eyes. Beſides, having viewed it with a Microſcope, he diſcovered a certain wonderful Net, binding and knitting together every one of thoſe little Bladders; which Net conſiſts of the minute productions and branchings of the Artery and Vein; which Veſſels circulate the blood by the ſmall and crooked paſſages, and by the many turnings of the Pipes.

Conſiſting of almoſt infinite Lobes.

The moſt renowned man hath found out beſide theſe little Bladders for the moſt part conſtituting the frame of the Lungs, a new and more admirable furniture of this Bowel, *viz.* he ſhews plainly the bulk of the Lungs to be blown up by almoſt infinite Lobes girt about with their proper Membrane, which being endued with common Veſſels, grow to the ſmall twigs of the *Aſpera Arteria*: the inſertion and ſituation of which kind of little Lobes are manifold, as being ſometimes affixt to the Baſis of the *Trachea*, ſometimes to the Ribs, or to its Cone; alſo according as they end in the outward and plain ſuperficies, or in the corners of the Lungs; and according as they ought to have a due poſition, knitting and inter-ſpaces among themſelves, rightly to fill up the frame of the Lungs. The little Lobes out of which each Lobe of the Lungs is made up, in the third Table are accurately and to the life expreſſed.

Their little branchings.

Certain inter-ſpaces diſtinguiſh theſe little Lobes (which manifeſtly appear in a larger Lung or in any other half boiled) which (as the renowned Perſon hath obſerved) are not bare cavities or empty ſpaces, but they have many Membranes ſpreading from the little Lobes, ſome parallel, ſome angular, and are alſo covered with many Veſſels, ſo as theſe inter-ſpaces are certain membranous little bladders, yet tranſparent and moſt thin. If you lightly open in one ſingle Lobe of the Lung one of theſe inter-ſpaces with the point of a knife, and ſhall blow into it by a ſmall hole through a Pipe, preſently that whole Lobe will be very much extended, every interſpace being pufft up; and then if you bring this frame to the light, the interſpaces being made tranſparent, do ſever by great intervals every Lobe very conſpicuous; and ſo every rank of the Lobes will appear like a Poly pody-leaf, and under the ſame figures, as *Malpighius* hath deſcribed, and are repreſented in Fig. 2. of our third Table. But when the little Lobes are filled and extended by liquor eaſily congealing caſt into the paſſages of the *Trachea*, the appearance thereof is ſomewhat diverſe, and ſeems in the form of Grapes, as is expreſſed in Fig. 1. of the ſame Table. The Veins and Arteries every where accompany this production of the *Aſpera Arteria*, and extend themſelves through the whole ſubſtance of the Lungs by a certain knitting and alike branching. This is plainly perceived by a pleaſant ſight, in a Lobe of the Lungs being emptied and turgid, Quick-ſilver being caſt into ſome of the Veſſels, and others filled with a coloured liquor. But in diſſecting the living, another ſort of Veſſels,

The Lymphæducts and nervous ſlips.

viz. Lymphæducts are manifeſt to the eye to be ſpread through the whole Lungs: and we have in another place clearly enough ſhewn, both very many Nerves and nervous ſlips every where to be diſtributed through them. Beſides theſe parts, and the primary

primary or chief veſſels of a Lung, ſome others, and thoſe as it were ſecondary, are to be obſerved. For the Pneumonic Veins and Arteries are endued with other ſanguiferous Veſſels ſpringing from the *Aorta*, moreover with Glandules, and likewiſe with Fibres as well nervous as moving; and the Wind-pipe is endowed with every one of theſe, and cartilaginous ones beſides.

The Veſſels of a Lung.

Whence we may infer, that the entire frame of a Lung is meerly fiſtulous, and compacted of Pipes of ſeveral kinds and magnitude, and variouſly and moſt intricately diſpoſed: which although they may appear wonderfully complicated, and many ways twiſted and wreathed, are yet every where continuous, and being ſtretched out with a mutual reſpect to one another, do hither and thither in good order and regularly convey and diſpoſe the air, the blood, the *Lympha*, and animal Spirits for ſome acceſſary uſes. To deſcribe as it were with a Pencil this bulk of a Lung, together with the branchings, ſeparatings, and mutual complications of all its Veſſels, would be no leſs difficult a task than to trace the ſeveral threads of a harl of ſilk, and their reſpect one to another. Nevertheleſs, that both the Pathology of the *Thorax*, and the cure, may be duly known according to our deſign, it ſeems to be material to recite here all the Veſſels of the Lungs one after another, and to deliver as well their deſcriptions, as their preternatural uſes and diſeaſes, to which at length the Therapeutic Method ſhall be ſubjoyned. And theſe are the Veſſels of which the entire fabrick of the Lungs conſiſts, the Wind-pipe, with the *Bronchia* and little Bladders, Arteries, Veins, Lymphæducts, and Nerves, to which may the parts and appendices of thoſe Veſſels be added, *viz.* the Coats of the greater Veſſels, which are endued with other ſanguiferous Veſſels and Glandules, and alſo with nervous Muſcles and Fibres.

Wait on the Trachea.

Therefore as to the chief Veſſels of the Lungs, although all theſe, by reaſon of their mutual offices, communicate among themſelves with a wonderful affinity; yet the Arteries and Pneumonick Veins attend on the *Trachea* and its partitions the moſt exactly; for the branches and ſprigs of every one of theſe ſpringing alike from their reſpective ſtocks, and ſtretcht out to and fro, go on every where with like pace; ſo that the *Trachea* and its branches are always in the middle, above that the Vein, and beneath the Pneumonick Artery are carried, and all are diſtributed with an equal and ſociable branching: and the ſprigs and branches, ſent from each of them, are preſently applied to their like, and are interwoven like wonderful Nets, of which the texture of the Lungs is almoſt totally conſtituted. It will be impoſſible to deſcribe the ſpreadings out and various complications among themſelves of all theſe going on together, as to the leſſer ſprigs and ſlips; yet if you will caſt into every veſſel apart Quick-ſilver, hot and flowing Gypſum, Wax mingled and made liquid with Oyl of Turpentine, or ſome ſuch matter, which will extend all or the chief paſſages, and continue them ſtufft, then you may exactly enough repreſent the figure: and after that manner the frame or texture of the whole Lung may be conceived, each being deſcribed by it ſelf and apart. Wherefore upon theſe and all other Veſſels and parts of the Lungs we will treat in order; and firſt of the *Trachea* or Wind-pipe.

The deſcription of the Trachea.

The Wind-pipe or *Aſpera Arteria* is a Pipe ſomewhat long, conſiſting of Griſles and Membranes, which beginning from the Throat or loweſt part of the Jaws, and leaning on the Gullet, and deſcending into the Lungs, is diſperſed by manifold little branchings through their whole frame. It is divided into two parts by the Ancients, *viz.* the upper, which is called the *Larynx*, and the nether commonly called *Bronchus*; to which a third or loweſt is added, by *Malpighius* called *Veſicularis*, or the bladdery one.

The deſcription of the Larynx.

The former of theſe, which is the beginning of the *Aſpera Arteria*, doth chiefly ſerve for vociferation or loud noiſe, formed of many and various Griſles, to which alſo are joyned proper Muſcles; the deſcription and uſe of all which are ſo exactly delivered by Anatomiſts, that there is no need of dwelling longer on the deſcription: we only advertiſe for methods ſake and by way of abridgment, that the Larynx contains ſome greater Cartilages of divers forms, and ſome uniform; the former, by reaſon of reſemblance, bear the denomination of *Epiglottis*, the Buckler-like Cartilage the Ring-Griſle, and *Arytænoides*. To this laſt doth ſucceed a continual rank or row of Cartilages, faſhioned altogether after the ſame figure and manner; every one of which, whereas they reſemble a circle, but not compleat, are diſpoſed after ſuch a ſort, as if one ſo compoſe many wooden Rings, that there ſhould grow up from the ſides of them, by laying a good many one upon another, a certain Pipe as it were with Ribs. Theſe circular Cartilages are equally diſtant one from another in their whole paſſage, and are knit together by the benefit of an inner Membrane (which fills up the ſpaces between like the *Perioſtium*) as with a ligament. But the hinder part of every Ring-like Griſle where it lies upon the Gullet, that it may ſerve

PHAR. Part. II.

better to the ſwallowing of meats, turns into a Membrane, which altogether is the ſame, and binding together thoſe cartilaginous rings, and covering the whole hollowneſs of the *Larynx*, is always moiſt with an unctuous humour, by which it may as well be defended againſt the ſucking in of ſharper air, as breathing out more acrimonious vapours.

Membranes encompaſſing the wind-pipe.

Beſides this inner Membrane, alſo another outward, though thinner, encompaſſes the whole Wind-pipe, by the aid whereof both the Cartilages are more firmly knit among themſelves, and the whole Pipe bound to its neighbouring parts, and deſcends more ſafely and ſtrongly into the Breaſt. Beſides, we judge there are ſome other uſes and offices of either Membrane, than that it only ſerve to faſhion or defend the ſides of the Wind-pipe: for as much as we do here manifeſtly obſerve many Nerves and nervous ſtrings every where inſerted, and alſo the more inward Coat of the *Aſpera Arteria* to be endued with Fibres, as well nervous as fleſhy or muſculous: from whence we may conclude the Wind-pipe to injoy both a certain ſenſe and motion either in the whole, or at leaſt in ſome parts. And truly it is manifeſt even to common obſervation, that its more inward paſſage doth excel with a moſt acute ſenſe; for as much as it is ſo much provoked by the ſmalleſt prejudice, that preſently it is wonderfully forced into a convulſive motion, *viz.* a Cough: but as a ſenſe of annoyance, and from thence very often an inſtinct of motion ariſes from this Veſſel; ſo we think that its Fibres do after a ſort move of themſelves both in breathing and coughing. Surely in reſpect of this it is not to be doubted, becauſe in this inner Membrane we find two orders of muſcular Fibres in that faſhion diſpoſed as in the *Aorta* and Inteſtines: to wit, there is one upper order of ſtraight Fibres, which while they are contracted, make all the circular Cartilages to be drawn together nearer to one another, and for that cauſe to abbreviate the Trunk of this Veſſel according to all its parts ſucceſſively. Under this lies another order of circular Fibres, which (while they are puffit up) being contracted, the hollowneſs of the Wind-pipe is much narrowed. Therefore when the moving Fibres of either kind make the paſſage to be ſtraitned according to all its dimenſions, it is obvious enough that they conduce to the diſcharge of the function of breathing, and more or leſs to be active, as there is endeavour to breath quicker or ſlower, more intenſly or more remiſs. Theſe Fibres being more vehemently contracted in a Cough, in hawking, in blowing out, and certain other more ſtrong exerciſes of expiration, do force the breath and other contents of the *Aſpera Arteria* to be violently expelled. Moreover from this action ſometimes either depraved or hindred, it ſhall be declared hereafter how an Aſthma, a Dyſpnœa, and ſome other diſeaſes about breathing do ariſe.

The glandulous and vaſculous Coats.

This inner muſculous Coat hath alſo two others, as if growing thereunto, to wit, one glandulous, and that full of veſſels. For as in another place we have remarked about the Anatomy of the ſanguiferous Artery, one may alſo here take notice, that the inward Pipe of the Weazand is covered with a moſt thick weaving of Veſſels of every kind, and eſpecially of thoſe carrying blood, in faſhion of a Net. The Arteries not ſpringing from the Pneumonic Veſſels, but from the Bronchial branch (which the moſt renowned Mr. *Ruiſch* diſcovered to have its riſe from the *Aorta*) are inſerted into this ſame; which the veiny ſlips do accompany, owing their origine to the *Vena cava*. The nervous ſprigs meeting theſe two, are variouſly folded; and ſo of all weaved together, is framed as it were a little Net, covering the whole back of the Weazand, under which folding of Veſſels very ſmall and whitiſh Glandules are every where ſtrewed, or rather cleave to them; juſt in the like manner, as we have in another place ſhewn to be in moſt other greater Veſſels, and in all membranous Bowels: on all which the Lymphæducts adjoyned do wait. As to the uſe of theſe, without doubt the Arteries and Veins waſh through the Pipe of the Weazand with bloody ſtream for its nouriſhment; and the Nerves carry plenty of Spirits, and the faculty of performing motions to the muſcular Fibres. Afterwards whatſoever of ſuperfluous moiſture be left by the Arteries, that the Veins cannot bring back, the Glandules do receive and retain, until it may be ſent back to the maſs of blood through the Lymphæducts. When they are too much filled, by reaſon of the Lympha more plentifully left, a humour diſtilling from the Glandules as well as from the Arteries into the hollowneſs of the Wind-pipe brings a Catarrh. All the Coats of the *Aſpera Arteria* diſtinct and ſeparated from each other are expreſſed in the ſeventh Table.

Of the Bronchia.

The ſecond part of the Wind-pipe, commonly called *Bronchos*, begins from the entrance of the Lungs: for near the fourth Vertebra of the Cheſt that great Pipe deſcending, is divided into Two Trunks, one whereof goes towards the right ſide of the Lungs, the other the left: afterwards both having entred the Lungs, and being ſubdivided for the greater Lobes, diſtribute very many ſprigs (as for the moſt part in

the gills of fiſhes) to the Lobes or leſſer Lobes through the whole frame of the Lungs. The paſſages of all theſe are furniſhed, even as in the Larynx, with Cartilages; but framed ſomething in a differing manner: for in the *Bronchia* theſe are not Ring-like, but reſembling a Coat of Male, ſo that when there is need to contract thoſe paſſages, the inferiour Cartilage goes under the hollowneſs of the upper, almoſt in the ſame manner as it is in the joynts of the ſhelly Coat of a Lobſter. Proviſion is ſo made by the work of God, that when the Lungs are dilated, the *Bronchia* are ſtretcht out into the greateſt length; and when they are contracted, the *Bronchia* are abbreviated, one part being drawn into another.

Their Syſtole and Diaſtole.

The Coats of the *Bronchia*, as alſo of the Larynx, have muſcular Fibres of both kinds, together with the Glandules and the Net-like twiſting of Veſſels: from whence we may alſo conclude, that all the leſſer Pipes of the *Aſpera Arteria* have their conſtant turns of Syſtole and Diaſtole, *viz.* all the Pipes are contracted while we breath out, and relaxed while we ſuck in air: moreover from the ſame Glandules and little Net of Veſſels every where continued almoſt within every inward receſs of the Lungs, doth diſtil the Catarrh humour. A certain Bronchial branch of the *Trachea* belonging to each Lobe of the Lungs is deſcribed in the ſecond Table *H. H.*

The Lobes of the Bronchia.

And the branched *Bronchia* of both ſides not only conſtitute two or more greater Lobes; but as *Malpighius* hath obſerved, many leſſer or little Lobes diſtinct among themſelves; for each Bronchial branch ſends forth to and fro many little branches or twigs, every of which twigs being joined with alike twigs of the Pneumonic Artery and Vein, from thence are parted into innumerable leſſer ſprigs; all which being every where fellowed and complicated among themſelves, and having got Nerves and peculiar Lymphæducts, and ending in the outward ſuperficies of the Lungs repreſent as it were a certain private Grove; and ſo the whole ſtructure of the Lungs conſiſts of many little branches of the aforeſaid Veſſels complicated, as it were of ſo many ſeveral Groves. The branches whereof and outmoſt ſides of which, although they may ſeem mutually to touch themſelves and cleave together, yet they are disjoyned one from the other, and are every one bounded within their proper limits; far otherwiſe than the productions and communications of Veſſels are in the Brain, where the Arteries and Veins riſing up in its ſeveral Corners, extend on every ſide, and creeping through its whole ſpace, and mutually inoſculating, do all communicate among themſelves.

Their little branchings disjoyned from one the other.

The uſe of the aforeſaid frame.

That former faſhioning of the Veſſels hath been very neceſſary to the uſes of the Lungs; for ſeeing the air ought only to enter the Lungs for that end, that it might pour out to the blood nitrous particles for its flame and vitality or life, and preſently return back; and ſeeing the blood doth paſs through the Lungs for that cauſe, that it might meet the air ſuckt in according to all its parts; therefore it behoves that both theſe, *viz.* the air and the blood be divided into ſmall portions, and with theſe make every where diſtinct and ſhort meetings. The manner of this is moſt elegantly perceived in the gills of fiſhes; for ſeeing the *Bronchia* are as ſo many greater Lobes, every one of theſe is divided into many rundles, furniſhed with a complication of every kind of Veſſels, as if it were into ſo many Lobes; in every one of which the blood is drawn out by minute portions, as it were little rivulets, that it might throughly meet with the nitrous particles, and afterwards return into its chanel.

The uſes of the little bladdery Cells.

The bronchial Pipes lead into the utter cavities, *viz.* into the numerous little Bladders diſcovered by *Malpighius*; which truly are certain continued parts of the *Aſpera Arteria*, but diſtinct from the former, becauſe the Griſles are wholly wanting to them, and, which ſupply the turn of theſe, are diſtant one from another in larger ſpaces: for all the Bronchial branches ſend forth leſſer ſlips from themſelves every way; whoſe paſſages, although void of Griſles, notwithſtanding are ſtraitned as it were with certain ligaments at certain intervals; and the ſpaces between theſe being filled with air ſuckt in do make partly thoſe ſmall bladdery little Cells. In truth thoſe paſſages may not unaptly be compared to the Gut Colon of a Mouſe, whoſe continued hollowneſs in as much as it is girt about in divers places, ſeems to be divided as it were into many little purſes. Moreover thoſe bladdery paſſages being ſhorter on either ſide the *Sinus* or hollowneſs, have as it were particular little Bladders growing thick to them, and therefore the heap of all the Cells ſeems not much unlike to a bunch of Grapes. The Figures of theſe as much as may be are exactly repreſented in the third Table. Thoſe little bladdery Cells, that they may put forth their contracting endeavours for breathing, have muſcular Fibres, as is plainly ſeen by the Microſcope. For as much as great plenty of air ought to be drawn within the Lungs, and reſerved in part leſt it fail at any time; therefore beſides thoſe upper

PHAR. Part. II.

per paſſages which are as it were the threſhold and dens, moreover more inner chambers and capacious are required, in which the air may be treaſured up, and from thence be diſpenced upon occaſion. For it ſometimes happens the external is too ſharp, or otherwiſe diſagreeable to the Lungs; ſo that as it was greatly neceſſary that it ſhould be ſuckt in more ſparingly, and its vehemence preſently be attempered and rebaited by the air treaſured within. Moreover it cannot be drawn in or inſpired otherwhile in quantity great enough, as in running, ſinging, or much ſpeaking, alſo in ſome crazy diſpoſitions; and in that caſe the inward air being rarified, ſupplies in a manner the defect of the outward.

Endued only with muſcular Fibres.

Therefore ſeeing thoſe bladdery little Cells receive a greater ſtock of air than that they can be bound preſently to return it all by every turn of expiration; therefore the griſly twigs are wanting to them, and their hollowneſſes are more large of themſelves, that they may be more largely diſtended: but that they may puff out a greater quantity of air upon occaſion, or throw out matter to be coughed out, being endued with Muſcular Fibres, they contract themſelves more narrowly, and throw out what is contained within them thoroughly. For the ordinary Syſtole's of the Breaſt, which the relaxation of the Muſcles do partly effect caſt out perhaps at every turn the whole air from the *Trachea* and *Bronchus*, but not from the little Bladders: for the emptying of theſe as often as need ſhall be, both the cavity of the whole Breaſt is very much ſtraitned, and the ſmall bladdery Cells themſelves are ſtraitned from their proper Fibres being drawn together.

The deſcription and uſe of the Pneumonic Artery.

2. The Next Veſſel is the Pneumonic Artery, of whoſe moſt thick branches extended every where to and fro, and with other branches twiſted and complicated together, the frame of the Lungs conſiſts. This Artery iſſuing from the right *Sinus* of the Heart, and inclining towards the *Trachea*, is parted into a right and left branch; which applying themſelves to the like parallel branches of the *Trachea*, do accompany them every where, or rather are ſet under them; for they are planted beneath, and are firſt carried into the greater Lobes of the Lungs, and afterwards into all the leſſer Lobes: in every of which the little branch of the Artery ſtretched out, ſends out on either ſide more ſlips from it ſelf, which preſently are aſſociated by other bronchial and venal ſlips, and are ſeveral ways complicated; and where the outmoſt ſprigs of the *Aſpera Arteria* depart into circular little Cells, the Arteries being complicated with the Veins (as is diſcovered by the Microſcope) do girt about thoſe little Bladders with their thick branching, and enwrap them like Ivy; from whence we may conjecture, that it is not for nothing that the Blood-veſſels that are any where in the Lungs, do curiouſly wait upon thoſe of the air, and every where inſinuate and intimately mingle themſelves. Surely whatſoever hath been ſuppoſed by others, I ſhall not eaſily believe that this is done for the more exact mingling of the Blood and its parts, be they never ſo unlike. For to do that, what need would there be of ſo full an acceſs of air, which in rightly making other mixtures (the more perfect whereof are called Digeſtions) we ſeek as much as we can to keep out? For if the air might freely come and go, the Particles that ſhould be mixed, would moſt of them flye away. And as to that which is affirmed, That the Blood in the Lungs is carried through thoſe ſmall, winding and extream narrow paſſages only that it may be the better mixed; I ſay, that its being ſo carried is quite contrary to ſuch an intention: For the beſt mixture of any liquor (as alſo of the Blood it ſelf) is made by fermentation; and the liquour to be ſo mixed or fermented, like Wine in a Hogſhead, requires a free and ſpacious room: but its going through theſe ſmall and narrow paſſages like ſo many ſtrainers, ſerves rather for the ſeparation than the mixture of its parts; wherefore unleſs the Blood be exactly mixed in the greater Veſſels, and be there rightly fermented, it does, while it paſſes through the Lungs, leave there the dregs and whatſoever parts are not rightly mixt, and ſo does ſtuff up and very much obſtruct their paſſages; as we may ſee in perſons affected with the Greenſickneſs, Cachexy, and that ſort of Dropſie called *Leucophlegmaſia*, who all have a difficulty of breathing, by reaſon of dregs of the ill-mixt Blood that are left there. Wherefore the uſe of the Lungs ſeems to be this, That the Blood through the leſſer Veſſels, as ſo many rivulets, may as to all its parts lie open to and meet with the nitrous Particles of the Air, and be by them enlivened and accended. The Pneumonic Artery, as alſo the *Aorta* and Wind-pipe, hath a muſcular Coat furniſhed with two ranks of Fibres, namely ſtraight and circular; which doubtleſs, when they are contracted, do make the Pneumonic Arteries to beat, and the Blood to be urged and driven ſtill more and more forward. A great many Glandules with a Net of Veſſels lie on this muſculous Coat. The frame and branching of the Pneumonic Artery in ſome one Lobe of the Lungs are expreſſed in the ſecond Table. All the Coats of this Veſſel are

drawn distinct and apart from one another in the sixth Table and first Figure, and also in the fourth Table and second Figure.

The description and use of the Pneumonic Vein.

The Pneumonic Vein, having its rise in the left Ventricle of the Heart, and being divided and variously subdivided first into greater branches, and then, according to the greater and lesser Lobes of the Lungs, into lesser, and lastly into the least of all, is carried above the Weazand, and as it goes on does exactly answer to the branching both of the Pneumonic Artery and the Weazand, and goes every where with them as it were cheek by joll; and where the Weazand ends into the little Bladders, the Veins being twisted with the Arteries (as was said before) do make as it were a little Net wherein those little Bladders are encompassed. The Anatome of the Pneumonic Vein differs little or nothing from that of the *Vena cava* and its branches. All the Vessels of this kind have four Coats distinct from one another.

1. The outmost of these Coats consists of Fibres that seem to be nervous, which perhaps are after a sort muscular and are extended straight long-wise, (though in no very regular order.) This Coat of the pulmonary Vein is very laxe, and loose from the rest of the Vessel, insomuch that it may all of it be blown up and very much extended, as if it were a distinct Vessel: Whence one might suspect that this were a peculiar passage to carry back *Lympha* or *Serum* separated from the Blood: but it seems to be more probable, that this outmost Coat is therefore made so loose, that the passages might be much distended and widened for the return of the Blood now hot and boiling.

The use of the venous and vasculous Coat.

2. 3. Two other Coats (common both to a Vein and Artery) *viz.* the vasculous and the glandelous lie under this: the office of the vasculous is to bring nourishment to the part, and of the glandulous to receive and send away the superfluous serosities.

The Muscular Coat.

4. The fourth and inmost Coat is plainly muscular, having Ring-fibres, as the like Coat of an Artery hath, which certainly being successively contracted after the stream of Blood, do cause its return to be hastened, and on occasion to be shortned.

Why there is no Pulse in the Veins.

But here arises a doubt, wherefore, seeing the Veins as well as Arteries have contracting muscular Fibres (which in the latter are pulsifick) and seeing both are alike joined to the Heart that beats continually, the Veins as well as the Arteries should not statedly beat according to the constant turns of the Systole's and Diastole's in the Heart? It may easily be answered to this, *first*, that the Arteries have a great deal more of the moving Fibres then the Veins have; and therefore whereas *those* being strongly contracted successively, do force the Blood along as if driven with a wedge, for *these* it sufficeth that whilst they are gently contracted behind the stream of Blood, they calmly and equally drive it forward, flowing back again of its own accord, and as it were down-hill. But *Besides*, the reason hereof seems to depend somewhat on the unlike or rather inverted conformation of the Vessels; for the Blood conveighed by the Arteries is driven still from wider to narrower spaces, and therefore going along it every where violently distends them, and lifting up the sides of the Vessels raises the Pulse; because whiles that part of the Artery that is behind the Blood is contracted by its muscular Fibres, that part which is before it, must needs beat being filled with the stream of blood gushing in: but on the contrary, the blood in the Veins returning to the Heart, runs out of less into greater spaces, or out of rivulets into a more capacious and deep chanel, and therefore glides along silently and without the fluctuating of a Pulse.

The disposition of the blood in the Pneumonic Veins.

The blood in the pulmonary Veins seems as much, or more then that within the Arteries to be animated or inflamed anew by the air insinuating it self every where from the Pipes or little Bladders of the *Trachea*, because in those Veins 'tis first changed from a black-purple to a scarlet: the reason whereof is, because the blood at the extremities of the Vessels, namely as it passes out of the Arteries into the Veins, does every where and most of all meet with the particles of the air. And for that reason it is, that if any liquor be squirted into the Pneumonick Artery, it will not so readily and quickly pass through the Lungs and return by the Vein, as it will do if you make the same experiment in any member, or part of the body besides; yea part of the liquor so injected will sweat through into the Pipes of the *Trachea*, or the spaces between the little Lobes, and another part, being turned into a froth, will return very slowly by the Veins: which is a certain proof, that while it passes through the Lungs it makes a stay in the mouths of the Vessels, and is mingled with the airy particles. The Circulation of the blood through the Lungs hath something diverse from, or rather contrary to that which is made through the rest of the body; seeing the Pneumonic Arteries contain a black-purple blood, and the Veins a scarlet, whereas in all the body besides the branches of the *Aorta* carry a scarlet blood, and those

PHAR. Part. II.

thoſe of the *Vena Cava* a black-purple. Beſides we may obſerve of the pulmonary Vein, that it does every where in its whole length want valves, except where 'tis faſtned to the Heart. Which appears by this, that when any liquor is injected into its trunk (juſt as it is in the Artery) it preſently paſſes through all its branches without lett. Which ought to be ſo, to this end, that the blood may always, becauſe of the violence of the paſſions, freely every way fluctuate and regurgitate in and about the Heart. Beſides, that the left Ventricle of the Heart might never be overcharged with the blood impetuouſly ruſhing into it, by the inſtinct of Nature the Fibres at the root of the Vein being contracted, its courſe might be inverted and flow back. The deſcription of the Pneumonic Vein as to its utmoſt branching is in the fourth Table and third Figure.

The Lymphæducts added to the aforeſaid Veſſels.

To theſe three ſorts of Veſſels, wherein the air and the blood are conveighed, the Lymphæducts that carry forth a water are joyned. A power of theſe diſperſed through the Lungs, wait on the Arteries and Veins. All the branches tending from the ſurface of the Lung towards its original, unite into ſome greater trunks; which, being inſerted into the Wind-pipe, diſcharge thereinto the Lympha that is ſuperfluous from the blood and nervous humour. Indeed there is need of a great many of this ſort of Veſſels in the Lungs; becauſe, ſeeing the blood is hotteſt of all here, is haſtily circulated, and yet can exhale nothing to without by tranſpiration, the Veins can hardly receive all the whole maſs of blood from the Arteries; and the Glandules contain not long what is depoſited in them: therefore there is need of Lymphæducts as ſo many channels, whereby the ſuperfluous humour might continually be ſent off. If theſe at any time happen to be obſtructed or broken, there often follows a Dropſie of the Lungs or Breaſt, and ſometimes Coughs and Phthiſicks. Theſe lymphatick Veſſels of the Lungs may very well be ſeen, if in diſſecting a live Dog you preſs the top of the Thoracick duct, that nothing may be poured into the ſubclavian Vein: for then the Lymphæducts of the Lungs, becauſe they cannot diſcharge themſelves into the common Receptacle now ſtopt and filled, ſwell much and are very apparent. If ſuch a ſtoppage be made for ſome time in a Dog that hath eat and drunk largely, a milky liquor will ſweat into the Lungs out of the Thoracick duct, the Valves being unlocked: yea and the ſame liquor will paſs through the Lymphæducts placed far beneath the Reins, and will render them ſtrutted with that humour, as if abounding with milk. The rough delienation of the Lymphæducts ſpreading themſelves in the ſuperficies of the Lobe of a Lung, is repreſented in the firſt Table.

The nervous ſlips diſperſed throughout the Lungs.

5. The laſt kind of Veſſels belonging to the Lungs are the Nerves and their branches, whereof there are many (as we elſewhere intimated) diſperſed every where through the Lungs. Heretofore doubting about the office of theſe, we were induced to think the firſt force, or at leaſt inſtinct of breathing depended on theſe Nerves; becauſe otherwiſe we can hardly conceive, after what manner the motion of the Lungs in breathing, coughing, laughing, and other their actions ſhould be always ſo exactly proportioned according to the ſeveral exigences of Nature. For even as the blood doth more intenſly or remiſly heat and boil up within the *Præcordia*, and as certain contents of the *Trachea* provoke the nervous Fibres, we breath either quicker or ſlower, and oft-times, though unwillingly, we cough. But beſides there doth occur another and more neceſſary uſe of theſe Nerves: for ſince it is manifeſt, that the Coats of thoſe Veins and of the *Trachea* are every where endued with muſcular or moving Fibres by which they are contracted, it is plain, that the Pneumonic Nerves do convey as well plenty of ſpirits, as inclinations of contraction to thoſe Fibres. And it is very probable from thoſe Nerves convulſively diſtempered, that the Palpitation of the Heart is often excited, as alſo the Aſthma and Chin-cough. We have ſome time ſince delivered the Anatomy or deſcription of the Pneumonic Nerves in our Treatiſe of Nerves, *viz. pag.* 311. ſo that there is here no need to repeat or inlarge. The fivefold Veſſels forementioned being mutual, and many ways accompanied in their diſtribution, as if divided into ſecret Groves with ſmall bladders as in Trenches every where interwoven, when they are complicated and variouſly woven together do conſtitute a fleſhy web, which is the very ſtructure of the Lungs: which moreover appears like a more ſolid *Parenchyma*, in as much the Arteries and Veins being filled with blood are ſtufft up, and the Veſſels of the *Trachea* and Lymphæducts being emptied of the air as well as water, do fall together and ſeem to cloſe. We ſhall the leſs admire the fleſhy fabrick of this Lung wove together out of meer Veſſels and little Bladders, if we conſider the frame of the ſeminal Teſticles to be nothing elſe than a heap compoſed of hollow filaments or ſpermatic Pipes woven together. The deſcription of the Nerves of the Lung, and what relates to the bundle of Fibres whereof it is compact, and to the ſpreading of its branches, are deſcribed in the fifth Table.

The

PHAR. Part. I.

The web of the Lung, as above-ſaid, being weaved together of Veſſels and little Bladders, and divided according to their greater and leſſer branchings into Lobes and little Lobes, a Membrane wraps them about as a common covering. Of this there are two Coats, *viz.* one outer and fine, which appears like a certain ſubtle texture or weaving together of nervous filaments (as is apparent in moſt other Bowels;) the other more inward, which is both rough and ſomewhat thick, and conſiſting almoſt of meer ends of Veſſels and little Bladders: and by reaſon of the hollowneſſes every where cauſed from theſe, its inward ſuperficies reſembles a Hive of Bees; the forms of theſe are aptly enough deſcribed in the eighth Table. This Membrane of two Coats blown up hath very many and large Pores, inſomuch that if Quick-ſilver be poured into the Trachial branch of one of the leſſer Lobes, almoſt filling within the whole Membrane, it will every where burſt out from the Pores. Both the arterial blood and the air beating in this Membrane as againſt a bank, are reflected; the former is brought back by the Veins into the left Venter of the Heart, a certain watry part being ſent away through the Lymphæducts. In the mean while the air is returned back by the ſame paſſages of the *Trachea* by which it flowed in. For continually freſh air ought to be ſuckt in, that it might ſupply nitrous Particles to the Blood; to make room for which the other old air being now weak and uſeleſs, muſt be firſt breathed out. Becauſe therefore both functions are to be performed within the ſame paſſages, it is to be done by alternate turns, firſt the one, then the other. While the air is drawn in, the Lungs are blown up, as if wind were forced into them; and whilſt the ſame is breathed out they fall down, and are narrowly ſqueezed together for the benefit of excluding it; and ſo after the manner of Bellows diſcharge conſtant changes of the Syſtole and Diaſtole. Yet by what impulſe and Organs it is accompliſhed, is worth our labour here to conſider.

The Coats of the Lungs, whereof one is ſmooth, and the other rough.

Therefore upon the whole matter it is manifeſt by common obſervation, the Diaſtole of the Lungs perpetually ſucceeds the opening the Breaſt, and its Syſtole in like manner its contraction; ſo that we may conclude, when the cavity of the *Thorax* being dilated a greater ſpace is yielded to the expanſion of the Lungs, the extern air of its own accord leaps into the *Trachea*, whether by reaſon of the Pulſe, or by its own Elaſtic force (for it is all one) and preſently enters into its Trunk, the *bronchia* and all the little bladders, and blows them up; namely for that end, that its nitrous particles may every where occur to the blood, waſhing all parts of the Lungs: afterwards when the breaſt receding from that dilatation, is ſtraitned as to its cavity, even the Lung being compreſs'd, falls together by its Diaſtole, and excludes the air even now breath'd in. But truly, becauſe the air doth not of its own accord leap out with that plenty as it skipt in, neither the hollowneſs of the breaſt ſo ſtraightly contracted, that it ſhould mightily compreſs the Lungs; therefore all the paſſages of the *Trachea* are endowed with muſcular Fibres, which being contracted orderly while we breath out, they may promote the expulſion of air. Wherefore, that the cauſe of breathing, and the manner of doing it may more plainly be made known, inquiſition ought to be made after what manner, and by what Organs, that interchangeable dilatation and contraction of the breaſt are performed.

The Syſtole and Diaſtole of a Lung.

We cannot enough admire, concerning theſe motions, the cunning artifice of the Divine Creator, evidently adapted unto Mathematical rules; for truly in no other matter doth He more plainly appear ὁ Θεὸς γεωμετρῶν. For when both the enlarging and the ſtraitening of the breaſt ought to be performed by ſome muſcles (to whoſe function it only belongs to contract;) the matter is ſo ordain'd, that the ribs which ſhape out the ſides of the *Thorax* even as of oblong parallel lines bowed towards a Cylinder, are brought one while in a ſquare figure with right angles for the enlargement of the breaſt, and afterwards into the form of a Diamond-figure with ſides unequal, with acute angles for the contraction thereof. What follows from the ſituation of parts ſo chang'd, that whenas the ſides depart fartheſt from one another, the ends are brought nearer, and ſo *è contra*; and for that cauſe the largeneſs of the ſpace is wont rather to be altered than either augmented or diminiſhed; leſt it may ſo happen about the cavity of the *Thorax*, it is ſo provided againſt by an admirable workmanſhip, that whileſt the ribs aſcend upward for enlarging the breaſt to a ſquare figure, leſt the ends ſhould be ſhortned inward, the *Diaphragma*, which cloſes the bottom, ſwells downward toward the Abdomen; ſo that the *Thorax* may be enlarged as well towards its length as to its depth: on the contrary, while the ribs beneath are brought to ſtraiten the breaſt towards the figure *Rhomboides*, leſt they ſhould depart farther than they ought, the Diaphragma aſcends upwards for that cauſe that the largeneſs of the *Thorax* may be ſtraitened, while we breath out, according to both dimenſions.

Its motion mechanically unfolded.

PHAR. Part. II.

The Muſcles ſerving reſpiration.

What belongs to the muſcles of the breaſt, ſerving as well to the enlargement for ſucking breath, as to the conſtriction for breathing out, the moſt wiſe Creator of Nature hath ordained more and ſundry inſtruments of either function; Therfore truly that the work of breathing being eſpecially neceſſary as to life might be performed inceſſantly and very ſtrongly, ſome of the former order of Muſcles, *viz.* thoſe by which the hollowneſs of the *Thorax* is opened, do raiſe the ribs and afterwards draw them back, even as they are bow'd and more enlarg'd; in which number there are three muſcles to the ſhoulder, one belonging to the loyns, and eleven intercoſtal outward; and another inward muſcle, *viz.* the Diaphragma, depreſſes the bottom of the breaſt, and enlarges its length and depth.

Their function as well in inſpiration;

The aforeſaid muſcles, *viz.* the ſcapular, lumbar, and intercoſtals being alſo appointed with the Diaphragma for the function of breathing, are accurately enough deſcrib'd by many Anatomiſts, but chiefly by *Fallopius*, that here ſeems little need to unweave this web; eſpecially becauſe a more full and permanent knowledge of theſe parts is not wont to be acquired unleſs by frequent diſſections and anatomical inſpection. The four former muſcles being of divers forms, conduce chiefly to ſtronger and violent inſpiration; but the exterior intercoſtals in regard of the ordinary actions of breathing employ their continual endeavours by turns during life, every one of theſe being uniform, with a fleſhy and more thick baſis, being rooted in the bottom of the upper rib are carried by oblique fibres, and broad towards the forepart into the top of the rib that lyes under, and are implanted to it with a ſmall and tendonous end; whence it follows, thoſe fibres being ſwell'd; and ſhortened towards their root, do lead and draw back the nether rib towards the upper; and ſo while all theſe muſcles are contracted together, all the ribs are raiſed upwards, and altered from oblique angles into direct ones, they render the trunk of the *Thorax* more large, but ſomething ſhorter; which defect that it may be helped, the Diaphragma (which being free before from the Syſtole, is hidden within the cavity of the breaſt) together with the ribs drawn upwards, is extended beneath; ſo that the breaſt, as it were a Drum braced, does become moſt capacious; and in the mean time the Lungs, having a more ample ſpace yielded to them, are blown up by the air ruſhing in whereſoever there is paſſage, and fill the whole hollowneſs of the *Thorax* enlarged.

As in expiration.

Thusfar touching the muſcles ſerving to inſpiration, which ever and anon ceaſing from contraction, the ribs preſently fall drown from a direct poſition into an oblique; and the Diaphragma alſo being freed from its extenſion aſcends into the cavity of the breaſt, or is rather thruſt thither by the bowels of the Abdomen; and ſo by reaſon of the poſition of parts ſo changed, *viz.* the breaſt ſtraitned, and the Lungs compreſſed, the act of exſpiration doth ſucceed. Some have determin'd this to be a meer intermiſſion of the other, and only to proceed from the reſt, or ceaſing of the muſcular motion (by which breathing is performed.) But the declination of the ribs from right angles into oblique, and the aſcenſion of the Diaphragma, is related to be the natural poſition of theſe parts, becauſe they are found in ſuch a ſcituation in dead bodies. I think my aſſent not eaſily owing to this opinion, becauſe ſometimes the function of exſpiration is performed much ſtronger and more violently than that of inſpiration, as in coughing, ſinging, laughing, hollowing, and in other effects whoſe exerciſes are the more difficult labour and more earneſt endeavours of the breaſt Wherefore there is no reaſon that we ſhould think that ſuch vigorous exerciſes of exſpiration, ſhould be excited by the meer reſt and ceaſing of the aforeſaid muſcles, but from the motion of others oppoſed to them. Moreover the Muſcles now cited and oppoſite, and ſtraitning the breaſt, ſeem to be required not only by reaſon of their violent exſpiration, but for their ordinary and conſtant ſervice, at leaſt for the poiſing the function of reſpiration: for otherwiſe thoſe other whoſe office it is to enlarge the cavity of the *Thorax*, being ſometimes unmindful of their task, do it either ſtronger or longer than is convenient; wherefore it is neceſſary they be forwith admoniſhed by others, *viz.* their Antagoniſts ſubſervient to Exſpiration, and to be reſtrained in their duty. But the Muſcles appointed for the ſtraitning the breaſt, are the *Sacrolumbus*, the Triangular, and inward Intercoſtals, and ſome muſcles of the Abdomen; the uſe and deſcriptions of all which are delivered by many Anatomiſts and moſt accurately by *Fallopius*. The inner intercoſtal muſcles as they obtain a contrary ſcituation, ſo a contrary function to the outer intercoſtals, which namely is to depreſs the ribs, and to ſtraiten the cavity of the breaſt, by forcing it into the *Rhomboidal* Figure. For we are to obſerve, that the carneous and thicker baſis of each of theſe is implanted in the loweſt part of the nether ribs, and the moving fibres, aſcending from thence obliquely and forward, and dividing croſs-wiſe the reſt of the outward intercoſtals, with their ſmaller and Tendony end are engrafted in the bottom of the upper-

rib;

rib; hence none need doubt, but that theſe inner muſcles do depreſs all the ribs, or bring them downward: but whilſt theſe ribs are ſo depreſs'd that the trunk of the breſt is rendred more ſtrait, theſe inward muſcles (otherwiſe than the outer) do not only incline the ribs downward, but alſo their griſtly or cartilaginous proceſſes. For *Fallopius* hath acutely deſcribed this: *That the outward intercoſtal muſcles do only fill up the inter-ſpaces of the ribs and not of the griſtles, but the inward fill up both ſpaces.* The reaſon whereof ſeems to be after this manner, affording a moſt delightful ſpeculation of the *Divine Architect*, viz. while the ribs are brought upwards to the exerciſe of fetching in breath, and are withal drawn back towards the Spine, that motion commencing backward, is performed by the ribs themſelves; which being firſt moved together, the cartilages eaſily diſcharge their function as cords fitted to that purpoſe; wherefore there ſeems little need of the muſcular aid to place theſe in their order; but to put the ribs in action, not only the intercoſtal muſcles afore mentioned, but the four other greater ones do continually endeavour it; but on the contrary, that the ribs may be depreſs'd and brought forwards together, the force taking its riſe before, is performed by the cartilages as ſo many leading cords, moſt eaſily bending the ribs downwards as far as need requires.

Moreover to this end, that the cartilaginous appendices of the ribs may be drawn down and nearer one the other for the exerciſe of expiration, not onely the inward intercoſtal muſcles fill as well the intervals of the cartilages of the ribs, but moreover an entire triangular muſcle is allotted for this function; for this ſpringing beneath from the bone of the Sternon, and aſcending upwards obliquely, is inſerted into the lower Cartilages, which it conſtrains towards its head, and bends the *Thorax* nearer on the other ſide. That is worthy of conſideration, which *Fallopius* hath remarked touching this muſcle, *viz.* whereas it is ſo little and minute in a man, that it may hardly be allowed for a Muſcle, it is ſtretched out in a Dog along the whole bone of the Breaſt, and reaches to all the Cartilages, even thoſe inoſculated into the Sternon of the true Ribs The reaſon of which difference clearly points at the Divine Providence touching the Fabrick of Animals. For whereas this Animal is born to moſt ſwift and long running, that the blood, while it is more vehemently agitated, may duly be kindled and fan'd, as it ought ſwiftly and ſtrongly to draw in the air, even ſo to expire it; (for that freſh air may be more freely ſuckt in, it behoves that all the old be ſtrongly caſt out and exploded) therefore for the ſtronger diſcharge of this exerciſe (of the which little uſe in a man) this Muſcle of a Dog is allotted a great bulk, proportionable to ſuch a work.

Wherefore the triangular Muſcle being ſmall in a man, is ſtretched out through the whole bone of the breaſt in a Dog.

Hitherto of the Muſcles that ſtraiten the Trunk of the Breaſt: by whoſe proviſion it is manifeſt enough, that the relaxation of the oppoſite muſcles are not ſufficient to this function. But that while the breaſt is conſtrained, the Diaphragma aſcending upwards may ſhorten its hollowneſs, it is not enough that it is releaſed from its contraction, but it is alſo neceſſary, that as ſoon as this ceaſes, the muſcles of the Abdomen being contracted ſqueez together the Bowels, and preſs them upwards, by which the Diaphragma being relaxed, is lifted up and driven higher into the Trunk of the *Thorax*.

The Diaphragma follows the motion of the Abdomen.

From the ſuppoſed reaſons of theſe things we may infer, no leſs endeavours of the muſcles are imployed in the exerciſe of expiration, than in inſpiration: nay rather we may affirm them greater, after this is added, that the Pipes of the *Trachea* and *Bronchii* are endowed with muſcular Fibres (as we have ſhewed) which being only contracted while we expire, do cauſe the air contained within to be caſt out with the greater force. And truly ſo it ought to come to paſs, becauſe the air prevailing with an elaſtic force, doth of its own accord readily enter the plumonary paſſages, as often as they are ſuffered to be open; but from thence that again it may preſently and thorowly be excluded, there needs a certain force and compreſſion of the parts to thruſt out. For although the inſpiration precede in courſe, yet it is neceſſary that expiration follow immediately after, and be proportioned according to the faſhion thereof; for that it may be great, the turns or changes of this being greater are requiſite. Wherefore in vehement exerciſe of the whole body of the Lungs alone that the freſh air may more plentifully be drawn in, all the old air muſt be moved, not only out of the *Trachea* and *Bronchii*, but alſo out of the fartheſt little Bladders every turn or change of breathing out, and expulſed moſt of it: whereas while we draw in the breath only the muſcles of the Breaſt are imployed, the Lungs having reſpite, in ſtrong breathing out both the oppoſite Muſcles and the Lungs themſelves labour.

The labour of Muſcles the ſame in expiration as in inſpiration.

Having thus explained the Organs of Breathing, it remains yet to be inquired into, by what inſtinct, being ſtirred up to motion, they ſo repeat perpetual changes of Syſtole and Diaſtole, that one while theſe muſcles are contracted for inſpiration, and another

The cauſes of the above-mentioned motions.

PHAR. Part. II.

another while for expiration, in the mean while the oppoſite muſcles have a pauſe, and are moved by turns, that they mutually give place to themſelves ſucceſſively. From all this in the firſt place it is clear (which likewiſe in another place we have abundantly declared) that the animal Spirits, for the exerciſing the contractive motion of the muſcles, leap from the Tendons into the fleſhy Fibres, and afterwards for their relaxation they recede out of theſe into thoſe. Moreover, whereas the mutual function is twofold, *viz.* ſpontaneous and meerly natural, we have before ſhewed in the former, that the Spirits are brought from the Tendons into the fleſhy Fibres by approaches according to the command of appetite, and to remain within during the action, till they are diſmiſſed by its will; and afterwards return into the Tendons, till they are again commanded forth; inſomuch that the times of their motion and reſt are unequal and uncertain, and variouſly determined at our pleaſure.

In the animal function.

And natural.

But it is far otherwiſe in the natural function: becauſe the animal Spirits are carried out from the Tendons into the fleſh by perpetual turns, or conſtant reciprocation, and a ſhort contraction being made, preſently leap back from the fleſh into the Tendons, and ſo alternately: after which manner the Heart it ſelf, the Organs of the *Trachea* and breathing, alſo the fleſhy Fibres of the Stomach and Guts, unleſs they are otherwiſe limited by reaſon of their objects, are drove on by their conſtant Syſtole and Diaſtole.

The motion of the former ſort ariſeth from the brain, the other from the Cerebellum.

It will be needleſs to repeat here what we have already obſerved in another place touching theſe two kinds of motions, *viz.* that the animal ſpirits of the ſpontaneous moving function are altogether or chiefly diſpenſed from the brain, and the others cauſers of the meerly natural function are diſpenſed from the *Cerebellum*; moreover alſo as the plenty of both ſorts of ſpirits, ſo the very inſtincts of beginning thoſe actions have their conveyance through the Nerves.

It is a quere of what kind the actions of breathing are.

Notwithſtanding here ariſeth a doubt, to what kind of moving function, *viz.* whether ſpontaneous, or meerly natural, the actions of breathing ought to be referred; alſo of what original, *viz.* whether of the Brain or *Cerebellum*, the animal ſpirits appointed to that employment, are. It is manifeſt enough that this function is in a ſort partaker of a ſpontaneous motion, becauſe it is in our power one while to ſhorten its exerciſes, at other times to prolong, and otherwiſe diverſly to alter them, yea ſometimes a little to reſtrain them. Moreover the nerves belonging to its chief moving Organs, *viz.* the Diaphragma and Muſcles of the breſt, ſpringing from the nerves of the Arms and Loyns, do owe their deſcent to the Brain, and do plainly acknowledge the ſpirits they contain are chiefly ordained for voluntary motions; but moreover on the contrary, this function is ſo far natural, that its organs do reciprocate the conſtant changes of Syſtole and Diaſtole in ſleep, without our notice, and while we wake, we not perceiving it: Moreover although we can for ſome little time ſtop its exerciſe, or at our pleaſure vary it, yet we deny it to be altogether or long ſuſpended: beſides, although the nerves appointed to the muſcles of the Breaſt and Diaphragma proceed from the ſpinal nerves, yet theſe latter coming from the branches belonging to the arm communicate in their progreſs with the ſlips of the intercoſtal nerves; moreover, all the other nerves (which belong to the *Cerebellum*) ariſe from theſe, which are ſpread about through the *Trachea* and Lungs.

It is concluded to be a mixt act.

From theſe it plainly follows, that the power of breathing is as it were a mixt action, and doth participate of either moving function, *viz.* as well of the ſpontaneous as natural; and that the ſpirits and nerves of either Province are imployed in this duty, which proceed as well from the brain as from the *Cerebellum*; and truly ſo it ought to come to paſs according to the animal government: for although ſome actions of breathing neceſſary for the preſerving life ought to be conſtant and perpetual, there are yet many other motions of the breſt and lungs only occaſional, and to be perform'd at our pleaſure, as may be diſcerned in laughing, crying, ſinging, hollowing whiſtling, and other ſingular offices of the lungs and wind-pipe; in which works that they may be done ſtrongly, the muſcles conſpire together, and endeavour joyntly. As in violent labours and exerciſes of the whole body, by which the blood being ſtirred up doth want the greater ventilation, the arms being vehemently moved alſo do force the muſcles of the breaſt, and other pneumonic organs, into more ſpeedy motions for a more frequent breathing. And truly for joint labour of this ſort of the Arms and Diaphragma, the nerves ſerving this motion proceed from the nervous branches of them. Moreover, it is provided for this purpoſe, leſt the exerciſes of the body might enfeeble at any time the ſtrength of the lungs, or exceed the order of breathing; for when its organs labour more difficultly, or begin to be weary, the nerves of the Diaphragma do warn the other nerves of the arms, plucking them and as it were admoniſhing of their duty to deſiſt from an over intenſe motion.

For

PHAR. Part. II.

For whereas the function of breathing is ordained for many uſes, whereof ſome are merely natural, and others ſpontaneous or violent; therefore the ſpirits and the nerves which proceed and have their government as well from the brain as from the *Cerebellum* ought to be joyned together, and to afford their ſocial endeavours; yet on that condition, and as it were by mutual agreement, that one give place to the other by turns for the diſcharging all works chiefly neceſſary, or convenient, and do mutually obey. From the pneumonick nerves, the inſtinct of ordinary breathing or meerly vital beginneth, and is preſently communicated to the nerves of the Diaphragma, and from thence to all of the *Thorax*; ſo that preſently all the moving parts agree together in the action, and cauſe the Syſtole and Diaſtole of the breaſt in ſuch ſort as are required to the preſent ſtate of the blood; notwithſtanding on the contrary, as to other actions of breathing, whether ſpontaneous or violent, it ſeems to have them alſo, *viz.* the inſtinct or firſt force of theſe, beginning one while from theſe muſcles, another while from them is preſently communicated to all the other Organs; ſo that it is called upon by a working conſort of all together ſooner than the twinkling of the eye, for the performing the deſigned acts of breathing.

The nerves of the lungs ſome rulers of the natural motion and others of the voluntary.

Both do alternately obey one the other, and agree in their office.

What we have hitherto declared about the Organs of Breathing and their functions and uſes, that they may more clearly be manifeſt, it ſeems to be material to expoſe to your view the forms of ſome of their chiefeſt parts deſcribed to the life, together with the explication of their Figures: yet it ſeems proper firſt to inſert a few things concerning the Lymphæducts and interſpaces of the Lobes omitted in the former Diſcourſe.

The moſt renowned *Malpighius* firſt diſcovered theſe little Lobes of the Lungs and their interſpaces; but to what uſes they ſerve he hath not clearly enough ſhewed. Haply it may ſeem that theſe little places and empty ſpaces within the Lungs, are certain receptacles of the air (that there may be a larger ſtore of it.) Notwithſtanding it is evidently manifeſt upon experiment frequently made, that the air pufft into the Pipe of the *Trachea* (which is the only entrance into the Lung) doth not enter or blow up theſe interſpaces of the little Lobes: notwithſtanding if you blow into the hole of any of theſe interſpaces, immediately all theſe ſpaces pufft up do ſwell in the whole lobe of the Lungs, ſo that all the little lobes diſtinct by great interſpaces, will appear with a pleaſant proſpect; as is expreſſed in the ſecond Figure of the third Table. Moreover the Lymphæducts creeping through the ſuperficies of the Lungs, ſeem to be every where included in little Membranes covering thoſe interſpaces, and to end in them. But as the lymphatic Veſſels are all furniſhed with little valves, ſo thoſe which appertain to the Lungs are furniſhed with almoſt infinite; as is to be ſeen in the warm large lobe of an Ox, and expreſſed to the Life in Tab. 1. d, d, d, d.

The interſpaces of the little Lobes have paſſage one into the other, and from thence into the Lymphæducts.

That I may dare to conjecture concerning the uſe of theſe things; it is probable, that thoſe cavities intercepting each little lobe, do receive the vapors flowing copiouſly every where from the blood being kindled, (when they cannot any where elſe be better thruſt down or ſeparated) which ſweat through their ſlender Coats into theſe cavities out of the ends of thoſe Veſſels, and thence being forced further, they are condenſed into water to be carried out of the Lungs through thoſe appropriate Veſſels: moreover leſt the Lympha's cauſed from vapors within thoſe paſſages, and ſo being made thick, ſhould whirle again back into the Lungs (which would bring great prejudice to them) the thickeſt obſtacles of the valves do hinder. For I have frequently admired what becomes of the vaporous ſteams which inceſſantly flow in great plenty, and ſometimes moſt impetuouſly out of the blood burning ardently in the *Præcordia*. For although very many of them flye away through the paſſages of the *Trachea* together with the air while we breath, notwithſtanding one only way of paſſage or particular ſluice doth not ſuffice to them, from every place breaking forth: wherefore theſe little places or empty ſpaces are every where placed, that they may receive thoſe vapors ſhut up in the lungs, and may drop out the ſame immediately condenſed through the Lymphæducts, as if through ſo many noſes of an Alembick.

Which therefore is done, that the vaporous ſteaming of the blood being received by the interſpaces, and condenſed into water in the Lymphæducts, may be conveyed out.

The lymphatick Veſſels having their paſſage out of the Lungs incline towards the paſſages of the *Thorax* with their numerous branches, and are for the moſt part mingled with them; but they climb upon the *Oeſophagus* in their way, as alſo the trunks of the *Trachea* and the *Aorta*, and do loſe many ſlips in them by a various inſertion; likely for this cauſe, that ſome of the lymphatic humor may be beſtowed for making ſlippery the ſides of thoſe Veſſels.

The progreſs and diſtribution of the pulmonary Lymphæducts.

The

PHAR. Part. II.

The Explication of the Figures.

THE firſt Table ſhews one entire Lobe of the Lungs, upon whoſe ſuperficies the Lymphæducts are ſeen ſpread through every where.

A. *The Orifice of the* Trachea *being cut lying in the midſt of the Veſſels.*
B. *The Orifice of the Pneumonic Artery lying under.*
C. *The Orifice of the Pneumonic Vein placed above it.*
d, d, d, d. *The outer Lymphæducts ſpread abroad through the ſuperficies of the Lobe.*
e, e, e, e. *More Lymphæducts meeting on the back of this Lobe, from whence they paſs into the Thoracick ducts.*

The ſecond Table ſhews one Lobe of a Sheeps Lung cut in the midſt, that the upper part (wherein is the trunk of the Vein) being removed, and the trunk of the *Aſpera Arteria* laid by it ſelf, the branching of the Pneumonic Artery is ſhewn throughout its whole frame, *viz.* through the ſmall and leaſt little Lobes. All the paſſages of this, *viz.* the ſlips and twigs how ſmall ſoever, being filled and coloured by any liquid thing caſt into them, are drawn to the life.

A, A, A, A. *The nether half of the Lobe divided, containing the branching of the Pneumonic Artery.*
B, B, B. *The Trunk of the Pneumonic Artery belonging to this Lobe.*
C. *A hole from whence its other branch was cut off and removed.*
D, D, D, D. *The Trunks from which its other branches (becauſe they could not be expreſſed in this Table) were cut off.*
E, E, E, E. *The arterious ſtems thereof ſtretcht forward into length, the ſide-branches on both parts ſtretcht out into the right and left ſide.*
F, F, F, F. *The twigs and leſſer ſlips, which are every where intermingled with the like from the Veins and Bronchials; and at laſt woven together with the Veins every where encompaſs the orbicular little Bladders, and bind them as it were in cluſters.*
G, G, G, G. *The Bronchial branches, which being cut from the ſtem of the* Trachea *laid aſide, and entring ſecretly into this Lobe of the Lungs, are accompanied with branches that bear blood.*
H, H. *The ſtem of the* Trachea *appertaining to this Lobe, which lay upon the Pneumonic Artery, cut and laid aſide.*
f, f, f, f. *The ſtems of the Bronchial branches, which are immerſed partly in this portion of Lobe deſcribed* G, G, G, G. *and are partly diſtributed in the other half cut off.*

The firſt Figure of the third Table expreſſes one Lobe of the Lungs, according to the branchings of the *Aſpera Arteria* divided into leſſer and leſs Lobes, the twigs and ſlips of which Veſſel being filled by a liquid firſt injected, and afterwards ſeparated from among themſelves towards the little Lobes, are alſo drawn to the life.

A. *The Trunk of the* Aſpera Arteria *being cut from the reſt of its body.*
B, B, B. *The inner part being cut open, that as well the holes leading into all its branches, as its ſtraight muſcular Fibres, are viewed together.*
a, a, a. *The above-mentioned holes leading into the every where ſtretched out branches.*
b, b, b. *The ſtraight muſcular Fibres, upon which the other circular do lye.*
C, C. *The upper part of this Tracheal ſtem being whole or ſhut, that the Ring-like Griſles might appear.*
D, D, D, D. *The branches of the* Trachea *conſtituting the leſſer lobes are whole and ſhut that the Ring-like Griſle may alſo appear in them.*
E, E, E, E. *The like branches being cut open, that the holes and ſtraight muſcular Fibres may be ſeen together.*
F, F, F, F. *The trunks from which the Tracheal branches being cut off are removed, that there may be ſpace afforded to the reſt when cut open.*
G, G, G, G. *The ſecondary little Lobes hung upon the trunks of the* Bronchii *as grapes, which alſo may be divided into leſſer Lobes, the more inward paſſages of all which paſs out of the* Bronchii *into the little bladdery Cells.*
h, h, h, h. *The veſſels bringing blood crawling over the ſuperficies of thoſe little Lobes.*

The ſecond Figure of the third Table expreſſes a part of the pulmonary Lobe, wherein

in the membranous interſpaces being blown up, all the little Lobes appear in their proper figure, and do ſomewhat repreſent the leaf of Polypody.

A, A. *A part of the* Aſpera Arteria *complicated with the other Veſſels, to which trunk made up of all thoſe, the little lobes grow like leaves of a tree.*
b, b, b, b. *The little Lobes themſelves.*
c, c, c, c. *The Veſſels bringing blood creeping through them.*
d, d, d, d. *The membranous interſpaces of the little Lobes, which alſo are covered with* e, e, e, e, *the Veſſels bringing blood.*

The fourth Table expreſſes as well the Veſſels belonging to the *Trachea* as thoſe bringing blood, ſeperate and diſtinct one from another, conſtituting one little Lobe, as alſo the peculiar framing of every one of them.

The firſt Figure repreſents the ſeperating into divers parts the Tracheal branch diſtributed into one little Lobe, and the branching into Pipes and orbicular little bladders.

A, A, *The trunk of the* Aſperia arteria, *in the ſuperficies whereof the ring-like griſtles do appear.*
b, b, b, b, *The leſſer branches going from that trunk, wherein alſo little Rings appear.*
c, c, c, c, *The paſſages of thoſe branches into orbicular litte bladders, which ſeem like the cluſters of Grapes.*
d, d, *The Veſſels bringing blood, diſtinct from the Pneumonic which cover the Trachea, and ſerve to nouriſh it.*

The ſecond and third Figure ſhews diſtinctly the equal branchings of the Artery and Pneumonick Veins within the ſame little Lobe; both which being complicated with Tracheal Veſſels, do for the moſt part make up the texture of the pulmonary frame.

The fifth Table ſets forth the pulmonary Nerve more accurately deſcribed by the aid of a Microſcope: ſo that it plainly appears that the Trunk is as it were a bundle of innumerable little Fibres bound together; Moreover its Trunk, while it creeps into the Lungs in the likeneſs of Mother of Time, doth ſpread the various little ſprigs every way.

Fig. 1. reſembles a part of the nervous trunk cut away, one end whereof being opened and lookt on by a Microſcope, ſeems to unfold it ſelf almoſt into innumerable little fibres.

A, *The Trunk of the Nerve.*
a, a, a, a, *The little Fibres divided from one the other about the end cut off, and ſpread abroad.*

The ſecond and third figure do ſhew ſome fibres as well of the trunk as of every branch, and moreover the ſlips of the little twigs from divers ſtemmes often repeated.

B. *The chief trunk.*
b. b. b. b. *The little fibres about the extremity cut off explicated.*
c. c. c. c. *The little twigs ſpringing from the bundles of the little fibres.*

The ſix Table firſt ſets from the anatomy of the Artery bringing blood drawn in apt figures, which we have deſcribed in a late treatiſe.

The firſt and upper figures hereof, repreſent the four diſtinct Coats of that Veſſel, *viz.* the nervous, muſcular, glandulous, and the vaſculous.

1. *The firſt inward nervous coat*, which perhaps is ſomewhat muſculous, conſiſting of ſtreight or long fibres, which being contracted ſhorten the Pipe of the Artery.

2. *The coat properly muſcular*, conſiſting of a heap of ſmall circular fibres, which when they are contracted ſucceſſively under the ſtream of blood, do make its circuit to be ſhortened. It is from the motion of theſe that the arteries beat.

3. *The glandulous coat*, which (like that in the guts) being placed over the muſculous coat, is weaved together of very ſmall and moſt numerous glandules.

4. *The outward vaſculous coat*, which variouſly folded together and wreathed, of Veſſels bringing blood, and with ſlips and nervous fibres, ſeems like a certain little net.

The *ſecond and lower figures* of the ſixth Table, do ſhew the anatomy of the Vein, or its four coats expreſſed in fit places; which Coats do appear entire as ſucceſſively taken one part from the other (beginning outmoſt.)

I. *The*

PHAR. Part. II.

I. *The outward coat* conſiſting of nervous fibres (which perhaps are ſomewhat muſcular) and as it were ſtreight or ſtretch'd out in length, although not orderly.

II. & III. *The vaſculous and glandulous coat*, which are the ſame as in an Artery.

IV. *The moſt inward muſcular coat*, conſiſting alſo of circular fibres as in an Artery, which being contracted behind the ſtream of blood, haſtens its returning courſe.

The ſeventh Table expreſſes the diſtinct Coats of the *aſpera arteria*, and ſeparated one from the other.

The firſt figure ſhews the moſt inward Coat, endowed with ſtreight or long muſcular fibres.

The ſecond figure deſcribes the glandulous coat, and the third figure the vaſculous coat (which are almoſt the ſame as in the veſſels bringing blood, and alſo in the Guts.)

4. *The fourth figure expreſſes the outward coat* (which is partly cartilaginous, and partly muſcular.) The tranſverſe or annular fibres hereof do fill up and weave together the interſpaces of the Cartilages.

The eighth Table ſhews a part of the utmoſt pulmonary Coat covering over its whole frame, moſt finely and curiouſly deſcribed by the help of a Microſcope.

The firſt Figure ſhews a portion of the above mentioned coat, which partly by reaſon of the extremities of Veſſels of every ſort ending in it, ſeems pricked full of holes as it were, and partly from the complications of the veſſels bringing blood, which like the twining ſprigs of Vines gird about the orbicular bladders, is diſtinguiſhed into many irregular *Area*'s.

The ſecond Figure repreſents a part of the outermoſt membrane ſeparated from the cluſters of veſſels pull'd off, and without any *Area*, only markt with little holes as it were with ſmall pricks.

The third Figure expreſſes one ſingular *area* of the Coat above mentioned, augmented in largeneſs by the help of a Microſcope.

SECT. I. CHAP. II.

Of the ſundry kinds of Breathing hurt, and their cauſes, with the accounts of their Symptoms.

HItherto we have ſtrictly viewed the Lungs, and the parts any way ſerving their motions, and conſequently the vital function; which being many and different, and the proviſion of the Organs as many very accommodate to breathing; ſo the ſame are many ways in hazard to be perverted or vitiated, upon ſundry occaſions. Truly a Watch framed with the greateſt artifice with a Spring, with wheels plain and toothed, with chain and ballance, is not more prone or eaſie to be obnoxious to depravation than this Pneumonic machine of the breaſt, through which by ſucking in air we preſerve the vital flame of the blood with its motion and heat. For whereas the veſſels of the Lungs belong to the function of breathing, *viz.* the *Trachea*, with the *Bronchii* and little bladders; alſo the heart with arteries and veins, beſides which there are nerves with fibres as well muſculous as nervous, Lympheducts and Glandules; alſo the contents of theſe Veſſels, *viz.* Air, the old and freſh blood, with its *Serum*, the Lympha, and the animal Spirits; any fault happening in any of theſe doth oftentimes diſcompoſe the whole Pneumonic function. Nor leſs alſo the moving Organs of the breaſt, *viz.* the muſcles with the Diaphragma, and the nerves appointed to their uſe. And likewiſe ſometimes the animal ſpirits before they enter into thoſe nerves, being ill diſpoſed, often cauſe great diſorders in breathing.

The organs of breathing being hurt, the breathing is hurt alſo.

The uſes and ends of breathing which uſe to be hurt.

When the chief function and uſes of the Lungs have been to convey the blood and air through the whole frames of the parts and their inmoſt receſſes, and every their ſmalleſt paſſages, and every where to mingle them; namely for that purpoſe, that the venal blood returning from its circuit, and diluted with freſh juice, and thereby crude and as it were half extinct, may as well be more perfectly mix'd and wrought together, as more effectually kindled afreſh in all its parts by the nitrous air; from hence the chief faults about this buſineſs or function of the Lungs do moſt of all conſiſt in theſe two things. Firſt, that the blood hath not due paſſage through the *Sinus* of the heart, and the pneumonic veſſels: And ſecondly, becauſe the Air is not drawn in and breathed out in a due manner into the *Trachea* and its paſſages.

There.

PHAR. Part. II.

There are two parts of either of these: For first as to the passage of the blood, sometimes the fault is caus'd within the right *Sinus* of the heart, or the pneumonic Arteries; and also sometimes caused within the pulmonary veins, or the left Ventricle of the heart: Secondly, as to the Air, the failure is chiefly in inspiring and exspiring; although each function offends sometimes equally. There are divers accidents of each and many causes and ways of its being done, whereof we will here briefly touch upon the chief.

The defects and failings of the Lung in its office.

Therefore first, when the blood doth not duly pass through the right Ventricle of the Heart and the Pneumonic Arteries, either it happens by its own fault, or by the fault of those passages, and sometimes by the fault of further passages. For sometimes the stream of blood stops in the nether region of the *Præcordia*, by reason of obstruction in the other; moreover, sometimes the defect or fault of the air breathed in stops the free passage of the blood.

First in respect of the blood.

What relates to that fault of the blood, when it passes not quick enough through the right *Sinus* of the Heart and Pneumonick Arteries, the opinion of the Renowned *Sylvius* should here be discoursed, but that it would be too tedious, and from our purpose. For he supposes, *The descending branch of the venal blood, moistned with chyme together with the lymphatic humour returning from the whole body, hath the nature of an acid-sweet spirit; and in the mean time its branch ascending impregnated with choler from the bladder of the gall mixt into the mass of blood, does participate of an oily volatile salt; and so by the meeting together of these something contrary to themselves, a gentle and friendly contention or boiling is stirred up in the right ventricle of the heart, in which and for which the fiery parts lurking and being shut up in each, being freed and set at liberty, do rarifie the chyle and blood, and so change and alter them, that they exercise the function of life and heat as well as motion and nourishment through the whole body.* There are many reasons why I assent not to this ingenious and neatly-framed Hypothesis. For besides that many do far otherwise determine about the origine and dispensation of Choler, and so not without strong reasons and experiments are thorowly perswaded, (by eye-sight) that there is not any such boiling up of the blood of a different quality, and striving or contending in the right ventricle of the Heart: Our judgment continues still, as it hath been, that both streams of blood, washed thorowly with the fresh chyme, do consist altogether of one kind; and for that cause the milky Vessels of the Chest carry about part of the Chyle so long a journey, which they pour into the descending trunk of the *Vena cava*, just as the Meseraick Veins pour the other part into its ascending trunk: also that the lymphatic humor together with the Chyle is poured into the subclavian Vessels, so that it may very commodiously be reduced into blood; neither truly doth there seem need of other or more passages. Moreover we determine that that humor rightly constituted doth agree with, and is easily assimilated to the mass of blood, as well as the Chyle it self made sweet, without any contention raised in the heart. But if the lymphatic humor returning from the Brain and nervous kind as well as from the Glandules, degenerate from its due temperature, and contract a sowrness (as it often comes to pass) then being re-infused into the venal blood it overcomes it, and precipitates it into serosities, and from thence great streamings of urine do ensue. Moreover we have shewed elsewhere, that the Diabetes is provoked from such a cause. But such a flux of the lymphatic humor is so far from exciting a greater boiling up of the blood in the right ventricle of the Heart, that rather on the contrary from thence often chilness of the whole or stifness, with a weak Pulse, and sometimes swoonings or convulsive fits are provoked, accompanied with a plentiful and pale urine. The reason whereof without doubt is, that then the clear humor flowing from the brain and nervous parts, turns the blood into serosities, and cools it by too much diluting; and for that cause the animal spirits being destitute of their vehicle, either faint or run into irregular motions.

The opinion of the famous Sylvius concerning the blood fermenting in the Lungs.

Which seems not likely to be true.

Our opinion hereof.

But truly as we altogether deny an Elastic effervescence of the blood in the right Ventricle of the Heart from contention of dissimular parts; so as often as from thence the blood is not cast out into the Lungs after a due manner, we determine it to happen not so much from the proper fault and defect of the blood it self as from the animal faculty. For if the spirits actuating the moving Fibres of the Heart, either grow weary, or are forced into convulsive disorders; for that cause the Heart beating in disorder, drives out before it the blood either infirmly or irregularly.

The pneumonic circulation of the blood is stopt sometimes by the fault of the heart it self.

But that the blood issuing out of the Heart doth not always with expedition pass through the Pneumonic Arteries, that sometimes happens from its own proper fault, and also sometimes from the passages obstructed, and also by reason of other causes. The blood it self in a double respect hinders its own passage through the Lungs, *viz.* either offending as to its kindling, or as to its temperature. There are sundry accidents of either of these. For first, even as the blood is more or less kindled than is con-

2. Sometimes by the fault of the blood.

3. Sometimes by reason of passages obstructed.

PHAR. Part. II.

venient, it is hindred or obſtructed in the pulmonary circuit: if at any time the watry, earthy, or fixt ſaline parts are predominant in the blood, the ſpirit and ſulphur being conſumed or brought low; by reaſon hereof its liquor being not well or leſs kindled by the nitrous air, is not eaſily rarified in the pulmonary paſſage, and ſcarce paſſes through them like a flame of its own accord, but it ſticks ſtill in its paſſages, heavy and muddy, and creates much trouble and labour to the Heart whereſoever it is circulated. Hence as often as the blood is a little more plentifully forced into the *Præcordia* by the quicker motion of the whole body, or of its parts, the Heart and Lungs labour hard for its driving about, and that with the utmoſt endeavours. And in this caſe it is probable, that the blood carried more rapidly into the right Ventricle of the Heart, doth ſomewhat ſtagnate; becauſe it cannot preſently be carried into the paſſages obſtructed before it. Moreover from this cauſe thoſe grumous or fleſhy concretions called the *Polypi* of the Heart ſometimes ſeem to ariſe. Hence both in the Pica, Leucophlegmatie, Dropſie, and inveterate Scurvy from the quicker motion of the body ariſes difficult and painful breathing.

The blood hindred in the Lungs ſometimes becauſe not kindled enough;

2. Sometimes the blood is too much kindled, and breaking out almoſt into a flame, and being above meaſure expanded, it can ſcarce be contained in the pulmonary paſſages (which it very much blows up and extends) but endangers them to be inflamed or kindled; wherefore leſt it ſhould tarry longer in them, the *Præcordia* beat with moſt frequent and ſtrong endeavours, that the blood ſo over-much kindled might be ventilated and circulated: for otherwiſe it being carried within the Lungs and inflaming them all over, would quickly deſtroy the vital function.

Sometimes too much.

Beſides theſe things which concern the kindling of the blood, there are other faults as to its temperament or mixture, by reaſon of which it leſs freely or expeditely is conveyed through the pneumonic paſſages. For when its conſiſtence is either too laxe or too cloſe, it will not eaſily paſs through the ſmall paſſages of the Lungs; but oftentimes is in hazard to ſtick and ſtagnate in them, and alſo run out and be extravaſated.

It is alſo ſtopt through its temperament being vitiated.

The blood being in a diverſe manner made looſe in its conſiſtence, either depoſites its Serum, or its dregs, or its putrefaction in the Lungs; which being lodged in the receſſes of the Veſſels, or affixed unto their ſides, do variouſly ſtop or pervert the courſe of the blood.

1. The diſſolution of blood, which is moſt commonly injurious to the Lungs, (although not very dangerouſly) is wont to happen, for as much as the ſeroſities being unapt to be contained within the maſs thereof, and when they are not preſently ſent away by ſweating or urine, they ſeparate from the blood within the Lungs; and ſo boiling up, and breaking out from their proper veſſels, do as well diſturb and ſtop the paſſage of air, as that of blood; ſo that for the ſake of expelling thoſe ſeroſities and continuation of the circulation of blood, the Lungs are provoked into a frequent and very troubleſom Cough. What the formal reaſon of this Cough is, and the manner of its being brought about, we ſhall declare hereafter.

When the blood is too much looſened in its conſiſtence.

Though there are many cauſes and occaſions, by which the ſerous liquor, departing from the looſned conſiſtence of the blood, flows out abundantly into the Lungs; yet for the moſt part it happens from one of theſe three, *viz.* firſt and moſt frequently, becauſe the Pores outwardly bound up by cold, caſt back the ſeroſities which were wont to be ſent away by perſpiration, into the maſs of blood; which compel it preſently to boil up, and caſt off the ſerous ſuperfluities in the Lungs. From this kind of cauſe Catarrhs and Coughs frequently ariſe, inſomuch that the beginning of every cough by the vulgar is always imputed to ſuch an occaſion, to wit, catching cold. 2. The drinking of ſharp and thin liquors, as Cider, Rheniſh Wine, white Wine, *Paris* Claret commonly cauſes to ſome a Cough, or catarrhal diſtemper: the reaſon whereof is, for that the blood, weak in temperament, is preſently diſſolved and precipitated into ſeroſities like milk by ſowre things caſt into it, which flow plentifully from the mouths of the inward Arteries. I have experimented this upon my ſelf yearly, when in the Summer ſeaſon (when the blood abounds with ſulphur) I have drank Cider and tartiſh Wines ſafely, yea frequently to advantage, the ſame in winter (when the blood is prone to ſowreneſs) but moderately taſted of, do preſently provoke a Cough. 3. There is another cauſe of this ſerous inundation flowing out upon the Lungs, *viz.* when the *Lympha* watering the nervous and ſolid parts, doth ſuddenly ſuffer a flux; and for that cauſe it ſtreams back into the blood out of the Fibres and Glandules, and other paſſages and receptacles; whoſe liquour it preſently diſſolves, and precipitates into ſeroſities, which often infeſts the Lungs.

Why it lodges the Serum in the Lungs.

The various cauſes and ways of doing it.

For this reaſon a ſudden and troubleſom Cough frequently accompanies convulſive diſtempers, which being commonly called a vaporous Cough is aſcribed unto vapours. Moreover in great alterations of air, eſpecially when the ſeaſon varies from dry into moiſt,

moiſt, and the volatile and fixed ſalts do thereby melt, the Cough and Catarrhs increaſe very much.

Neither doth the ſerous liquor only, but alſo many other humors or recrements of the blood lodged in the Lungs frequently ſtuff up their paſſages; ſo that by obſtructing both the paſſages of air and of blood, they cauſe difficult breathing or a cough. This is every where perceived in ill-habited bodies, alſo in Gluttons and Drunkards, and others leading an inordinate and ſloathful life. Wherefore Foot-men uſe a thin and ſpare diet, that they may have their Lungs free from the filth and recrements of the blood. I have obſerved ſome melancholly perſons, the aduſt *faces* abounding in the pulmonary paſſages, to have voided blackiſh ſpittle like ink; alſo others cholerick, and inclining to the Jaundice to void yellow, and ſometimes very bitter, as if it had been meer choler.

The blood diſſolved alſo lodges in the Lungs infections that cauſe corruption.

3. Moreover many inſtances manifeſtly declare, that ſometimes the Lungs are tainted by the corruption and putrefaction of the blood. For the blood, toucht with an infection or a peſtilent or venomous contagion, begins to be corrupted, and withdraw into clotted and corrupted portions; from thence the Lungs undergo the chief taint, from whence the greateſt danger of life is threatned. This is too well known in the Meaſles, ſmall Pox, Plague, and malignant Feavers, for me now to undertake to explicate it: by which maladies as often as the ſick die, it ſeems to come to paſs, either becauſe the blood clodding in the veſſels of the Heart or Lungs, obſtructs the way of its proper courſe, ſo that preſently its influx into the Brain is hindred, or becauſe the corruption of the blood, affixt to the ſides of the pulmonary paſſages, cauſes a Phlegmon as it were; and therefore provokes a moſt troubleſom cough or difficult breathing, and frequently bloody ſpittle. So much for the impediments of the circulation of the blood, which happen in the Lungs by reaſon of the maſs of blood too much diſſolved, and apt to depart into parts and portions, (which being there left obſtruct their paſſages.)

The blood is hindred in the Lungs by reaſon of the too thick conſiſtence of the blood;

There remain other no leſs prejudices to the *Præcordia*, which proceed from the conſiſtence of the blood too much bound up together, and ſending nothing from it ſelf: by which a burning Feaver, Pluriſie, or Peripneumony ariſe.

As is perceived in a Feaver.

In the former diſtemper the blood being more ſulphurous than it ought, and therewithal being thick, is not diluted enough with its Serum; and thoſe particles of it contained within it ſelf, it puts away with great difficulty: wherefore it is more plentifully kindled in the Lungs; and when it paſſes through the paſſages hereof with more difficulty, by reaſon of its greater boiling, and its thickneſs, the Heart beating quick and moſt vehemently, endeavours its circumpulſion with all its might; notwithſtanding from its greater flame growing hot within the *Præcordia*, heat and a moſt troubleſom thirſt, with roughneſs, and as it were a certain parching of the tongue ariſes.

In a Pleuriſie and Peripneumony.

In the other kind of diſtemper, *viz.* a Pleuriſie and Peripneumony, the blood is alike thick, but leſs ſulphurous, and inflammable; wherefore it doth not participate of ſuch a burning: yet by reaſon of its thickneſs it doth not ſo eaſily and quickly paſs through the Cheſt or Lungs, is frequently extravaſated, and ſticking to the interſpaces or ſides of the paſſages, cauſes obſtructions, and ſoon after an inflammation, to which pain often ſucceeds with bloody or diſcoloured ſpittle. We may obſerve in blood-letting in theſe kind of diſtempers, that after it hath ſettled, its ſuperficies is covered with a little whitiſh Skin, or otherwiſe diſcoloured, but always with a thick and viſcous: the reaſon whereof is, that the blood, when it doth not ſend away in the circulation its old particles, nor doth admit enough of new, it is thickned with a continual boiling, and like boiled fleſh changed from a bloody colour into a whitiſh; in which ſtate, paſſing with difficulty through the ſmall paſſages of the veſſels, it is in danger to be extravaſated, and eaſily provokes a Pleuriſie or Peripneumony.

The blood is hindred in the Lungs by the fault of the heart.

Beſides theſe ſtoppages of the Blood, cauſed by its own fault, while it paſſes through the *Præcordium*, there are alſo other impediments, which happen either by the defect of the Heart, or its paſſages, or by the fault of the air inſpired. By what means and for what cauſe the Heart offending in its motion, forces the blood from its right Ventricle through the Lungs into the left irregularly, we have clearly ſhewn in our late Tract of Cardiack Diſtempers: to wit, that muſcle ſometimes labouring for want of ſpirits doth not vigorouſly and ſtrongly enough perform its beatings. For when in corporal exerciſe the blood more plentifully than uſual, is forced from the *Vena cava* into the Ventricle of the Heart; if this cannot firmly contract it ſelf, labouring according to its ſtrength, it cauſes frequent and weak Pulſes: moreover to help this as well the Pneumonic Arteries, as others in ſundry parts of the body, which drive about the blood every way, do cauſe frequent and inordinate contraction. Thus I have obſerved in Virgins afflicted with the Green-ſickneſs, and in other cachectical bodies, from a quick motion of the body, not only a palpitation of the Heart, but in the neck, temples, and other pla-

1. When the ſpirits thereof are wanting.

PHAR. Part. II.

ces the Arteries to have beaten irregularly. Neither is it the want of ſpirits only, but their diſorder is ſometimes the cauſe that the *Præcordium* doth with leſs ſtrength convey the blood; for ſometimes the ſpirits, the inmates of the Cardiacal nerves, being ſtirred up by an incongruous conjunction, and affected convulſively, do impreſs their irregular contractions upon the Heart or Arteries, whereby the progreſs of the blood is ſeveral ways perverted or hindred, as it often happens in Palpitation of the Heart, Trembling, intermitting Pulſe, and other the like paſſions.

2. Becauſe moved inordinately.

3. The blood is hindred from obſtruction of the paſſages. Which are ſhut up divers ways. For divers cauſes here rehearſed.

3. The Pneumonic proceſs of the blood is variouſly ſtopt, becauſe the paſſages are not open enough: which impediments happen often as the Pores of thoſe paſſages are either ſtopt or broken. Of the former there are two reaſons *viz.* ſometimes the ways are ſhut, for as much as the paſſages of the veſſels, contracted by the carneous fibres, are brought nearer one another; as we have elſewhere ſhewed, doth ſometimes happen in Palpitation of the Heart, and a convulſive Aſthma. The affects of which ſort, by reaſon of the ſtream of blood ſhut within the *Præcordia*, difficult or hard breathing, a ſmall Pulſe, and chilneſs of the whole body are wont to accompany. Moreover ſometimes the courſe of the blood is ſhut up, becauſe the paſſages of the veſſels are preſſed together by a body, or by ſome humor from without: wherefore when the little Cells or bronchial Pipes (as is uſual) are filled with a viſcous flegm, purulent matter, or blood extravaſated, as the free paſſage of the air is hindred in them, ſo alſo the paſſage of blood is ſtopt in the veſſels adjoyning. On the ſame account come tumors, little ſwellings, worms, alſo ſtony, ſandy, and curdly concretions, and others of another kind are in diverſe manners excited; the chief whereof we ſhall touch on hereafter. Moreover we ſometimes ſee the canals as well of an Artery as of the Pneumonic Vein, made very bony in ſome part, and their ſides ſo compreſſed, that a very ſmall chink remains for the blood to paſs. Not long ſince we diſſected a young man who died by reaſon of an ill formation of the Pneumonic Vein, in whom the Trunk of this veſſel growing ſtony near the juncture to the heart, did ſtick ſo cloſe, that the blood did drop into the heart only by drops, or by a very little ſtream. 2. That the paſſages bringing blood are often filled and ſtopt, inſomuch that the ſtream of blood is obſtructed or ſtraitned, many anotomical inſtances and obſervations manifeſtly declare. From thence it appears, that grumous, or as it were carnous concretions of the blood do frequently ſo ſtop the ventricles of the heart, and the roots of its larger veſſels, that the courſe of the ſtream of blood is almoſt entirely ſtopt. Moreover reaſon perſwades, and experience concludes this more frequently to happen in the leſſer veſſels: for ſeeing (as we have even now intimated) the blood emitted by Philebotomy in Rheumatiſms, Peripneumonies, and Pleuriſies, when it is cold is covered all over with a thin skin altogether of the like ſubſtance with thoſe concreted Polypus's, it plainly appears, that it paſſes with difficulty through the paſſages of the leſſer veſſels by reaſon of thoſe viſcous excrements: wherefore that it may paſs by ſome means, it diſtends them very much, and ſometimes breaks quite through them, alſo it frequently unlocks their mouths, and opens gapes into the *Trachea*, inſomuch that portions of the extravaſated blood are by coughing frequently ejected. We have known ſome to have died Aſthmatic or ſhort-winded, whoſe Lungs being free from an Ulcer, or any more grievous wound, have ſwelled ſo much, that they wanted room for their motion within the cavity of the Cheſt: the reaſon whereof doubtleſs was, that the thicker and more feculent blood, for that cauſe not eaſily paſſing through thoſe veſſels, every where extended the Arteries and Veins, and cauſed it to ſtagnate in the leſſer Pipes. Moreover the feculencies of blood one while ſalt of different kinds, another while ſulphureous or earthly being combined with them, and thruſt into the ſmall paſſages of the veſſels, and fixed there, do altogether obſtruct them; inſomuch that the Pneumonic circulation of the blood is contracted into a ſhorter ſpace, and conſequently the function of breathing is ſtraitned in the compreſſed Pipes or little Cells. There are many kinds and ſundry ways of ſuch an obſtruction, which if all or the chief ſhould be enumerated, ſuch a Pathology would ſwell into too great a bulk.

The bronchial Pipes are filled.

Sometimes wax hard.

The veſſels are ſtuffed with concretions reſembling the Polypus.

The blood is alſo hindred becauſe the paſſages are burſt aſunder, as in ſpitting blood.

3. The Pneumonic paſſage of blood is not truly hindred by reaſon of the paſſages ſhut and obſtructed, but ſometimes alſo being burſt aſunder. For thoſe veſſels being ſmall, or tender, or very looſe in ſome perſons, are frequently opened by the force or acrimony of blood; ſo that the blood either burſting into the *Trachea*, is ejected by ſpitting, or heaped up in the interſpaces of the paſſages, cauſes Preripneumony, or falling down into the cavity of the Cheſt, produces an Empyema. Of all theſe we ſhall treat ſingly in the Chapter of ſpitting of blood.

One impediment of the blood is want or default of air.

3. There remains as yet a third impediment of blood in the Pneumonic paſſages, which happens for the want or fault of Air. If at any time the blood is not kindled after a due manner within the paſſages of the Lungs, from air breathed in by the *Trachea*; for that cauſe as preſently its flame is irregular, ſo likewiſe its motion is variouſly ſtopt or perverted:

perverted: for although the blood is forced through the Lungs by the meer impulſe of the heart, notwithſtanding the Pulſe hereof is proportioned according to the tenour of its being kindled by the air; wherefore when the flame of blood is diminiſhed, or ſuppreſt, for want or through the fault of the air, preſently the Pulſe proves languid or unequal, and by reaſon of the bloods courſe being troubled, or ſtopt, preſently a paleneſs and coldneſs ſucceeds throughout the whole body, with enervation of the members. But if inſpiration be wholly intercepted or fruſtrated (becauſe the nitrous particles are wanting) preſently the pulſe ceaſes, and anon life is loſt. The reaſon of all which is, both becauſe the blood being much impeded in its aſcenſion, or extinct, like Muſt given over working preſently ſubſides, and is unapt for any motion; and chiefly becauſe the flame of the blood failing, and being ſubſtracted from the brain, preſently the Hypoſtaſis of the Animal Spirits, as it were light ſtreaming from thence, immediately fails, and together with it the exerciſe or actions of all faculties do ceaſe. But if the blood is too much kindled, the Sulphur of the Blood, and the Nitre of the Air running together more than it ought; for that cauſe preſently, that this too much burning may be eventilated enough, the Pulſe of the heart is increaſed to its utmoſt. We might adde many inſtances of this kind; but truly this conſideration of the blood leads us to the ſecond thing propoſed of Reſpiration hurt; namely that we may duly weigh, what ſort of failings or defects do happen about the inſpiration as well as exſpiration of the Nitrous air, requeſite for the preſerving the nitral flame of blood; that is to ſay from what cauſes they proceed, and alſo what effects they are wont to produce; in which ſearch we will firſt treat of Inſpiration hurt.

SECT. I. CHAP. III.

Of Inſpiration hurt.

BReathing is accounted hurt, when its uſe is fruſtrated, or any ways hindred; which moſt frequently happens, by reaſon of the fault or defect of the Air drawn in. As to the former, if the Air chance to be depraved, it neither duely kindles nor eventilates the blood, yea it ſometimes overthrows the temperament thereof, or infects it, as is every where ſeen in a Conſtitution of Air very malignant. That we may touch on the chief reaſons of theſe diſtempers, we are to obſerve, That as the Nitrous particles of Air are chiefly neceſſary, (as is manifeſt by manifold experiment) for the preſervation of life; ſo frequently it happens that Nitre of the Air either to fail or be wholly wanting, or by particles of another kind to be ſo much muffled, or bound up, that they cannot enough exerciſe their vital power, or laſtly malignant or fatal Corpuſcles to be adjoyning thereunto. Firſt, the nitrous particles of Air are deficient, if when it ſtagnating or growing hot the Nitre is chaced thance, or not ſtirr'd into action. Wherefore, in a low-rooft Chamber, or too cloſe, and in other places crouded with aſſemblies of men, or made hot with the ardor of the Sun, we difficultly or weakly breathe. The ſame comes to paſs in places of great height, on the tops of thoſe Mountains exceeding the top of the *Atmoſphere*; wherein breath is faintly drawn for want of Nitre, neither can we live long there. Secondly, the Nitrous Particles of Air are wont to be obſcured or blunted by other acceſſories, alſo ſometimes they are too much ſharpened. For as often as the South-wind blows, the Air is too moiſt and thick, inaſmuch as the Nitrous particles are ſeiz'd upon by the watry and ſulphureous, and are much blunted, ſo that while it is drawn in, the blood is not vigorouſly kindled, but like green wood put into fire it rather ſmokes than burns bright; wherefore during ſuch a ſtate of Air we become ſtupid and dull, and unapt for motion; but on the contrary, the North-wind blowing, the cooling ſharp and moſt nipping Particles are adjoined to the Nitrous, and the blood is enough kindled, and we breath freely; yet the Vital flame is every where reſtrain'd by intenſe froſt diſportion'd thereunto, and unleſs refreſh'd by motion and heat, it is frequently and entirely extinguiſhed.

Breathing hurt by the vicious qualities or defect of air.

The faults of the air.

2. Beſides theſe faults of the Air, whereby breathing is wont to be hurt, moreover this evil ſometimes proceeds from its defect; inaſmuch as it cannot be drawn in plenty enough. Of which effects though there are many and divers cauſes, yet for the moſt part it happens in reſpect of the organs of breathing, either hindred as to their motion, or their paſſages obſtructed.

The defect of air hurting breathing proceeds from the Pneumonic Organs.

the

PHAR. Part. II.

1. The Organs of breathing are either meerly paſſive, *viz.* which are moved, as the Lungs; or are active, and move themſelves, and thoſe together, as the muſcles of the Cheſt and Diaphragma. In every of theſe the impediments of the motion by which breathing is hurt, happen variouſly. And firſt what reſpects the Lungs, we mentioned before, that they ſometimes very much ſwell, by reaſon of the Veſſels being much diſtended, and fill'd with blood, inſomuch as being ſtiff and inflexible, they obey not the turns of the Syſtole and Diaſtole of the Cheſt. Moreover it happens ſometimes through a Phlegmon, little ſwellings, and other concretions of divers forms, that a like ſtiffneſs is cauſed in them. Secondly, the active organs of breathing, or the moving parts, *viz.* the muſcles of the Cheſt and Diaphragma are wont to be perverted or ſtopt from their moving function by divers cauſes. A ſolution of continuity made in any part of theſe, either by clotting of blood, or by falling down of the *Serum*, and other humors, as in the Pleuriſie and Scurvy, or in thoſe that are wounded or bruiſed, doth every where cauſe pain in the place affected, with impotency of motion and difficult breathing. Moreover, ſometimes without pain, or any evident cauſe, thoſe parts being hindred from their motion do produce a moſt heavy purſineſs; As is frequently ſeen in an Aſthma, Suffocation of the Womb, and in certain other Convulſive or Hypochondriac diſtempers. The reaſon of which paſſion without doubt conſiſts in this, for that the animal ſpirits appointed to the moving function of thoſe parts, are diſturbed about their Origine, or hindered in the paſſages of the Nerves, and are turned aſide from their due influx into the moving fibres: Inſomuch as many who are ſound enough as to their Lungs, and only obnoxious to affects of the Brain and Nerves, are frequently ſurprized with horrid fits of an Aſthma, as we have at large declared in another place.

2. The ſtopping of air, hindering breathing, whereby it leſs freely enters the Lungs, frequently happens, by reaſon of the Conveyances, *viz.* the paſſages of the *Trachea* being ſhut, or not enough open. For indeed thoſe paſſages are wont to be ſtopt (as we have formerly obſerved touching the Veſſels bringing Blood) and prohibit the full entrance of air, when they are either obſtructed or compreſſed, or more narrowly contracted. Though there are many cauſes and ways whereby the paſſages of the *Trachea* are wont to be obſtructed, yet chiefly and moſt often a Catarrhal diſtillation of the *Serum*, while it departs from the blood, and flows out of the veſſels bringing blood into theſe parts; which being firſt thin and ſharp, produces a troubleſome Cough; afterwards thickning by digeſtion, and cleaving to the ſides of the *Trachea*, exceedingly ſtraitens the ways of inſpiration, and ſhortens them by quite ſtuffing up their extremities. In like manner the ſweating out of extravaſated blood, as alſo of *Pus* or ichorous matter out of the Lympheducts or Veins into the tracheal little bladders, doth frequently produce an Aſthma, and often a Conſumption; the reaſon of which ſort of diſtempers ſhall be more largely explained hereafter. Secondly, it is manifeſt enough by common obſervation, that the Tracheal paſſages as well the laſt as the intermedial, often-times are ſtraitned, or ſhut, by compreſſion. For after a plentiful meal, or abundant drinking of Wine or ſtrong Ale (inaſmuch as the Pneumonick veſſels are very much diſtended by reaſon of the turgency of blood, and the ſides of the Trachea being preſs'd together, do not admit of a free and uſual entrance of air) men otherwiſe healthful enough, do breath difficultly and painfully: Which truly we eſteem to happen from the Lungs being filled and extended rather, than from a cram'd ſtomach hindering the Syſtole of the Diaphragma. Moreover, for this reaſon, even in the very paroxyſmes of feavers a frequent and painfull breathing is manifeſt. Neither onely from the turgency of blood, but alſo from the ſame ſtagnating, or extravaſated, and alſo from ſtony concretions, and divers other manners, the veſſels of the Trachea being preſſed together, cannot diſcharge a free breathing.

The various ways of Obſtructions.

A Catarrh.

The ſwelling of blood by which the paſſages are preſs'd together.

3. The paſſages of the Trachea being ſometimes more nearly contracted and cloſed from their fibres convulſively diſpoſed, deny a paſſage to the Air for due breathing. From hence, when there is no obſtruction, or ill conformation in the Lungs, as alſo no conſumptive diſpoſition, yet from thoſe fibres preternaturally convulſed and drawn together, dreadful fits of an Aſthma frequently ariſe. Whereas we have in another place diſcourſed of theſe paſſions, it will not be requiſite here again to repeat that diſcourſe. Beſides theſe accidents of breathing hurt, there are certain others which are ſtirr'd up by reaſon of the Air prohibited in its firſt entrance, *viz.* in the Noſtrils, the throat, the *Larynx*, from a tumour or ill conformation: For the *Polypus* in the Noſe, the Quinzy in the Throat, or inflammation of the Tonſils, do render a difficult breathing; in the ſame manner as a heap of ſand about a Haven, obſtructs the ingreſs and regreſs of Ships. But truly ſince the reaſons of thoſe paſſions, and their manner of being made, are expoſed to ſenſe, it ſeems ſuperfluous here to deliver their cauſes.

The Cramps of the tracheal paſſages.

SECT.

PHAR. Part. II.

SECT. I. CHAP. IV.

Of Expiration hurt.

AS Expiration is much eaſier, and with leſſer trouble performed than Inſpiration, ſo it is leſs endangered to be ſtopt or perverted, as to its function: for in truth the contractive endeavours of fewer muſcles are required to perform that, inſomuch as ſome do affirm that the meer relaxations of the moving parts, whereby the dilatation of the breaſt is diſcharged, doth ſuffice for its conſtriction. Hence when in the agony of death, the ultimate labour is to open the breaſt, and fetch breath, by which the flame of life may be continued; as ſoon as that endeavour is become fruſtrate, the animal exſpires, and is readily extinct. But truly we have already clearly enough evinced, that the tasks of breathing out, no leſs than thoſe of breathing in, are performed by the help of peculiar muſcles. Wherefore, when it happens that the Organs of Exſpiration are either hurt or prejudiced, there muſt needs follow difficulty or depravation of that function. The moving parts, which bind together the breaſt, and ſtraiten the cavity thereof, are eſpecially the inward muſcles of the breaſt, ſome belonging to the Loyns, and others to the Abdomen; as alſo the muſcular fibres of the *Larynx* and *Trachea*; by reaſon of ſome faults, occupying ſometimes theſe, anon them, either ſingle or many together, exſpiration is wont to be ſtopt or perverted after a diverſe manner. Although the hurt of this function frequently depends upon inſpiration being prejudiced; notwithſtanding it ſometimes happens alone; ſo that when we ſuck in Air eaſily and duely enough, we return it diſturbed or perverſly, which truely is wont to come to paſs through divers cauſes, and after many manners (the chief of which we ſhall here briefly touch upon.)

The act of expiration is eaſier than of inſpiration.

Expiration hurt ſometimes proceeds from the fault of inſpiration.

1. For firſt, when a wound, or convulſive or paralytical diſtemper happens in one muſcle (which cauſes exſpiration) or in more, for that cauſe the cavity of the *Thorax* cannot be ſo freely drawn together and compreſs'd, for the more full breathing out air or breath. Hence not only ſuch as labour in a Pleuriſie, but in a tumour or wound in the intercoſtal muſcles or the Abdomen, cannot eaſily cough, or ſing, or perform other acts of ſtronger exſpiration: Neither is the due drawing together of the *Thorax* leſs ſtopt, by reaſon of the moving fibres of thoſe parts affected either by a reſolution, or a cramp.

Sometimes being alone depends on various cauſes.

1. *On the wound of a part moving.*

2. The act of exſpiration, whereas it is variouſly perverted or diſturbed, ſo it chiefly happens in a cough, in ſneezing, in laughing, in crying, and in Hiccough; into the reaſon and manner whereof we will briefly enquire; And firſt we ſhall ſpeak of a Cough.

2. *In a Cough.*

A Cough may be deſcribed, that it is a vehement, more frequent, unequal and loud exſpiration, ſtirred up either for the quieting of ſome troubleſome and provoking thing, or for expelling of it out of the Lungs through the paſſage of the *Trachea*. For air being violently excluded, and daſh'd in the way on the ſides of the Tracheal paſſages, whatſoever is in any place impacted in them, if it be eaſily moved, it diſcuſſes and wipes it away, and frequently ſends it out of doors.

The deſcription of a Cough.

For the exciting of a Cough, both the muſcles contracting the *Thorax*, and alſo the moving Fibres of the *Bronchii*, do concur in motion with a joynt force together. For while the muſcles ſtraiten the cavity of the breaſt, and every where ſqueeze the whole Lungs; theſe fibres one while contracting theſe tracheal paſſages, another while them, cloſing behind the air while it is driven forwards, do endeavour its expulſion more quick and vehement.

Its formal reaſon, and the manner of its being done.

A more intenſe ſudden inſpiration precedes every act of a Cough, to wit that the air being admitted in greater plenty, may preſently be more violently driven out with noiſe; in which endeavour not only the new that is freſh breathed in, but alſo the old, being heaped up before in the tracheal little bladders, is driven forth together with a noiſe, for the encreaſe of breath blown out; and when what is troubleſome is not ſettled nor removed at the firſt aſſault, the vehement exſpiration of this kind is repeated by a frequent courſe, even to the great wearying of Nature.

The firſt cauſe of every Cough is an irritation of the nerves or fibres belonging to the lungs; concerning the nerves we are to obſerve, that not only the branches and their ſlips inſerted into the Lungs, but others from which they do ariſe, or with which they do intimately communicate, being provok'd in places far diſtant from the breaſt immediately cauſe a cough: for which cauſe oftentimes a ſharp humour being lodged within

Its primary cauſe.

PHAR. Part. II.

within the Brain, and from thence falling down into the little head of the pectoral nerves, is wont to produce a most troublesome Cough or Asthumatick distempers, as not long since we have declared by notable instances. For the same reason a pain inflicted on the nostrils, palate, or *Gula*, provokes a Cough, or rather a vain attempt of coughing. Moreover a little *Serum* distilling from the Arteries into the upper parts of the *Gula* or *Larynx* produces a frequent and very troublesome Cough, without any notable prejudice of the Lungs. But truly this provocation, inflicted on the nerves and fibres distributed in the Lung it self, more frequently, and truly more violently provokes an endeavour of Coughing, which is repeated by courses, till what is troublesome be turned forth, or the provocation restrained. Of this kind of Cough from the nerves, a notable Example shall be after set before you.

The evident causes thereof.

The provoking causes producing a Cough are manifold, and make their stay in several places: for besides that the nerves, as we but now intimated, and also the membranes, with which there is an intimate communication with the Lungs, being provoked in the open Nostril, give an impression of that passion at a distance to the Lungs; most frequently that irregular exspiration is stirr'd up, by reason some incongruous or in some measure unproportion'd thing is cast into the Lungs. For in the first place, that this troublesome thing may be removed, the nerves and the nervous fibres dispersed about the Lungs are irritated; afterwards by the consent of these, the muscles of the breast that draw it together, and the moving fibres of the Trachea at once are forced into vehement and often repeated contractions.

The kinds thereof.

Every Cough is either moist or dry; in the former a cetain humour being deposited in some place within the tracheal passages is shaked by coughing, and being to be thrown out upwards is cast into the mouth. That humour, whereas it is manifold and after divers sorts, for the most part it is either call'd serous, or nutritious, or purulent, or bloody.

Of the former there are many kinds and differences; namely, as to its consistence it is either thin, or thick, or crude, or digested; as to its colour, it is either white or yellow, or somewhat greenish; also sometimes it is blewish, or black. Moreover,

A moist Cough.

a moist Cough is variously distinguished, as to the places from whence the humour to be coughed out proceeds. For sometimes cleaving to the sides of the *Larynx*, or sweating from them, the moving fibres being shaken by a gentle little Cough, it is easily and by a short passage cast forth into the mouth; sometimes the matter to be excerned, being impacted a little deeper in the pipes of the *Bronchii*, is not shook out but by large exspirations, and often repeated; and lastly, it sometimes happens that the excrements to be cast out, are deposited within the fartheſt little bladders of the Trachea, out of which it is not brought forth without a vehement labour of coughing, and that frequently repeated, and at last driven forth by a long journey through the whole Lungs. Concerning the Cough of a nutritious humour, as also of a bloody and purulent, hereafter it shall be discoursed when we treat of a Consumption and its remedy.

A dry Cough.

A dry Cough, as often as it is the proper passion of the Lungs, is excited after many manners and by sundry causes; for an obstruction of any of the Pneumonic passages, whether it be by compression, or oppletion, or contraction, doth necessarily induce this. Wherefore an inflammation, a tumour, a little swelling, a stagnation of the blood either through plenty or scarcity, also gravelly, stony, or polypose Concretions, worms and many other preternatural things, inasmuch as they almost perpetually provoke the nervous fibres, do induce a dry, vain Cough, but very troublesome. But a dry Cough sometimes is stirr'd up by the instinct of Nature, as in place of a Pump; to wit, that the blood either by reason of its proper ill temperament, or by reason of the Pneumonic Vessels not being open enough, not passing well through the Lungs, may be promoted by the shaking of these parts, and forced into a more rapid motion.

What belongs unto the other acts of exspiration hurt, as when in sneezing, hiccough, laughing, crying, and in other affects its natural and even function is troubled or perverted; seeing the rendrings of the causes of these (which also in another place we have in part designed) do not properly appertain to our purpose, omitting them here we will pass to the thing chiefly designed, *viz.* to the diseases of the breast and their remedies, and to the reasons of curing them.

SECT.

SECT. I. CHAP. V.

Of a Phthiſis or Conſumption in general.

WHereas we have hitherto viewed the fabrick of the Lungs accurately delineated, and the motion thereof together with that of the whole Breaſt, and the ways and paſſages of the air, and of the blood, and of other humors through them; and have alſo obſerved their various impediments, their remora's, or diverſions, according to which its happens the act of the Pneumonic function is after a diverſe manner hurt or perverted in inſpiration and exſpiration: now in the next place we are to deſcend to the Pathology of this region ſo travelled over, and, which was our deſign from the beginning, to treat of Medicines belonging to the *Thorax*, or Remedies appropriated to heal the diſtempers of the Breaſt, and the manner of their operation.

A Phthiſis accounted chief among the diſeaſes of the breaſt.

Of all the diſeaſes of the Breaſt a Phthiſis, or Conſumption, by right claims the firſt place: for there is none more frequent or difficult to cure. Moreover all the other affects of the *Thorax* being ill, or not at all cured, do lead into this, as leſſer ſtreams into a greater Lake, and ſo ending in a Phthiſis, loſe both their natures and ancient names.

The various acceptation of Phthiſis.

But truly theſe terms of *Phthiſis* and *Tabes* in their proper ſignification denote an Atrophy, or a withering away of the ſolid parts with debility of ſtrength: the diſtempers of which ſort frequently proceed from a wound or Ulcer of the Lungs; notwithſtanding ſometimes without any fault of theſe, the extenuation or pining away of the whole body takes its riſe from the meer fault of the blood, or chiefly from the nervous juice. Therefore before we handle a private pulmonary Phthiſis, ſeems to our purpoſe to explain the general reaſons of this ſickneſs, and to declare how many ways, and from what cauſes the ill temperaments of the humors are wont to induce a privation of nouriſhment of the whole body, as it were conſumptive. For truly the Conſumption of the Lungs it ſelf doth not next and immediately proceed from an Ulcer or corruption of that bowel; but it ariſes for as much as the blood from them contracting a corruption, and highly defiled, for that very cauſe loſes altogether its nutritive virtue. Moreover as well this as the nervous liquor acquires ſuch an indiſpoſition. Of which in general we will now inquire.

It denotes any Atrophy.

An Atrophy firſt depends on the blood made unfit to nouriſh.

And firſt what relates to the Blood, we may often take notice, that ſome pine away without a Cough, or without any apparent fault either in the Lungs or Breaſt; in the mean time as to appetite, digeſtion, ſleep, and almoſt the œconomy of the whole natural and animal function do carry themſelves indifferent; notwithſtanding, as if nouriſhment ſhould be poured into a Receptable bored through, they are not nouriſhed, but pine away ſenſibly maugre all Dietetical Rules. The formal or conjunct reaſon of which kind of affect frequently conſiſts only in this, that the blood being notably depraved, cannot aſſimilate the nouriſhing juice continually mixt with it; wherefore it doth not only forthwith ſend it away, but alſo takes away ſome particles of the ſolid parts; which ſnatching to it ſelf, it preſently throws out, or caſts it into ſome place or other, or conſumes it by evaporation.

The depravations or degenerate ſtates of the blood, that are wont to induce an Atrophy, either conſiſt in its proper diſtemper, or themſelves are communicated from ſome other place, and indeed chiefly from the bowels, or from the nervous liquor being alſo degenerate.

The conſumptive Dyſcraſie of the blood either from it ſelf or communicated from other parts.

The proper Dyſcraſie of the blood it ſelf is twofold, according to which it happens, that the ſaline-acid particles or the ſulphureous and moſt ſharp are exalted above meaſure, and predominate over the reſt. For ſometimes the blood withdraws it ſelf from its genuine diſpoſition, *viz.* a ſweet and volatile into an acid, as is always found in ſcorbutical, melancholy, or cachectical perſons. Wherefore the nutritious juice being ever mingled with the bloody maſs, ſeeing it cannot for that reaſon be aſſimilated, and affixed to the ſolid parts, is releaſed again in a ſhort time; and is either forthwith ſent away by Urine, Sweat, or a Diarrhœa; or being pen'd up within the fleſh or cavities of the bowels, brings a Dropſie: of which ſort of diſtempers, being led forth into an evil ſtate, the ordinary effect is wont to be, that when ſome parts do ſwell very much, other parts are very much extenuated. Here it would be far from our purpoſe to deliver the true cauſe of the above-mentioned affects, and to put our ſickle not only into another mans harveſt, but alſo one far remote. 2. Moreover there is another ſtate of blood unfit for nouriſhment quite contrary to this, to wit, when being above meaſure hot and ſul-

1. The kinds of the former are reckoned up.

PHAR Part. II.

phureous, and from thence always violently burning out, it conſumes the nutritious juice by its effervescence and raging, and cauſes it too much to evaporate; ſo that the ſolid parts being defrauded of their proviſion pine away. The perſons obnoxious to this diſtemper have large veſſels, and much diſtended with blood, but their fleſh withered and hardned by heat. Though perſons ſo affected ſeldom pine away to death, yet they grow old ſooner, and end their life in a ſhorter ſpace.

This proceeds ſometimes from a fault of the bowels or ſolid parts;

2. The blood not only from its proper *indoles*, but alſo by reaſon of a Conſumption elſewhere, and chiefly communicated from the bowels and nervous juice, is often unfit to nouriſh. And firſt this frequently happens by fault of the bowels; for theſe being ill-affected, ſometimes do not duly digeſt the Chyme to be conveyed over to the blood; alſo oftentimes they pervert and defile it with their extraneous and heterogene ferments, inſomuch that the functions are fruſtrated in the faculties of breeding good blood and nouriſhment. Moreover ſometimes by reaſon of the Veſſels bringing the Chyle obſtructed within them, though much be eaten, yet little or leſs than due, is conveyed into the bloody maſs. Alſo in the bowels of concoction ſometimes Tumors, Impoſthumes, and Ulcers happen; from whoſe corruption the blood being infected in its paſſage, contaminates the reſt of the maſs, and renders it unapt to the work of nouriſhing. How often do we ſee from a Schirrus happening in the Spleen, Liver, Pancreas, or Meſentery, or by an Ulcer or cancrous Tumour of ſome Gut, as alſo of a Kidney, Womb, or Bladder, or otherwiſe malignant Sore, a deadly Atrophy to have ſucceeded without any notable fault of the Breaſt or Lungs? Yea Tumors, Impoſthumes, or cancrous and ſtrumous Ulcers happening in the outward parts, and eſpecially in the Back, do frequently end in a pernicious Conſumption. The reaſon whereof is plain, *viz.* in as much as in ſuch diſtempers both great plenty of the nutritious juice brought to the affected part through the Arteries, is either entirely beſtowed in the ſame place, or from thence is poured fourth abroad, inſomuch that all the other parts of the whole body are defrauded of their due proviſion; as alſo that the virulent or very incongruous matter there engendered and lodged is ſwallowed up again by the Veins, which defiles the blood by an impure black gore, and from thence renders it altogether unapt to diſcharge the faculty of nouriſhing.

Or from the nervous juice.

Neither only from the bowels and ſolid parts, but alſo from the nervous juice the ſtain (by which it becomes unfit to nouriſh) is frequently communicated to the blood. For when this liquor degenerates from its genuine temper, to wit, ſweet and volatil into an acid, preſently flowing out of the fibres and nervous parts, flowing back into the blood, it doth precipitate the liquor thereof, and compels it into fluxes, whereby all the nutritive matter is caſt forth, and one while poured forth by Urine or Sweat, another while by Vomit or Looſneſs. The reaſons of all theſe, and how they come to paſs we have explicated in a late Treatiſe.

The nervous juice ſometimes of it ſelf is chiefly the cauſe of an Atrophy.

But the nervous liquor, ſometimes by it ſelf, departing from its good temper, and being vitiated in its temperament, is a cauſe of want of nouriſhment, which alſo happens to be made in a twofold reſpect, or two manner of ways. For ſometimes that juice being very much vitiated and degenerate, proves as it were vappid and decayed; ſo that it doth not actuate enough the fibres as well nervous as carnous, and inlighten them with an animal ſpirit: wherefore as the motive virtue, ſo alſo the nutritive fails in the ſolid parts. From hence either the entire body, or certain members and parts thereof being for ſome while affected with a Palſie, at length they wither away: as we have at large declared the reaſon thereof in another place. 2. We have alſo obſerved, that many labouring with a ſlow Feavour (or as called by us a nervous) do preſently languiſh, and in a ſhort time become much emaciated. In either caſe the ſame reaſon ought to be aſſigned; for, as is ſhewed in another place, ſeeing the animal ſpirits, together with the nervous liquor, their vehicle (which is as it were the maſculine ſeed) do actuate the nutritive humour every where collected by the ſolid parts even as the feminine ſeed, and render it as it were pregnant with a nutritive faculty; for that cauſe if that nervous liquor becomes either depraved or vappid, the bulk of the ſolid parts pines away as if it were made barren.

Two chief kinds of Atrophies.

So much of theſe things touching an Atrophy, or waxing lean, and the formal reaſons thereof, the cauſes and various manners of its coming to paſs in general. Of this diſeaſe as there are many Kinds and differences, ſo two chiefly and more obſervably occur, where-

Tabes Dorſalis.

of either will deſerve a particular conſideration; *viz.* *Tabes* or *Phthiſis Dorſalis* comuonly ſo called, and a Conſumption of the Lungs. This latter, which properly belongs to this place, ſhall be diſcuſſed in the following Chapter; in the mean time concerning that (becauſe the knowledge thereof doth illuſtrate the Pathology of this (we ſhall ſpeak in a word.

Two kinds.

Tabes Dorſalis, although it hath almoſt loſt its name in this our Age, or perhaps changed it into a Gonorhœa, yet *Hippocrates* makes mention of it, and handling it avowedly,

avowedly, he aſſigned a twofold kind thereof, *viz.* one from immoderate Venery, and the other from a deſtillation into the Spine of the Back. What relates to the latter, I have often obſerved ſome to be moſt grievouſly vexed with a pain about their Loyns, yea ſometimes in the whole Back, which when for ſome time ſome have ſo laboured under, they afterwards come to be lame or crooked, and at laſt fall away in the whole body, all but the head. The cauſe of which diſeaſe doubtleſs conſiſts in this, *viz.* firſt a humour or a certain incongruous morbific matter, deſcending with the nervous juice through the ſpinal marrow, did run into the branches of the vertebral Nerves, and therefore from the beginning, by reaſon of the Fibres being twitched, a continual pain almoſt did ariſe; afterwards by reaſon of ſome Fibres being reſolved, the oppoſite ones more vehemently contracted diſtort certain Vertebra's of the Spine; and laſtly ſeeing the animal Spirits cannot actuate enough the Nerves and Fibres belonging to the trunk and members, by reaſon of the nouriſhment fruſtrated, the withering of the entire body ſucceeds. Surely when the nervous liquor and animal ſpirits paſs not fully and freely out of the Dorſal Spine into the whole body, from thence oftentimes a pining doth ariſe: hence Impoſthumes and Ulcers ariſe about the Loins or the *Oſſacrum*, which in as much as they conſume or pour fourth the nervous liquor too much, cauſe an Atrophy in the whole, or at leaſt in the lower parts.

PHAR. Part. II.

From the nervous juice ſtopt or depraved in the loyns.

2. Another kind of *Tabes Dorſalis* far more frequent, is alſo twofold: *viz.* it either ariſeth from the great or too-often loſs of the genital humor, or from a continual corrupt flux from the genital parts.

From the expenſe of the humour through the genital parts.

1. As to the firſt, it is manifeſt by vulgar obſervation, that the immoderate uſe of Venery, yea involuntary efflux of the ſeed, if it be either great or continual, produce a faintneſs in the whole body, and at length a pining away. The reaſon of this (as we have intimated in another place) is not, that the ſeed, according to the opinion of ſome, deſcends from the Brain through the Nerves into the ſpermatic bodies, and from thence, by reaſon of a great loſs thereof firſt the Brain, and then the parts, all depending on the influence of the Spirits ſpringing from thence, become infirm and pine away. But ſeeing we have ſufficiently evinced, that the ſeminal matter is immediately ſupplied out of the maſs of blood into the genital parts, and that it is altogether the ſame with that out of which the animal Spirits inſtilled into the Brain are procreated, it will neceſſarily follow by how much the greater portion is got to the Teſticles for repairing the loſs of ſeed, by ſo much is the Brain defrauded of its due ſhare, and therefore at length the function in the whole body, as well motive as nutritive, doth waver and diminiſh. Our furious Whoremongers are ſenſible of a great debility about their Loins, and the parts placed below them, to wit, the Thighs and Legs do chiefly wither away; the reaſon is, becauſe as well the proviſion of the animal Spirits in its firſt ſpring, *viz.* in the Brain failing, the outmoſt channels, *viz.* the ends of the ſpinal marrow, and the Nerves ſpringing from it, do ſuffer firſt and chiefly for this defect; and moreover becauſe near the Loins the Arterious blood gives out to the Teſticles more excellent particles and chiefly reſtaurative, being deſtined to nouriſh the Back, and in the mean time the venous blood being for that cauſe decayed or conſumed, is enfeebled, and ſteals from the Loins as much as poſſibly may be.

That humour is firſt either ſeed, a too great expence whereof induces an Atrophy.

The loſs of the ſeed cauſing a Conſumption is ſometimes voluntary, of which ſort the ſalacious and prone to Venery do ſuffer: ſometimes involuntary; of which affects there are divers kinds. For in ſome it only happens by dreams or obſcene phantaſms; but in others, beſides thoſe occaſions, every endeavour of the Back, whether through bearing a weight, or excretion of Urine, or the *feces* of the Belly, cauſes the genital humor to be thruſt out: the cauſe whereof is, both becauſe the ſeed is watry and thin, and at once ſharp and provocative, alſo becauſe the parts are weak, and not able duly to digeſt or retain it.

The loſſes whereof are voluntary or involuntary.

In the other *Tabes Dorſalis* above-mentioned, not the ſeed it ſelf, but an ichor or a certain putrilage is caſt out abundantly from the genital parts; the efflux whereof, if it be great and continual, doth frequently impair the ſtrength of the whole body, and by withdrawing and prodigally removing the nutritive matter, it induces an Atrophy or Conſumption. For near the ſpermatick Veſſels, or in paſſage from them, as well in men as women, there are certain Emunctories placed, whoſe faculty is to receive the ſuperfluous humour from the ſeed formed, and when it abounds to ſend it abroad through the genital parts. For this cauſe that thoſe paſſages in either Sex may be made ſlippery and moiſt (leſt they grow dry, and become leſs ſenſible) the Proſtates in men and the Glandules about the horns of the Womb in women are conſtituted: out of both which always in the act of coition, and ſometimes without, when the ſpermatic bodies abound with too much moiſture, a certain ſerous liquor ſweats out: and in women (whoſe bodies are more moiſt, and in whom Nature hath made theſe ways for their menſtrual

2. Or Ichor flowing into thoſe parts from ſolution of continuity.

The formal reaſon of a virulent Gonorrhea.

PHAR. Part. II.

menſtrual excretion) this doth oftner and more plentifully happen than to men. But if theſe Emunctories be affected with a great debility, or a certain virulency, ſo that they corrupt this liquor ſent, or do not retain it enough, it is not only ſent away inceſſantly, and flows out plentifully through the *Pudendum*, but alſo other ſuperfluous humours or recrements of the whole body flowing together to thoſe weak parts are thrown forth together. Alſo the nutritious Juice deſtined to the neighbouring parts flows thither, and preſently goes out together; ſo that at length by reaſon of the loſs of the nutritious Juice (which flowing to the ſame place is corrupted and continually ſent away) not only pains of the neighbouring parts, but of the whole body, and a pining doth ſucceed. Theſe things are commonly known in a Gonorrhœa, alſo in *fluore muliebri*, or thoſe affects from an impure bed, or immoderate Venery, or are cauſed by a blow, a bruiſe, violent exerciſe, or any other hurt inflicted upon the Loins. It is not proper to this place to deliver particularly the true rendring of the cauſe and curatory method of healing of this ſort of paſſions: we ſhall proceed to treat of a *Phthiſis* or *Tabes* properly ſo called, *viz.* which ariſes from the only or chief fault of the Lungs, which was the buſineſs of our deſign.

SECT. I. CHAP. VI.

Of a Phthiſis properly ſo called, or of a Conſumption ariſing by fault of the Lungs.

A Conſumption doth ſo frequently and uſually proceed from the Lungs being depraved, that ſome have termed it the peculiar Diſeaſe of this Bowel: and that it very often ſo comes to paſs, the reaſon is; becauſe (as we have ſhewed before) the pining of the body doth for the moſt part more immediately proceed from the blood depraved and unapt for nouriſhment, it is manifeſt, that as its perfection is acquired in the Lungs, ſo from theſe being ill-affected the ſame is moſt of all vitiated, and degenerates into a languiſhing and corruptible ſtate. For in the Lungs rather than in the Heart or Brain, the threads of life are ſpun, and there they are oftneſt defiled or broken.

The definition of a Phthiſis.

A Phthiſis is uſually defined to be A pining away of the whole body, taking its riſe from an Ulcer in the Lungs. But leſs true: becauſe I have opened the dead bodies of many that have died of this diſeaſe, in whom the Lungs were free from any Ulcer, yet they were ſet about with little ſwellings, or ſtones, or ſandy matter throughout the whole: for from thence the blood, becauſe it could neither be freely circulated in the *Præcordium*, nor animated enough by the nitrous air, and when in the mean time it is perpetually polluted by its proper dregs depoſited in the Lungs, is frequently vitiated and made incapable of nouriſhing thereby: wherefore a *Phthiſis* is better defined, *That it is a withering away of the whole body ariſing from an ill formation of the Lungs.*

The cauſe aſſigned by the Ancients.

The Ancients following *Hippocrates*, for the moſt part have aſſigned only two cauſes of this diſeaſe, *viz.* a *Catarrh*, and *the breaking of a Vein*, to which ſome have added an *Empyema*: and others exclude a Catarrh from this number: for what is vulgarly affirmed, that flegm falling from the Head into the Lungs, and abiding there putrifies, is moſt commonly the cauſe of a Phthiſis, or is often brought by it, we have formerly intimated to be altogether erroneous, and ſhall preſently ſhew it more clearly. In the mean time to ſhew what the matter is that generates a Conſumption as often as it ariſes without an Empyema or Hæmoptoe going before, it muſt be conſidered after how many manners and by what ways any thing diſagreeable or Heterogene can enter into the Lungs; which diligent ſearch being made, it will eaſily appear, that any thing that is an enemy to the Lungs creeps in and is admitted chiefly either by the *Trachea* or by the Pneumonic Arteries, yea and ſometimes haply by the Nerves, but nothing by the Veins or Lympheducts, whoſe function is only to carry back or away the blood or Lympha, and to leave there nothing at all.

What the conſumptive matter is.

By what ways it enters the Lungs.

As to the *Trachea*, it is manifeſt it is ordained for this end, that by its paſſages or pipes the air might be conveyed in or preſently carried back by a conſtant recourſe from whence it comes; moreover, whether any matter being hurtful or mortal to the *Præcordia* may be admitted the ſame way, ſhall be now our preſent diſquiſition. And that the Lungs frequently incur a pernicious pollution by this entrance is clear from

Sometimes by the Trachea, yet not deſtilling from the head.

hence

hence becauſe the moiſt air, of ſome regions, repleat with fumes, or abounding with malignant vapours, doth frequently induce the conſumptive inclination; nevertheleſs the affection thereof is wont to be communicated only by aerial minute particles (whereby either the temperament of the blood or the conformation of the Lungs or both are prejudiced.) But whether beſides this a ſerous matter or ſome humor corrupting the Lungs doth enter them through this paſſage, is not without reaſon doubted: though many do determine a Catarrh or a diſtillation of the Serum from the Brain into the Lungs by the paſſages of the *Trachea*, the principal cauſe of a Phthiſis. Which opinion being erroneouſly delivered by the Ancients, I admire any either of our modern Phyſicians or Philoſophers have admitted thereof; for it is manifeſt by anatomical obſervations, that nothing from the Brain by the *Glandula pituitaria* (which ſeems the only paſſage from thence) falls down into the Palate or Breaſt, but that the Serum there depoſited is conveyed by appropriate paſſages to the jugular Veins, and is remanded to the blood. Moreover it is manifeſt to ſight, that whatſoever relique of Serum is laid aſide in the Glandules of the Ears, Mouth, Noſe, or Face, is conveyed from them all by peculiar paſſages, inſomuch that no humor whatſoever deſtils from the Brain or the Palate into the Lungs.

But although matter exciting a Cough doth not deſtil from the Head by the *Trachea* into the Lungs, yet ſometimes falling down from the ſides of the *Trachea* into their Cavities, it produces that Diſeaſe commonly called a Catarrh. For the *Aſpera Arteria*, like the Arteries bringing blood, are endued with a nervous and muſculous Coat, and ſo do occaſionally enjoy ſenſe and motion, having alſo a glandulous Coat and full of little veſſels to ſuſtain the vital heat and nouriſhment. Theſe laſt Coats make thoſe interſpaces, and as it were cover the Cartilages. Moreover the ſuperfluous ſeroſities proceeding from the blood watering the *Trachea* are depoſited into this glandulous Coat, which for the moſt part preſently ſweating into the Cavities of the *Trachea*, ſerves chiefly to make them ſlippery and moiſt. But if the maſs of blood be poured out too much, and precipitated into ſeroſities (as it frequently happens, a cold being taken, or the ſwallowing down of acid things, and on many other occaſions) for this cauſe a great plenty of watry matter ſweats out of the Glandules of the *Trachea* and mouths of the little Arteries into its Cavities, which ſoon doth cauſe a moſt troubleſom Cough, and often much ſpittle (which afterwards comes to be conſumptive.)

But ſweating out of the ſides of the Trachea.

But ſurely this cauſe of Spittle and as it were a Catarrhal Cough very rarely comes alone, becauſe while the blood watering the *Trachea* having ſuffered ſolution, throws in its ſeroſities into the Glandules (whence preſently they ſweat into its Cavities) and alſo the remaining blood being in like ſort diſſolved, it inſinuates its *Serum* ſet apart within the Pneumonic Arteries, partly into the Tracheal hollowneſſes, and partly into the Lympheducts, by the overflowing whereof the Lungs are as it were overwhelmed and much incited, for the moſt part provok'd to Cough and continual ſpitting. A Cough and ſpitting of this kind as long as moderate, only throwing off the ſeroſities of the blood, rather are beneficial than prejudicial; becauſe the maſs of blood, and the very Lungs being throughly purged after this ſort, thoſe ſymptoms for the moſt part ſpontaneouſly abate, and from thence enſues a more perfect health. But if they be protracted a long time, the ſerous humour being on both ſides laid aſide into the tracheal paſſages, and from thence more plentifully daily heapt up, at length it will change into corruption; becauſe as well the free enjoyment of air is impeded, as alſo the motion of the blood, and its temperature wholly perverted; from hence a Cough becomes more fierce, and breathing more difficult; nay rather the whole maſs of blood in as much as it is defiled by the foul blood (which the Veins receive from the Lungs) degenerating by degrees from its benign properties, and being depraved, it not only continually pours forth the ſuperfluous Serum, but alſo the nutritive Juice (which it cannot aſſimilate) out of the Pneumonic Arteries into the tracheal paſſages; and ſo this maſs of conſumptive matter is daily increaſed, till the Lungs being more and more obſtructed and filled, and the blood being defiled, and rendred unfit to perform any of its functions, the Cough and Spittle become worſe and worſe, and preſently become dangerous; Moreover breathing being hurt, the faintneſs and pining away of the whole body, the debility of all the functions, and at length a hectick feaver, and a haſty declination to death follows.

The conſumptive matter brought into the Lungs rather by the pneumonic Arteries.

A Cough and ſpitting ſometimes healthful.

Yet often being too much is dangerous.

When by the long continuance of a Cough and Spitting, le: ſurely encreaſing, the humour is more plentifully depoſited out of the maſs of blood into the Lungs, it firſt of all enters into the tracheal little bladders, and at length fills them, and ſomewhat diſtends them, from which while every morning by expectoration thence more copiouſly performed, it is almoſt entirely caſt out from them, thence the *Thorax* is exempt for a ſhort ſpace from the burden, and reſpiration ſeems more free, yet a little afterwards

Why the Conſumptive matter affects, and by degrees hurts the lungs.

PHAR. Part. II.

afterwards the blood being ſtuff'd again with *Serum* or nutritive juice, it pours down new matter into the Lungs; and from thence again after meat or ſleep the little bladders are fill'd, and the humors by the afflux daily encreaſed, are more diſtended and enlarged, and at length the ſides of two or more of the little bladders, being burſt, many little bladders are here and there framed as it were into one lake, within which the conſumptive matter being more abundantly collected, there it putrifies (for it is not entirely preſently caſt out) and from thence it corrupts the ſubſtance of the Lungs, to which it is joined, and imparts a putrid defilement to the blood paſſing through it. This breach thus made in the Lungs is daily encreaſed, and frequently more are at the ſame time formed in divers places, and by reaſon of the great plenty of humours heaped up and putrified in them, a heavineſs of the breaſt is felt, like a weighty burden upon them, the breathing is more hindred; moreover from the tabid blood being more plentifully intermix'd with the maſs of blood, frequent effervescencies of it, deſtruction of the nutritive juice, alſo thirſt, heat, loſs of appetite, nightly ſweats, and a pining of the whole body do ariſe. But the blood being polluted from the Lungs, cauſes them to be puniſhed with a reciprocal affection, that is to ſay from its peculiar pollution; becauſe the blood in the veins receiving this purulent matter in every circuit, it immediately delivers it into the arterial; from whence, whereas it cannot be ſent enough away by ſweat, or by Urine, it is brought back by the Pneumonic arteries to the Lungs, where again being ſeparated from the blood, it is every where conveyed as well into the little bladders of the Trachea as into the leſſer paſſages; inſomuch, that at length the whole frame of the Lungs being filled, clefts or ulcers are formed conſequently in many places, and all the other hollowneſſes are ſtufft with frothy quitter.

How an Ulcer of the Lungs is made.

But ſometimes it happens that there is one Ulcer or hole, or happily two formed in the Lungs, and the ſides grow callous round about, ſo that the matter being there gathered together is not conveyed into the maſs of blood, but is daily expectorated though in a vaſt plenty. They that are ſo affected, as if they had but an iſſue in the Lungs, although they caſt up much Spittle, and thick and yellow matter every morning, and a little ſomtimes all day, yet otherwiſe they live well enough in health, they breath, eat and ſleep well, are well in fleſh, or at leaſt remain in an indifferent habit of body, and frequently arrive to old age: inſomuch that ſome are ſaid to have been conſumptive thirty or forty years, and to have prolonged the diſeaſe even unto the term of their life (for that cauſe not being ſhortened.) And in the mean time others who cough or ſpit leſs, within a few months fall into a hectick feaver, and in a ſhort while are hurried into their grave.

An ulcer of the lungs covered with a callous leſs prejudicial.

Hitherto touching the conjunct cauſe and formal reaſon of a Phthiſis or pulmonary Conſumption; what belongs to the other cauſes (that is to ſay, procatarctic and evident ones) they truly are various and manifold, inaſmuch namely as they are more near or more remote, inward or outward, and laſtly connatural or adventitious; That I may undertake to deſign the powers, operations, and modes of effecting of all theſe in producing a Phthiſis; primarily it is requiſite that I ſhew, by how many modes, and by reaſon of what occaſions the ſerous humour or (as folks commonly ſay) the Catarrhal, is laid apart out of the maſs of blood into the little Bladders of the Lungs, and into other Paſſages of the Trachea. Upon diligent ſearch of this it is obvious to any one to perceive the morbific cauſe conſiſts of two parts, and that the fault is in the ill temper of the blood ſending an offending matter to the *Thorax*, and alſo the weakneſs for ill tone of the Lungs eaſily receiving it.

The evident cauſes of a conſumption.

The primary cauſes of a Conſumption ſome from the blood, others in part from the lungs.

As to the former, it is manifeſt enough by common obſervation, that the maſs of blood being ſtuft with incongruous particles, *viz.* its proper ones degenerated, or with others from other places intermingled, doth boyl up for the expurging of them, and what is to be ſeparated, when it is not eaſily ſent away by any other ways, it is ſpread abroad into the Lungs, (if they are of a weaker conſtitution) and cleaves to them.

The ill temper of the blood diſpoſes to it.

There are many dyſcracies of the blood, and thoſe of divers kinds and affections, by which its liquor being diſſolv'd in its conſiſtence, and as it were curdled, doth not rightly contain the ſerous and nutritive juice within it ſelf; moreover ſending away theſe and other excrementitious humours unceſſantly from it ſelf, as ſometimes it depoſits them among other parts, ſo more often into the Lungs.

1. The blood ſometimes like Milk grown ſour of it ſelf, is depraved by little and little, and at length departing from its genuine faculty into a ſourneſs, and being diſſolv'd in its exiſtence, doth caſt abroad its ſeroſities (too eaſily prone to ſeparate themſelves) out of the Pneumonic and alſo Tracheal Arteries into the Tracheal paſſages. Thus to ſome it is ordinary once or twice in a year, without any manifeſt cauſe to be afflicted with a grievous and troubleſome Cough, with copious ſpitting, which

PHAR. Part. II.

which in a certain proceſs of time (after the blood purged from its dregs and excrements recovers its temperature) doth ſpontaneouſly abate, and after doth ſucceed a more firm and durable health. By reaſon of ſuch a Cough ſerving for a purge to the blood, I have known ſome often in a day, and eſpecially every morning, who were wont to ſpit out ſpittle like black Ink, with a ſmall endeavour of the Trachea; which diſtemper when for many months they had conſtantly labour'd under, after a greater Cough occaſionally contracted, with much and yellow ſpittle, they have afterwards eſcaped altogether free from that former black ſpittle; the reaſon whereof is, that a heavier Cough abiding with plentiful ſpitting for ſeveral days, altogether purges away thoſe melancholy fœculencies from the blood, and moreover it alters the temperament of the blood, or rather takes away the ill temperament thereof.

And ſometimes it receives a conſumptive taint from the nervous juice.

2. The nervous juice being frequently degenerated, and with an abundant lympha returning back out of the fibres and nervous parts into the blood, as it produces ill affects of the bowels, and of the reins (whereof in another place we have hinted) ſo ſometimes it cauſes a fierce and very troubleſome Cough. This kind of Cough one while is Catarrhal, inaſmuch as the Lympha having paſs'd through the maſs of blood, is depoſited in the Lungs by the Arteries; another while it is convulſive, inaſmuch as the Nerves and Fibres, conſtituted to move the breaſt, are poſſeſt by that liquor, and are provok'd into convulſive motions: from either cauſe either conjunct or ſeparately it comes to paſs, that more grievous paſſions of the brain and nervous kind frequently call on a troubleſome Cough, or are wholly changed into it.

And ſometimes by reaſon of a fault communicated from the Lympheducts.

3. Beſides the faults of the blood and nervous juice, frequently exciting a Cough, it is probable that it ſometimes ariſes from the Lympheducts being obſtructed, which belong unto the Lungs: for whereas very many Veſſels of this kind are ſpread abroad through the Lungs, whoſe function it is to receive whatſoever is ſuperfluous of the Lympha that is carryed through the Arteries into the *Præcordia*, and not immediately brought back by the veins, and to convey it to the trunk of the paſſage of the *Thorax*; if by chance it happens that theſe paſſages are ſtopt, or obſtructed by viſcous matter, or compreſs'd or thickned by cold ſhould not well diſcharge their duty, it muſt needs be that thoſe watery excrements ſhut out from their wonted ſluces, or whirling back into the blood, do incite its fierce boyling up, or being poured into the paſſages of the Trachea, do ſtir up a Cough.

The fourth reaſon is uſual evacuations ſuppreſſed.

4. Neither do the humors above-mentioned only, in as much as they either pervert or hinder the craſis or motion of the blood, induce a Cough (which frequently is the beginning of a Phthiſis;) but moreover any uſual or wonted Evacuations ſupreſſed, or let, do uſually impreſs a fault upon the Lungs. The menſtrous flux or the Hæmorrhoids obſtructed, often bleeding at the Noſe if by chance it ceaſes, Iſſues cloſed up, Puſtles, Scabs and Wheals driven back, do frequently affix a taint in the *Thorax*. If a plentiful ſpitting from the Glandules of the Mouth ſtops of its own accord, or be cured by Medicine, afterwards ſometimes a Conſumptive Cough ſucceeds; wherefore the ſame is vulgarly called a Rheum, which had lately fallen from the Head into the Jaws and Throat, and thence diſtilled deeper into the Lungs; when indeed it is nothing elſe but a certain ſuperfluous ſerofity of blood, that being uſed to be put aſide by the ephalic Arteries into the Glandules of the Mouth, now being excluded thence, is hurried through the Pneumonic Arteries into the Lungs.

By reaſon of tranſpiration hindred.

Beſides theſe private and periodical, or extraordinary evacuations, whoſe ſuppreſſions incline to a Cough and Phthiſis, there occurs another general and conſtant Evacuation *viz.* inſenſible tranſpiration; which being either ſtopt or ſuppreſſed, is oftner the occaſion or parent of that evil than all the reſt. For the ſteams that uſually evaporate by the Pores of the skin being reſtrained within, ferment the blood, and ſoon pervert it, and cauſe it to be precipated into ſeroſities; which with other excrements of the maſs of Blood being immediately laid aſide in the Lungs, do ſtir up a troubleſom Cough and often a Conſumptive one. Hence it is a common obſervation, that the catching of a cold, by which the Pores are ſtopt, whether it be by blowing of cold air, or being wet by rain, or leaving off cloaths, or by what other means it may come to paſs, diſpoſes very many to diſtempers of the *Thorax*. Wherefore in our Idiom the cauſe being put for the effect, a Cough is called *Catching of cold.*

Partly from the Lungs. From the breaſt ill formed. From the hereditary diſpoſition. From foregoing diſtempers of the breaſt.

Theſe are the chief cauſes and occaſions which occur from the blood any ways depraved, and therefore depoſiting a peccant matter into the Lungs. There follow other cauſes in regard of the Lung it ſelf, *viz.* thoſe which diſpoſe this Bowel more readily to a Cough or a Phthiſis, of which there are three ſorts. 1. An ill frame of the Breaſt. 2. And innate weakneſs of the Lungs, or hereditary diſpoſition to a Conſumption. 3. Preceding diſeaſes of the *Thorax*, as a Wound, a Blow, a Pleuriſie Peripneumony, Empyema, ſpitting of Blood, the ſmall Pox and Meaſles, *&c.* 4. The incongruity of

From incongruity of the air. of air which is inſpired (as deſerving a place among the procatarctic cauſes.) By reaſon of any one of theſe cauſes, and ſometimes of many together, the matter provoking a Cough, proving often after Conſumptive, doth eaſily aſſault the Lungs, and enters them, and frequently imprints a deadly hurt. On each of theſe we ſhall inſiſt a little.

The reaſon of the former expoſed. Firſt therefore as to the frame of the Breaſt the caſe ſtands thus; *viz.* that the Lungs being ſtill whole and ſound, and free from any Phthiſical impreſſion, may be kept for a long time in their office, it will behove that they ſtill be exerciſed with a motion that is vigorous, and with ſtretched out ſails as it were to diſcharge the ſtrong interchanges of the Syſtole and Diaſtole; to that end, that the air being plentifully ſuckt in, may be admitted to their inmoſt appartments, and from thence immediately be caſt back for the moſt part together with all the effluvia and ſooty vapors at every change of breath. Wherefore ſince the action of the Lungs doth depend much on the frame of the *Thorax*, as being the moving Engine, it muſt needs be, that by reaſon of its ill faſhioning, the function of breathing becomes defective in many things. There are two ſpecial kinds of a Breaſt ill framed, (*viz.* crookedneſs, and ſhoulders like wings) for which reaſon many are found prone to a Phthiſis: the reaſon of which is, that in any ſuch figure of the breaſt, being either depreſſed or made long, the Lungs do neither injoy a ſpace ſo free and ample, nor can the moving Muſcles be ſo ſtrongly contracted as in a ſquare breaſt.

What an hereditary diſpoſition is. 2. The innate debility or hereditary diſpoſition of the Lungs to a Conſumption is ſo frequent and vulgarly known, that when any is found inclining to a Conſumption, he is preſently queſtioned, whether his parents were not obnoxious to this Diſtemper? Very many of theſe being endued with a narrow breaſt and a neck ſomewhat long, and of a conſtitution very tender, contract a Cough from the leaſt occaſion; neither can they endure a cold or moiſt air. To ſome of theſe a Manſion in a City is very prejudicial, where the air is breathed in thick and ſmoaky; on the contrary, to others prone unto the ſame diſpoſition it is very friendly (the reaſon whereof we ſhall diligently inquire hereafter.) To all of them a North-wind is for the moſt part an enemy, conſidering that it uſually irritates a Cough, alſo Spitting of blood, a Pleuriſie, or Peripneumony, *viz.* The Pneumonic or the Thoracical Veſſels being thereby ſtufft, and in the mean time the blood being rendred more turgid and ſharp, by reaſon of tranſpiration hindred, and effluvia's reſtrained within the maſs thereof.

In what it conſiſts. For an Hereditary diſpoſition to a Phthiſis doth chiefly conſiſt in theſe two things, *viz.* 1. In regard the Patients being endued with a more ſharp and elaſtick blood, do require a more plentiful tranſpiration; which perhaps if it be leſs granted, the matter that was wont to evaporate redounds upon the infirm Lungs. 2. If the Pneumonic Veſſels be too looſe and tender, they do not duly contain the Serum and other recrements of blood within the diſſolved maſs thereof, but they ſometimes ſuffer both them and a certain portion of the blood it ſelf to break out into the Tracheal paſſages: whoſe moving Fibres, when they are infirm, do not preſently turn forth what is poured out into the cavities; but they ſuffer it to abide and putrifie in the ſame place, and at length to degenerate into black filthy gore corruptive both of the Lungs and blood.

What the conſumptive diſeaſes of the breaſt are. 3. A Phthiſis is ſometimes the product or conſequent of ſome other previous diſtempers of the Breaſt. Thoſe conſumptive paſſions chiefly are Empyema's, Pleuriſies, a Peripneumony and Impoſtume of the Lungs; and ſometimes the ſmall Pox, Meaſles: alſo irregular Feavers ill or ſlightly judged, do cauſe the ſame effect. The chief of theſe diſtempers, or at leaſt thoſe which are proper to the *Thorax*, together with the rendring the reaſon of the cauſes, and how they diſpoſe to a Conſumption, ſhall be declared hereafter, with the reaſons and manner of procedure; in the mean time we are to take notice, that this kind of fault is common to them all, that is to ſay, they diſſolve the unity and weaken the tone of the Lungs, and pervert the temperature of the blood; whence whatſoever incongruous or diſtempered thing is poured out upon them from its depraved maſs, they do eaſily admit thereof, and difficultly or not at all drive it back.

The influence of the air for exciting a Conſumption. 4. The procatarctic cauſes of a Phthiſis being now explained, *viz.* thoſe which conſiſt as well from the blood as the Lungs, there is another common to them both, which may be juſtly added, and (although altogether extrinſic) hath great affinity with them both, *viz.* the condition or temper of the air breathed in. For ſuch is the influence hereof to ſome Conſumptive Perſons, that the cauſe of the diſeaſe is ſometimes wholly aſcribed to the incongruity of the air wherein they dwell, and for a cure the alteration of air or ſoil is preferred to all other remedies whatſoever. Hence many of our Country troubled with a Cough, or being in a Conſumption, flock to the Southern parts of *France*; and others in the mean time who cannot go beyond Sea; or will not, preſently haſten to remove out of the City-ſmoke into the Country as to a moſt undoubted refuge

fuge: wherefore all our Villages near *London*, which injoy a clear and open air, are eſteemed as ſo many Spittles for Conſumptive Perſons. Notwithſtanding all do not alike receive help from ſuch a change of places; for many either paſſing to *France* or to Country Villages, do in thoſe places rather find their graves than Health. And therefore *London* is not preſently to be forſaken by all phthiſical Perſons: for I have known many obnoxious to a Cough or Conſumption to have enjoyed their health much better in this ſmoaky air than in the Country. So that for Cure of the ſame Diſeaſe, while ſome avoid this City as Hell, others flye to it as to an *Aſylum*.

The groſſer and City-air to ſome Conſumptive perſons healthful, to others hurtful.

The reaſons of theſe things do clearly appear out of the Doctrine of Breathing before handled; for we do demonſtrate the blood paſſing through the Lungs, both as to its kindling or vitality, and as to its motion doth chiefly depend on nitrous air ſuckt in; whence it is a conſequence, that the tenor of this ought to be ſo proportioned to the temperament of that, that the blood being moderately kindled within the *Præcordia*, may burn out clearly and vigorouſly, as well without ſmoak and ſootineſs as without too intenſe a flame, and that it may paſs the Pneumonick Veſſels freely, and without any hindrance of leaving off recrements. Wherefore a moiſt, fenny, and cloſe air, as it is healthful to none, ſo to them that Cough it is eſpecially hurtful; on the contrary, a ſerene and mild air, moderately injoying the Sun and wind, as it is healthful to all perſons, ſo it is friendly to all Conſumptive Perſons. As to other conditions of the air, ſome eſcape a Cough, or looſe it living in mountainous places expoſed to the Sun, where the impendent Atmoſphere being free from all thick, ſmoaky, and feculent vapours whatſoever, abounds with nitrious particles: for thoſe whoſe thick and feculent blood abounds with an impure Sulphur, to kindle this duly and to waſte the dreggineſs, there is need of a very thin and nitrous air. If the Lungs be not too tender, but firm and ſtrong, they endure the more fierce aſſaults of its Particles; on the other ſide, they who have a thin and ſubtile blood, eaſily diſſolvable and endued with a more pure but very little Sulphur, and having tender and ſoft Lungs, very ſenſible, and of a fine texture; theſe perſons being impatient of a nitrous and ſharper air, are moſt at eaſe and beſt in a thick and more ſulphureous one. Wherefore it conduces to theſe perſons, that they breath the groſs and more fat air of a ſmoaky City; which to an impoveriſhed and more thin blood, doth afford Sulphur (which fails ſometimes) and alſo Nitre, and doth ſomething thicken and fix its ſubtile conſiſtence; moreover it dulls the ſubſtance or texture of a Lung too much ſenſible and more thin, and is a defence againſt the invaſions of a more ſharp and improportionate Air. It is manifeſt by frequent experience, that a thicker Air, provided it be ſulphuerous, proves very benign to ſome Phthiſical perſons (that I do not ſay to all.) It is a common obſervation, that a Conſumption ſeldom infeſts thoſe Regions either in *England* or *Holland*, where fires are nouriſhed by turff, and do breath a very ſulphureous odour, yea rather thoſe places are chiefly wholeſom and frequently ſanative to Perſons obnoxious to a Phthiſis or labouring under it. To which we may add, that a ſuffumigation of Sulphur and Arſenic (which is filled with much Sulphur) is reputed for the curing of almoſt incurable Ulcers of the Lungs, although the laſt, yet the moſt efficacious remedy. Moreover add to this, that pectoral Medicines prepared of Sulphur are far to be preferred to any other; ſo that Sulphur is juſtly reported by Chymiſts to be the Balſam of the Lungs. By what order, and by what means theſe Medicines do work, and ſo notably help in Diſeaſes of the *Thorax*, we ſhall hereafter make diligent ſearch into: in the mean time that Sulphureous Air is found helpful to ſeveral Phthiſical Perſons, the reaſon conſiſts in theſe two things; *viz.* in the firſt place, as we now intimated, from ſuch an Air ſuckt in there is help brought to the jejune and depauperated blood and to the tender Lungs. Secondly, that the ſulphureous Particles being ſuckt in with the nitrous, do provide againſt, or take away the acidities of any of the humors (by which their flowings and extravaſations into the Lungs do chiefly ariſe.) And for this reaſon it is that ſulphureous Medicines, being alſo taken inwardly, do confer ſo excellent a help to them that cough or are phthiſical: and therefore Sulphur, as I now hinted, hath the report of being the Balſam of the Lungs. For as Balſamic things applied to an Ulcer or Wound extinguiſh the acidity of the Ichor there ſweating out and corrupting and paining the little Fibres, ſoon eaſe the pain, and afterwards heal the wound; ſo alſo the ſulphureous Particles, paſſed into the Lungs either with the air or with the blood, in as much as they provide againſt or aboliſh the acidities of all humors, *i. e.* the blood, the Serum, the Lympha, the nervous or nutritive Juice, they conduce to the prevention or cure of a Conſumption. We ſhall in what follows more at large declare the cauſe, when ſulphureous Medicines ſhall be particularly treated of.

The reaſon whereof is inquired.

A ſulphureous air healthful to ſome Conſumptives.

Sulphureous Medicines chiefly agreeing.

The reaſon thereof diſcourſed.

The conjunct and procatarctic cauſes of a Phthiſis being thus handled, it will not be neceſſary to diſcourſe much touching the evident cauſes. For in what manner a cloſing

of the Pores by cold, a ſurfeit or tipling, and other errours of ſeveral ſorts, in the ſix non-naturals, diſpoſe to thoſe diſtempers, and ſometimes preſently do bring them, is ſo clear, that it needs no explaining. Neither is there any reaſon we ſhould be long delayed about the Semiotical part of this Diſeaſe; nevertheleſs it is fit we obſerve the divers ſtates or diſtinctive ſigns which certainly belong unto it. 1. When it is meerly a Cough. 2. When it begins to degenerate into a Phthiſis. 3. When it is a perfect and almoſt deſperate Phthiſis. From which things duly deſigned, the Prognoſtic of the above-mentioned affections will be very apparent.

The three times or diſtinct ſtates of a Cough.

when new, there is no ſuſpicion of a Conſumption.

1. And in the firſt place what belongs to a new Cough, and as yet alone, this taking its riſe from any cauſe whatſoever in bodies prediſpoſed to a Phthiſis, will ſcarce ever be free from the ſuſpicion of danger; but in a ſtrong man, and one who hath often before endured a Cough Scot-free, it will not be immediately to be feared: for when being ſtirred up from a more forcible evident cauſe, without Feaver or indiſpoſition of the whole body, it ſhall not be very troubleſom, then it meerly paſſes for a cold being taken, and is altogether neglected, or in a ſhort time is wont to be finiſhed without many or very conſiderable Remedies. Moreover if a ſmall Feaver with thirſt and want of appetite accompany this, there is hope that the blood being reſtored to its due temperament, the Cough then will ceaſe of its own accord: but if it be protracted longer, and not eaſily yield to vulgar Remedies, and produces much ſpitting, and that diſcoloured, it muſt not be any longer neglected, but be provided againſt by a method of healing, and by fit remedies and an exact courſe of diet. For then it may well be ſuſpected, that the Lungs being prejudiced in their ſtructure, do not circulate the blood entirely, but let fall the Serum and Lympha, and frequently the nutritive Juice; and moreover thoſe humors ſo laid aſide do putrifie; and from thence the blood is defiled, which by a reciprocal hurt prejudices again the Lungs.

When it begins to induce a Conſumption.

2. But if to a Cough growing daily worſe and worſe with plentiful and thick ſpittle, a languiſhing, and pining of the whole body, loſs of appetite, difficult breathing, thirſt, and fervent heat of the blood be added, there is great cauſe of ſuſpicion that it is come at leaſt to the firſt limits of a Phthiſis (if not further.) Wherefore it will behove us to uſe all means, whereby the Lungs may be freed from the great quantity of matter heaped up together, and be defended from its continual aſſault or invaſion; and alſo that the maſs of blood being cleanſed from all dregs, and reſtored to its due temperament whereby it may rightly contain its ſeroſities and other humors within it ſelf, or transfer them to ſome other place than the Lungs.

When it becomes a confirmed Conſumption.

3 But if, beyond the ſtate of this diſtemper now deſcribed, plenty of ſpittle, and that diſcoloured, ſhall be daily increaſed, and all other things growing worſe and worſe, a dejection of the whole ſtrength, and a Hectic Feaver with a continual thirſt, night Sweats, an Hippocratical face, an utter decay of the fleſh almoſt to the drineſs of a Skeleton, happen upon all theſe, then for the moſt part no place is left for Medicine, but only a dreadful prognoſtic; at leaſt all hope of Cure being waved, we muſt inſiſt upon Anodynes, whereby an eaſie death may be procured.

The curing method, and firſt againſt a beginning Cough.

What therefore belongs to the Cure of a Cough in general, according to the three above-mentioned ſtates of this Diſeaſe, a threefold method of healing ought to be appointed, *viz.* that bounds as it were being ſet, we may more diſtinctly preſcribe what is to be done for the cure of a Cough, whilſt being on this ſide of the limits a Phthiſis, it paſſes only for a cold catched. 2. What manner of healing to a beginning Phthiſis. 3. What to a Phthiſis conſummated, or deſperate.

1. Although againſt a new Cough for the moſt part there are uſed only Remedies Emphirical, and ſcarce any of the common People but are furniſhed with many and divers of this ſort, which every where without the advice of a Phyſician very many confidently take, and without method, and give them to others: yet men of a delicate conſtitution, or inclining to a Conſumption Hereditarily, or ſometimes formerly in hazard from a Cough, ought immediately to provide againſt the firſt aſſaults thereof, and readily betake themſelves to the Precepts of Phyſick; according to which, that the method of healing may be duly inſtituted, the curatory indications ſhall be chiefly theſe three *viz.* 1. to appeaſe or take off the diſorder of the blood, from whence the fluxes of the Serum do proceed. 2. To derive the excrements of the blood and all *exuviæ*, apt to ſeparate from it, from the Lungs to the Pores of the ſkin, or to the urinary paſſages, and into the other Emunctories. 3. To ſtrengthen the Lungs themſelves againſt the reception of the Serum and other humors, and alſo to defend them againſt the invaſion of outward cold, whereby they are wont to receive further hurt. Upon each of theſe we ſhall treat a little more plainly.

Three indications.

The firſt reſpects the effervescence of the blood.

1. The firſt indication reſpects as well the boiling up of the blood, wherein by reaſon

ſon of the effluvia's reſtrained, it grows too fervently hot, and boils in the veſſels; as its diſſolution, whereby being ſolved in its conſiſtence, it lets go too much Serum and other humors from its embraces. For the taking away of both, a thin diet muſt be appointed, and, the injury from outward cold carefully declined, a little more ſweating ought to be procured, or at leaſt the accuſtomed reſtored. To this end let the Patient put on thick garments, and let him keep his Bed or Chamber, at leaſt let him hardly go out of this houſe, evening and morning let a ſmall breathing Sweat be provoked by Poſſet-drink boiled with Roſemary or Sage. If notwithſtanding all this the Cough increaſes, Phlebotomy, if the ſtrength and conſtitution will bear it, is often uſed with ſucceſs: after which Hypnoticks for the moſt part help, in as much as they retard the motion of the heart, and conſequently the too precipitate courſe of blood: moreover they cauſe it to circulate in the Pneumonic Veſſels gently and mildly without any great throwing out its ſeroſities, and to ſend away what is ſuperfluous either by Sweat or Urine. To this purpoſe pectoral Decoctions are alſo too be adminiſtred, in as much as they deſtroy the acidity of humors, and hinder the diſſolution of the blood, and its melting into ſeroſities. By the like reaſon and manner, Medicines prepared of Sulphur do ſo ſignally help againſt a Cough.

The ſecond reſpects the derivation of the Serum and other excrements from the Lungs.

The ſecond indication, *viz.* that the Serum and other recrements of the blood, derived from the Lungs, may be evacuated by other ways, is performed by Diaphoretics, Diuretics, and mild Purgers; which ought to be mixed with other Remedies, or now and then uſed alone. Wherefore after Phlebotomy we uſe to preſcribe a gentle Purge, and ſometimes to repeat it. Among the Ingredients of the Pectoral Decoction let the Root of Chervile, Butchers-broom, Elicampane, and other things that provoke Sweat and Urine be put. Hog-lice, volatile Salt of Amber, and other fixed Salts and Powders of Shells made into Pills with Turpentine are often given with ſucceſs.

The third intends the ſuppreſſing the Catarrh and ſtrengthning the Lungs.

The third indication, that the Lungs and their paſſages might be defended againſt the flowing of humors, the encountring of cold, and the ſuppreſſion of the Catarrh, as they commonly call it, is performed by Linctus's, Lohochs, and other private Remedies, and chiefly reſpects two things; *viz.* that the mouths of the Veſſels and Glandules opening into the *Trachea* be ſhut with moderate Aſtringents, leſt they ſhould too much caſt out the ſeroſities into it: and ſecondly, that the ſides of the Tracheal paſſages may be made ſmooth and glib, that neither from the pouring out of the ſharp Serum, nor invaſion of any outward cold they may be offended, and continually provoked into a troubleſome Cough; and moreover when thoſe paſſages are made ſlippery enough, the ſpittle ſometimes obſtinately cleaving to their ſides, might be the more eaſily coughed out. For the firſt intention it is, that Conſerve of red Roſes, Olibanum, Maſtich, Lohoch of Pine-tree, Syrup of Jujubes, of dried Roſes, of Cup-moſs, and other Aſtringents are often put into the forms of Pectoral Preſcriptions. For the ſecond intention Liquoriſh, with the divers preparations thereof, is reputed a famous Remedy againſt any Cough: for this purpoſe Syrups and Lohochs, and all other ſweet Pectorals ſeem to be ordained. To which is added Oyl of ſweet Almonds, either adminiſtred by it ſelf, or brought with Pectoral Syrups after a long ſtirring of them together into a milk-form liquor.

Forms of Medicines which are moſt in uſe.

Theſe are the chief Therapeutic indications, together with the apt intentions of healing, which ſeem chiefly to be of uſe for a new Cough, while as yet we have no ſuſpicion of a Phthiſis, or at leaſt that it ſubſiſts without the manifeſt limits thereof; it now remains, after this general method briefly ſhadowed out, that we ſubjoin certain choice forms of Medicines appropriated to every intention. Theſe though they are manifold and of divers preparations, yet thoſe which are of chiefeſt note and moſt in uſe, are Mixtures, Linctus's, Lohochs, Tinctures, Balſams, Troches, Lozenges, Powders, Pills, Decoctions, and diſtilled Waters. Of each of theſe we ſhall ſet down ſome choice Receipts.

1. Mixtures.

Take of Syrup de Meconio, of Jujubes, of each an ounce and half; of powder of Olibanum a dram, the water of Earth-worms, or of aq. Hyſterica, or Peony compound a dram, mingle them. The doſe is one ſpoonful at bed-time and after midnight.

Take of the water of Snails, of Earth-worms, of each an ounce and half; of the liquid Laudanum Tartarizated two drams, Syrup of Violets an ounce. The doſe is one ſpoonful at bed-time.

Take of Snail-water ℥vj, *Syrup of the juice of ground-Ivy,* ℥iij. *Flower of Brimſtone* ʒſ. *mix them. The doſe is one ſpoonful at bed-time, and ſoon in the morning.*

Take of our Syrup of Sulphur 4 *ounces, Water of Earth-worms* 1 *ounce. Doſe* 1 *ſpoonful after the ſame manner.*

PHAR. Part. II.

2. Linctus's.

Take of Syrup of Jujubes, Maiden-hair of each one ℥ and half, Syrup of red Poppys 1 ounce, mix them, to be lick'd with a Liquoriſh Stick.

Take Oyl of Sweet-Almonds freſh drawn, Syrup of Maidenhair, of each 1 ounce and half, white Sugar-candy 2 drachms, mix them by beating in a Glaſs-morter, or ſhaking them in a Glaſs Vial till it wax white.

3. Lohochs.

Take Conſerve of Red Roſes 2 ounces and half, Lohoch Sanum 1 ounce and half, Spec. Diatragacanth. frig. 1 dram and half, flowers of Brimſtone half a dram, Syrup of Violets or red Poppyes as much as ſufficeth, let it be made a ſoft Lohoch. Doſe 1 dram and half at night and early in the morning; at other times to be licked with a Liquoriſh ſtick.

Take of the powder of the leaves of Hedg-muſtard, or Rockets, 1 ounce and half, clarified Honey 4 ounces, mix them for a Lohoch, let it be adminiſtred after the ſame manner. It agrees with cold Conſtitutions.

4. Tinctures.

Take of Tincture of Sulphur, without empyreuma 3 drams, Doſe from 6 drops to ten in the evening, and early in the morning in 1 ſpoonful of Syrup of Violets, or of the juice of ground-Ivy; I ſcarce know a more excellent remedy for any Cough, provided there be no feaver.

Take of Tincture of the Sulphur of Antimony 2 drams, Doſe 20 drops evening and morning in one ſpoonful of the pectoral Syrup.

Take the Tincture of Gum Ammoniack (prepar'd with the Tincture of Salt of Tartar) 1 ounce, Doſe from 15 drops to 20. After the ſame manner the Tinctures of Galbanum, Aſſa fœtida, Gum of Ivie (prepar'd after the ſame manner) are proper for a Cough in any cold Conſtitution.

5. Balſams

Take of Opobalſamum 2 drams, Doſe from 6 drops to ten in a ſpoonful or two of Hyſſop, or Penny-royal, or any other Pectoral water.

Take of the Balſam artificially diſtill'd, commonly call'd the Mater Balſami, *two drams, Doſe from 6 drops to ten in one ſpoonful of Syrup of Violets or Canary Wine evening and morning.*

Take Balſam of Sulphur two drams, the doſe from five drops to ten after the ſame manner.

Take of Balſam of Peru *one dram, Doſe from two drops to 4 or 6 in Conſerve of Violets.*

6. Troches.

Take of the Species of Diatragacanth. frigid. ℥ſ8. Liquoriſh ʒ j. flower of Sulphur ℈ij. flower of Benzoin ℈j. Sugar Penids ℥iij. make a Paſte with the diſſolution of Gum Tragacanth in Hyſſop-water, form it into troches of the weight of ʒſ8. Take one often in the day or in the night.

Take of the ſeeds of white Poppies ʒ vj. of the powder of the flowers of red Poppies ʒ j. extract of Liquoriſh ʒ ij. milk of Sulphur ʒſ8. Sugar Penids ʒ ij. with mucilage of Quince-ſeeds make a Paſte, and form it into troches.

Take of the Species Diaireos, *of the lungs of a Fox, of each ʒſ8. Sugar Penids ʒij. with the diſſolution of Gum Tragacanth, make them into Troches.*

Take of powder of Elicampane, Anniſeeds, Liquoriſh, of each ʒij. flower of Brimſtone ʒj. of Tablet Sugar ʒiſ8. juice of Liquoriſh diſſolv'd, as much as will ſuffice, make Troches.

7. Lozenges.

Take of the Species Diatragacanth. frigid. ʒiij. powder of the flowers of red Poppies, milk of Sulphur, of each ʒſ8. of Sugar diſſolv'd in Poppy-water, and boyl'd to make Tablets, ℥iiij. form lozenges of ʒſ8. weight.

Take of Species Diaireos, *of the Lung of a Fox, of each ʒiij. flower of Brimſtone, powder of Elicampane of each ʒſ8. of the whiteſt Benzoin ʒj. make them in a fine powder,*

der, adding of Oyl of Anniſeeds ℈j. *Sugar'd diſſolved, and boyled to a height to make lozenges* ℥viij. *for lozenges of* ʒſ. *weight.*

8. Powders.

Theſe though more ſeldom, yet are ſometimes given with ſucceſs in a Cough, and Pneumonic diſtempers.

Take of the tops of Ground-Ivy ſomewhat reddiſh, a ſufficient quantity, bruiſed let them be form'd into a Cake, which dryed preſently in the hot Sun, reduce into fine powder, and keep it in a glaſs. This plant keeps its virtue with ſmell and taſte longer than any either Conſerves or Syrups, and greatly profits in a grievous and pertinacious cough. Take from ʒſ. *to a dram, in diſtill'd water, or pectoral decoction twice in a day.*

After the ſame manner Powders of other pectoral Plants are prepared, and taken with benefit.

Take of Cup-moſs or chin-cups ʒiij. *milk of Sulphur* ʒj. *Sugar-candy* ʒſ. *make a powder; the doſe from* ℈j. *to* ʒſ. *twice in a day. This powder is given with great benefit to thoſe labouring with a chin-cough.*

Take of the flour of Brimſtone, Olibanum, *Ceruſe of antimony, of each* ʒij. *divide it into* xii. *parts, take one part in the morning, and another in the evening in a ſpoonful of a convenient vehicle.*

9. Pills.

Take of Aloes roſata, *or rather of* Ruffus's *his Pill, flower of Brimſtone of each one dram and half, flowers of Benzoin* ℈j. *Juice of Liquoriſh diſſolv'd in as much Snail-water as will ſuffice to make a maſs, form it into ſmall Pills to be taken* 4 *at night to be repeated every or every other night.*

Take of powder of Elecampane, Liquoriſh, flower of Brimſtone, of each one dram, flowers of Benzoin half a dram, Tarr as much as is ſufficient, form it into ſmall pills, the doſe 3 *or* 4, *evening or ſoon in the morning.*

Take of Millepedes or Hogs-lice prepared ʒij. *The powder of the ſeeds of Nettles, Burdock of each half a dram, Oyl of Nutmegs diſtilled* ℈j. *Salt of Amber half a dram, Juice of Liquoriſh what will ſuffice, form it into ſmall Pills, take three in the morning and in the evening.*

10. *Decoctions.*

Theſe are taken either by themſelves, or with the addition of Milk. Among thoſe which are of the firſt kind, 1. The Pectoral Decoction according to the *London Diſpenſatory*, offers it ſelf. Which is taken twice a day from ℥iiij. to vj. or ℥viij.

Take of the leaves of Ground-Ivy, white Maiden-hair, Harts-tongue, Coltsfoot, Agrimony, of each one handful, Roots of Chervil, Knee-holm, of each one ounce, Carthamus and ſweet Fennel ſeeds, of each half an ounce, boyl them in 6 *pints of Spring-water to the conſumption of half, adding towards the end Liquoriſh three drams, Raiſins ſtoned two ounces, Jujubes,* nº vi. *or clarified Honey three ounces, make an Apozeme, clarifying it with the white of an Egge; Doſe* 6 *ounces warm,* 2 *or* 3 *times in a day.*

Decoctions taken with Milk, are uſed morning and evening inſtead of Breakfaſt and Supper, according to the manner following.

Take the flowers of greater Daiſies one handful, three cleanſed Snails, half an ounce of candied Eringo roots, Barly 3 *drams, boyl them in a pint and half of water to a pint. Take* 6 *or* 8 *ounces warm, adding a little milk; and afterwards the quantity encreaſed by little and little.*

After the ſame manner, Cup-moſs, Ground-Ivy, St. *John*'s-wort, and other pectoral herbs are boyl'd and taken with Milk.

The Decoction of Woods often does conduce much to the cure of a ſtubborn Cough, eſpecially if appointed in the place of Beer, for ordinary drink, and taken for ſome time.

Take

PHAR. Part. II.

Take of the roots of Sarſaparilla 4 ounces, China two ounces, white and red Sanders of each half an ounce, ſhavings of Ivory and Harts-horn of each 3 drams, let them be infuſed, and boyled from 8 pints of Conduit-water to 4, adding Liquoriſh 6 drams, Raiſins ſtoned an ounce and half; in a phlegmatick or colder conſtitution, add of ſhavings of Lignum vitæ.

II. *Diſtilled Waters.*

Every one may compound manifold and divers forms of theſe as occaſion requires, and appoint according to the conſtitution of the Patient, ſometimes ſimple Milk, ſometimes Milk with ſome part of Wine, ſometimes Ale, or *Brunſwick* Mum. For a Sample we will preſcribe the form of theſe.

Take of the leaves of ground-Ivy, Hyſſop, Penny-royal, of each four handfuls, of Snails half-boyl'd in their ſhells two pounds, Nutmegs ſliced n°. vj. *Upon all being cut ſmall pour eight pints of freſh milk, let it be diſtilled in the common Organs,* i. e. *a Pewter-Still.*

The doſe 3 ounces twice or thrice in a day by it ſelf or with ſome other Medicine.

Every doſe let it be ſweetned when it is taken with Sugar-candy, or with the ſyrup of the juice of Ground-Ivy.

In a conſtitution leſs hot, eſpecially if there be no fervent heat of the blood or *Præcordium*, to ſix or ſeven pints of Milk, add one pint or two of Canary wine; and in a phlegmatic or old body, inſtead of Milk let the *Menſtruum* be Ale or *Brunſwick* Beer, *i. e.* Mum.

Moreover, in Winter-ſeaſon when Snails cannot eaſily or ſcarcely be procured at all, there may be ſubſtituted in their ſtead Lambs or Sheeps Lungs, alſo ſometimes Calves, being half-boyl'd and cut ſmall, with the forementioned ingredients, and a fit *Menſtruum* being added, let them be diſtilled in common Organs, or Roſe-ſtills.

The convulſive Cough of Children call'd the Chin-cough.

To this form, treating of a Cough not yet arrived to a Phthiſis, ought to be referred the convulſive or ſuffocation Cough of children, and in our Idiome called the *Chin-Cough*. This aſſaults chiefly Children and Infants; and at certain ſeaſons, *viz.* Spring and Autumn eſpecially, is wont to be epidemical. The diſeaſed are taken with frequent and very fierce fits of Coughing, wherein namely the Organs of breathing do not only labour in pain, but alſo being affected convulſively, they do variouſly ſuſpend or interrupt their actions; but for the moſt part the Diaphragma convulſed by it ſelf, or by the impulſe of other parts, doth ſo very long obſtinately continue the Syſtole, or Diaſtole, that Inſpiration, or Expiration being ſuppreſs'd for a ſpace the vital breath can ſcarcely be drawn; inſomuch that coughing as being almoſt ſtrangled they hoop, and by reaſon of the blood ſtagnating, they contract a blackneſs in their countenance; if perhaps, thoſe organs not in ſuch a meaſure convulſed, they are able to breathe any thing freer; notwithſtanding they are forced always to cough more vehemently and longer, until they wax faint.

The Reaſon thereof.

The formal reaſon or conjunct cauſe of this diſeaſe, conſiſts in theſe two things, *viz.* that there is preſent a quick and vehement irritation of the Lungs, whereby they are almoſt continually incited to throw off ſomething troubleſome by Cough; and alſo that the motive parts of the *Thorax*, *viz.* the Nerves and nervous fibres being prediſpoſed to convulſions, as often as they are irritated, do excite a Cough not regular but convulſive, and ſuch as is oppoſite or injurious to the uſual function of breathing.

The cauſe partly in Catarrh.

The matter provoking the Lungs ſo frequently into a Cough ſeems to be the *Serum*, unceſſantly ſoaking out of the maſs of blood, by reaſon of its frame being too much looſened, and troubling the parts belonging to the breaſt, inaſmuch as it diſtills as well through the tracheal arteries into the hollowneſs of *aſpera arteria*, as that it is poured in plentifully through the Pneumonic arteries into all the open paſſages.

A convulſive diſpoſition of the parts of the breaſt.

The convulſive diſpoſition of the moving parts, as in other convulſive diſtempers, ſeems to proceed from a heterogene and elaſtic matter falling from the brain through the nervous paſſages, together with the nervous liquor, into the ſmall moving fibres of the breaſt; wherefore, when the ſpirits that are contained in thoſe little fibres, are ſtirr'd to perform violent motions of breathing out, they paſs into convulſive motions.

The prognoſtick of this diſeaſe.

What relates to the Prognoſtick of this diſtemper, this Cough although it be ſeldom very dangerous or mortal, yet it remains very difficult of cure; and frequently it rather ceaſes by change of the ſeaſon than is extinguiſhed by remedies. The cauſe whereof is, that here not, as in an uſual Cough, the blood onely ought to be altered, and its recrements to be derived out of the Lungs, to be conveyed to the habit of the body by ſweating, but Moreover an amendment of the nervous juice ought to be procured.

About

PHAR. Part. II.

Cures first Empirical.

About the curing of this diſeaſe, the way of healing uſed in other kinds of Coughs doth rarely profit here; wherefore old women and Empiricks are oftener conſaulted than Phyſitians, and the rational curatory method being poſtponed and neglected, remedies for the moſt part onely Empirical are brought into uſe.

Among the many remedies of this kind, theſe two following are preferr'd to all others, and chiefly wont to be uſed; *viz.* Cup-moſs or Chin-moſs or Chin-cups, and the various preparations thereof and compoſitions are taken inwardly, and if there ſhall be need of any further medicine, that ſome Bugbear being preſented, the Child labouring with it may be caſt into a ſudden fright. But if the wiſhed ſucceſs wanting to adminiſtrations of this ſort, Ptiſans, Syrups, Julips, or Decoctions, and other pectoral helps are rejected, and frequently they deſiſt from all other Medicines, expecting until the diſeaſe either at length of its own accord determine, or be cured by reaſon of the ſucceeding change of the year.

Chin-cups a great remedy.

1. Chin-cups or Moſs is in moſt common uſe in our Countrey againſt the Coughs of Children, and is vulgarly enough known as to its form and manner of growing. It is of an aſtringent nature (as far as we gather by its taſte) and contains in it ſelf particles ſomewhat ſharp and biting, and ſmelling of plenty of volatile Salt: from whence we may ſafely conjecture that its uſe is to fix the blood, and to appeaſe the fluxes of *Serum*, and moreover by volatiliſing the nervous juice, to take away the convulſive diſpoſition. It is uſually adminiſtred in form of Powder, Decoction, and Syrup, according to the following Receipts.

The reaſon whereof is inquired.

Take of Chin-cups in powder one dram, Sugar-Candy one Scruple, mix them, divide it into three or four parts, take a doſe morning and evening with a fit vehicle.

Take of the ſame Cup-moſs two drams, milk of Brimſtone two ſcruples, powder of Anniſeeds one ſcruple, divide it into ſix parts to be taken as the former.

Take of the ſame Chin-moſs or cup-moſs one dram boyled in milk for one doſe; take it morning and evening. To thoſe with whom milk doth not agree, or to whom it little profits, let it be boyled in Spring-water or Hyſſop-water, or in any other pectoral water, and let it be given from two ounces to four, twice in a day, ſweetning it with Sugar or ſome fit Syrup.

Take of this Muſcus Pyxidatus or chin-moſs one ounce, boyl it in two pints of ſome pectoral water to the conſumption of half: to it ſtrained add of Sugar-Candy one pound, and evaporate it in a gentle bath, to the conſiſtence of a ſyrup.

Frights profit in this Cough.

2. The other remedy for the convulſie Cough is wont to be, that they be caſt into ſome ſudden fright; from hence, when as medicines effect leſs, with the vulgar it is a familiar practice, that, to fright them, while a great Mill is driven about with a ſcreeking noiſe, and a dreadful aſpect in the wheels, the diſtempered be put into the Trough or Receiver of the Grain or Corn, and from thence the ſudden cure of this diſeaſe ſometimes happens. The reaſon whereof without doubt conſiſts in this, that the Animal ſpirits being put to flight and forced into freſh diſtractions, they relinquiſh their former diſorders; moreover, the convulſive matter is either diſſipated by that diſturbance, or is forced into other nerves where it is leſs troubleſome.

The rational cure.

The Empirical cure of this diſeaſe being deſcribed after this manner, together with the remedies vulgarly uſed, and the rendring a reaſon of the cauſe at leaſt probably unfolded, from hence it will be lawful to deſign rational method of curing, and perhaps more efficacious againſt childrens Coughs of this kind. Wherefore, in ſuch a caſe ſometimes ſucceſſefully enough I have preſcribed according to the following forms. And ſeeing we ought to begin with purging,

Purging.

Take of the ſyrup of Peach flowers one ſpoonful, of Aqua Hyſterica one ſcruple, mix it, and let it be taken with government.

Or, take of Mercurius dulcis *6 grains, Scammony prepared with Sulphur, Reſine of Jalap, of each three grains; make a powder, give it in a little Pulp of a preſerv'd Cherry to a lad ſix years old, and let the doſe be encreaſed or leſſened according to the age, let the Purge be repeated in 6 or 7 days.*

If the Patient (as it often happens) be prone to vomit, Take of Oxymel of Squils 6 drams, Salt of Vitriol 4 grains, mix it for a child of ſix years old, and according to this proportion let the doſe be accommodated to others. I have known a Vomit of this kind taken every morning for four or five dayes together with good ſucceſs.

Veſicatories.

Veſicatories or Medicines drawing bliſters are in daily uſe, and are applyed ſometimes to the *Nucha* or nape of the Neck, another while behind the Ears, then to the inſide

PHAR. Part. II.

inſide of the arms near the arm-pits, and as ſoon as theſe ſores begin to heal in theſe places, let others be raiſed in other places.

Inſtead of Beer let the following Decoction be uſed for ordinary drink.

Take China-roots an ounce and half, of all the Sanders of each half an ounce, the ſhavings of Ivory, and Harts-horn of each three drams, let them be infuſed and boiled in ſix pints of ſpring-water to the conſumption of half, adding Raiſins ſtoned an ounce and half, Liquoriſh three drams.

Mixtures.

Take of Spirit of Gum Ammoniac with Salt Armoniac a dram, Syrup of Chin-moſs three ounces, Aq. hyſterica an ounce: the doſe is a ſmall ſpoonful in the evening and morning faſting.

Or, *Take of tincture of Sulphur two drams, doſe three drops in the evening and firſt in the morning in a ſpoonful of the Syrup of Cup-moſs.*

To ſome endued with a hot conſtitution, and while they cough their countenance is ſpread with redneſs, or rather blackneſs, I have preſcribed Phlebotomy or drawing of blood with Leeches to two or three ounces with good ſucceſs.

Take Hog-lice living and cleanſed two ounces, powder of Aniſeed a dram, Nutmeg half a dram, fine Sugar an ounce, bruiſe them together, and pour upon them ſix ounces of Hyſſop-water, of Magiſtral Snail-water two ounces, ſtir them together a little, and preſs them out hard: the doſe two or three ſpoonfuls twice a day.

Hitherto of a Cough and its Remedy, while it is only an entrance to a Conſumption; now it remains to treat throughly of the diſtemper it ſelf, having paſſed the limits of this dangerous diſeaſe, and to deſign a method of curing, and the forms of remedies, which are proper to heal an inveterate Cough, when either being neglected, or not eaſily giving place to remedies, it begins to degenerate into a Phthiſis; namely when it arrives to that ſtate, that the blood being diſſolved in its conſiſtence, doth not only pour out the ſuperfluous Serum, but alſo the nutritive Juice, and perhaps the nervous, the Lympha, and other its ſuperfluities on the Lungs, and lodges them within its paſſages; and in the mean time the corruption of the Lungs is ſo much encreaſed, that the little Bladders being diſtended, or many of them broke into one, ſo that a ſolution of continuity or an Ulcer being cauſed, a greater plenty of corruption is daily heaped in; and moreover the matter in that place gathered together, becauſe it is ſuffered to abide there long, putrifies, and for that reaſon doth ſtill more corrupt the Lungs themſelves, and defile the blood flowing through. In this caſe the Therapeutical indications ſhall be chiefly theſe three: *viz.* in the firſt place to ſtop the diſſolution of the blood, which is the root of all this evil, and to make proviſion that it pour not out the matter any longer in ſuch abundance upon the Lungs. Secondly, by expectorating the purulent matter heaped up within the Lungs, and to evacuate it quickly and ſufficiently. Thirdly, to ſtrengthen and dry the Lungs looſned from their unity, or being too looſe or moiſt or otherwiſe infirm, leſt they be daily more and more corrupted, and give more reception to the morbific matter. Every of theſe indications ſuggeſts various intentions of healing, and requires remedies of divers kinds and many ways of adminiſtrations. The chief of which we ſhall here briefly treat of.

Of what ſort the beginning of a conſumptive Cough is.

Three indications concerning its cure.
1. To ſtop the diſſolution of the blood.
2. To draw out the filth from the Lungs.
3. To heal the Lungs hurt.

1. Therefore what the firſt indication ſuggeſts, that the diſſolution of blood may be prohibited, theſe three things (as much as may be) ought to be procured: *viz.* Firſt that the maſs of blood may contain and aſſimilate whatſoever of nutritive juice it may be furniſhed with; and that it be ſo proportioned, that it neither offend in quality nor in quantity. Secondly, that the acidities either generated in the blood, or poured into it from ſome other place, may be ſo deſtroyed, that the blood retaining as yet its mixture or temperament, may not be prone to flowings and pourings out. Thirdly and laſtly, that all the excrements produced in the blood may be derived from the Lungs to other Emunctories and places of Evacuations.

The firſt indication ſuggeſts three intentions of healing.

The firſt intention, that the nutritive juice may be proportioned to the blood and aſſimilated by it.

1. As to the firſt intention of healing, *viz.* that the nutritive Juice may be proportioned to the blood, let it be adviſed before all things, that they who cough and are phthiſical abſtain chiefly from drink, and that they take liquid things in a very ſmall quantity; for that the blood being infirm in its temperament, ſo long as it is not too much imbued with freſh juice, may be able to digeſt ſmall portions, and retain it within its own conſiſtence. Moreover, let that freſh juice conſiſt of ſuch kind of particles, which being mild and thin, may be tamed by the blood, and aſſimilated without any effervescence or heat. Wherefore Aſſes milk, alſo ſometimes Cows or Goats milk; alſo Water-gruel, Cream of Barley, Ptiſan, Almond-milks, and other

ſimple

ſimple nouriſhments will better agree and nouriſh more than Fleſh, Eggs, and Gelly-broaths, ſtrong Ale, Wine, or any other kind of richer fare. Secondly, that the blood retaining its own temperament, be not eaſily diſſolved into ſeroſities injurious to the Lungs, it behoves that as well the acidities of it ſelf as of other humors mixt therewith, and chiefly the nervous and limpid ones be deſtroyed: which intention Medicines prepared with Brimſtone will beſt accompliſh; which for that cauſe in this caſe (provided a hectic Feaver be not preſent) may be more frequently and in abundance taken. Wherefore the Tincture, the Balſam, the Syrup, the Flowers, and Milk of Sulphur in ſomewhat a large Doſe may be exhibited twice or thrice a day. For the ſame reaſon traumatic or vulnerary Decoctions, alſo Decoctions of the pectoral Herbs commonly ſo called, alſo of the Woods, are to be taken inſtead of ordinary drink. Moreover the Powder of Crabs eyes, Hog-lice, and other things endued with an Alcali or volatile Salt are often adminiſtred with great ſucceſs. The third intention of healing reſpecting the firſt indication, *viz.* that the ſuperfluous dregs of the depraved blood, (if they ſhall be very much predominant) being commanded out from the Lungs, may be diſcharged by other Emunctories, ſuggeſts very many ways to be uſed for their diſpatch. For beſides Phlebotomy, Diureſie, and ſometimes a gentle purgation (which take place in all Coughs, yea in the beginning of a conſumptive Cough, or Phthiſis) hither alſo ought to be referred Baths, taking in a more warm air whereby they may more freely tranſpire, alſo Frictions of the extreme parts, Dropaces, Iſſues, Bliſterings, or Depilatories, Errhines, Gargles, and other private or public ſluices either of umors or vapours.

2. That the acidities of the blood and other humours be taken away.

3. That the excrements of the blood be drawn off from the Lungs.

The ſecond indication in the beginning of a Phthiſis, *viz.* that the Conſumptive matter laid aſide within the Lungs may be eaſily and daily evacuated, is performed by expectorating Medicines. Theſe are ſaid to operate after a twofold matter, according to which their virtue is conveyed two ways to the Lungs. For of thoſe being taken by the mouth, ſome immediately diſmiſs their active particles into the *Trachea*, which partly by making the way ſlippery, and looſning the matter impacted, and partly by provoking the excretory Fibres into Convulſions, do procure expectoration: in which number are chiefly accounted Linctus's and Fumigations. The expectorating Remedies of another kind, which deſervedly are accounted more available, do exerciſe their energie by the paſſage of the blood. For whereas they conſiſt of ſuch kind of particles which cannot be digeſted and aſſimilated by the maſs of blood, being ſpread through the blood, becauſe they cannot be mixt with it, they are preſently again exterminated, and ſo penetrate from the Pneumonic Arteries into the Tracheal paſſages; where lighting on the matter they divide, and attenuate, and ſo diſturb it, that the little fibres being irritated from thence, and ſucceſſively contracted while they Cough, the contents of the Trachea and of its little bladders are ejected upwards into the mouth. Medicines proper for this uſe beſides Sulphur and the preparations of it, are artificial Balſams diſtilled with Oil of Turpentine, Tinctures and Syrups of Gum Ammoniac, Galbanum, Aſa fœtida, Garlick, Leeks, and ſuch like yielding a ſtrong ſcent; from which alſo Lohochs and Ecclegam's are prepared. And theſe work both ways, partly by ſlipping into the Trachea, and partly by entring the Lungs by the circulation of the blood, and aſſault the morbific matter both before and behind, and ſo exclude it with the greater force.

Second indication requires expectorating Medicines.

3. What belongs to the third indication, *viz.* that the frame of the Lungs being hurt, or their conſtitution vitiated, may be either reſtored or amended; ſuch things are of uſe as reſiſting putrefaction do cleanſe, heal, dry, and ſtrengthen; to which intent alſo Remedies prepared of Sulphur, Balſamicks and Vulneraries do agree. Hence ſome Empirics do not only ſucceſsfully preſcribe the Smoak of Sulphur vivum, but alſo of Auripigmentum, to be ſuckt through a Pipe or Funnel into the Lungs. Moreover it is for this reaſon, that change of air and ſoil, *viz.* from Cities to the Country or ſulphureous air, or the paſſage from one Region into another that is hotter, is of ſuch a ſignal advantage.

Third indication is performed by Balſamicks and vulneraries.

Hitherto of the Method of Healing, which ſeems to be of uſe againſt the more painful Cough, or Phthiſis beginning; now it remains according to all thoſe curatory indications to ſubjoin certain ſelect Forms of Medicines, which alſo, according to the way of healing deſcribed above in a ſlight Cough which is ſhort of a Phthiſis, we ſhall diſtinguiſh into certain ranks, *viz.* which are Mixtures, Linctus's, Lohochs, Tinctures, Balſams, Troches, Lozenges, Powders, Pills, Decoctions, and diſtilled Waters. We ſhall ſet down ſome Examples of each of theſe: whereto alſo may be referred ſome of the forms of Medicines before deſcribed for a beginning Cough, and not as yet conſumptive.

Forms of remedies for a conſumption.

PHAR. Part. II.

1. Magisterial Medicines and Syrups.

Mixtures. *Take of our Syrup of Sulphur three ounces, water of Earth-worms an ounce, tincture of Saffron two drams, mingle them. Take one spoonful at night, and first in the morning.*

Take of Syrup of the juice of Ground-Ivy three ounces, Snail-water one ounce, flour of Brimstone a dram, mix them by shaking. The Dose one spoonful at night and morning.

Take of tincture of Sulphur two drams, Laudanum, tartarizated a dram, Syrup of the juice of Ground-Ivy two ounces, Cinnamon-water two drams: the dose one spoonful at bed-time, and if sleep be wanting, towards morning.

Syrupus Diasulphuris.

Syrups. *Take of Sulphur prepared after our manner half an ounce, best Canary wine two pints, let them be digested 28 hours in a water or sand Bath; which being done, take of the finest Sugar two pounds dissolved in Elder-flower-water, and boyl to a height to make tablets: afterwards pour to it by little and little Wine coloured with Sulphur and warm, let it boil a little on the fire, strain it through Woolen. You will have a most delicate Syrup of a gold colour, and for Coughs and other Distempers of the Lungs (where a Hectic Feaver and heat of the Praecordium is absent) most profitable: the dose a spoonful morning and evening by it self or with other Pectorals.*

Syrup of Garlick.

Take ten or twelve cloves of Garlick stript from the little skins, and cut into slices, Aniseeds bruised half an ounce, Elicampane sliced three drams, Liquorish two drams, let them digest for two or three days in a pint and half of Spirit of Wine close and warm; strain it clear and hot into a silver dish, and add a pound and a half of fine Sugar, the dish standing upon hot coals, let the liquor be fired, and while it burns stir it; and strain it through woollen, and keep it for use.

Syrup of Turneps.

Take Turneps sliced and fine Sugar of each half a pound, put them in a glased pot a lay of Turneps and a lay of Sugar, the pot being covered with paper, put it into an oven to bake with the bread; when it is taken out, press the liquor, and keep it for use: the dose one spoonful morning and evening.

Syrup of Snails.

Take fresh Snails with their shells n. xl. cleanse them with a Linnen cloth, afterwards each being run through with a bodkin, let the open shell be filled with powder of Sugar-candy, and being put in a linnen bag, let them be hung in a cellar, it will dissolve into a Syrup and drop into a glass vessel set under it: the dose one spoonful twice or thrice a day in a convenient vehicle, viz. Milk-water or pectoral Decoction.

2. & 3. Linctus's and Lohochs.

Linctus's. *Take of conserve of red Roses three ounces, of our tincture of Sulphur two drams, mix them in a glass mortar: the dose the quantity of a Nutmeg evening and morning. To this sometimes to appease a troublesom cough add from half to a dram of powder of Olibanum.*

Lohochs. *Take conserve of red Roses four ounces, flour of Brimstone four scruples, fine oyl of Turpentine a dram, powder of Fox-lungs three drams, Syrup of the juice of Ground-Ivy as much as will suffice to make a soft Lohoch, to be taken after the same manner, viz. morning and evening; also to be licked at other times with a Liquorish-stick.*

Take powder of Sugar-candy four drams, tincture of Sulphur two drams, mix it in a glass mortar: take it after the same manner.

In the place of Tincture of Sulphur may be administred other Balsamic Tinctures, *viz.* Balsam of Peru, Opobalsamum, Gum of Ivy, Guajacum, Amber, with many other, which either may be mixt with Conserve of red Roses, or with the Conserve of the flowers of Colts-foot, or with Sugar-candy.

4, 5. *Tinctures* and *Balsams* of the same nature and composition, but in a larger Dose are convenient in a Phthisis, which we have above prescribed for a beginning Cough.

Tinctures. *Take of Tar an ounce, Lime-water thrice cohobated two pints, distil it in a Bath to half, afterwards being filtrated, let it be drawn off to the consistence of Honey in Balneo; to which*

pour

pour half a pound of tincture of salt Tartar, let it digest in a close glass to extract the tincture: the dose from 20 drops to 30 in a fit vehicle. After the same manner is prepared the tincture of the black oyl of Soot, liquid Amber, liquid Storax, and many others. PHAR. Part. II.

Take of our prepared Sulphur an ounce, adding Mirrh, Aloes, and Olibanum in treble quantity, draw off a tincture with oyl of Turpentine, also with rectified spirit of Wine: dose from 15 drops to 20.

6, 7, 8. *Troches, Lozenges,* and *Powders,* because they chiefly respect a Cough, are almost of the same nature and composition with those before-described for a new Cough; unless that for the drying and healing of the Lungs things sulphureous and Vulneraries are required in a greater proportion.

Take powder of the leaves of Ground-Ivy a dram, flour of Brimstone two drams, of Sugar pemids a dram and half, with juice of Liquorish dissolved in Hyssop-water make troches of the weight of half a dram. *Troches.*

Take of Tarrow bruised and dried in the Sun half a dram, flour of Brimstone, Olibanum, of each a dram; powder of dried red Roses half a dram, Sugar dissolved and boiled to a height six drams, oyl of Aniseeds a scruple and half, make Lozenges of half a dram weight: take one three times or oftner in a day, and especially evening and morning. *Powder.*

9. Pills.

Take a pint of the juice of Ground-Ivy clarified in the Sun, flowers of Colts-foot dried, the tops of Hyssop, Sage, Pennyroyal, each a handful; Aniseed, Caraway-seeds, sweet-Fennel-seeds bruised, each half an ounce; distil them in Balneo Mariæ to half; strain it and distil it to the consistence of Pills, by adding half a dram of juyce of Liquorish, powder of Elicampane, flour of Brimstone, each three drams; flowers of Benzoin a dram, Balsam of Peru *half a dram, tincture of Sulphur three drams, tartarizated Laudanum two drams: make it into a mass, and form it into small Pills to be taken three or four evening, and first in the morning.* *Pills.*

10. *Decoctions,* as I have above prescribed for a stubborn Cough, are used with success against a beginning Phthisis. In a case almost desperate I have prescribed the following Decoction to be taken twice a day, and also instead of odinary drink with very good success. *Decoctions.*

Take Lignum vitæ four ounces, China, Sassaphras, each two ounces; of all the Sanders each an ounce, shavings of Ivory, Harts-horn, each three drams: infuse them, and boil them in twelve pints of Spring-water to half, adding Liquorish an ounce, Raisins stoned four ounces: strain it.

11. *Distilled Waters,* such as we have before prescribed, are specific here, whereto may be added Solenander-water, of Hogs blood and Turpentine; also Balsamic Waters distilled from Turpentine with Pectoral Ingredients. *Distilled Waters.*

Take leaves of Ground-Ivy, white Horehound, Hyssop, Pennyroyal, each three handfuls; roots of Elicampane, Orris of Florence, *each two ounces; Turpentine dissolved in Oyl of Tartar four Ounces, Hyssop-water four pints, Malaga wine two pints; distil them in a sand Bath: let all the liquor be mixed, the Oyl separated: the dose two or three spoonfuls twice aday, with a spoonful of Syrup of Ground-Ivy.*

12. *In the last place* we must describe the forms of Vapors and Fumes; the administration whereof doth use to profit more than any other remdies in a Phthisis not yet desperate, for that they arrive at the very Lungs, and so purge them by an immediate affect, dry them, and keep them from putrefaction, strengthen and open all their passages, 1. Therefore a moist steam may be made after this following manner. *Fumes and Vapours.*

Take leaves of Hyssop, Ground-Ivy, white Hore-hound, each two handfuls; Elicampane two ounces, Calamus aromaticus half an ounce, Aniseeds, and Caraway-seeds, each an ounce: boil them in a sufficient quantity of Spring-water: let the vapor of the hot strained liquor be drawn by the Lungs through a paper rolled up like a cone or funnel: and used morning and evening for a quarter of an hour. *Formules of the former.*

PHAR. Part. II.

2. A fumigation or dry vapour, is made one while more mild out of meer Balſamics, another while more ſtrong out of Sulphurs, and ſometimes out of Arſenicals.

Forms of the more gentle Fume.

Take of Olibanum, white Amber, Benzoin, of each two drams, Gum Guaiei, Balſam of Tolu *of each one dram and half, powder of red Roſes, and red Sanders, of each one dram to be ſtrewed upon burning coals.*

Of the more ſtrong.

Take Gum of Ive, Frankinenſe, of each two drams, Flower of Brimſtone one dram and half, Maſtich one dram, with a diſſolution of gum Tragacanth, form Troches.

Arſenicals.

Take of white Amber, Olibanum, of each two drams, prepared Orpiment half an Ounce, Styrax, Labdanum, of each one dram and half, with ſolution of Gum Tragacanth, make Troches for fumigation.

Smoak of Auripigment.

Mountebanks do ordinarily preſcribe the ſmoak of Arſnick to be ſuckt into the mouth, like Tobacco kindled in a Pipe, and ſometimes with good ſucceſs: Moreover it is in practice with the Vulgar, to burn like Tobacco in a Pipe little bits of cloth ſtained with Arſenick (ſuch as wherewith the walls of Taverns are hung) and ſo ſuck the ſmoak into the conſumptive Lungs for cure.

Of a confirm'd Conſumption.

3. Theſe things being thus unfolded concerning a Cough, and a Phthiſis beginning, both as to what belongs to the Pathologie, and cure; it remains now laſtly to diſcourſe of a more painful Phthiſis confirm'd, and almoſt deſperate; and to conſult what is to be perform'd, when the Lungs being very much vitiated and affected with one or more filthy ulcers, neither the air nor the blood do rightly paſs through them, but choak or corrupt the maſs thereof, by continually ſuggeſting filthy corruption; inſomuch that a hectick feaver and an Atrophie, by reaſon of nouriſhment being fruſtrated infeſt the diſeaſed, with the loſs of all their faculties, and by daily weakning their ſtrength precipitate them to the grave. The moſt certain ſign of this diſeaſe growing deſperate, uſes to be accounted a pain very troubleſome with an inflammation of the throat; for this ſymptom argues a great putrefaction of the Lungs from whence the putrid *effluvia's* exhaling are thrown about in the narrow paſſage of the throat, which wound and grievouſly irritate thoſe tender fibres there. In this caſe the cleanſing of the Lungs, as alſo the drying up of the Ulcer are in vain deſigned: for all hotter Medicines ordain'd for thoſe purpoſes, and fit enough in the beginning of a Phthiſis, are not to be endured in a confirmed one; inaſmuch as augmenting the inflammation of the Lungs they procure a hectick feaver, thirſt, watchings, and other more painful ſymptomes, or call them back afreſh. For truly in ſuch a ſtate of this diſeaſe where onely the prolongation of life is propoſed with a little toleration and an eaſie death; thoſe remedies help chiefly, which bridle the fervour of the blood, allay the heat in the *Præcordia*, and reſtore the ſpirits, and gently cheriſh them. Hence for food, Aſſes Milk, alſo Water-gruel, Barly-broths, Cream of Barley, and for drink, Ptiſan, Emulſions, water of milk diſtilled with Snails and temperate pectoral herbs, are uſually of greateſt ſucceſs. Syrups and Linctus's, which appeaſe the inflammation of the Throat and Lungs, and facilitate expectoration, but chiefly the more mild Hypnoticks, whereby moderate reſt may be procured, may be frequently or daily taken. The forms of theſe are common enough; but however according to our method we will annex ſome of the more ſelect of each kind.

The formal reaſon thereof.

Forms of remedies in a deſperate Conſumption.

Decoctions.

Take of Barly half an ounce, candied Eringo roots 6 drams, parings of Apples one handfull, Raiſins ſtoned two ounces, Liquoriſh three drams, boyl them in three pints of ſpring-water to two, make a Ptiſan to reſtrain thirſt: take it 3 or 4 times aday, alſo in the room of ordinary drink if it agree.

Take the tayls of twenty Creviſes, candied Eringo roots one ounce, a cruſt of white-bread, Raiſins ſtoned two ounces, Liquoriſh 3 drams, boyl them in 3 Pints of Spring-water to two, ſtrain it, and take 3 or 4 ounces three times aday. After the ſame manner is prepared the Decoction of Snails.

Diſtilled waters.

Take of Snails half-boyled and cut three pound, ground-Ivy 6 handfuls, Nutmegs ſliced numb. 6. crum of white-bread two pound, freſh milk 8 pounds, diſtill it in a Pewter Still. The ſame way is diſtilled the water of Creviſe-tayls. The doſe 3 or 4 ounces three times aday, ſweetned with pearl'd Sugar or Sugar of Roſes.

Hypnoticks.

Take ears of green Wheat as many as convenient, diſtill them in a common ſtill; drink three or four ounces three times aday, ſweetn'd with pearl'd Sugar.

Eclegmas'.

Take ſyrup de Meconio *three ounces, water of green Wheat 6 ounces, mix them, drink two or three ſpoonfuls at bed-time, every or every other night.*

Take Conſerve of Mallow-flowers wild or garden three ounces, Lohoch de pino *two ounces*

ces, Syrup of Jujubes two ounces, make a Lohoch, of which take often a dram and half, or two drams.

PHARM. Part II.

What hitherto we have discourſed of concerning a Cough of every kind (whether it be ſolitary and ſimple, or the forerunner and companion of a Phthiſis) alſo what is to be preſcrib'd in every caſe touching the method of healing, it would be eaſily illuſtrated by the hiſtory of Cures, or by the Anatomical obſervations on thoſe that have dyed by that diſeaſe. For inſtances of this ſort, and very many examples are every where had, and happen daily; it pleaſes us here to annex a few of the more ſelect out of the large choice of theſe, accommodated to the chief kinds of a Cough, and Phthiſis. And firſt I will endeavour to illuſtrate the type of a ſimple Cough by one hiſtory or two, and which takes its riſe of it ſelf, and is altogether void of the ſuſpicion of a Phthiſis.

The Hiſtory of a Cough threatning a Conſumption.

It is now many years ſince I took care of the health of a certain Student, obnoxious to a Cough from his tender years, and who was wont frequently to undergo the more painful affections of it, and thoſe of long continuance. This perſon ſeemed of a melancholick temper, of a ſharp wit, of an indefatigable ſpirit, of a conſtitution indifferently ſtrong, but that his Lungs originally being infirm, did ſuffer when the blood diſſolv'd into ſeroſities. In Summer as long as he tranſpired freely, he lived healthily enough; but in the Spring and Autumn, when the blood changing its temperament, thoſe ſerous fluxes came upon him either of their own accord, or from any ſleight occaſion, he fell eaſily into a Cough with abundant and thick ſpittle; notwithſtanding this diſtemper frequently within ſix or ſeven dayes, as ſoon as the maſs of blood was purged throughly by the Lungs, vaniſhed leiſurely without any great uſe of remedies. But if to the aforeſaid occaſions of this diſeaſe were added ſome ſtronger cauſes, as chiefly the obſtruction of the pores, and errors touching his diet, ſometimes a more prodigious and ſtubborn cough, neither preſently nor eaſily yielding to remedies, and threatning nothing leſs than a Phthiſis, did come upon him; then manifeſtly the patient for the firſt days ſuffered light ſhiverings in his whole body, and the ſenſe of a Catarrh in his *Larynx*; afterwards by frequent coughing with thin ſpittle, together with a giddineſs, he was afflicted with numneſs of his ſenſes, and a dropping at his noſtrils.

In this ſtate his beſt remedy was wont to be, and frequently tryed with ſucceſs, to drink a little more freely generous Wine, and any other liquor very ſparingly: for ſo the acidity and fluor of the blood being ſuppreſſed, and tranſpiration procured more freely, he was much eaſed, and ſometimes recovered health in a ſhort time. Moreover at night and early in the morning he was uſed to take ſeven or eight drops of the tincture of Sulphur in a ſpoonful of Syrup of Violets, or of the Juice of Ground-Ivy, or

Take Conſerve of red Roſes three ounces, ſpirit of Turpentine two drams mingled, the doſe the quantity of a cheſnut evening and morning.

If that theſe remedies together with the *Canary* Antidote and thin diet effected little, the diſeaſe not being ſo cured, ſpinning out into a long period, and preſſing him ſharply for many weeks, yea ſometimes months, it reduced the ſick to a remarkable leanneſs, and to the very brink of the Grave. For then the Cough daily encreaſing and being very troubleſome, did very much impede and break his ſleep, his ſtrength languiſhed, his appetite was dejected, heat and thirſt moleſted him; in the mean time ſpittle every day encreaſed, and was caſt forth in great plenty; ſo that not only the *Serum* of the blood, and the recrements, but alſo the nutritive Juice, and the drainings of the ſolid parts being continually poured out upon the Lungs, turn'd into corruption, which was abundantly cough'd out; moreover his breath was difficult, his joints very infirm, and his fleſh very much conſumed.

When of late our Patient laboured after this manner, we preſcribed the following method, and remedies, by the continued uſe whereof at length he recovered his health. Firſt of all, a thinner diet being appointed him, and for the moſt part Ale being forbidden altogether, he took twice in the day of the following Apozeme about ſix ounces warm, and a little at other times cold to reſtrain his thirſt.

Take of the roots of China two ounces, Sarſaparilla three ounces, white and yellow Sanders of each one ounce, Ivory and Harts-horn of each three drams; infuſe and boyl them in 8 pints of water to half, adding Raiſins of the Sun 3 ounces, Liquoriſh 3 drams, ſtrain it, and keep it for ordinary drink.

Take

PHAR. Part. II. *Take Tincture of Sulphur three drams, take from seven drops to ten, at night and in the morning, in a spoonful of Syrup of Violets, or of syrup of the juice of Ground-Ivy.*

When he began by continual use to nauseate this Medicine, in its place the following Eclegma was appointed.

Take conserve of red Roses three ounces, spirit of Turpentine two drams, mix them; the dose is one dram, at the same hours.

Afterwards instead hereof the following Powder was sometimes taken.

Take of the powder of the leaves of ground-Ivy dryed in the Summer Sun three ounces, Sugar-candy half an ounce, mix them, the dose half a spoonful twice in a day, with three ounces of the following water.

Take Ground-Ivy 6 handfulls, Hyssop, white Hore-hound, of each 4 handfulls, Lambs-lungs half-boyl'd and cut small, pour upon them eight pound of Posset-drink made with small ale, distil it in common Organs, the liquor being mixed, let it be sweetned to the taste as it is used with Sugar-candy or syrup of Violets.

Troches. To appease his almost continually troublesome Cough, he swallowed the following Troches, and sometimes a little of the extract of Liquorish.

Take of the species of Diatragacanth. frig. 3 drams, Annise, Carue, sweet Fennel-seeds, of each half a dram, flower of Brimstone two scruples, flowers of Benzoin one scruple, extract of Liquorish dissolv'd in Hyssop-water; make a paste which form into Troches. Or,

Take of Species Diaireos, è pulm. Vulpis, of each two drams, flower of Sulphur, of Elecampane, of each half a dram, Oyl of Annise seeds ℈ß. Sugar dissolv'd in a sufficient quantity of Pennyroyal-water and boyl'd to a body ℥ vj. form Lozenges of half a dram weight, let him eat one, swallowing it by degrees, as oft as he will.

In the midst of this course, although he was endowed with a weak pulse and more cold temperature, we breath'd a vain in his arm: moreover, with these remedies, the chiefest help accrued to him from the open air, which for the most part he daily enjoyed, either by riding on Horse-back, or in a Coach; for from hence he first began to recover his appetite, his digestion, and sleep; whereto afterwards a relaxation of the other symptoms did sensibly follow, till at length he recovered his entire health. As often as he was afflicted since then with a stubborn and tedious Cough, he used a method like this, and with the like success; and now although he lives altogether exempt from that distemper, notwithstanding he is constrained to decline carefully all occasions or causes whereby either the pores might be shut, or the flux of blood or its precipitation into serosities might be provok'd; which were chiefly his going by water on the *Thames* at *London*, and drinking of acid liquors, as Cider, French or Rhenish wine.

From the above-mentioned history, you may easily conceive both the means and the reason of healing of the Cough, (which caused by the fault of the blood, is without the limits of a Phthisis): The other follows, which illustrates the nature of the same distemper, when it chiefly proceeds from the nervous juice.

The second remarkable History. A Boy about ten years of age, of a hot temper and fresh countenance, from his infancy obnoxious to a frequent Cough, in his succeeding years sustained more grievous and lasting fits and assaults of this distemper, and by turns was used to labour with a strong and shrill Cough, without spitting, which almost continually afflicted him day and night, and so infesting him many days, yea weeks, brought the sick to utter weakness. *A hooping Cough.* Afterwards the period of his disease being come (which happened not but by consuming the store of the morbific matter) he again in a short time became healthy enough, and very free from any sickness of the Thorax: till the morbific matter (as it seems) being heaped again to great abundance, without any evident cause, the same distemper returned and performed its Tragedy with its wonted fierceness. About its first beginning the Cough was troublesome only morning and evening: afterwards the evil by little and little increasing, he almost continually coughed whole days and nights, and if at any time sleep happening of it self, or by the use of Anodynes, afforded any truce, a more outragious fit of coughing succeeded his wakening. After this manner most frequently and fiercely coughing without any spittle, he laboured for three or four weeks, till he was brought to an extreme leanness and weakness; and then the sickness leisurely remitted, so that he coughed somewhat seldomer, and enjoyed moderate sleeps;

sleeps; afterwards in few days growing very hungry, being quickly made full of flesh and vigorous, he recovered his former health in a short time. Fits of this kind more seldom infested him in Summer-season, but in the rest of the year, repeated three or four turns, and brought the sick even into great hazard of life.

If disquisition be made of the nature, causes, and formal reason of this unwonted and as it were irregular kind of Cough, it is manifest it proceeds like all others, from the provocation of the Lungs; nevertheless as to the matter exciting, its seat, and manner of affecting it is doubted: because neither thick spittle nor plentiful thin (as is usual in other distempers) is here cast out; neither doth the Patient complain of feeling a Catarrh, nor of any weight of the Lungs. Wherefore, not as in a common Cough, does the serous humour either slowly or plentifully sweating out of the Trachea or Pneumonic vessels into the little bladders or Pipes of the Trachea, induce the afore-mentioned symptoms: But it is plain from thence that the passages of the *aspera Arteria* are wholly empty of the serous or thick humour, because the deep and sounding Cough throws off nothing. Moreover, neither from the blood impacted in the Membranes of the Lungs, doth this Cough take its origine, because neither feaver, nor thirst, nor pain, are present here as in a Peripneumonie. Besides, neither doth the morbific matter seem to adhere to the nerves or muscles appointed to the function of breathing; because then besides a Cough, Asthmatical or otherwise convulsive fits would sometimes urge with a sense of a strangling; which notwithstanding did not happen to our Patient.

Having frequently and seriously meditated about the Ætiologies of this very difficult case, I am at length induced to think, that a certain serous and sharp matter, as being loaded with a scorbutical taint, falling from the head by the passage of the nerves, doth enter into the nervous Fibres and Membranes of the Lungs or Trachea; which cleaving thoroughly to them, is by degrees encreased to a fulness, and at length being chaf'd, and grown turgid with a perpetual provocation, creates so troublesom a Cough. We have in another place declared the matter of this kind impacted in the Coats of the guts, and the neighbouring parts about them, not rarely to excite a scorbutical Cholick, for many days, yea sometimes weeks, infesting them with vomiting and most sharp torment; and what else is this Cough, but a certain Convulsive Distemper of the Lungs, whose taint notwithstanding, according to the capacity of the part labouring, is impress rather and more on the motive, than on the sensitive Power. For the Lungs however twicht and hurt, do suffer small pain, or scarce any at all; notwithstanding from any light occasion, they are invaded by storms and fits of Coughing. Indeed we compare this distemper of coughing so much the rather to the Cholick, because the subjects of either of them, that is to say, the Trachea, and the guts, as to their coats, vessels, little fibres and glandules, are after the same manner fashioned. *The conjunct cause of the Disease.*

The chief cause of the Cough now described, depends upon the morbific matter heaped together within the little fibres of the rough Arteries to a provoking fulness; wherewith when they are loaded, first a quick and painful breathing infests only, with a mornings Cough; because from the beginning only some small portion of that matter being disquieted provokes the part: afterwards when the whole mass thereof growing turgid, almost perpetually twitches the fibres, there follows a most troublesom Cough; which also being often repeated, endures a long season; because the Morbifick mass impacted in the parts affected, is neither presently cast off by the strength of nature, nor easily gives place to any remedies.

For in all the fits of this Disease, I have made tryal of various methods of curing, and of Medicines of divers kinds, though with little success. That distemper beginning at any time, is wont to make a long period, maugre all remedies. The medicines commonly called Pectoral, as Syrups, Lohochs, Eclegma's, or Lambitives, have conferred little benefit to its cure; notwithstanding sometimes it hath seemed good to admit of them into use for this purpose, that they might make slippery and moisten the Lungs, lest they run the hazard of being rent by a violent Cough, and their vessels burst asunder: for sometimes a more fierce fit troubling our sick Patient, he hath been wont to Cough out a little blood, though no thick spittle.

A gentle Purge both in the beginning and declination of this Distemper hath succeeded well. Opening and diuretical Apozemes are ever administred with success, both which he used enough through his whole course instead of ordinary drink. Evening and Morning he took some drops of the Tincture of Sulphur with the Milk-water of Snails; late at night I was sometimes constrained to administer a Dose of Diacodion or of liquid Laudanum: his belly for the most part loose enough, that it seldom required Clysters: in two of his fits he breathed a vein, whereby nothing of success ensued.

PHAR. Part. II.

In the last fit, beginning about the Autumnal Equinoctial, which passed away a little more lightly and gently, this following method of healing was observed.

The usual method of curing.

First of all this Purge was given, and after four days repeated. *Take of Mercurius dulcis ten grains, Resine of Jallop four grains, mix and make a powder to be taken in a spoonful of Syrup of Violets.*

A Drink.

Take China-roots sliced a dram, Grass-roots three ounces, Chervil an ounce, candid Eringoes six drams, shavings of Ivory, Harts-horn, each three drams, Raisins of the Sun stoned three ounces: boil these in three pints of Spring-water to two pints, strain it and use it for ordinary drink.

A Mixture.

Take Syrup of Jujubes two ounces, Diacodion an ounce, Spirit of Salt Armoniac with Gum Ammoniac a dram, mix them: the dose a spoonful at night and early in the morning. He was much relieved with this Medicine, notwithstanding he took it only every other or third day, and for change sometimes a dose of the tincture of Sulphur with syrup of Violets.

The Disease declining a Purge was twice repeated, and afterwards, recovering his health by degrees, within two weeks he became healthy enough. But when I beheld him not only obnoxious to frequent relapses of Coughing, but every fit to be irresistible when it assaulted him, and its stay very long notwithstanding the use of remedies, and all this threatning no less than a Phthisis at length; I advised that as well for his preservation, as for the more easie Cure of the Distemper, if it should return, he should travel into a hotter Region. Hereupon he did not much delay, but sails into *France* about the beginning of *November*, and from thence by a strait journey to *Montpelier*, where abiding half a year he was sick only twice and both times lightly: afterwards returning into *England* quite free from a Cough, praise be to God he enjoys his perfect health.

SECT. I. CHAP. VII.

Of Spitting Blood.

Hitherto of a Cough and Phthisis, as well in its beginning as confirmation; which are the most common affects of the Lungs, and most especially dangerous. Besides which there are many other Diseases of those parts that do occur, which when they are not at all, or not seasonably enough Cured, for the most part degenerate into a Phthisis. These passions, or at least the chief of them, (as we have before hinted) are spitting of blood, an Impostume, or Ulcer of the Lungs, a Peripneumony, Empyema, a Pleurisie, a Tumor of the Lungs, and obstructions by reason of things divers ways concreted, *viz.* sometimes little Pustles and Scirrhus's, another while gravel and little stones, and sometimes other preternatural matter; and lastly hitherto belong an Asthma and convulsive distempers of the Breast. Of these we shall treat in order, and first of Spitting blood.

Spitting blood a distemper very frequent.

The spitting blood out of the Lungs, and the ejections thereof by Cough sometimes less and almost none, another while more violent, is a Distemper frequent enough, and truly an admiration it is, that it happens not more frequently. For whereas the vessels bringing blood are divided into twigs and innumerable slips, and those very small; and whereas the blood even fiercely boiling, is violently conveyed through them all, complicated after divers manners and variously intorted; we can hardly conceive how the circulation thereof being so perplexed and intricate, and also so impetuous, should be performed without some impediment and interruption. And truly we conclude it to be very difficult in living bodies, because it hardly succeeds by injection in the dead: for as much as liquor sent through the entrance of the Pneumonic Artery, will not readily and easily return by the Veins; but sticking longer in the passage, and Skipping over the usual passages, variously runs out into the little bladders and other canals of the Trachea, and into the interspaces and other various gaps of the little Lobes.

Three things to be considered concerning it.

Concerning an Hæmoptosis or spitting blood we are to consider, first out of what vessels, and by what distemper the blood bursts out; secondly in what places most frequently laid up; thirdly by what means it is wont either to be ejected or brought upward, that it may be discharged by the mouth.

Out of what vessels the blood bursts out.

As to the first, we are to suppose by the Law of Circulation, that the blood of it self bursting out, doth altogether proceed from the Arteries: for the Veins, as long as they remain whole, do reduce it towards the Heart, and not at all pour it out; although we deny not that sometimes they being hurt by a wound, fall, bruise, or some violent accident, so as to be loosned from their unity, do let go the blood out of their cavities. Nevertheless the blood most commonly causing an Hæmoptoe or blood-spitting, proceeds

ceeds from the little mouths of the Arteries being open or torn; and then the fault is wont to be either in the ill temperament of the blood, or ill framing of the veſſels.

Of either of theſe there are various kinds and differences, which alſo concur after a diverſe manner to provoke the ſpitting of blood. For the blood being ſometimes more thin and alſo ſharp, it unlocks or corrodes the mouths of the little Arteries; and ſometimes again being more thick and prone to coagulate, when it cannot readily enough be received by the Veins, it is extravaſated. By reaſon of theſe faults in the blood, they who labour with the Scurvy or with a peſtilent Feaver, as alſo thoſe who have drunk ſome ſort of poiſon, do frequently fall into a ſpitting of blood. Neither is this diſtemper leſs wont to ariſe from the fault of the veſſels, in as much as thoſe being too tender or too thin, many times are burſt by a violent motion, as by Coughing, hollowing, leaping, or other vehement exerciſes; or for that being too looſe and moiſt, their mouths open, and ſuffer the blood to break out of its circulation: moreover ſometimes for that the Veins being contracted and wrinkled by cold, do not readily paſs away the blood, but the ſame reſtagnating diſtends the little Arteries, and burſts out of their mouths.

By what fault both of the veſſels and of the blood it happens.

As to the Arteries out of which the blood breaks, cauſing a ſpitting of blood, it concerns much of what ſort they are, and where they are placed; for beſides that there ariſe notable differences of bloody ſpittle, according as the blood breaks out from a ſmaller or a greater veſſel; and if either of them be placed in the top of the Lungs near the Larynx, or in the middle region thereof among the greater branches of the veſſels, or laſtly in the lower region among the orbicular little bladders: moreover we obſerve, that the Arteries which uſe to void blood, are either of the number of them, which ariſing out of the pulmonary Trunk, do every where accompany the branches of the Trachea; or of thoſe which owning their origine to the Aorta, do cover the coat of the Trachea with a thick branching.

What Arteries chiefly and where placed do void blood.

Both the Pneumonic and tracheal are in fault.

For it is apparent (as we have declared before) from the mouths of theſe, as alſo of the Glandules, an unctuous humour ſweats out to make the inner ſuperficies of the Trachea ſlippery: moreover in as much as a ſerous humour diſtils abundantly out of the ſame into the cavity of the rough Artery, a Catarrh ariſes. Wherefore we doubt not at all to affirm, that even from the mouths of theſe being open, meer blood ſometimes ſoaking into the Tracheal paſſages, does propagate a bloody ſpittle, though in quantity very ſmall. I have obſerved many, who without a Cough or any indiſpoſition of the Lungs, have once or twice a day voided one or two bloody ſpittles: which as often as it came upon them, the Patients perceived, either in the bottom of the throat, or on the top of the breaſt a kind of diſtillation; whence immediately by the meer contraction of the Tracheal Fibres, with a Snail-like motion, a little of the fluid blood being mixed thoroughly by flegm, and not at all frothy, is voided: and when ſometimes that diſtemper had laſted for many months, no prejudice enſued from thence, which might bring or threaten the Phthiſis: which would not have come to paſs, if any of the pneumonic Veſſels had been opened.

Spitting blood from the tracheal Arteries.

2. So much concerning Veſſels voiding blood, and of their divers affections. What belongs to the places wherein the extravaſated blood is depoſited, theſe chiefly and almoſt only are the rough Artery, and the inward cavity the parts thereof. For into this, as into a Jakes, all the filth or ſuperfluities of all the reſt of the paſſages are derived by the utmoſt endeavors of Nature, as far as poſſible, to be preſently ſent out of doors. But if the extravaſated blood be thrown into the interſpaces of the little Lobes, or ſoaking out of the outer Membrane, fall into the cavity of the *Thorax*, it doth propagate an Empyema, and frequently an Impoſthume in that place. But for the moſt part the blood ſubject to fall from the pulmonary courſe, produces various kinds of bloody ſpittle; according as it makes its neſt, either upwards within the cavity of the Larynx, or a little beneath about the intermedial paſſages of the Trachea, or laſtly further within the orbicular little bladders. The firſt diſtemper proceeds alone from the mouths of ſome Artery being opened, which covers the trunk of the Trachea; the next ſometimes perhaps from this cauſe, yet more often from the Pneumonic Arteries themſelves being open or burſt aſunder, which veſſels as they are greater, pour out often a dreadful quantity of blood; the ſpitting out whereof proves plentiful and violent, in regard that the muſcles of the whole breaſt, together with the fibres of the Trachea are much provoked and greatly contracted. But if the ſpring of bloody ſpittle conſiſts in the lowermoſt little bladders; the blood is thrown out more ſparingly, but with a profound, frequent and very troubleſom Cough.

2. In what places the blood is depoſited.

Either in the Larynx, or in the middle of the Bronchii, or in the orbicular little bladders.

3. And from hence (which was in the third place purpoſed) the differences of bloody excretion out of the Lungs, and the manifold modes and courſes of bloody ſpittle are made known. For the blood ſoaking into the Larynx, after a ſmall tickling in

PHAR. Part. II.

the throat without Coughing or Hawking, doth eaſily and almoſt inſenſibly aſcend into the mouth: and if an extravaſation of this kind of blood happens in ſleep, it preſently flows out of the mouth upon wakening, they being ſcarce ſenſible of it; in as much as the moving fibres of the Trachea being contracted while one ſleeps, have then emptied the blood freſh diſtilled into the mouth. But if from a greater veſſel gaping or burſt about the middle of the Lungs, the blood (which is ever frothy) does break out abundantly into the Tracheal paſſages, this by an outragious Cough raiſed thereby is forthwith caſt upwards with violence and in great plenty; inſomuch that the ſick ſeem rather to vomit than Cough out blood. And finally, if the blood breaking out of the foldings of the veſſels wherewith the orbicular little bladders are encompaſſed, falls down into thoſe little cells, from thence it is diſcharged by turns in leſſer quantity, and not unleſs by a ſtrong and very frequent Cough.

The procatartic and evident cauſes thereof.

So much concerning the formal reaſon, the conjunct cauſes and differences of an Hæmoptoe: as to what belongs to the primary and evident cauſes, either of them are manifold and various. In the former number are reckoned, firſt an hereditary indiſpoſition of the Lungs, whenas they have originally been weak and ſoft with a ſtraitneſs of the breaſt. Moreover their ill temper from a Cough, Empyema, or Pleuriſie going before, and eſpecially an obſtruction or ill confirmation do very much diſpoſe to ſpitting blood, and ſo much the rather, if in ſuch a habit an acrimony or Dyſcraſie of the blood ſhall accrue from an ill courſe of Diet, unwholeſome Air, or by any other means.

The ſuppreſſion of the Menſtrua, the Hæmorrhoids, or blood flowing from the Noſtrils incline moſt to a ſpitting blood. Secondly, among the evident cauſes ought to be reckoned primarily the exceſs either of heat or cold; for when the blood grows above meaſure hot, or the tranſpiration thereof through the Pores of the skin is hindred; thereupon ſwelling after a huge manner, it frequently burſts out of the pneumonick Veſſels. From hence *Hippocrates* long ago obſerved, and as yet it is vulgar obſervation, That ſpitting blood moſt frequently happens in a winter when the North-wind blows. Neither leſs ſeldom hath the uſe of bathing brought this evil upon many, before the uſe whereof they were healthful enough. Moreover many contract this from drinking of wine and ſtrong waters, from a blow, of a fall, hollowing, vomiting, coughing, or any other violent ſtirring of the whole body or of the Lungs. Alſo certain poiſons, and according to *Herninus* the Lunar beams (the reaſon whereof doth not eaſily appear, neither doth there remain any credit thereto) are reported to provoke this diſtemper.

The Prognoſtics of this diſeaſe.

The Prognoſtics of this diſeaſe are enough known to the vulgar, whereas there is not any one of them, who doth not ſuſpect the ſpitting of blood as very dangerous. Nevertheleſs whereas the kinds hereof are various, one is found more leſs dangerous than another. The blood ſoaking out of the veſſels of the Trachea is often free from any evil: moreover when breaking out from the loweſt and leſſer pulmonar Veſſels, it often admits of Cure; at leaſt it is much ſafer than a plentiful ſpitting of blood happening from the great branches of the Artery being opened into the Trachea. But the prediſpoſition of the Patient makes a great difference into the Prognoſticks of this diſeaſe: for if blood-ſpitting be provoked by reaſon of a ſolitary evident cauſe, and ſhall happen to a body formerly ſound and well ſet, there appears far greater hope of help, than if the diſtemper ariſing of its own accord ſhall happen to a cachectical, phthiſical, ſcorbutic, or otherwiſe ſickly body. However 'tis a common obſervation, that this diſeaſe is dangerous and always difficult to cure: the reaſon whereof is alſo clearely manifeſt, for as much as the function of the Lungs conſiſting in a perpetual motion, is altogether contrary to the method of healing a wound, whereto primarily eaſe and reſt are required. In like manner this happens to be a greater hindrance to its Cure, in as much as the frame of the Lungs is not a Parenchyma (as was thought) but a texture or very ſubtile web of innumerable veſſels; the unity whereof if once diſſolved, it will be altogether impoſſible, for the ends of the disjoyned veſſels to meet again together, or the ſpace to be filled up with fleſh or callous, as in other parts. But there is this only to be hoped, that while the ends of the veſſels grow together incongruouſly and always imperforated, the circulation of the blood ceaſing in the part diſtempered, may be ſupplied by another neighbouring part: which indeed rarely ſucceeds without hurt or prejudice of the whole Lungs.

The Cure thereof.

As to what appertains to the Method of healing the Hæmoptoe or ſpitting blood, the curative indications ſhall be chiefly theſe two, *viz.* to ſtay preſently and reſtrain the flux of blood; then ſecondly, to heal the diſſolution of unity without any relicts of a Conſumption in the Lungs.

I. Indication.

I. As to the former, theſe two things are chiefly to be procured, *viz.* firſt that blood flow not to the part diſtempered; and ſecondly, that in the mean time the opening of the veſſel may be ſome-how ſhut.

1. That

PHAR. Part. II.

1. That the blood may not flow to the part distempered, there are many intentions of healing in use, *viz.* it will be requisite to diminish the abundance of blood, to restrain the boiling thereof, to alter the intemperament, and depress its motion or divert it another way: for which purposes Phlebotomy, Ligatures, and Frictions are often convenient: also Juleps, Decoctions, Emulsions, and succulent Expressions of Herbs ought to be drunk. Likewise moderate Hypnotics, and in the first place Diacodiates are exhibited with success: for these, by restraining the motion of the Heart, do force the blood to cool. *1. It stops the flux of blood.*

2. That the opening of the vessel may be shut, astringent and agglutinating remedies are in the first place convenient. The chief of these are used to be exhibited in the form of a Linctus, so that while one swallows, certain particles gliding into the rough Artery, may more immediately communicate their power to the part diseased. But the reason of this operation seems not to be of any great moment; because the efficacy of the Medicines themselves, chiefly and almost only by the conduct of blood reaches to the seat of the disease. Wherefore not only Lohochs, but also Decoctions, Powders, and Pills of vulnerary and balsamic Ingredients are prescribed with success. The forms hereof we shall annex beneath. *2. It shuts the opening of the Vessels.*

II. The second indication, which is also preservatory, respecting the healing of the dissolution of unity without any remaining hurt of the Lungs, ought to provide against two sorts of evils, *viz.* lest the spitting blood (whereunto the distempered are afterwards always prone) begin again; and lest a Phthisis succeed, which threatens every body subject to the Hæmoptosis. For these ends for the prevention of this disease daily care and constant course of healing ought to be ministred to the blood and Lungs. *II. The second preservatory indication.*

1. As to the blood, the mass thereof ought to be contained ever in a due quantity, and a right temperament, with a mild and equal motion. Hence lest it superabound, or distempered with a Dycrasie enter into turgescencies, or lodge its impure feculencies in the breast: it is requisite sometimes to use Phlebotomy, and a gentle Purgation. An exact course of Diet is always necessary. Moreover for the depurating and sweetning the blood, drinking of Asses milk, or of Medicinal waters sometimes does greatly help. But Decoctions, distilled Waters, Juices of Herbs, which carry away the ill temperaments of blood, and derive the Serum and other impurities from the Lungs, and bring them forth either by Sweat or Urine, are to be carefully drunk. Besides for this purpose Issues do chiefly conduce. *1. It respects the blood which is to be kept in a right Crasi.*

2. Neither ought there to be less care of the Lungs themselves, namely that the whole frame thereof, and chiefly the place affected, be preserved in due frame and right tone. Hence every violent motion, whereby its unity is more dissolved, or the restitution thereof hindred, should be industriously declined. Let the party live in a clear and open air, but not too fierce, or sharp; let him abstain from grosser foods, from Noon-sleeps, from plentiful Suppers, and other errors in diet, which induce either repletion or obstruction upon the *Præcordia*. But let remedies be admitted in daily use, which by a peculiar property, or certain specifick vertue are reported to heal the Lungs. *2. A due frame of the Lungs to be procured.*

The method of healing requisite for spitting of blood, being shadowed after this manner, there yet remains as to all the therapeutic indications, and according to the various intentions of healing which belong to them, for us to subjoyn some more choice forms of Remedies, whose Van those deservedly lead which meeting with the symptom most urging, do suddenly restrain the flux of blood cast out by coughing or otherwise out of the Lungs. In the first rank of these Medicines, those are reckon'd which hinder the blood from flowing to the part affected, and together are impregnate with a certain astrictive and agglutinative power whereby the opening of the vessel may be shut; and after the Belly being cleared with a Clyster, and Phlebotomie (unless a weak pulse and defect of heat withstand it) made use of, there is wont to be given somewhat in form of a Julep, Decoction, Emulsion, juicy Expression, Powder, Pills or Lohochs. We will annex certain more elegant and more efficacious Receipts of all of these, as likewise of Narcoticks, which notwithstanding ought not every where and indifferently to be used, but methodically and seasonably, according to advice of a discreet Physician, according to the various constitution of the Patient and condition of the disease. *The forms of Medicines.*

1. Juleps and *Distilled Waters.*

Take of Purslain and Poppy-water of each 6 ounces, Dragons-blood in most fine powder half a dram, syrup of red Poppies two ounces, spirit of Vriol of Mars ℈ ss. mix them; the dose ℥ iij. repeated once in 5 or 6 hours. Juleps.

Take

PHAR. Part. II.

Take of Plantane-water lb. *j. Gum Tragacanth and Arabick powder'd, of each* ʒſs. *mingle and diſſolve them; after adding ſyrup of dryed Roſes* ℥j ſs. *make a Julep; the Doſe* ℥iij. *or* ℥iiij. *every third or fourth hour.*

Take of the water of Oak-buds, red Roſes, Water-lillies, of each ℥iiij. *of Blood-ſtone finely ground, Role-Armenick powder'd of each* ʒſs. *ſyrup of Water-lillies,* ℥ij. *mix them; the doſe* ℥iij. *or* ℥iiij. *three or four times aday.*

Diſtilled Waters. *Take of the Dew or almoſt inſipid Phlegm of Vitriol* lb. *j. Syr. of Myrtles* ℥ij. *mix them, the doſe* ℥ij. *or* ℥iij, *often in the day or in the night.*

Take of Cypreſs tops M. viij. of the leaves or flowers of Willow M. vj. *the greater Comfry-roots, Water-lillies, of each* lb. ſs. *Pomegranate flowers* M. ij. *All being cut ſmall together, pour on them* lb. viij. *of new Milk; let it be diſtill'd in common Organs, the doſe* ℥iij. *or* iiij, *often in a day.*

Take of this diſtill'd Water, and of Plantane-water, of each lb. ſs. *Gumm Tragacanth and Arabick of each* ʒij. *diſſolve them; the doſe is* ℥iij. *every third hour.*

The following Mixture is preſcribed by Dr. *Frederick Decker*, to be taken a ſpoonful at a time in ſpitting blood, and ſeems a very beneficial one.

A Julep. *Take of Plantane-water* ℥ij. *Cinamon-water* ℥ij. *conf. of Hyacinth* ʒ *i* ſs. *diſtill'd Vinegar* ʒ, *of red Coral prepar'd* ʒſs. *Balauſtins, Dragons-blood, of each* ʒſs. *Landanum Opiate gr. iij. Syr. of Myrtles* 1 *ounce, mingle them.*

Take of Plantane, red Roſe, & Purſlain-water, of each 4 *ounces of Blood-ſtone & Dragons blood reduced into fine-powder of each half a dram, Sugar-Candy* ʒ vj. *make a Julep.*

A Solution of common Vitriol, or of Vitriol of Mars made in Spring-water, and applyed with a rag to a wound, wonderfully ſtops bleeding, but is ſcarcely convenient to be given inwardly.

2. Decoctions, Tinctures, *and* Emulſions.

Apozems. *Take the leaves of Blood-wort, Periwincle, Mouſe-ear, Plantane, Wood-ſorrel, both ſorts of Daiſies, of each one handful, red Roſe leaves half a handful, Barly half an ounce, Raiſins two ounces, boyl them in three pints of Smith-forge water filtred (or water wherein hot Iron hath been often quencht) to two pints. To the ſtrain'd liquor add two ounces of the ſyrup of the Juice of St.* John's *wort, or of Mouſe-ear, make an Apozeme, doſe from four ounces, to ſix, three times in a day.*

Take the leaves of St. John's *Wort, roots & leaves of Tormentil, of the greater Burnet, Meadow-ſweet, of each one handful, of the ſeeds of Purſlain, Plantane, Sorrel, of each one dram, Conſerve of red Roſes half a pound, Spring-water eight pound, boyl them for* 12 *hours in* Balneo Mariæ, *to it being ſtrained add half a ſcruple of the ſpirit of Vitriol of Mars, to be taken as the former.*

Tinctures. *Take of Barly-water with Madder-Roots boyled in it a pound and half, infuſe in it being warm a handful of red Roſe-leaves, adding one ſcruple of ſpirit of Vitriol, after three hours ſtrain it, adding Syrup of the Juice of St.* John's-*wort one ounce and half, take three or four ounces, three or four times aday.*

Emulſions. *Take of the decoction of the roots of freſh Nettles a pound and a half, white Poppy and Henbane-ſeeds of each two drams, Melon-ſeeds 6 drams, make an Emulſion, ſweeten it with Sugar of Penids; the doſe is three ounces, three or four times in a day.*

3. Juices of Herbs and juicy Expreſſions.

Juices of Herbs. *Take of the Juice of Plantane half a pound, take two or three drams three times aday, in three ounces of the diſtilled water preſcribed before; ſweeten it to pleaſe.*

Take of freſh Nettles, Plantane, the ſmaller Daiſies, of each 3 *handfuls, bruiſe them, and pour upon them of Purſlain-water* 6 *drams, make an expreſſion, take it as the former.*

4. Powders *and* Pills.

Powder. *Take of the powder of Blood-ſtone, Dragons-blood, ground with Roſe-water on a Marble, Pearles, of each one dram, Bole Armenick, and Earth of Lemnos, of each half a dram, Troches of Winter-cherries two drams, make a powder, divide it into twelve parts, one part to be taken three times aday in the former diſtill'd water.*

Take of Henbane, white Poppy-ſeeds, of each 10 *drams, ſealed Earth, red Coral, of each* 5 *drams, Sugar of Roſes three ounces, make a powder, the doſe one dram morning and evening*

ning; this compoſition made up with a fit Syrup into a ſoft conſiſtence, was anciently call'd and renowned in Germany, *by the name of* Helideus's *Electuary.* PHAR. Part. II.

The aforeſaid Powders with the addition of Gum Tragacanth diſſolv'd, or ſome fit ſyrup, may be reduced into Pills or Lozenges. Pills.

The ſpongious excreſcence uſually growing to the fruit of Hipps or Dog-bryar, reduced into powder, half a dram taken twice aday, is a very profitable remedy in ſpitting blood.

Take of Yarrow bruiſed and dryed in the Summer-Sun as much as you pleaſe, reduce it into powder to be kept in a Glaſs; the doſe from half a dram, to a dram twice aday in any convenient liquor.

Julius Cæſar Scaliger's *Powder, or rather that of* Serapion *is mightily commended. Doſe four drams twice or thrice aday.*

5 Lohochs *and* Electuaries.

Take conſerve of red Roſes, of Dog-roſe, of each two ounces, powder of white Poppy and Henbane-ſeeds, of each two drams, ſpecies Diatragacanth. frig. one dram and half, of Blood-ſtone, Dragons-blood prepared, of each half a dram, Syrup of red Poppies what will ſuffice to make an Electuary. Take the quantity of a Cheſnut evening and morning, at other times let him lick with a liquoriſh ſtick. Electuaries.

Take Conſerve of the greater Comfry flowers, of Water lillies, of each an ounce and half, Troches of Winter-cherries, of Diatragacanth. frig. of each a dram and a half, ſyrup of Jujubes what will ſuffice to make a ſoft Electuary, of which lick often. Lohochs.

Take of the white of an Egg well beaten two drams, Sugar of Roſes one dram, of white Starch three drams, make a Lohoch to be taken often with a ſpoon.

Take of Conſerve of red Roſes 3 ounces, Leucatell's *Balſam half an ounce, Troches of Winter-cherries two drams, Syrup of red Poppies what ſuffices to make a ſoft Lohoch: the doſe is the quantity of a Cheſnut night and morning.*

II. The ſecond preſervatory Indication exhibits ſuch remedies, which by containing the blood in its right temper, and the Lungs in their due frame, do provide againſt a relapſe of ſpitting blood, and the following of a Phthiſis. Such things which reſpect the blood, either are mild evacuators by Stool, Urine or Sweat; or are meerly Alteratives. Every of theſe are uſually preſcrib'd either in form of Potion, Powder, Electuary, or Pills: We will here ſhew you the moſt ſelect patterns of the chief of them. *The ſecond Indication.* *The firſt intention in reſpect of the blood.*

1. As to Evacuators, a gentle Purgative is ſometimes appointed after this manner. A Purge.

Take of the beſt Senna three drams, Caſſia Fiſtula bruiſed one ounce, Tamarinds three drams, Coriander-ſeeds a dram and a half, boyl them in Spring water to 6 ounces, to it ſtrain'd add Syrup of Chichory with Rhubarb one ounce, clarifie it with the white of an Egg.

Or,

Take four ounces of Gereon's *decoction of Senna, Syrup of Apples purging one ounce, mingle them and make a potion.*

2. That the good temper of the blood may be preſerved, and the ſuperfluities drained from the Lungs may be continually diſcharged by Sweat and Urine, theſe following Alteratives, or ſome of them are for the moſt part receiv'd into conſtant uſe; which alſo being endued with a healing power, do ſuccour the weak Lungs, or thoſe whoſe Unity is diſſolv'd. Alteratives.

For ordinary drink, let ſimple water, eſpecially in a hot conſtitution, or being colour'd with a little Claret-wine, be drunk. Thoſe with whom this doth not agree, *a Bochet of China, Sarſa, with ſhavings of Ivory, Harts-horn, with white Sanders,* or *ſmall Beer, or ſmall Ale, with the leaves of Harts-tongue, Oak of Jeruſalem,* and the like infuſed, are frequently uſed with good ſucceſs.

Pectoral Decoctions or Hydromels with temperate Vulneraries are taken twice or thrice aday to ſix or ſeven ounces.

Take of freſh Nettles, Chervil, of each one ounce, Harts-tongue, Speedwell, Mouſear, Ground-Ivy, St. John's-*wort, of each a handfull, boyl them in three pints of Spring-water, to two pints, adding Raiſins ſtoned an ounce and half, Liquoriſh two drams, to it ſtrain'd* Decoctions.

add

PHAR. Part. II.

add Syrup Byzantine two ounces, clarifie it with the white of an Egg, make an Apozeme to be taken from 4 ounces to 6, twice or thrice in a day for a month. In a more cold or Phlegmatick conſtitution, let the Liquoriſh and Raiſins with the Syrup be omitted, add at laſt of Honey well clarified two ounces, ſtrain it and keep it for uſe. The Doſe is the ſame.

The uſe of theſe is ſometimes intermingled with a diſtilled water appropriate for that uſe, which likewiſe is more frequently taken by ſuch who nauſeate and loathe Apozemes.

A diſtilled water.

Take the tops of Cypreſs, leaves of Ground-Ivy, of each 6 handfuls, of Snails half boyled one pound and half, of all the Sanders bruiſed of each one ounce, being cut and bruiſed infuſe them in 8 pound of freſh Milk, diſtil it in common Organs, the Doſe 3 or 4 ounces with a ſpoonful of Syrup of Ground-Ivy, to be taken twice in a day.

The ſecond intention reſpects the Lungs.

2. In reſpect of the Lungs, *viz.* that without obſtruction or opening of the veſſels, the Union of parts and due conformation of the whole may be preſerved, temperate balſamicks chiefly conduce. To this intent *Leucatellus*'s Balſam is commonly preſcribed to be taken daily and for a long ſeaſon. Chymiſts and certain Noble women do cry up with great praiſe a balſamick Oyl drawn by diſtillation, called by them *the Mother of Balſam.*

It would be eaſie here to reckon up very many other remedies againſt ſpitting blood very much celebrated by the ancient as well as by modern Writers; notwithſtanding the harveſt of theſe already gathered together doth at preſent ſeem rich enough. But it remains, that I illuſtrate as well the Theory of this diſeaſe, as the curatory method above delivered, by a Hiſtory or two of ſick Patients.

The firſt Hiſtory.

A noble young man, when after a ſcorbutical *Cachexia* he was affected with a Palſie, and for curing this diſeaſe, remedies not only great but improportionate to the blood and ſpirits were experimented by him, *viz.* Salivation and the uſe of Baths, he contracted a ſpitting of blood, whoſe fits (of all I ever knew not preſently mortal) were moſt fierce. Preſently on the firſt appearance of this diſeaſe, ſpitting blood followed the Operation of *Hues*'s powder (from which having for ſome time ſuffered a flowing of the Mouth, without his Palſie being cured he was reduced to great weakneſs:) Then being afflicted with a Catarrh, and a Cough very troubleſom, he began to diſcharge a diſcolour'd Spittle, ſometimes ſtained, and ſometimes ſprinkled with blood; but this diſeaſe being mild from the beginning, did ſuddenly vaniſh away by the uſe of remedies, and after going into the Country, and ſucking in a more pure air, he became better, and after a while ſeeming healthful enough in his breaſt, he went to the Bath for the benefit of his Palſie; where daily bathing for a fortnight in thoſe hot waters, he again contracted a Cough, and a little after an horrid Hæmoptoe or a ſpitting of blood, ſo that in the ſpace of 24 hours, coughing often and plentifully, he poured out blood in a vaſt quantity.

I firſt viſiting him in this condition, proviſion being made for the whole, I preſcribed preſently Phlebotomy for revulſions ſake: notwithſtanding after this adminiſtration (both then and ever after) he either repeated the bloody ſpittle, or grew worſe. Moreover, I exhibited Juleps, Lohochs, Decoctions, and alſo Hypnoticks, which helping little or nothing, ligatures made about his arms and thighs, did firſt of all reſtrain the tyranny of this diſeaſe: And when afterwards the Evil broke out again, I perſwaded him at length, (his drink of Beer being left) that he ſhould conſtantly drink the decoction of China and Sarſa with the Pectorals. By the continual uſe hereof, obſerving moreover an exact courſe of diet, and altogether abſtaining from wine, more hot Aliments, and Salt, and Sugar, for above two years he was well in health.

But afterwards when by being crouded in a Court of Judicature, he grew mighty hot, he relapſed back again into a terrible ſpitting of blood. A Phyſician being ſent for, he was preſently let blood in the arm, whence his ſpitting of blood became more ſharp; and when afterwards letting blood was repeated the ſecond and third day, and the evil grew worſe every time, at length Ligatures (as at firſt) being adminiſtred, and the pectoral drink and a Linctus being often taken, the diſeaſe preſently remitted, and in a ſhort ſpace wholly ceaſed, notwithſtanding he continued the uſe of his pectoral decoction and ſlender diet. *viz.* no fleſh-meat, for a fortnight; and from thence he obtained truce from his enemy for three years; and when afterwards at any time the blood ſwelling by drinking of wine, or taking more dainty food, began to break out from the Lungs, preſently by ligatures, and the uſe of the Decoction and Lohoch, and a thin diet, its aſſault was wont to be repulſed. But he did not ſo ſafely eſcape, but

that

that it was neceſſary for him for the moſt part to keep perpetual watch againſt that enemy always lurking: for not long ſince by reaſon of the intemperature of the year, he cantracted a troubleſom Catarrh, with a Cough, a plentiful ſpittle, and ſometimes bloody, and then the former Medicines effected leſs; wherefore, he betook himſelf by his own advice to new things, and in the firſt place took evening and morning a ſpoonful of Syrup of Ground-Ivy, and thereby enſued a notable help: but when the Syrup became quickly loathſom by reaſon of the Sugar, he took the powder of that herb well prepared half a dram, or one dram twice a day in a ſpoonful of ſome liquor; by the long uſe of which Medicine he was much better as to his Catarrh and Cough. But when the ſpitting of blood now and then broke out, though in little quantity, he chang'd again his Medicine, and took twice in a day the powder of the tops, and chiefly of the hairy excreſcences of Cynorrhodon or Dog-bryer: which only Medicine a certain Phyſician renowned formerly for the cure of ſpitting blood, uſed with great ſucceſs. Neither did our Patient receive a leſs happy effect from that Medicine, for preſently after he eſcaped altogether free from a Cough, a Catarrh and bloody Spittle, and ſo remained for a long while: until at length believing this diſeaſe of the Breaſt to be wholly ſubdued, and therefore ſlighting it, he aſſumed weapons againſt the other more ancient enemy the Palſie. Wherefore, while his Hæmoptoſis or Spitting of Blood was neglected, he daily took a large doſe of hot Medicines to conquer that other diſtemper, *viz.* magiſtral waters diſtilled with Wine, ſpirit of Harts horn, of Salt Armoniack and Aromatick, Powders and Confections; Beſides, whilſt he indulg'd himſelf in a more plentiful diet, with a moderate drinking of Ale and Wine, the roaring Lion that at firſt ſeem'd to ſleep, was again ſtirr'd up, *viz.* he had not long continued in that antiparalytical Method, but the Spitting of blood returned with its greateſt fierceneſs, ſo that in the ſpace of a day and a night he coughed out above three pints of ſpumous blood. But afterwards a Phyſician being ſent for who preſently preſcribed Phlebotomy, the ſpitting of blood began to ceaſe upon bleeding (as formerly it was always wont to do) but then fell into ſharp fits again: which however by the uſe of Ligatures, and a Lohoch and pectoral Decoction daily taken, was preſently aſſwaged, and a while after wholly ceaſed. And when afterwards he uſed the pectoral Decoction three months, and a very ſlender Diet, *viz.* without any fleſh, only of Herbs, Barley, &c. and Milk-meats, in a ſhort time he recovered his former health, and now lives in that ſtate, ſo triumphing over that cruel diſeaſe, that many Hæmoptotic perſons conſult him as their Oracle, and for a Cure do propound a method of this kind of living to be followed before the Phyſicians advice.

The reaſon of the caſe.

What is moſt wonderful in this caſe is, that after ſo many breaches ſo often happening in the Lungs, this famous Perſon was not in the intervals affected with a Cough, neither fell afterwards into a Conſumption; whereas moſt after any of the ſmalleſt veſſels being open in the *Præcordia*, for ſome time after labour with a Cough with plentiful and thick ſpittle, and at length frequently become Conſumptive. And that it happened otherwiſe to our Patient, I chiefly attribute to the balſamick conſtitution of his blood, *viz.* in the maſs whereof the ſerous recrements are either leſs collected, or ſo ſtrictly mingled, that they cannot be eaſily ſeparated thence; wherefore after the veſſels were broken, or their unity diſſolved, a plentiful Ichor or ſharp humor (being wont to generate a Cough and ſpittle) did not ſweat out as in many others. Moreover what he himſelf obſerved, contrary to many others, that his ſpitting blood happened never in winter, but in Summer, came alſo ſo to paſs by the ſame reaſon: becauſe when the blood did leſs abound with vaporous recrements, the opening or obſtruction of the Pores were neither an advantage nor prejudice to it; nevertheleſs the blood growing hotter than it ought to be, ſeeing it exhaled not, there was a neceſſity it ſhould break out of the veſſels; and when again diminiſhed in quantity, ſending away little or no ſerous Ichor out of the orifices of the veſſels, the ſpitting of blood ceaſed without a remaining Cough. The ſame reaſon holds of many that ſpit blood, wherefore ſome are found much inclinable, others not prone to a Conſumption. This Gentleman ever found the uſe of the pectoral Decoction advantageous to him: wherefore when he often varied other Medicines he always retained the ſame Decoction: moreover he hath commended it to many others ſpitting blood with ſucceſs. The form of the Preſcription was this.

A Drink.

Take of all the Sanders of each ſix drams, infuſe them for twelve hours in ſeven pints of Spring-water, then boil them to a conſumption of a third part, after add leaves of Colts-foot, Maidenhair, Mouſe-ear, Speedwel, flowers of St. John's*-wort, each two handfuls; ſweet Fennel-ſeeds ſix drams, Liquoriſh half an ounce, Raiſins ſtoned half a pound: boil them to four pints, afterwards ſtrain it, and keep it for ordinary drink.*

Moreover

PHAR. Part. II.

Moreover the ſpitting of blood threatning and preſſing upon him, he took thrice or oftner aday the quantity of a Nutmeg of the following Electuary, drinking after it ſeven ſpoonfuls of a Julep.

The Electuary.

Take conſerve of red Roſes three ounces, conſerve of Hips, Comfry, each an ounce and half; Dragons blood a dram, ſpecies of Hyacinth two ſcruples, red Coral a dram, with a ſufficient quantity of ſyrup of red Poppies, mix them and make a ſoft Electuary: let him take hereof evening and morning a dram and half, drinking after a draught of the following Julep. At other times let him lick it with a Liquoriſh-ſtick.

The Julep.

Take Plantane and Spawn-Frog water, each ſix drams; ſyrup of Coral, dried Roſes, each an ounce; Dragons blood two ſcruples: mix them, and make a Julep.

Among the examples of them that ſpit blood the caſe of that Reverend perſon Dr. *Berwick* S.T.P. and lately Dean of St. *Pauls* Church ought not to be omitted, which ſome while ſince I learned partly from the Patient himſelf, and partly was communicated to me from his Brother that moſt skilful Phyſician Dr. *Berwick* my moſt dear Friend.

The ſecond Hiſtory.

That moſt renowned Divine fifteen years before he died laboured with a moſt obſtinate Cough, and ſometimes with a bloody and ſalt ſpittle, with a grievous breath ſtinking like Hell; by which being made lean by a pining away of the body, he wanted but little of being almoſt extinguiſhed by a Conſumption. As often as his ſpitting blood intermitted, the rankneſs of breath and ſpittle ceaſed alſo; afterwards the return hereof declared conſtantly that other affect to be preſently attendant. In this languiſhing condition, when this Renowned man was diſcovered to favour the Kings Party at that time oppreſſed with a grievous Tyranny, and being caſt into a ſtrait Priſon, did drink meer water inſtead of ordinary drink, he recovered his health beyond the hope and expectation of all perſons, and ſo remained indifferently healthful for above ten years ſpace. Nevertheleſs afterwards, I know not by what occaſion, unleſs by the hardſhip of a cold winter, not only the aforeſaid evils, *viz.* a Cough with bloody and ſalt ſtinking ſpittle did become fierce upon him, but alſo over and above, a debility of ſtomach, want of appetite, and a nightly Feaver did accrue. But not long after theſe Symptoms a little remitting, fair weather again ſeemed to ſhine out; until on a certain day, the air being ſuddenly changed into an intenſe cold, towards night he was aſſaulted with great ſtraitneſs of breaſt and difficult breathing, with a quick and weak pulſe, and fainting of all his ſpirits, as if he had been expiring. Nevertheleſs from this danger he ſuddenly eſcaped by the interpoſition of a Criſis, *viz.* by a plentiful ſpitting of blood, and after by a breathing Sweat: but from that time his ſpittle remitted much of the uſual ſtench, and ſomething of its ſaltneſs; and when in a ſhort time afterwards the laſt and moſt painful invaſion of ſpitting blood threatned him, that uſual preſage from ſtench of breath was wanting; but the ſubſequent ſpitting of blood being very plentiful, did ſo debilitate his ſtrength, that from that time declining ſenſibly, he expired within a month: and when a little before his deceaſe, by reaſon of a ſharp pain in his ſide, a Vein was breathed, his blood ſeemed to fail ſo, that almoſt none ſtreamed out. Moreover in his body diſſected after death very little quantity of blood was found: nor could they find any footſteps of the other moſt notable Symptoms, *viz.* ſpitting of blood and of the ſtinking breath and ſpittle; for there was no collection of any filth or ſtinking and putrid matter, nor any cavity in the Lungs made by an Ulcer or Wound; but only one lobe of this bowel, or rather the whole left ſide was ſo hardned from a ſchirrhous Tumor, that the blood could not eaſily or but very little paſs through the frame being ſo obſtructed, and as it were ſtony: wherefore it is no marvel, if the blood that ſhould have paſſed moſt ſwiftly through the Lungs, did now and then burſt out in ſome place from the veſſels, which were joined together, or ſuffered not a circulation by reaſon of the Schirroſity.

The reaſons of the caſe.

Notwithſtanding here a greater difficulty ariſeth, *viz.* whereas his Lungs were found altogether free from any Ulcer or notable wound, whence that moſt dire ſtench of ſpittle and breath, always a forerunner and companion of the bloody ſpittle (the laſt invaſion of this diſeaſe only excepted) proceeded. We have in another place given remarks upon all theſe things, as that Ulcers of the Lungs and the purulent ſpittle of conſumptive perſons ſeldom or never ſtink, but the matter caſt out of an Impoſthume of the Lungs doth frequently ſtink: but that in the ſick Doctor the Lungs being free from either affect, breathed out ſo horrible a breath, the reaſon will beſt of all appear, if we inquire of the manner and cauſe of a ſtench in general. For we obſerve this to be excited when the impure Sulphur is diſſolved either by a lixivial, or an acid Salt, and is precipitated by the other. Let common Sulphur, or Sulphur of Antimony be diſſolved by Oil of Tartar or Stygianw ater; afterwards if you pour on this ſolution a diſſo-

lution

lution of fixed Salt, and upon that, Vinegar, a moſt hideous ſtench will ariſe. In like manner we may conceive in the caſe propoſed, that the ſulphureous particles of the blood being very impure, were corroded by the fixt Salt, with which its juice abounded very much; afterwards when the acid humor, having endured a flux, reflows from the nervous parts into the maſs of blood, it precipitates the diſſolved Sulphur, and ſo cauſes that ſtench to be exhaled from the Lungs, and whilſt it forces the blood into a turgency, a little after it compells to a ſpitting of blood. I have known ſome endued with a breaſt firm enough, and free from all Coughs, and conſumptive diſpoſition, who have for the moſt part breathed out a moſt hideous ſtench: which could proceed from no other cauſe, beſides what even now we have obſerved. The impure blood abounding with Sulphur diſſolved with Salts, if perhaps while it is rarified within the Lungs, and looſned in its frame, it meets with an acid humor, it will exhale in breathing putrid and horrid effluvia's. It happens by the like reaſon of the blood otherwiſe diſpoſed, that as the breath of ſome perſons is very ſtinking, ſo of others very ſweet. And indeed the breath or air reciprocated through Reſpiration, for that it carries out with it the effluvia's of blood highly rarified within the *Præcordia*, one while diſperſes a grateful vapor, another while a moſt unpleaſant.

SECT. I. CHAP. VIII.

Of a Peripneumony, or Inflammation of the Lungs.

The deſcription of a Peripneumony.

A Peripneumony is uſually defined to be, An Inflammation of the Lungs with an acute Feaver, a Cough, and difficult breathing. They who labour with this diſtemper are greatly ſenſible of a notable inflammation in their breaſt with a ſwelling of the Lungs, and ſometimes a pricking pain, they draw a painful and ſhort breath, or as *Hippocrates* affirm, a deep breath; the Feaver preſſes with great thirſt, watching, and painful Cough; whereto alſo bloody ſpittle, or ſtreakt with blood, ſucceeds. By which Symptoms it clearly appears, that this diſeaſe ariſes, in as much as the blood boiling feaveriſhly, doth not eaſily paſs through the leſſer pneumonic Veſſels; but ſticking, in their paſſages, begets firſt an obſtruction, afterwards being more heaped and extravaſated, propagates a Phlegmon or Inflammation with heat, a Cough, and diſcoloured ſpittle. Moreover in as much as the blood ſo accumulated and ſtagnating, puffs up theſe paſſages of the Lungs, and compreſſes them, a difficulty of breathing is cauſed; and in as much as it pulls or diſtends the nervous Fibres, a pain frequently ariſes.

After what manner a Phlegmon is bred in the Lungs.

But if it be asked, how a Phlegmon ſhould grow together in the frame of a Lung meerly bladdery and excarnous; and after what manner it is diſtinguiſhed from that diſtemper which is wont to be ſtirred up in muſculous fleſh, or the ſubſtance of a bowel? We muſt anſwer, although the above-mentioned parts vary as to the texture, notwithſtanding the reaſon of the affect is altogether the ſame in each of them. For the ſmall ſanguiferous veſſels do every where alike embrace, bind, and variouſly gird about both all the Tracheal paſſages in the Lungs, and alſo the fleſhy fibres in the Muſcles, and laſtly the little fibres and nervous threds, with the thickeſt foldings, like cluſters, of the Parenchyma. But that which produces a Phlegmon is the blood it ſelf, which, while it grows very hot, and is hindred in its paſſage, every where, and eſpecially in the Lungs, whoſe veſſels branch into very ſmall foldings, doth firſt beget an obſtruction, and then an inflammation.

The conjunct cauſe of a Peripneumony conſiſts in two things.
1. *That the blood boils.*
2. *That it ſticks in the paſſages.*

Wherefore the formal reaſon and conjunct cauſe of a Peripneumony conſiſts in theſe two things *viz.* that the blood boils feaveriſhly, and ſticking alſo within the more narrow paſſages of the Lungs, engenders there an obſtruction cauſing inflammation. Unleſs theſe two things concur, there is an exemption from this diſeaſe; for in many other Feavers, eſpecially in a burning Ague, though the blood, moſt intenſly, heated and inflaming all the *Præcordia*, as alſo in the longing of women, the Green-ſickneſs and the Dropſie of the breaſt, is very clammy, yet though ſticking very much in the paſſages of the Lungs, it does not ſtir up a Peripneumony: to produce which both diſtempers muſt concur and joyn their ſtrength. Nevertheleſs when there is an indiſpoſition of both theſe, one while this, another while that, is firſt in act, and after a ſort one is the cauſe, or at leaſt the occaſion of the other. For ſometimes the blood irritated into a Feaver cauſes an obſtruction of the Lungs; and the blood alſo ſometimes finding a remora in the Lungs, receives a feaveriſh boiling from its proper obſtruction. Not-

Sometimes this diſpoſition ſometimes that is firſt.

PHAR. Part. II.

withſtanding, for the conſtituting the procatarctic cauſe of this diſeaſe, the blood ought to be fitted as well for the boiling, as for the obſtructing the veſſels of the Lungs.

What that is Phlebotomy diſcovers.

Tho it will not be eaſie to ſhew what this diſpoſition of the bloody liquor is inclining to a Peripneumony, yet the reaſon thereof doth ſomething appear by Phlebotomy, always made uſe of in this diſeaſe with the beſt ſucceſs. For the blood being drawn from any labouring with this diſeaſe, as alſo from thoſe in a Pleuriſie, after it grows cold in its ſuperficies, inſtead of a Scarlet cream, it hath a little film ſomewhat white or otherwiſe diſcoloured growing on it, which alſo is very tough and viſcous: whence we may conjecture, that the maſs of blood being too ſtrait in its frame, whilſt that in the circulation it doth not diſcharge its recrements, grows too thick, and as it were clammy, and for that cauſe becomes too prone as well to boil as to ſtick within the narrow paſſages, and eſpecially of the Lungs.

What affection of the blood produces it.

But if farther inquiſition be made, from whence this diſpoſition of blood proceeds, by which it becomes clammy and viſcous like ropy wine; the general reaſon hereof is this, *viz.* that the more thick parts of blood are not made thin enough by the more ſubtile; ſo that all of them being equally mixed and mutually incorporated, at length the good humors ſeparate themſelves into their appropriate functions, and the ſuperfluous are perpetually diſcharged by their proper Emunctories. But on the other ſide in as much as the ſulphureous particles of the blood being combined together with the ſaline and earthly too much exalted, enſnare and entangle all the reſt; for that cauſe its liquor containing within it ſelf all its recrements and impurities, grows clammy as glue, and in that regard contracts an inflammable diſpoſition.

For it is obvious to every perſon, that the blood that grows clammy in this manner, is rendred prone to obſtruct the narrow paſſages of the veſſels (which ſurely are very ſmall in the Lungs); moreover for the ſame reaſon they are diſpoſed to become feaveriſh: *viz.* becauſe retaining obſtinately within its own boſom all the feculencies and recrements, from the ſame preſently gathered into a heap, it is conſtrained into a great turgeſcence or ſwelling, whereby of neceſſity an inflaming obſtruction of the Lungs takes either its origine or augmentation.

The fault of the Lungs produces it.

Moreover as to the procatarctic cauſe of this diſeaſe very frequently the faultineſs of the Lungs is joined herewith, and determines that general intemperament of blood to affect this part in ſuch a ſort. For as the clammy blood grows hot, the more ſtrong and ſound *Præcordia* do frequently diſcharge the deſigned miſchief from themſelves, and the taint being fixed to the Pleura, or about the habit of the body, a Pleuriſie or Rheumatiſm is rather cauſed than a Peripneumony. Nevertheleſs the tender Lungs being obnoxious to a Cough, or formerly prejudiced in their frame either by ſpitting blood, or other diſtempers of the breaſt, from the blood boiling up (while it is too much bound and clammy in its own conſiſtence) they eaſily engender an obſtructing Phlegmon.

The evident cauſes of a Peripneumony.

Hitherto of the conjunct and procatarctic cauſes of a Peripneumony: as for what regards the evident cauſes, whatſoever ſuddenly perverts the temperament of the blood, or reſtrains its free tranſpiration, ought to be referred hither, as chiefly are exceſſes of heat and cold, or the inordinate drinking of Wine or ſtrong Waters, any vehement exerciſe, and the drinking of ſome waters, and thoſe eſpecially icy. Beſides, ſometimes a malignant diſtemperature of Air doth engender this diſeaſe in many, and makes it Epidemical.

It often ſucceeds or follows after a Pleuriſie.

Authors in Phyſick do every where obſerve (and it is alſo a vulgar obſervation) a Peripneumony frequently ſucceeds or comes upon a Pleuriſie; but nothing is more uſual than in a Pleuriſie a bloody and thick-ſpittle, and as it were purulent to be voided. Hence a great diſquiſition ariſes, by what paſſage or ways the matter by ſpittle caſt out, can be conveyed from the Pleura to the Tracheal paſſages. Some think, that this being fallen into the cavity of the *Thorax*, is ſucked into the Lungs as with a Sponge; and others ſuppoſe, that it is tranſferred thither by the Membranes adhering thereto, by which the Lungs often ſtick unto the Pleura. But truly either way ſeems improbable if not impoſſible. For firſt, that the Lungs do not ſuck in the contents of the hollowneſs of the Cheſt is manifeſt from hence, becauſe in a Dropſie or wound of the breaſt, when they happen, the Lungs being unhurt, neither water nor blood is at all diſcharged by coughing; though frequently great plenty of this or that humor be there, which preſently flows out of its own accord from the *Thorax*, inciſion being made. But that ſometimes the Membranes growing from the Lungs, knit themſelves to the Pleura, is clearly manifeſt by Anatomical Obſervation; yea and by this way of return I have ſometimes known the purulent matter tranſlated into the ſide, and there by an Iſſue, made by Art or Nature, to have been evacuated with a healthful Criſis: nevertheleſs ſuch Membranes of the Lungs joined to the Pleura do ſeldom pre-exiſt, and in a Pleuriſie, which is a very acute diſeaſe, they cannot, like a Muſhroom, be the iſſue of one or

two

two days: moreover, though ſometimes thoſe obſcure paſſages may be ready at hand, which perhaps by ſome admirable inſtinct of Nature diſcharge ſomething out of the Lungs towards the precincts of the *Thorax*; yet it ſeems againſt the Oeconomy of Nature, that they can derive any corruption outwardly engendered to this moſt noble part within, which ſurely is the fountain both of life and heat.

The reaſon of this is inquired into.

As to this, if it may be lawful to propound our Judgment, I am induced to think that a Peripneumony and Pleuriſie are one while ſingular and ſeparate affects, and another while bred together and coexiſting from the firſt, and another while are by courſe one after another or ſuccedaneous. For the procuring cauſe being ſtirred up into act, ſo that the blood growing clammy, and boiling together, obſtructs in ſome places the leſſer veſſels: the neſt of the diſeaſe ſometimes is faſtned on the Pleura, or ſeperately in the Lungs, ſometimes in each of them together, and ſometimes firſt in one, and then in t'other: but for the moſt part, the Pleura being firſt healed, preſently the ſame morbific cauſe invades alſo the Pneumonic Veſſels. Moreover we have known a various ſhifting of this effect; *viz.* that it has firſt troubled the right or left ſide, preſently that being deſerted, to have occupied the Lungs, and afterwards both being deſerted, to affect the Brain, and frequently to transfer its ſeat from thence into the above-mentioned places. But for the reaſon aforeſaid a Peripneumony not only ſucceeds a Pleuriſie, but frequently a Squinancy, and ſometimes other diſtempers: for while the Blood growing clammy, and boiling together, continues a Feaver in the whole, it transfers the obſtruction cauſing a Phlegmon variouſly hither and thither. And from hence the ſolution of that obſervation is clearly manifeſt, which has ſo much puzled Interpreters, *viz.* that a Palſie or dead Palſie of one ſide doth ſometimes ſucceed a Peripneumony, becauſe the blood that being clammy, had lately obſtructed the Pneumonic Veſſels, afterwards ſtuffing certain foldings of the veſſels of the Carotides, prohibits the engendring of animal ſpirits in this or that part of the head, and ſo reſtrains their influence into the reſpective nervous parts. From what hath been ſaid, the chief differences of a Peripneumony are made plain, namely that it is either a ſimple diſtemper, or joined together with a Pleuriſie, Squinancy, or ſome other, and then it is either primary or ſecondary. Moreover it is uſually diſtinguiſhed as to the Feaver and ſtate of breathing: to wit, according as this is more or leſs prejudiced, and as it ſhall be more intenſe or remiſs, this diſeaſe alſo is denominated either more or leſs acute.

The differences of this diſeaſe.

Prognoſtics.

As to the Prognoſtics of this diſeaſe, common experience doth atteſt, that it is a very dangerous diſeaſe, becauſe many Patients either die of it, or very difficultly recover health. No leſs may we conclude this from the reaſon or Etymology of it; for a wound with much extravaſation of blood, or a ſtagnation cauſed in the Lungs, is moſt difficulty cured, and the affected place is never reſtored unto its former conformation. The Prognoſtic ſigns, which are of greateſt note, are taken from the appearance of Symptoms and nature of things thrown out, and the State of ſtrength.

1. From the appearance of Symptoms.

1. A Peripneumony coming upon a Pleuriſie or Quinzy, for the moſt part is worſe than ariſing of it ſelf, or ſucceeding either of them: but if upon this diſeaſe, after what manner ſoever begun, an acute Feaver follows with great thirſt, watchings, and not breathing unleſs ſet upright, it is ill; and yet much worſe, if upon it a Delirium, a Frenzy, convulſive motions, or a Palſie on one ſide enſue. Moreover the Patient is not in leſs danger, if he be very purſie, if troubled with vomiting, or frequent ſwounding away, a weak Pulſe, and a cold ſweat. For while theſe Symptoms are inſtant upon him, the obſtruction of the blood in the Lungs is not removed, nothing is digeſted or ejected by ſpittle; but circulation of the blood being more and more hindred, and its kindling by breathing ſtopt, the animal ſpirits are throughly diſordered, and at length faint, until together with a proſtration of the whole ſtrength the vital flame is extinguiſhed.

2. From what is excreted.

2. As to Prognoſtics from things excerned, we obſerve Peripneumony to be dangerous, wherein nothing is thrown out by ſpittle; next to this, when the ſpittle is thin and crude, mixed with blood; it is far better when the ſpitting is yellow and thick, ſtreaked with a little blood. The Urine being yellow from the beginning, and of a good conſiſtency, with a cloud in the midſt ſhews that almoſt all the recrements of the blood are lodged in the place affected; when from that ſtate it is changed into a thick and turbid Urine, it ſhews the morbific matter to be ſwallowed up again from that part into the blood; but if ſuch kind of Urine be ſuddenly changed into a thin one, then a Delirium or death it ſelf is impendent. Much Sweat and plenty of Urine, a Diarrhœa, bleeding at Noſe, flowing of the Menſtrua's, or the Hæmorrhoids do frequently promiſe good in this diſtemper, yea any of theſe Evacuations happening ſeaſonably doth frequently diſcharge the diſeaſe.

PHAR. Part. II.

3. From the ſtate of ſtrength.

3. The condition of ſtrength is ever of great moment in forming a due Prognoſtic in this diſeaſe: for oftentimes when horrid Symptoms, as an intenſe Feaver, a Breathing very painful, with a Cough, watchings, and other ominous ſigns, ſhall be preſſing, if the Pulſe be as yet ſtrong, and the animal ſpirits perſiſt in their vigor, there is better hope of the Patient, than if theſe things being more quiet, there were a weak Pulſe, and the Spirits ſhould become drowſie and oppreſſed.

The Cure hath two chief indications.

The firſt indication about the curatory Method in a Peripneumony is, that the blood being impacted in the pneumonic Veſſels, and cauſing a Phlegmonous obſtruction, may be from thence diſcuſſed and reſtored to its priſtine circulation. Which if not to be procured, the ſecond indication will be, that that matter be dully digeſted or brought to ſuppuration, and with all expedition voided by ſpittle.

The firſt indication ſuggeſts four intentions of curing.

While the former indication prevails, the intentions of healing will be theſe enſuing Firſt, that the more plentiful afflux of blood to the part affected be prevented, or prohibited, by ſome means. Secondly, we muſt indeavour, that the matter ſtagnated or extravaſated in the Lungs, be ſwallowed again by the Veins into the reſt of the maſs, and cauſed to circulate. Which that it may be the better procured, thirdly, the blood ought to be freed from its clammy viſcouſneſs, whereby its fluidity is impeded. Fourthly, that we apply to the Symptoms moſt urgent, *viz.* a Feaver, Cough, Watchings, and difficult Breathing, fit Remedies. But if notwithſtanding all theſe another indication ſhall come into uſe, it will be requiſite to preſcribe maturating and expectorating Mddecines vulgarly ſo called, together with theſe.

1. The firſt intention that the afflux of blood may be cut off. 2. That the extravaſated be reduced to circulation.

1. That we may ſatisfie the firſt and ſecond intention together, Phlebotomy is for the moſt part requiſite in every Peripneumony, yea ſometimes it ought to be more frequently repeated; for the veſſels being emptied of blood do not only withdraw the nouriſhment of the diſeaſe, but do alſo ſup up the matter impacted in the place affected Wherefore if ſtrength remain, and the Pulſe be ſtrong enough, a more free breathing of a Vein is convenient at the very beginning; but otherwiſe let it be uſed in a little quantity, which however may be repeated as occaſion offers it ſelf. We intimated above, that blood drawn in a Peripneumony and alſo in a Pleuriſie, after it is cold, contains in its ſuperfices a ſmall viſcous and diſcoloured film: moreover we may obſerve one while the blood entirely, another while only a portion thereof is ſubject to this change. For when the blood is received into three or four diſhes, ſometimes in all, but oftener in the ſecond and third diſh it is apparently bad, and in the firſt and laſt laudable enough: wherefor e they commonly give it in precept, that blood is alwayes ſo long to be emitted, till that which is ſo depraved begins to come forth; and if ſtrength remain, the bleeding ſhould continue till the good blood flows out again. Truly as common experience doth approve of this praictice, even ſo doth reaſon it ſelf; for in this diſeaſe, becauſe the whole maſs of blood doth not preſently acquire that clammineſs, the depraved portions are chiefly accumulated about the place of obſtruction, and adhere on every ſide in the leſſer veſſels. Wherefore the blood firſt iſſuing by Phlebotomy is often void of any fault; afterwards the veſſels being emptied receive the other morbific matter at firſt ſtagnated, and reſtored it to its circulation; and when the portions thereof being placed near, are carried as it were in a joint troop, they flow out together at the orifice of the opened Vein, and after that entire maſs of bad blood hath flowed out, the reſidue being more pure doth ſucceed. Wherefore in this caſe ever let inciſion be made with a large orifice, and let the blood be drawn out not only with a more plentyful ſpouting, but alſo with a continued: for otherwiſe if in the midſt of Phlebotomy, the bad blood iſſuing out, the orifice (as the manner of ſome is, leſt the ſpirits ſhould faint) be cloſed with the finger, when again it is opened, the blood pure enough will iſſue next, but the bad ſliding by, if there be any remaining, will not return preſently to that orifice. Beſides Phlebotomy many other remedies, *viz* whatſoever do repreſs the turgency of Blood, and empty the paſſages thereof, whereby the morbific matter may be ſuckt up, are here to be uſed. Wherefore a very thin diet is preſcribed for the moſt part meerly of Barley and Oats: and if Cathartics are altogether prohibited, becauſe they diſquiet the Blood, and hurry it more impetuouſly into the part affected; notwithſtanding Clyſters which gently looſen the Belly, and draw the recrements of the blood towards the Belly, ought to be daily uſed. Moreover Juleps and temperating Apozemes which bridle the fervour of the blood, and draw out the ſuperfluous ſeroſities thereof, and which alſo do gently open the paſſages of the Breaſt, are taken with ſucceſs

Rules concerning Phlebotomy.

The third intention of healing is that the clammineſs or viſcoſity of the blood may be taken away.

3. The third intenſion of healing, which reſpects the withdrawing of the clammineſs or obſtructing viſcoſity of the blood, is altogether to be performed by remidies which unlooſe the ſrame thereof being too much bound, and diſſolve the coupling together of its ſalts. And truly the remidies of this kind, which in this reſpect reaſon and analogy

analogy would dictate, are now received into use by long experience. For Powders of Shell-fish, the Tooth of a Boar, and the Jaws of a Pike, and other things endued with an Alkali Salt, also Sal Prunellæ, for the most part are prescribed by all Practitioners, as well modern as ancient. I have more frequently known the Spirit of Salt Armoniac and of Harts-horn to have yielded notable relief in this disease: and for the same reason it is, (*viz.* because the volatile Salt is useful) that the infusion of Horse-dung, though a common remedy, affords oftentimes singular help. PHAR. Part. II.

4. As to the Symptoms and their Cure, very many remedies appropriated to these fall in together with the former; for against the Feaver the same Julips and Apozems which appease the heat of blood, and withal recreate the animal spirits are of most common use: to which besides in respect of the Cough and difficult breating, temperate pectoral Remedies are added. The great difficulty is what ought to be exhibited against want of sleep, when it shall grievously oppress; for Opiates, because they do further prejudice the breathing, which in this disease is already hindred, are scarce safely administred, nay sometimes become mortal. Wherefore Laudanum and the strong Preparations of Opium are to be shun'd in a Peripneumony worse than a Dog or a Snake; nevertheless Anodynes sometimes, and mild Hypnotics, as water and Syrup of red Poppies, are not only allowed, but accounted specific remedies in this disease and in a Pleurise: but sometimes it will be expedient to use Diacodiates as long as strength endures, and as long as the Pulse is strong and good enough. For the pain of the breast if at any time it be troublesome, it is expedient sometimes to apply Liniments, Fomentations, and Cataplasms. *4. That the most urging Symptoms may be helpt.*

The second curative indication whose intentions are to digest the matter impacted in the Lungs (if it cannot be discussed or suckt up) and to throw it out by spittle, requires ordinary maturating and expectorating Medicines, both which notwithstanding ought to be temperate, that is to say, such as asswage thirst, and appease the feaverish heat rather than exasperate it. We have above recited in the Chapter of a Cough the kinds of these sorts of Remidies properly called Pectorals; the more select Receipts and chiefly accommodated to this affect, shall be annexed here beneath. *The second indication respects the maturation and expectoration of the morbific matter.*

The Forms of Remidies.

1, 2. The Medicines conducing to the first and second intention are prescribed according to the following Forms,

Take the water of Cardus Mariæ ten ounces, red Poppies three ounces, Syrup of the same an ounce, Pearls prepared a dram, make a Julep: the dose six spoonfuls every fourth hour. Juleps.

Take water of black Cherries, Cardus Benedictus, Balm, each four ounces; powder of a Boars tooth a dram, Syrup of Violets ten drams: make it into a Julep to be taken after the same manner.

Take Grass-roots three ounces, shavings of Ivory and Harts-horn each three drams, Raisins stoned an ounce and half, Liquorish two drams, boil them in Spring-water from three pints to two, to the strained liquor add Syrup of Violets an ounce, Sal prunellæ a dram: make an Apozem to be taken thrice a day about three or four ounces. Apozemes.

For the same intention, *viz.* that the Vessels being emptied may withdraw the nourishment from the disease, or sup up the morbific matter, a Purge is prescribed by many. In the Practice of the Ancients against this disease, even as against many others, after Phlebotomy, Preparatives and Purgatives were usually appointed in a constant course, and of late the Chymists with greater boldness do recommend Vomits, and in a Peripneumony prefer it to all other remedies. Yea Phlebotomy being omitted or countermanded, they place the chief Cure in stibiate Vomits: than which rash advice of theirs I know not any thing may be thought of more pernicious. Indeed in rustic and robust bodies sometimes this Cure has been effected without danger, notwithstanding for the most part no less unsuccessful; but in tender constitutions it ought to be reckoned little inferior to poyson. But for what respects Purgation, although it may not be presently convenient from the beginning, because it is then for the most part prejudical, nevertheless the flowing of the morbific matter being finished, and the effer vescency of blood being appeased, we may safely and gently evacuate the body with a loosning Purge. *Purgation.*

Take of the decoction of Senna of Gereon *four ounces, Syrup of Roses solutive an ounce: mix them for a Potion.* Or, Purges.

Take the best Senna three drams, Cassia and Tamarinds each half an ounce, Coriander-seed two drams: boil them in a sufficient quantity of Spring-water to six ounces, to which strained add Syrup of Violets an ounce, clarified with the white of an Egg, and let it be given.

Purgative

PHAR. Part. II.

3. From the ſtate of ſtrength.

3. The condition of ſtrength is ever of great moment in forming a due Prognoſtic in this diſeaſe: for oftentimes when horrid Symptoms, as an intenſe Feaver, a Breathing very painful, with a Cough, watchings, and other ominous ſigns, ſhall be preſſing, if the Pulſe be as yet ſtrong, and the animal ſpirits perſiſt in their vigor, there is better hope of the Patient, than if theſe things being more quiet, there were a week Pulſe, and the Spirits ſhould become drowſie and oppreſſed.

The Cure hath two chief indications.

The firſt indication about the curatory Method in a Peripneumony is, that the blood being impacted in the pneumonic Veſſels, and cauſing a Phlegmonous obſtruction, may be from thence diſcuſſed and reſtored to its priſtine circulation. Which if not to be procured, the ſecond indication will be, that that matter be dully digeſted or brought to ſuppuration, and with all expedition voided by ſpittle.

The firſt indication ſuggeſts four intentions of curing.

While the former indication prevails, the intentions of healing will be theſe enſuing Firſt, that the more plentiful afflux of blood to the part affected be prevented, or prohibited, by ſome means. Secondly, we muſt indeavour, that the matter ſtagnated or extravaſated in the Lungs, be ſwallowed again by the Veins into the reſt of the maſs, and cauſed to circulate. Which that it may be the better procured, thirdly, the blood ought to be freed from its clammy viſcouſneſs, whereby its fluidity is impeded. Fourthly, that we apply to the Symptoms moſt urgent, *viz.* a Feaver, Cough, Watchings, and difficult Breathing, fit Remedies. But if notwithſtanding all theſe another indication ſhall come into uſe, it will be requiſite to preſcribe maturating and expectorating Mddecines vulgarly ſo called, together with theſe.

1. The firſt intention that the afflux of blood may be cut off. 2. That the extravaſated be reduced to circulation.

1. That we may ſatisfie the firſt and ſecond intention together, Phlebotomy is for the moſt part requiſite in every Peripneumony, yea ſometimes it ought to be more frequently repeated; for the veſſels being emptied of blood do not only withdraw the nouriſhment of the diſeaſe, but do alſo ſup up the matter impacted in the place affected Wherefore if ſtrength remain, and the Pulſe be ſtrong enough, a more free breathing of a Vein is convenient at the very beginning; but otherwiſe let it be uſed in a little quantity, which however may be repeated as occaſion offers it ſelf. We intimated above, that blood drawn in a Peripneumony and alſo in a Pleuriſie, after it is cold, contains in its ſuperfices a ſmall viſcous and diſcoloured film: moreover we may obſerve one while the blood entirely, another while only a portion thereof is ſubject to this change. For when the blood is received into three or four diſhes, ſometimes in all, but oftener in the ſecond and third diſh it is apparently bad, and in the firſt and laſt laudable enough: wherefore they commonly give it in precept, that blood is alwayes ſo long to be emitted, till that which is ſo depraved begins to come forth; and if ſtrength remain, the bleeding ſhould continue till the good blood flows out again. Truly as common experience doth approve of this praictice, even ſo doth reaſon it ſelf; for in this diſeaſe, becauſe the whole maſs of blood doth not preſently acquire that clammineſs, the depraved portions are chiefly accumulated about the place of obſtruction, and adhere on every ſide in the leſſer veſſels. Wherefore the blood firſt iſſuing by Phlebotomy is often void of any fault; afterwards the veſſels being emptied receive the other morbific matter at firſt ſtagnated, and reſtored it to its circulation; and when the portions thereof being placed near, are carried as it were in a joint troop, they flow out together at the orifice of the opened Vein, and after that entire maſs of bad blood hath flowed out, the reſidue being more pure doth ſucceed. Wherefore in this caſe ever let inciſion be made with a large orifice, and let the blood be drawn out not only with a more plentyful ſpouting, but alſo with a continued: for otherwiſe if in the midſt of Phlebotomy, the bad blood iſſuing out, the orifice (as the manner of ſome is, leſt the ſpirits ſhould faint) be cloſed with the finger, when again it is opened, the blood pure enough will iſſue next, but the bad ſliding by, if there be any remaining, will not return preſently to that orifice. Beſides Phlebotomy many other remedies, *viz* whatſoever do repreſs the turgency of Blood, and empty the paſſages thereof, whereby the morbific matter may be ſuckt up, are here to be uſed. Wherefore a very thin diet is preſcribed for the moſt part meerly of Barley and Oats: and if Cathartics are altogether prohibited, becauſe they diſquiet the Blood, and hurry it more impetuouſly into the part affected; notwithſtanding Clyſters which gently looſen the Belly, and draw the recrements of the blood towards the Belly, ought to be daily uſed. Moreover Juleps and temperating Apozemes which bridle the fervour of the blood, and draw out the ſuperfluous ſerolities thereof, and which alſo do gently open the paſſages of the Breaſt, are taken with ſucceſs

Rules concerning Phlebotomy.

The third intention of healing is that the clammineſs or viſcoſity of the blood may be taken away.

3. The third intenſion of healing, which reſpects the withdrawing of the clammineſs or obſtructing viſcoſity of the blood, is altogether to be performed by remidies which unlooſe the frame thereof being too much bound, and diſſolve the coupling together of its ſalts. And truly the remidies of this kind, which in this reſpect reaſon and analogy

analogy would dictate, are now received into use by long experience. For Powders of Shell-fish, the Tooth of a Boar, and the Jaws of a Pike, and other things endued with an Alkali Salt, also Sal Prunellæ, for the most part are prescribed by all Practitioners, as well modern as ancient. I have more frequently known the Spirit of Salt Armoniac and of Harts-horn to have yielded notable relief in this disease: and for the same reason it is, (*viz.* because the volatile Salt is useful) that the Infusion of Horse-dung, though a common remedy, affords oftentimes singular help. PHAR. Part. II.

4. As to the Symptoms and their Cure, very many remedies appropriated to these fall in together with the former; for against the Feaver the same Julips and Apozems which appease the heat of blood, and withal recreate the animal spirits are of most common use: to which besides in respect of the Cough and difficult breating, temperate pectoral Remedies are added. The great difficulty is what ought to be exhibited against want of sleep, when it shall grievously oppress; for Opiates, because they do further prejudice the breathing, which in this disease is already hindred, are scarce safely administred, nay sometimes become mortal. Wherefore Laudanum and the strong Preparations of Opium are to be shun'd in a Peripneumony worse than a Dog or a Snake; nevertheless Anodynes sometimes, and mild Hypnotics, as water and Syrup of red Poppies, are not only allowed, but accounted specific remedies in this disease and in a Pleurise: but sometimes it will be expedient to use Diacodiates as long as strength endures, and as long as the Pulse is strong and good enough. For the pain of the breast if at any time it be troublesome, it is expedient sometimes to apply Liniments, Fomentations, and Cataplasms. *4. That the most urging Symptoms may be helpt.*

The second curative indication whose intentions are to digest the matter impacted in the Lungs (if it cannot be discussed or suckt up) and to throw it out by spittle, requires ordinary maturating and expectorating Medicines, both which notwithstanding ought to be temperate, that is to say, such as asswage thirst, and appease the feaverish heat rather than exasperate it. We have above recited in the Chapter of a Cough the kinds of these sorts of Remidies properly called Pectorals; the more select Receipts and chiefly accommodated to this affect, shall be annexed here beneath. *The second indication respects the maturation and expectoration of the morbific matter.*

The Forms of Remidies.

1, 2. The Medicines conducing to the first and second intention are prescribed according to the following Forms,

Take the water of Carduus Mariæ ten ounces, red Poppies three ounces, Syrup of the same an ounce, Pearls prepared a dram, make a Julep: the dose six spoonfuls every fourth hour. Juleps.

Take water of black Cherries, Carduus Benedictus, Balm, each four ounces; powder of a Boars tooth a dram, Syrup of Violets ten drams: make it into a Julep to be taken after the same manner.

Take Grass-roots three ounces, shavings of Ivory and Harts-horn each three drams, Raisins stoned an ounce and half, Liquorish two drams, boil them in Spring-water from three pints to two, to the strained liquor add Syrup of Violets an ounce, Sal prunella a dram: make an Apozem to be taken thrice a day about three or four ounces. Apozemes.

For the same intention, *viz.* that the Vessels being emptied may withdraw the nourishment from the disease, or sup up the morbific matter, a Purge is prescribed by many. In the Practice of the Ancients against this disease, even as against many others, after Phlebotomy, Preparatives and Purgatives were usually appointed in a constant course, and of late the Chymists with greater boldness do recommend Vomits, and in a Peripneumony prefer it to all other remedies. Yea Phlebotomy being omitted or countermanded, they place the chief Cure in stibiate Vomits: than which rash advice of theirs I know not any thing may be thought of more pernicious. Indeed in rustic and robust bodies sometimes this Cure has been effected without danger, notwithstanding for the most part no less unsuccessful; but in tender constitutions it ought to be reckoned little inferior to poyson. But for what respects Purgation, although it may not be presently convenient from the beginning, because it is then for the most part prejudical, nevertheless the flowing of the morbific matter being finished, and theeffer vescency of blood being appeased, we may safely and gently evacuate the body with a loosning Purge. *Purgation.*

Take of the decoction of Senna of Gereon *four ounces, Syrup of Roses solutive an ounce: mix them for a Potion.* Or, Purges.

Take the best Senna three drams, Cassia and Tamarinds each half an ounce, Coriander-seed two drams: boil them in a sufficient quantity of Spring-water to six ounces, to which strained add Syrup of Violets an ounce, clarified with the white of an Egg, and let it be given.

Purgative

PHAR. Part. II.

Purgatives are not always to be exhibited, nor ever unadviſedly in this diſeaſe: but frequent Clyſters, and almoſt daily are in uſe; but let them be gentle and emollient only, which eaſily looſen the belly, without any great agitation of humours or blood. For this purpoſe Milk or the Whey thereof is often convenient, with red Sugar, or ſyrup of Violets: Or,

Clyſters. *Take the leaves of either ſort of Mallowes, of Melilote, of Mercury, of each one handful, Linſeed and ſweet Fennel-ſeeds, of each half an ounce, ſweet Prunes, numb. vi. boyl them in a ſufficient quantity of Spring-water to a pinte, to which add ſyrup of Violets one ounce, Sugar ten drams, ſal Prunella one dram, make a Clyſter.*

Things diſſolving the clammineſs of the blood. 3. Medicines for the third intention, *viz.* for the diſſolving the Clammineſs of the Blood, are wont to be adminiſtred in form of a Powder, of a Spirit, a Potion, or of a Bolus, according to the manner following.

1. Powders.

Powders. *Take of Crabs eyes two drams, ſal Prunella one dram and half, pearl'd Sugar one dram, make a powder for 6 doſes, one to be taken every ſixth hour, with a proper Julep or Apozeme.* Or,

Take of the Tuſk of a Boar, (or the Jaw of a Pike) of Crabs-eyes, of each one dram and half, flowers of Salt Armoniack, Powder of red Poppy Flowers, of each half a dram, mix them for 4 doſes.

2. Spirits and Chymical Liquors.

Spirits. *Take of ſpirit of ſalt Armoniack diſtill'd with Olibanum, 3 drams; the doſe from 12 drops to 15 or 20, three times in a day.* Or,

Take Spirit of Urine or Soote, after the ſame manner, three drams.

Take of the ſweet Spirit of Nitre, (viz. often cohobated with Spirit of Wine,) 3 drams, the doſe from 6 drops to ten after the ſame manner.

Take half an ounce of Spirit of Tartar, doſe 15 drops to 20 or 25, in a fit vehicle.

Take of the ſimple mixture one ounce: the doſe is one ſcruple to half a dram, after the ſame manner.

3. Potions.

Potions. *Take of Cardnus-water one pound, freſh Horſe-dung 3 ounces, diſſolve it warm, and filtre it; the doſe is 3 or 4 ounces, twice or thrice in a day, with half an ounce of Syrup of Violets or red Poppyes.*

Take of the Leaves of Dandelyon two handfuls, bruiſed and infuſed in half a pound of Carduus Mariæ water, Treacle-water half an ounce, preſs it out, and add powder of Crabs-eyes one dram: take 4 or 6 ſpoonfuls three times aday.

The cure of the Symptomes. The fourth intention of Healing in reſpect of the ſymptomes greatly urging, doth ſuggeſt divers ſorts of preparations of Medicines. 1. In reſpect of the Feaver, the Juleps and Apozemes above recited are convenient. Moreover, the uſe of Mineral Cryſtal ought to be frequent. 2. For the Cough and difficult Breathings, Linctus's, Eclegma's, and Decoctions, or pectoral Juleps are adminiſtred with ſucceſs.

Linctus's. *Take of Syrup of Jujubes, of Maiden-hair, of each one ounce and half, of Violets one ounce, flower of Nitre one ſcruple; make a Linctus to be lickt now and then.*

Take of ſyrup of Marſh-mallows one ounce, Diacodium, red Poppyes, each half an ounce, powder of Crabs-eyes two ſcruples; make a Lohoch, to be taken the ſame way.

Lohochs. *Take ſyrup of Hyſſop, of Liquoriſh, of each one ounce and half, red Poppy-flowers powder'd, one ſcruple, Crabs-eyes one dram, Lohoch de Pino 6 drams, make a Lohoch, take the quantity of a Nutmeg four times or oftner in a day.*

An Apozeme. *Take the roots of Graſs, Chervil, Marſh-mallows, of each one ounce, Figgs numb. 4. Jujubes and Sebeſtens, of each numb. 6, Raiſins one ounce, Liquoriſh three drams, Barly half an ounce, boyl them in three pints of Spring-water to two, ſtrain it; the Doſe three or four ounces.*

Take Raiſins ſtoned one ounce and half, Filberds numb. 4. cut, Liquoriſh ſliced 3 drams, of Hyſſop-water a pound and half, infuſe them warm in a cloſed Veſſel 6 hours, ſtrain, and add ſyrup of Marſh-mallows an ounce and half, make a Julep, the doſe is 3 or 4 ſpoonfuls often in a day, ſwallowing it by degrees.

3. Againſt

3ly, Against Watchings, *Take Poppy-water 3 ounces, ſyrup of red Poppies 6 drams, Aq. Epidemica 2 drams, for a draught, to be taken at night.* PHAR. Part. II.

If the Pulſe be ſtrong, and the ſtrength agreeable, *Take Cowſlip-water 3 ounces, ſyrup de Meconio half an ounce, for a draught at night.* *Againſt Watching.*

4. If the pain be troubleſome about the place affected, *Take Oyntment of Marſh-mallows two ounces, Oyl of ſweet Almonds an ounce and half, mingle them for a Liniment to be applyed with thin Lawn-paper.* *For pain.*

Take of Oyntment of Marſh-mallows and pectoral Oyntment, of each an ounce and half, Linſeed Oyl freſh drawn one dram, to which add the Plaiſter call'd Emp. de Mucilaginibus, make a Plaiſter for the Region of the breaſt, to be applyed on the place affected.

Fifthly, For the laſt intention of curing which anſwers to the ſecondary Indication, and preſcribes Medicines ripening and expectorating, the following forms are convenient.

Take Linſeed Oyl freſh drawn three ounces, Syrup of Violets two ounces, Hyſſop-water half a pound, mix them in a Glaſs, take two or three ounces three times in a day, ſhaking the Glaſs firſt. *Maturating medicines.*

Take powder of Olibanum one dram, put it into an Apple made hollow, and roaſt it in hot Embers, let him eat it at night, repeating it three or four times.

Take Oyl of Almonds freſh drawn, Syrup of Maiden-hair, of each an ounce and half, Sugar-Candy two drams, ſtir them well in a Glaſs-mortar until they are perfectly mixt, make a Linctus to be taken often in a day with a Liquoriſh ſtick; alſo let a ſpoonful be taken three times aday in a draught of Poſſet-drink. *Expectorating Medicines.*

As to the reſt, Remedies preſcribed againſt a beginning Conſumption do alſo profit in this caſe.

It would be eaſie to heap up here many Hiſtories and Inſtances of Patients affected with a Peripneumonie; but whereas the ſame order and figure of the diſeaſe, and the ſame reaſons of the Symptoms are almoſt in all, it ſuffices here to note one or two Examples only. And while I was writing theſe things I am ſent for to a Patient grievouſly ſick with a Peripneumonie. He was aged about Fifty years, lean in body, and of a cholerick temper, by taking cold he fell into a Feaver, with a Cough, with pain of the Breaſt, and difficult breathing: when he had laboured thus four dayes without any remedy or phyſical adminiſtration, I found him in a notable Feaver, with thirſt, and a huge inflammation of the Precordia, breathing very difficultly, with labour of the Thorax, and painfully, with a noiſe of the Bronchia, inſomuch that he ſeemed evidently in the very Agony of death. His Pulſe being ſtrong enough (although quick and diſturbed) I immediately preſcribed Phlebotomy, to eight or ten ounces, by which when he received a little relief, after three hours intermiſſion, a Clyſter being firſt adminiſtred, I ordered him to repeat his bleeding to twelve ounces: Moreover, I ordered Spirit of Harts-horn to be given twelve drops every ſixth hour, with an appropriate Julep, and in the diſtance between I ordered a doſe of the following Powder to be adminiſtred: *The firſt Hiſtory.*

Take powder of Crabs-eyes, ſal Prunella, of each one dram and half, Pearls a dram, Sugar-Candy two ſcruples; make a powder to be divided into 8 doſes.

Moreover, he took as often as he pleaſed a draught of a pectoral Apozeme. By the uſe of theſe within three hours all the ſymptoms began to abate, and the night following he ſweat, and ſlept a little; the day after I repeated Phlebotomy, and after continuing the ſame Remedies in four or five days he intirely recovered his health. The blood we took from him was always in the Superficies viſcous and diſcoloured.

A certain Gentleman of a ſanguine Complexion and a ſtrong habit of body, after an immoderate drinking of Wine contracted a Feaver, with a moſt painful Peripneumonie, inſomuch that thirſt and heat mightily preſſing him, ſitting always upright in his Bed or Chair, and breathing ſhort and very frequent, he could ſcarcely, yea almoſt not at all ſuck in air enough to ſuſtain the vital flame. Becauſe he could not undergoe a large Phlebotomy, I drew blood twice or thrice day after day; frequent Clyſters were adminiſtred: Moreover, Apozems, Juleps, alſo Spirit of Armoniack, and powder of *The ſecond Hiſtory.*

Fiſh-ſhels

PHAR. Part. II. Fiſh-ſhells were adminiſtred by turns. Within four or five days the Feaver ſomewhat abated, alſo he began to breathe better, and ſometimes to take ſhort ſleeps, yet he did always complain of a notable heavineſs of his breaſt, and intolerable oppreſſion of the Lungs; wherefore, when Phlebotomy was no longer ſafe, I applyed very large Veſicatories to his Arms and Thighs, the bliſters in his arms dry'd up in a ſhort ſpace, but thoſe on his legs did not only remain open, but after five or ſix days did run hugely, and afterwards almoſt for a month daily diſcharged great plenty of a moſt ſharp Ichor; in the mean time his lungs ſenſibly amended, and at length were delivered from all their burden; laſtly, the little ſores raiſed by the Veſicatories very painfully and not without frequent Medicines could be cured.

SECT. I. CHAP. IX.

Of a Pleuriſie.

The diſeaſes of a Pleuriſie and Peripneumonie are akin.

HOw great affinity there is between a Pleuriſie and Peripneumonie, we have hinted before; *viz.* although either diſtemper is ſometimes ſolitary, and exiſts ſeparately from the other, yet they often happen together, or one while this, another while that, come one upon the other, or ſucceeds it. The foregoing cauſe is the ſame of both, *viz.* a diſpoſition of the blood to be clammy and boyl up withall; alſo, the conjunct cauſe is the ſame, *viz.* an obſtructing Phlegmon in ſome part of the leſſer Veſſels, by reaſon of ſuch a diſpoſition of blood. Moreover, the ſame method of Cure is preſcribed by moſt modern Phyſicians for either diſeaſe: The chief reaſon of the difference whereby they are diſtinguiſhed one from the other, is taken from the places affected, which their Names denote. For the blood prediſpoſed to the enkindling in ſome place an inflaming obſtruction, therefore often plants the neſt of the diſeaſe in the breaſt, becauſe here it burns out more hideouſly, by reaſon of the Hearth of vital fire; and alſo is not freed from the vaporous Effluviums and other Recrements which hinder Circulation. To all which there enſues, that in this Region, the maſs of blood being ſhut up, and not able to paſs through the more ſtrait Conveyances; is not as in the bowels of the lower Belly, opened with any ferment, or new waſht with any watery juice: wherefore, if perhaps the blood, carried through the vertebral Arteries into the membrane encompaſſing the ribs, ſhall ſtick in its paſſage, about the narrowneſs of the Veſſels or inter-ſpaces, the Diſtemper of which we now treat ſucceeds: In like manner, if an obſtruction happen within the paſſages of the Lungs, a Peripneumonie, will enſue, as we have declared before. Wherefore, according to the Pathologie of this diſeaſe before delivered, thoſe things which belong to the Theory of a Pleuriſie, as well as the Curatory method, may with ſmall labour be deſigned.

How they differ betwixt themſelves.

The ſeat of a Pleuriſie.

Both the ſenſe of pain, as well as Anatomical Obſervations taken from the Patients dead of a Pleuriſie do plainly atteſt, the ſeat of this Diſeaſe (as often as it exiſts primarily and ſolitarily) conſiſts in the Pleura or Membrane environing the inſide of the ribs. And a true and ſingular Pleuriſie is an inflammation of the Pleura it ſelf, from the abundant flowing in of inflamed blood, growing clammy withall, taking its motion through the vertebral Arteries, with a continual and acute Feaver, a pricking pain of the ſide, a Cough and difficulty of breathing.

The next cauſe of it.

The next Cauſe is the blood obſtructed by reaſon of its clammineſs in the leſſer veſſels and interſpaces of that membrane (in like manner as it is in a Peripneumonie) or being extravaſated, being heaped in the ſame place more plentifully, by reaſon of the ſwelling up, for that cauſe exciting an inflammation. An acute pain ariſeth upon this, by a wound in a part highly ſenſible; alſo there ariſeth a Cough by reaſon of a provocation giving impreſſion to the intercoſtal muſcles; moreover a difficult breathing by reaſon of the muſcular fibres being hurt as to their action; which becauſe they cannot perform long and ſtrong contractions, they are conſtrained to undergo weak although more frequent Contractions, otherwiſe than in a Peripneumonie, in which that ſymptom ariſeth from a Lung too much fill'd and ſtuffed. The Feaver is caus'd from efferveſcence of blood, and is for the moſt part rather the aſſociate than the effect of a Pleuriſie. For the blood from what cauſe ſoever driven into a feaveriſh turgeſcency, if it be bound up together in its maſs, will be apt to grow clammy, which together with the Feaver moſt often induces a Pleuriſie or a Peripneumonie, or both

of

of them. From hence we may obſerve this diſeaſe doth frequently vary its kind, and change its place, *viz.* from a Pleuriſie into a Peripneumonie, and on the contrary; afterwards it paſſes from both or either into a Frenzy or a Squinancy: for that the blood while it is boyling throws off its viſcous recrements one while in this part, another while in that, another while in more together, and laſtly it reaſſumes them again, and variouſly transferrs them.

The more remote cauſes of this Diſeaſe.

The more remote cauſes of a Pleuriſie are the ſame as of a Peripneumonie, *viz.* whatſoever ſtirs up the blood, prediſpoſed to grow clammy and alſo to boyl up, and provokes a feaveriſh turgeſcency. Hither appertains exceſs of heat and cold, a ſudden conſtipation of the pores, ſurfeit, drinking of Wines or Strong-waters, immoderate exerciſe; ſometimes the malignant conſtitution of the Air brings this diſeaſe almoſt on every body, and renders it Epidemical: whereto may be added, that this diſeaſe is very familiar to ſome from their conſtitution or cuſtome; ſo that a diſtemperature of blood, induced almoſt by any occaſion, immediately paſſes into a Pleuriſie.

From what we have already ſaid, the ſigns of this diſeaſe do appear manifeſt enough, by which it is well known as to its Eſſence, and is diſtinguiſhed from other diſeaſes, and eſpecially from a Baſtard Pleuriſie and a Peripneumonie. But it is to be obſerved that a pain in the ſide ariſes ſometimes very troubleſome; which while it counterfeits a Pleuriſie, is ſometimes taken for it, although falſly. For in ſome perſons obnoxious to the Scurvy, and the affects of the nervous kind, ſometimes it happens that a ſharp humour, and very painful deſcends into the Pleura or intercoſtal Muſcles, and being fixt there produces moſt fierce tortures; which diſtemper is yet diſcriminated from the Pleuriſie, inaſmuch as it is void both of Feaver and Thirſt, the Pulſe always abides moderate and laudable, frequently the appetite and ſtrength endure; moreover, the pain is not long fixed or limited to one place, but ſenſibly creeps hither and thither into the neighbouring parts, as the matter ſlides down through the paſſages of the fibres, out of one place into another.

The differences of it.

We meet not with many differences of this diſeaſe; notwithſtanding it is uſed to be diſtinguiſhed, *viz.* to be either true and exquiſite even as we have now deſcribed, or ſpurious, which having its ſeat in the intercoſtal muſcles, or their interſpaces, proceeds from wind, or a ſerous and ſharp humour heaped up in the ſame place, and raiſes a pain leſs ſharp, without ſo much as an inflammation or feaver: And whereas the grief is planted externally, the Patient for the moſt part lyes better on the oppoſite ſide, otherwiſe than in a true Pleuriſie. Secondly, a Pleuriſie is either ſingle, or complicated with a Peripneumonie or ſome other diſtemper, and ſo it is either primary, or ſecondary, or join'd with ſome other affection.

The Prognoſticks.

As to the Prognoſtics of this diſeaſe, *Hippocrates* hath obſerved many certain tokens whereby a good or evil event is ſignified to Patients ſick of the Pleuriſie. To run through each of theſe, and to unfold them with Commentaries added to them, we have neither leiſure, nor doth it ſeem worth our endeavours. The chief thing of all in a Pleuriſie, is, that the diſeaſe be preſently diſpatch'd partly with a free and frequent bleeding, and partly by a Critical Sweet, ariſing about the fourth day, or before the eight; or theſe things not duely ſucceeding, it will be prolonged, and then moſt frequently a Peripneumonie or Empyema, or a Collection of corrupt matter between the Breaſt and Lungs, or both diſtempers do ariſe in this diſeaſe; from which there follows a ſolution of the diſeaſe but ſlow and incertain, and moſt frequently full of dangerous chances.

A Peripneumonie coming upon a Pleuriſie not preſently cured (as it is often wont to be) all our hope is placed in digeſting maturely the Spittle and quick Expectorating thereof: for if this be laudable and plentiful, and eaſily and haſtily thrown off, it doth often finiſh both diſeaſes intirely. Notwithſtanding, it is not therefore a conſequent that the matter of a Pleuriſie is derived from the ſide into the Lungs by I know not what blind paſſages, or that the ſame being ſweat out of the Pleura into the Cavity of the breaſt is imbibed by the Lungs, and at length drawn upwards through the paſſages, and excern'd forth. But when a Peripneumonie ariſes on a Pleuriſie, and the matter impacted in the Lungs begins to be evacuated by Spittle, ſo that the affected places of the Lungs are continually emptyed; the blood reſumes the other matter fixed in the Pleura, and carries it to the Lungs where the places or conveyance are open, to be ejected by Spitting. But if the Pleuriſie be cured neither by it ſelf, nor aſſociating with a Peripneumonie, then at length either by an Impoſthume made in the Pleura or in the Lungs, an Empyema or corruption between the Breaſt and Lungs ſucceeds; or all the matter being brought into the Lungs and there putrified, looſning the unity of the Viſcera, it propagates a mortal or ſcarce curable Conſumption.

PHAR. Part. II.

The Cure thereof.

As to the cure of the Pleuriſie, foraſmuch as the ſtate of this Diſeaſe, the Criſis and tendencies are manifold, divers curatory Indications offer themſelves according to their various regards; and as occaſion ſerves, according to the advice of a prudent Phyſician, they ought to be appointed in the beginning, and ſometimes altered or continued. For ſurely one Method is convenient for a ſolitary and ſimple Pleuriſie, and another if it be complicated with a Peripneumonie: Beſides it behoveth to ordain another and another if perhaps a Criſis be expected by Spitting, or matters growing worſe, the diſeaſe is either paſſing into an Empyema, or tends to a Conſumption. As to the three later caſes, that is to ſay, when a Pleuriſie commencing, paſſes into a Peripneumonie or Empyema, or laſtly into a Conſumptive diſpoſition, there is deſigned an appropriate way of curing in the Pathologies of each of theſe diſeaſes particularly delivered. But as to what appertains to our preſent purpoſe, three Indications offer themſelves for a primary and ſimple Pleuriſie, and they are curatory, preſervatory and vital.

The firſt Indication.

I. The firſt Indication takes care that the Inflammation or obſtruction of blood in the Lungs by all manner of means with all expedition be removed; for which intent Phlebotomie in every Age by all Phyſicians (excepting ſome Fanatick or falſe Chymiſts) is wont to be preſcribed, as a principal remedy: The reaſon of which is altogether the ſame as in a Peripneumonie and many other diſtempers, cauſed by reaſon of a ſtop of blood in ſome place, and ſo an accumulation: Becauſe that the veſſels bringing blood being much emptied, do not only refcind the nouriſhment of the diſeaſe, but drink up the matter which is the conjunct cauſe thereof, and convey it to another place. Wherefore blood is to be freely drawn away in a Pleuriſie, if the ſtrength endure it, and the Pulſe be ſtrong. And ſurely it is far better that the firſt time and every time after (as often as there is need to repeat it) blood be more largely emitted, than to do it more often and more ſparingly. For very many portions of the blood growing clammy and degenerating into viſcouſneſs, are heaped up about the place affected; which, unleſs they are call'd away from thence by emptying the Veſſels through large Phlebotomie, and in a great part let forth, the letting of blood will be fruſtrated of its deſired effect. Wherefore, that Phyſicians preſcribe blood in a Pleuriſie to be drawn out even to ſwooning, ſeems not incongruous to reaſon, although that practice is not raſhly to be attempted, for that every evacuation ought to be proportioned to the tenour and tolerance of the ſtrength, which rule ſuch a Phlebotomy doth exceed.

Phlebotomy neceſſary almoſt in all Pleuriſies.

What Vein is to be opened in a Pleuriſie.

But though there is almoſt a general conſent of all Phyſicians to breath a vein in a Pleuriſie, notwithſtanding there was ever an earneſt contention about the place, what Vein ought to be opened. *Hippocrates* and *Galen* opened a Vein on the ſame ſide of the patient; afterwards the *Arabians* and their followers the *Italians*, and *French*, did either open the *Saphene* or the *Baſilica* of the oppoſite ſide, damning the Phlebotomy of the ſame ſide by Bell, Book and Candle. Yet in the later generation, the practice of the Ancient *Greeks* by little and little revived, ſo that ſome did dare to make inciſion on the ſame ſide; yet always one ſide judged the others of the oppoſite perſwaſion as it were guilty of murder, as often as any unlucky event did happen. So that while among Phyſicians about Phlebotomy there was no leſs a contention than among the *Jews* and *Samaritans* about the Sacred place of Worſhip, at length the Doctrine of the Circulation of the Blood held out like a new Light by the moſt renowned *Harvey*, diſcuſs'd all the clouds of this Controverſie; ſo that immediately it clearly appeared to be almoſt the ſame thing, whether inciſion be made in the Vein on the affected or oppoſite ſide of a Patient ſick of a Pleuriſie; although in our Age Cuſtom hath prevailed firſt and rather to open the Vein of the affected ſide. Notwithſtanding a Vein being opened in either Arm draws nothing at all immediately from the vertebral Artery or from the Pleura; they are only the branches of the Azygos, or of the vertrebral Vein that receive the blood out of the place affected: but that they may accompliſh this, they are not unloaded in any other manner, but that the quantity of the whole blood be abated by Phlebotomy whereſoever made. Onely this may be affirmed for opening rather the Vein of the affected ſide, that the Baſilick Vein being unloaded, the Arteries of the Arm receive the more ample proviſion of blood; from hence the bloody ſtream of the Vein Aorta runs down more ſwiftly from that ſide towards the branches of the Arm, and perhaps in the interim of its quick paſſage it infuſes leſs blood into the vertebral Arteries, for the nouriſhment of the diſeaſe. As to that opinion, that the blood is ſometimes more plentifully carried from place to place, that from hence the right Lung or Liver being beſet with an inflammation or obſtruction, the right part of the head is in pain, and of the face grows more red; I ſay this ſometimes is brought to paſs, becauſe the Patients

Various opinions are recited.

do

do conſtantly lie in their bed on the ſide affected; wherefore, the Veſſels being compreſs'd, the blood ſtays longer in other parts of the ſame ſide while it is circulating. But of theſe things we will make a more diligent ſearch when we ſhall render the Hiſtory and Ætiologie of Phlebotomy.

Cupping-glaſſes with Scarification ſupply the place of blood-letting.

But if Phlebotomy by reaſon of a weak pulſe, and fainting of the animal function, neither ought to be at firſt adminiſtred, nor repeated, though the pain be moſt urging; Cupping-glaſſes with Scarification do well ſupply the turn hereof, being applied to the place pained. *Riverius* and *Zacutus Lucitanus* have cited notable Examples of Cures effected by this remedy. And ſurely this practice ſeems to lean upon a reaſon ſtrong enough; for the blood being drawn away from the ſide affected, that which is lodged in the neighbouring veſſels, being the conjunct cauſe of this diſeaſe, is moved with it, and partly drawn away, and partly turned it to its Circulation. Moreover, to remove an inflammation of the Pleura, beſides withdrawing blood by a free Phlebotomy or Scarification, alſo the ſerous and other excrementitious humors ought to be gently ſolicited and excerned as well out of the maſs thereof, as out of the bowels, by Stool, Urine and Sweat. The more ſtrong Purgatives are deſervedly prohibited, becauſe they diſquiet the blood, and conſtrain it to be impacted more deep into the places affected. And that certain renowned Chymiſts, viz. *Angelus Sala*, *Hartman*, *M. Rulandus*, with many others, do audaciouſly exhibit Vomits of Stybium to any afflicted with a Pleuriſie, and magnifie it for the beſt remedy, ſeems to me neither ſafe nor congruous to reaſon; the only reaſon of helping, as I think, and that very uncertain and full of danger, may be, *viz.* that the medicine operating more vehemently while the Patients ſuffer exolution of ſpirits or ſwoonings, all the vigour and turgeſcence of the blood abates, and for that cauſe the nervous Fibres remit their wrinklings or painful contractions, and the Veſſels carrying blood being much emptyed, do ſuck up the morbifick matter: In the mean time, there is danger leſt the humors being violently diſturbed, ruſh more impetuouſly to the part affected; at leaſt, leſt the Spirits being too much dejected, and the work of Nature diſquieted about the digeſting or ſeparation of the morbific matter, ſtrength ſhould utterly fail, before the diſeaſe be cured. Yet in the mean time, Clyſters are of frequent or daily uſe: yea ſometimes more benign ſolutive purgatives are allowed, provided that the Feaver be not very intenſe. Julips and temperating Decoctions and things gently moving Sweat and Urine, as we have preſcribed before for a Peripneumonie, are alſo here convenient; but let all hot and ſharp things, whether aromatick, or endowed with a vinous ſpirit be carefully declined.

Whether Purges and Vomites are to be taken in a Pleuriſie.

What other kind of Remedies are convenient in this diſeaſe.

II. The ſecond Indication preſervatory, deſigned againſt the clammineſs and boyling up of the blood, preſcribes Medicines of that ſort which conſiſting of a volatile or alcalizated Salt, do deſtroy the combinations entred into, of the acid and fixed or otherwiſe diſtempered Salts, with the other more thick particles. For which intent the Eyes or Claws of Crabs, the tooth of a Boar, the ſtone of Carps, the jaw of a Pike Fiſh, the Bone in the Heart of a Stag, the Priapus of a Hart, Sal Prunella, Salt of Coral, Salt of Urine, or volatile Salt of Harts-horn, powder of Goats-blood, infuſion of Horſe-dung, Spirit of Harts-horn, of Salt Armoniack, Spirit of Tartar, the ſimple mixture, mineral Bezoar, Diaphoretick Antimony, flowers of Salt armoniack, are very famous Remedies in a Pleuriſie.

The ſecond Indication preſervatory.

III. The Third indication vital which provides that the ſtrength and vital heat be preſerved during the courſe of the Diſeaſe in due tune and ſtate, gives in precept firſt an apt kind of food, and moreover Cardiac and Anodyne remedies, and thoſe which ſeaſonably occur to other ſymptomes, if perhaps they ariſe. Firſt, in a true Pleuriſie, a moſt thin Diet ought to be appointed, *viz.* of meer Oatmeal and Barley; and for ordinary drink, a Ptiſan or Poſſet-drink rather than Beer alone is convenient: although in an outragious thirſt this alſo is to be allowed of in a moderate quantity. Moreover, for quenching thirſt, Juleps, Apozemes, and Emulſions are taken by turns; to all which add Sal Prunella. Secondly, let only the temperate Cordials be adminiſtred which mildly do recreate the animal Spirits, and not at all intend the kindling of the blood, burning out of its due proportion. For theſe intentions, the water of *Carduus Maria*, *Carduus Benedictus*, of Balm, Borage, Cowſlips, Black-cherries, are uſually given with ſucceſs: whereto let the powder of Pearls and Coral be added. Thirdly, It behoveth to adminiſter Anodynes, both inwardly, to provoke ſleep in caſe it be very much wanting, and alſo externally, to alleviate the pain of the ſide. Of the former kind the more uſual are the diſtill'd water, Syrup and powder of red Poppies, which are eſteemed Specificks in a Pleuriſie and in a Peripneumony: Moreover, when the pain is very acute, and watchings inſtant upon the Patient, they may lawfully drink Diacodiates. Againſt pains, Liniments, Fomenta-

The third indication vital.

Cardiacks.

Anodynes.

PHAR. Part. II.

tions, Cataplaſmes, and ſometimes the hot bowels of Animals newly ſlain are convenient to be applied. Theſe are the principal Intentions of healing which ſeem requiſite to cure an exquiſite and ſimple Pleuriſie, before it contracts a Peripneumonie to it ſelf, or paſſes into it or into an Empyema. It only remains to adapt to each of theſe the more ſelect forms of Medicaments.

Forms of Remedies. Firſt therefore in the beginning of the Diſeaſe, for taking away the Phlegmon, Juleps, Apozemes, Powders, and gentle looſening Clyſters are wont to be preſcribed.

Firſt for the removing the Inflammation. *Take water of Carduus Maria eight ounces, red Poppies 4 ounces, Syrup of red Poppies one ounce, ſal Prunella one drachm, make a Julep, the doſe two or three ounces every third hour.*

Juleps, & Apozemes. *Take of Graſs-roots 4 ounces, Barly half an ounce, Apple-parings one handful, Raiſins one ounce, Liquoriſh two drams, boyl them in three pints of Spring-water to two; clariſie the ſtrained liquor, adding Syrup of Violets one ounce and half, Sal Prunella one dram and half, make an Apozeme, the doſe 3 or 4 ounces often in a day.*

Powder. *Take of Sal Prunella two drams, flowers of Nitre one dram, powder of red Poppy flowers two ſcruples, Sugar-candy four ſcruples, make a powder, the doſe half a dram three or four times in a day.*

A Purge. *Take of the Decoction of Mallows, leaves and roots, with Prunes, one Pound, Syrup of Violets three ounces, Sal Prunella one dram, make a Clyſter.*

Take Caſſia bruiſed two ounces, Tamarinds one ounce, Damask-Roſe leaves one handful, Coriander-ſeeds two drams, boyl'd in Spring-water to a pint, ſtrain it, and add Syrup of Chicory with Rhubarb two drams, clariſie it with the White of an Egg, the doſe is 5 or 6 ounces in the morning, continued for two or three dayes.

Secondly for the taking away the Ccammineſs of the Blood. Secondly, The following are of uſe to diſſolve the clammineſs or coagulating viſcoſity of the blood, in the form of a Drink, of a Powder and of Spirit.

An infuſion of Horſe-dung. *Take freſh Horſe-dung 4 ounces, Carduus-water one pound and half, infuſe it warm for two hours, after filtre it, to which add Syrup of the juice of Dandelyon, or of Chichory two ounces, Spirit of ſalt Armoniack one dram, let five or ſix ſpoonfuls be given three or four times in a day.*

To this end Water of Horſe-dung wonderfully profits.

And diſtilled water. *Take of Horſe-dung 4 pounds, leaves of Carduus Benedictus, Carduus Maria, Scabious, Pimpernel, of each three handfulls, upon them cut and mixt together pour ſix pints of new Milk, diſtill them in common Organs. The Doſe is from two ounces to three, either with it ſelf or with other diſtill'd Waters, in form of a Julep.*

For the ſame uſe, the Tinctures, or the ſolutions of other Dungs are adminiſtred by ſome Phyſicians, and highly magnified by them. *Helmont* commends the dung of an Ox, *Panarolus* commends Pidgeons-dung, others the white dung of a Cock, for the Pleuriſie. *Epiphanius Ferdinandus*, was wont to give with ſucceſs the Decoction of Tobacco with new Wine; *Valeriola* by experiment as a familiar remedy made uſe of the Decoction of the Flowers of red Poppies: The renowned *Sylvius* preſcrib'd the following mixture to be taken by Spoonfuls, within ſhort ſpaces of time.

Sylvius's Anti-Pleuritick.

Take Parſly and Hyſop-water, of each two ounces, Fennel-water one ounce, Treacle-water ſimple half an ounce, Laudanum Opiate 4 grains, Salt Armoniack half a ſcruple, Syrup of red Poppies one ounce. Mingle them.

Frederick Deckers adds to this the *Powder of Crabs-eyes*, and *Mineral Bezoar*, *of each one ſcruple.*

Medicines chiefly efficacious for this uſe are wont to be adminiſtred in form of a powder: for examples ſake.

Powders. *Take Powder of Crabs-eyes two drams, Sal Prunella one dram and half, of the flowers of red Poppies half a dram, mix them and make a Powder, the doſe half a dram, three or four times aday, in a convenient Vehicle.*

Inſtead

Inſtead of Crabs-eyes, the powder of the Jaw of a Pike, or the Tusk of a Boar, or the Pizzle of a Stag, or Bull, are uſed, and if they prove ineffective, try the following.

Take of Antimony Diaphoretick, or the Ceruſs thereof, or Bezoar Mineral, two drams, the volatile Salt of Harts-horn half a dram, the powder of red Poppies two ſcruples, make a Powder; The Doſe from one Scruple to half a dram, three times or oftner in a day.

For the ſame intention of curing it was, that *Riverius* gave of the Powder of *Soot* from half a dram to a dram; others the powder of Pidgeons dung, or of a Cock. And indeed by reaſon of this Analogy, whereby the dungs of Animals ſtored with volatile Salt, do ſuccour in this Diſeaſe; it is probable, the dung of a Dog doth no leſs conduce to cure a Pleuriſie than a Squinancy, and ſo much the rather, becauſe theſe Diſeaſes frequently change their forms among themſelves, and one aſſumes the ſpecies of the other. Chymical liquors endued with a volatile Salt do alſo notably help ſometimes in a Pleuriſie.

Chymical Liquors.

Take of Spirit of Blood two drams, Water of red Poppies three Ounces, the Syrup of the ſame one ounce. Let it be given by ſpoonfuls often.

Take Spirit of Sal Armoniack, diſtill'd with Oblibanum, three drams, the doſe from 12 drops to 15 or 20, twice or thrice a day, in any convenient liquor. After the ſame manner the Spirit of Urine, Soot, or Harts-horn may be given.

Take the Spirit of Tartar 3 drams, the doſe one ſcruple in a convenient vehicle.

Take of the ſimple mixture 3 drams; Doſe from one ſcruple to half a dram.

What remedies the third intention requires.

As for the third Intention, beſides a thin diet, Cardiac remedies and Anodynes are preſcribed. Examples of the former kind for the firſt indication may be ſupplied by Juleps and Apozemes; for the ſecond Indication they may be ſupplied by Spirits and Powders. Anodynes are preſcribed to be exhibited inwardly upon watching, and very intenſe pain, according to the following method.

Hypnotick Anodynes.

Take of Poppy-water two ounces, the Syrup of the ſame 6 drams, Spirit of Harts-horn 12 drops, make a draught to be taken at Bed-time.

If we muſt proceed higher, *Take Carduus-water two ounces, Diacodium from three drams to half an ounce or 6 drams, Spirit of Sal Armoniac with Frankincenſe half a ſcruple, make a draught: and ſometimes although rarely Laudanum is expedient, which timely given, inaſmuch as it excites ſleep, and moves Sweat & Urine, does greatly profit.*

Take Cowſlip-water two ounces, Tartariz'd Laudanum from 16, drops to 20. the Spirits of Blood half a Scruple, Syrup of Violets two drams, mingle them for a draught.

External Anodynes.

Outward Anodynes in form of a Liniment, Fomentation, and Cataplaſm, are uſually preſcribed.

Take Oyntment of Marſhmallows two ounces, Oyl of Almonds one ounce, Dogs-turd two drams, mix them by grinding together.

Take the Plaiſter of Mucilages two ounces and a half, moiſtened with Linſeed-Oyl, and applyed upon Lawn-paper.

Take the tops of both Mallows, the leaves of Mercury and Beetes, of each 4 handfuls, boyl them in Spring-water, and ſtrain'd, let it be uſed for Fomentation.

Take the Dregs of the herbs after the liquor expreſſed, to which add the bran of Oats 6 ounces, Linſeed and Fenugreek-ſeeds, of each two Ounces, Oyntment of Marſh-mallows two ounce, make a Cataplaſme.

An Hiſtory.

There is no occaſion to go far for Hiſtories and Inſtances of Patients ſick of a Pleuriſie, for a notable Example of this diſeaſe is now under our hands: to wit, A very lovely Maid, frequently and as it were habitually obnoxious to that diſtemper, is committed to our care. This Virgin being very amiable, of a ſanguine complexion, but of a weakly conſtitution, upon any the ſmalleſt occaſion, *viz.* by taking cold, or by errors in any of the ſix Non-naturals, yea ſometimes from the meer alteration of the year, or the air, has for many years been wont to fall into a feaver; whereupon immediately Pleuritick pains, with a Cough and difficult breathing come upon her, and afterwards for the moſt part hideous Convulſions: under which paſſion in time paſt ſhe did ſo grievouſly labour, that frequently every year for above ſix months ſhe was conſtrain'd to keep within her Chamber. But of late, though ſhe is not acquitted from

PHAR. Part. II.

from this hurt, yet ſhe is ſeldomer puniſh'd with it. The laſt year all the Summer, and almoſt the Autumn, ſhe enjoyed her health indifferently; in the beginning of Winter ſhe took her bed with this ſickneſs, and now about the end is again ſick. A pain from the Pleuriſie conſtantly afflicts her right ſide, where the blood ſticking in its paſſage, and being extravaſated about the intercoſtal muſcles, the Fibres being provoked, fall into a moſt troubleſom condition, together with a Convulſive motion of Coughing, and almoſt perpetually repeat it: In the mean while her Lungs being ſound enough, and open as to the paſſages, do readily convey the blood without any ſtop by its clamminеſs, (which frequently is the Author of a Peripneumonie.) No remedies that are uſed will do her good without Phlebotomie, which continually is ſo very neceſſary, that upon every return of the ſickneſs, in ſpite of all things we are compelled three or four times to repeat it, and ſometimes oftner: the blood let out in the Superficies hath conſtantly a viſcous and whitiſh filme. This diſeaſe was ever a ſimple Pleuriſie void of a Peripneumonie, and for cure ſhe with conſtant ſucceſs uſed the following method.

Take Spirit of Sal Armoniack diſtilled with Gum Ammoniacum three drams; take from 15 drops to 20, three times aday, with the following Julep.

Take Carduus and Black-Cherry water, of each ſix ounces, Hyſterical Water one dram, Sugar 6 drams. Between whiles ſhe took a doſe of this Powder with three ounces of Apozeme.

Take Powder of Crabs-Eyes, of a Bores tooth, Sal Prunella of each one dram, make a Powder for ſix doſes.

Take Graſs-roots 3 ounces, candied Eringo one ounce, Shavings of Ivory and Harts-horn of each two drams, the Parings of Apples one handful, Raiſins one ounce, boyl them in three pound of Spring-water to two pound, to it ſtrain'd add Syrup of Violets one ounce, ſal Prunella one dram, mix them, and make an Apozeme.

Clyſters of Milk with Syrup of Violets were injected, ſometimes every, ſometimes every other day. If Opiates, however mild, were given to allay pain, upon it a pain and drowſineſs of the head, and Convulſions did infeſt her moſt grievouſly.

SECT. I. CHAP. X.

Of an Empyema.

An Empyema is the product of other diſeaſes of the breaſt.

IT is clearly manifeſt from what hath been ſaid before, that a Pleuriſie, and Peripneumonie, are diſeaſes not only akin but commutable among themſelves and ſucceſſive to one another; Moreover, as well this as that, and frequently both together, not being well cured, do paſs into an Empyema. For when a Phlegmon rais'd about the Pleura is brought to ſuppuration, at length the Impoſthume being broke, the matter falling into the cavity of the Thorax, produces this diſeaſe. In like manner ſometimes it follows from the Lungs being inflamed: inaſmuch as the Ichor accumulated about the place affected, turns into a thick and yellow humour by a long digeſtion, which unleſs it be ejected by a Cough, either ſenſibly corrupting the inner ſubſtance of the Lungs, it cauſeth a Conſumptive diſpoſition, or diſſolving the unity of the intire Lungs, and at length corroding the outmoſt membrane, it ſlides down into the Breaſt, and ſo engenders an Empyema. Any one labouring with an Impoſtume or Ulcer of the Lungs, although he do ſpit out abundant and fœtid matter (as it frequently happens in an Impoſtume of the Lungs,) is not therefore accounted obnoxious to an Empyema. For in truth, by the common acceptation of this Term is ſignified a Collection of rotten matter within the cavity of the Thorax, by which the Organs of breathing are oppreſſed: but that rotten matter is wont to have a conflux thither either by a Pleuriſie or Peripneumonie, (and ſometimes perhaps from a Squinancy) brought firſt to ſuppuration and afterwards broke.

It rarely or never begins of it ſelf.

Foraſmuch as an Empyema never begins primarily and of it ſelf, but for the moſt part is the effect or product of other diſeaſes, not duely Cured, it will not be requiſite to make much inquiſition about the cauſes thereof. The formal reaſon or conjunct

conjunct cauſe thereof is known well enough (to wit) it is a purulent matter, poured out from the Pleura, or the Lungs, or the Larinx, into the cavity of the Thorax. But the other proper cauſes of the previous effects, appertain to the Etiologies of every of them.

What the morbific matter is.

There is a certain diſpute about the morbific matter; for ſome contend that it is meer corruption, others not that, but that it is a purulent matter, of which opinion is *Johannes Heurnius*, who averring a purulent matter for the conjunct cauſe of an Empyema, diſtinguiſhes between this and mere and pure Pus, affirming this to come to paſs *from a bloody nutritious humour*, i. e. *from the blood it ſelf ſomewhat corrupted, but capable of digeſtion, but that a purulent matter is an excrementitious humour*, viz. *a Serum or Ichor*, which proceeds from the blood obſtructed and hindered ſomewhere in its Circulation. From hence we may obſerve concerning an Impoſthume which affords true and laudable *Pus* or matter, that it is for the moſt part compact, every way ſhut up and wrapt up together either in a bladder, or (as it were) within private Apartments, and then after it is maturated and broken, pours out the contained humour, and is ſoon and eaſily healed. But an Impoſthume affording a purulent matter forms its neſt not ſo bound up and encompaſs'd by walls, but for the moſt part unequal and crooked, and being broken rather pours out filthy blood or gore than matter or Pus, and then by reaſon of the ſucceſſive ſource of excrementitious humour, it is very difficultly healed.

The difference of Pus and a purulent matter.

Moreover, we are to conſider, that each humour as well Pus as purulent matter doth ſometimes ſtink notably, and is alſo ſometimes very free from any bad ſavour. Some maturated and broken Impoſthumes pour out fetid matter, others matter without any ſmell. I have often obſerv'd Impoſthumes of the Lungs, as well as Phlegmons of other parts to have this ſeveral diſtinction. Purulent matter from many Ulcers ſtinks ill; the Spittle of Conſumptive perſons which is eſteemed to be very dangerous, for the moſt part is without any ſcent. It is uſual where the ſide is opened by reaſon of an Empyema, that at firſt the matter flows out not unſweet, but after two or three days the air having more frequently enter'd into the orifice, it ſtinks moſt horribly: which ſtench notwithſtanding after an injection of ſome aromatical or vinous Spirit vaniſhes again in a ſhort ſpace. But it would be a thing of much tediouſneſs to denote the particular reaſons of each of theſe accidents and alterations, for that never ſo little alteration of Pus or purulent matter, both cauſes and removes that ſtench from them. When the ſulphureous Particles are equally digeſted, and being ſubjugated to the ſalts are contained in a mixture, there is no ſtench; but as ſoon as they being looſed begin to fly away, and carry the ſalt particles with them (whereby they are ſharpened) they diſperſe a very bad ſtench round about. But whereas an Injection or Lotion with vinous and aromatical liquors, being ſometimes adminiſtred to a putrid Ulcer or neſt of an Empyema, frequently removes all ſtench; the reaſon is, becauſe the ſides of an Ulcer, no otherwiſe than as a ſtinking pot, infect the contained liquor as with a certain ferment, and ſo impreſs a ſtink: but when that ferment of the veſſel or bowel is waſhed or overcome by a well-tempered and ſtrong liquor, then that propagation of a ſtench ceaſeth. From hence follows not always an ill ſign, nor is it ſo very good, if the Spittle of conſumptive perſons, and the Impoſthumes of ſuch as are Empyematical are excerned either with, or without ſtench; for that I have known it to have been to ſome healthful, and to others deadly in either caſe. Moreover a more certain Judgment it not to be taken from thence, that the Spittle of ſome Conſumptive perſons floats upon the water, and that of others ſinks.

Why both ſometimes with and ſometimes without ſtench.

But although we do not much diſapprove of that diſtinction of Pus and purulent matter, notwithſtanding we adjudge neither only this, nor always that, to be a conjunct cauſe of an Empyema. Whenas this diſeaſe ſucceeding a ſimple Pleuriſie, ariſes from an Impoſthume being ſuppurated and broken in the ſide, it is moſt commonly pure and meer Pus, which falling into the Cavity of the Breaſt, engenders that diſeaſe. But if an Empyema be an Offspring of a Peripneumonie (unleſs an Impoſthume of the Lungs intervene) the ichorous matter being accumulated about the place of the phlegmon, and after thickning by meer concoction, it wounds the Lungs, and at length making a hole through the membrane encompaſſing it, and flowing out into the Thorax, produces an Empyema. That matter is rather to be accounted purulent than meer Pus.

Neither the cauſe of an Empyema.

The ſigns of an Empyema either prognoſticate it while it is in *fieri*, or indicate it plainly done. Some foregoing diſeaſes are eſteemed of the former ſort, whoſe iſſue this uſes to be, of which ſort are the Pleuriſie, Peripneumonie, and Squinancy, alſo ſometimes a ſtroke or wound of the breaſt, and ſometimes other diſtempers thereof, not

The Signs of an Empyema whilſt beginning.

PHAR. Part. II.

not well cured, nor discharged; out of which the suspicion will be greater of an Empyema to ensue, if after one or two weeks without abundant Spittle, the shivering of an Ague and fainting of the Spirits overtakes one. Then after fourteen or twenty days, there will be signs of an Empyema fully made, as difficult breathing, a heavinefs of the breast, a swimming to and fro of the matter, and a sense of pain from the position of the body chang'd, thirst and a small feaver almost continual, redness of the cheeks, disquietness of the whole body, and watching.

When perfect.

An Empyema is distinguished many ways, *viz.* First according to the distemper going before, whose Offspring it is; also according to us seat, one while in the right side of the breast, another while in the left, and another while in the whole capacity thereof; and lastly, as to the morbific matter, which is either meer and laudable Pus, or purulent matter, and this one while gentle, and benigne, and another while sharp and stinking.

Prognosticks of this disease.

Prognosticks of this disease begin as well before as after incision; the former determins whether the side ought to be opened or not, also it presages of what sort the event will be, either with or without opening. If an Empyema succeeds more slow, after the first distemper, to wit, not before the thirtieth or fortieth day, whenas the strength is very much worn, and the Lungs are vitiated, and their structure hurt; and also if a feaver remain as it were hectick, the breathing short and painful, the Pulse weak and quick, with cold sweat, and with a Diarrhea or wasting loosness, and frequent faintings of the Spirits, then the state of such a person being evidently desperate, doth not admit of any opening; let a Physician suffer him to dye without bleeding, lest he seem to murder him. But if on the contrary, after manifest signs of an Empyema more maturely perfected, the painfulness of the Lungs or side, as also the feaver and other symptoms abate, and the Pulse, and strength of the Spirits are in vigour, it will be lawful safely to advance to cutting, and thereby to hope a happy success. Incision being made, if white Pus duly concocted or otherwise laudable skip out with ease, and thence the heavinefs of the breast and difficult breathing abate, and the Patient is better as to the other Passions, there will not the least doubt remain of his cure: but if no Pus, or that which is bad, if thin, something bloody or stinking, flow from the side being opened, we can conceive thereby but small hope of recovery.

What it signifies when the Probe is guilded by the Empyematical matter.

Hippocrates among the presaging signs of a mortal Empyema, recounts that of the Probes being coloured by the Pus, as by fire; or what we often observe and sometimes without any evil event, if the silver Probe being put into the orifice of the open'd side, be presently ting'd with a colour as it were of Gold or Copper; which surely signifies no other thing but that the sulphureous particles of the Pus, or purulent matter are so exalted, and loosen'd from the bond of mixture, that easily departing they may be affix'd to any other body, and especially silver, whereunto they are akin. Sometimes I have seen Venison kill'd by long and wearisome hunting, presently bak'd in an Oven for Entertainment, become not only most tender, insomuch that it might be taken out with Spoons, but even to have guilded a bright silver Spoon at the first touch. The reason whereof is the same with the former, *viz.* that the flesh was so disposed to putrefaction by too much exercise while the Animal lived, that the particles of the Sulphur being exempt from Concretion, and apt to fly away, presently adhere to any other fit Subject: But this by the by.

The cure of the disease.

As to what belongs to the curatory part of an Empyema, we ought chiefly to consider whether the signs of this disease, as being now perfected, be certain, or doubtfull. In the former case there will not be much need of medicine, but the body only being prepar'd before-hand, we may immediately proceed to the opening of the side. Wherefore, if from a Pleurisie or Peripneumonie not rightly cur'd, or from blood poured out after a stroke, fall, or inward wound, a fluctuation of Pus or purulent matter, or bloody within the cavity of the Thorax, he perceived, with no Spittle, or with little, there will not be need that we dwell longer on maturing or expectorating Medicines, but the belly being loosened, and the blood and humours rightly temparated by Juleps, Apozemes and Anodynes, either that a bare Section be ordained; or that in tender and fearful persons a Cautery be applyed between the *6th* and *7th* Vertebra, and after the Eschar is rais'd the Incision-knife be obliquely forc'd by little and little, towards the hinder and upper part, until it penetrate into the very Cavity of the Thorax; afterwards, a little silver Pipe being put in, let the contained matter be sent out by degrees; notwithstanding in such manner, that, if his strength will bear, an evacuation of the whole humour be accelerated; for a portion thereof being left within, often contracts a hideous stench, within a few days (by reason of the Air, as is abovesaid, being admitted) which evil, that it may be

The cutting or opening the side.

The Empyematical matter is wont to stink by the often admission of the Air.

be provided againſt, or ſoon removed, a vulnerary and abſterſive liquor is to be caſt in twice or thrice aday by a Syphon or Syringe. It will not be requiſite to preſcribe particularly the other things belonging to this operation, and the proceſs thereof; for that each of theſe things are evidently known to any of the more expert Chirurgeons, and are uſed in familiar practice. After inciſion and the appertaining adminiſtrations rightly performed, there will not be much beſides left for a Phyſician to doe. It is convenient there be a right courſe of Diet, a frequent looſening the belly (as often as need ſhall be) by Clyſters; and moreover it behoveth us to preſcribe remedies vulgarly called Vulnerary, which hinder the diſſolution of blood, and the profuſion thereof into ſeroſities injurious to the breaſt.

Thoſe things which perſwade or forbid a Paracenteſis.

But if the Signs of this Diſeaſe be leſs certain, and (as for the moſt part it is wont to be, from a Peripneumonie and Impoſthume of the Lungs going before) altogether doubtful, Inciſion muſt not too ſoon or raſhly be made. For I have known ſome ſpitting forth a purulent matter, yea a fetid Pus, with painful breathing, and heavineſs of the breaſt, to have undergone a Paracenteſis in vain, and not altogether exempt from hurt. Wherefore, until it is apparent by pathognomic ſigns that it is an Empyema confirm'd, expectorating medicines (as are before preſcribed for the cure of a Peripneumonie) as alſo things gently moving evacuation by Urine and Sweat, may be uſed for ſome time: But theſe availing nothing, and the Empyema ſtill remaining or increaſing, (becauſe whileſt there is ſtrength it is better to try doubtful Medicines than none) proceed to a Paracenteſis.

Forms of Remedies.

As to the Forms of Medicines requiſite to the curing an Empyema, before Inciſion, the ſame remedies that are preſcribed in a Peripneumonie are convenient; but the Paracenteſis being made, theſe following will be chiefly in uſe.

Againſt fainting of the Spirits, and ſwoonings which happen in that operation, or afterwards, let the following Julep be at hand to be taken now and then about four or five ſpoonfuls.

Cardiacs.

Take Balm and Black-cherry water, of each ſix ounces, Aq. Mirabilis one ounce, powder of Pearl one dram, ſyrup of Gilliflowers one ounce. Mingle for a Julep.

The following Decoction to be drunk three or four times aday.

A Vulnerary Decoction.

Take of Harts-tongue, Speed-well, Agrimony, Colts-foot, Mouſear, Sanicle, of each one handful, Madder and Chervil-roots of each one ounce, Barly half an ounce, red Cicers half an ounce, Raiſins an ounce and half, boyl them in four pound of Spring-water to half, ſweeten it with clarified Honey, or with Syrup of Mouſe-ear as you take it, to your pleaſure. If a Feaver be wanting, the following Pills may be taken from one ſcruple to half a dram, Evening and Morning.

Take powder of Crabs-eyes two drams, Flower of Sulphur one dram, Sal Prunella half a dram, Spec. Diarrhodon Abbatis one ſcruple, Venice-Turpentine waſhed, make a maſs formed into ſmall Pills, or omitting the Turpentine take the powder from half an ounce to two ſcruples, twice in a day.

An Hiſtory of one troubled with an Empyema, the cutting of whom was mortal.

Examples of perſons ſick of an Empyema are not ſo frequent, and thoſe cured of that Diſtemper more ſeldom. I have known two, unwilling to admit of an Inciſion preſcribed by all means by the Phyſicians, to have fatally expired, and their dead bodies I have diſſected. Alſo I ſaw that operation adminiſtred to two others, whereof one recovered health, the other dyed conſumptive; but the reaſon thereof was, his Lungs being notably corrupted, and his ſtrength utterly loſt, the too late opening his ſide conferr'd no help to him; but did much depreſs his ſpirits, weak enough before, and waſted his ſtrength. He whoſe ſide was opened, had Lungs ſound enough; but from the Impoſthume of the ſide being broke inwardly, the matter falling into the Cavity of the Thorax did ſo compreſs the Diaphragma that he could ſcarcely breathe. The Chirurgeon without a Cauſtick thruſt in his Inciſion-knife between the 6*th* and 7*th* Vertebra, and having made a hole quite through his fleſh, he put in his Pipe. A bloody ichor firſt flowed out, afterwards being drawn away by a moderate quantity at times for three dayes, it flowed out without any ſtench; but afterwards as often as the Orifice was opened, a moſt horrid ſmell came forth, exceeding the ſtench of any Jakes, though ne're ſo ſtinking, and infected the whole Chamber with the ill ſcent: Moreover it remain'd ſo for many days, until by injections made of Myrrh and bitter herbs, boyl'd in Water and Wine, and very often adminiſtred every day, at length it was extinguiſhed; by the daily uſe of which, the morbific matter and at length all the ſordidneſs being waſhed away, all flowing out ceaſed; and laſt of all the

Of another who recovered by that remedy.

PHAR. Part. II.

Orifice being cloſed, the Patient recovered his entire health. I diſſected the dead bodies of thoſe who dyed, when by no perſwaſion of Phyſician or Friends they would admit of the opening of their ſide. One I have ſpoke of otherwhere, the reſult whereof was, the Pus ſtreaming from the Impoſthume raiſed in the Pleura, and in the intercoſtal Muſcles, and broken internally, had waſted part of the affected place, and of the contiguous Lung, with a Sphacelus or Gangrene, and ſo corroding the Diaphragma, and a hole being made on the right ſide thereof, it had deſcended into the Viſcera or bowels of the lower belly: and there in the whole paſſage of the Ventricle and Inteſtines, the outer Coats on which the purulent matter had fallen, appeared eaten and diſcoloured; and at length the purulent matter corroding and boring through the *inteſtinum rectum*, it came forth through the fundament together with his excrement. The ſick man being ſtrong and impatient of any Medicine, endured the tyranny hereof for about two months, but in the mean while he lived miſerably, afflicted with a light Feaver, thirſt, inquietude, pain of the ſtomack, and frequent tumbling up and down, and almoſt with continual watchings. His body being opened after his deceaſe, a moſt horrid ſtench, exceeding any Jakes, diffuſed it ſelf throughout the whole Chamber. The Anatomy of another who dyed by an Empyema, afforded not ſo vaſt an effuſion of purulent matter. This indeed had its neſt in his ſide, from whence falling into the cavity of the Thorax, and there accumulated in a vaſt heap, and continually defiling his Lungs drenched therein, it cauſed a ſlow and as it were a hectick Feaver, whereby the Patient, being very old, dyed.

The Hiſtory of one who dyed becauſe he was not cut.

A fourth Hiſtory like the former.

SECT. I. CHAP. XI.

Of an Impoſthume of the Lungs.

Vomica Pulmonis a diſeaſe ſeldom obſerv'd.

A *Vomica* of the Lungs is ſomething a-kin to an Empyema or Peripneumonie, conſidering that the morbific matter is always meer Pus, which notwithſtanding is generated in the Lungs without a Feaver and Phlegmon, yea without any great Cough or Spittle, as it were ſilently, and without noiſe; and frequently this evil doth not diſcover it ſelf before it kills the Patient. *Galen* makes mention of this in *lib.* 1. *de locis affectis*; but among Authors who have written Syſtemes and the practical parts of Phyſick, mention thereof is ſeldom or ſcarce to be met with. *Tulpius* in *lib.* 2. *chap.* 10. deſcribes this diſtemper after this ſort. *This evil* (meaning an Impoſthume of the Lungs) *lurks in the beginning ſo ſecretly that it ſcarce diſcovers any ſigns of it ſelf, beſides, in the firſt place, a little dry Cough, and preſently moiſt; which continuing for ſome time, the breath is drawn with difficulty, the ſpirit fails, and the body withers by degrees, although in the mean time the Spittle makes no ſhew, either of pus or blood; and if the Impoſthume break by way of ſurpriſal, the man is kill'd immediately.* It is wont ſometimes ſo to happen, but I have known many who in an Impoſthume riſing inſenſibly, being maturated, and at length breaking, have ſpit up great plenty of fetid corruption; and though with voiding daily ſuch a Spittle, for many weeks, nay months, they became very weak, and as it were, conſumptive, yet at length by the help of Medicines after the Ulcer hath been mundified, and dryed, they have recovered their health entirely.

The formal reaſon and conjunct cauſe thereof.

This diſeaſe, if we ſearch into the formal reaſon and conjunct cauſe thereof, is in truth a concourſe of ill humours gathered in ſome part of the Lungs; whoſe matter although it be heterogene and an enemy to nature, notwithſtanding from the beginning appears not ſharp, or irritative. For when at firſt being ſeparated from the blood, it is depoſited in ſome hollow place of the Lungs, perhaps in ſome bladdery cell, it doth neither raiſe a Cough nor produce a Feaver; but afterwards when ſenſibly encreaſed it compreſſes the neighbouring Veſſels bringing blood, and moreover infinuates into the very blood paſſing by, incongruous Effluviums; from thence a ſmall Feaver ſucceeds, with a certain diſquietude, and feebleneſs; and at length being accumulated to its fulneſs, and maturated by a long digeſtion into mere Pus; breaking its neſt very much diſtended before, it flows out every where all about. But if the ways are not open for the iſſuing of the Pus, it incontinently mingles it ſelf with the blood, and either impoyſons it, or impedes it from Circulation; or ruſhing by heaps into the Tracheal paſſages, it doth fill moſt of them at once, and ſo ſtuffs them, that a ſufficient entrance is denied to air to kindle the blood, and preſently the vital flame expires: but

but if this matter find paſſage, and flow by degrees into the Trachea, from whence again it may be preſently carryed away, and ſpit out, there will be then ſome truce of life, with hope and opportunity of cure. And indeed I have known many cur'd of this diſeaſe.

The uſual matter of an Impoſthume of the Lungs is meer Pus, which often ſtinks notably, and by that differs from the Spittle which is ejected in a Peripneumonie or a Conſumption of the Lungs. But whence that matter proceeds in the beginning thereof, and of what diſpoſition it was before it was ripened into Pus, I cannot ſo eaſily determine: becauſe the ſeeds of this diſeaſe being privily ſow'd, and growing up ſecretly, ſpring wholly from an occult original; wherefore its procatarctick or more remote cauſes lye conceal'd, yea while it begins and encreaſes, can neither be diſcovered by any pathognomical Signs, nor can any prognoſtick be deviſed, before it diſcovers it ſelf with a mortal ſtroke, but the whole procedure thereof is treacherous. *The morbifick matter.*

Now if after the Impoſthume is broke, and the Spitting up of Pus with an eaſie diſcharge being begun, with a conſtancy of ſtrength, there be means offer'd for ſome method of cure, the chief Indications according to the common cuſtom in moſt diſeaſes will be theſe, *viz.* Curatory, preſervatory, and vital. The firſt commands the matter of the Impoſthume ſpeedily to be diſcharg'd by Spittle, and that the ſides thereof ſhould be cleanſed and healed as much as is poſſible. The ſecond Indication provides againſt the conflux of new matter to that neſt, or other adjoyning places of the Lungs (whence a Conſumption may be engendred). The third reſtores the languiſhing of the Spirits, the loſt ſtrength, and the fruſtrated Nouriſhment.

1. As to the firſt Indication, remedies commonly called expectorating, and of them thoſe that are more hot and ſharp, and do very much cleanſe and drye, but eſpecially (for that for the moſt part here a Feaver is wanting) ſulphureous remedies are expedient; which alſo may be preſcribed according to the following forms. *Firſt Indication.*

Take of Tincture of Sulphur three drams, take from ſeven drops to twenty, at bed-time, and early in the morning in a ſpoonful of Syrup of the Juice of Ground-Ivie, Or, *Forms of Remedies.*

Take our ſyrup of Sulphur, as before ſet down, 6 ounces, let a ſpoonful be taken at the ſame hours.

Take the dried leaves of Ground-Ivy, Germander, white Maiden-hair, Coltsfoot, Hyſſop, white Hore-hound, Savory, of each one handful, Enula-campane, Orris and Chervil roots, of each one ounce, Anniſeeds half an ounce, boyl them in 6 pound of Spring-water to three pound and a half, adding towards the end White-wine 6 ounces, clarified Honey three ounces. Let the ſtrained Liquor be clarified, and kept for uſe: the doſe 6 ounces warm, three times a day. Or,

Take of Lime-water 6 pound, put it in a Glaſs with a large mouth, hanging in it the following bag.

Take the dried leaves of Germander, Ground-Ivy, white Horehound, of each one handful, Orris and Enula-campane ſliced one ounce and a half, Anniſeeds bruiſed two ounces, Liquoriſh an ounce and half, Raiſins ſtoned three ounces, let them be ſtopt and ſtand cold. Pour out for uſe, the bag remaining.

Take Lohoch Sanum three ounces, Species Diaireos two drams and a half, flower of Sulphur one dram and a half, of ſimple Oxymel two ounces, make a Linctus to be licks with a Liquoriſh-ſtick.

Take the powder of Hedge-muſtard, Ground-Ivy, of each half an ounce, flower of Sulphur a dram and half, ſyrup of Sulphur (or of the juice of Ground-Ivy) what will ſuffice to make a Lohoch.

Take of fine Mirrh, of white Amber, of each half an ounce, Sulphur Vivum, Auripigment, of each two drams, the rinds of Piſtaches one dram and a half, make a powder for Fumigation, to be uſed in a Paper-funnel, morning and evening.

2. The preſervatory Indication, aboliſhing the morbific matter, and ſo providing againſt a Phthiſis prone to ſucceed; endeavors the purifying of the blood, and ſtrengthning the Lungs, to which ends, Purgers, Vulnerarie Decoctions, diſtill'd waters and phyſical Drinks, are convenient. *Second Indication.*

Take of the Decoction of Senna of Gereon (with one dram and half of Agarick) three ounces and a half, purging ſyrup of Apples one ounce, Aq. Mirabilis two drams, make a potion to be taken with government once in a Week.

PHAR. Part. II.

The form of the Wound-drink let be the ſame as was preſcribed for an Empyema after opening, or 4 or 6 ounces of the Decoction common in Shops, three times aday, (becauſe here is no feaver.)

Take of Firr-tops 6 M. freſh Ground-Ivy, Hyſſop, Sage, Rockets, Hedge-Muſtard, St. Barbaries *herb or Winter-creſſes, of each four handfuls, the ſeeds of the Sun-flower 6 ounces, ſweet Fennel-ſeeds two ounces, Enula Campane, Orris-roots, of each 3 ounces, being cut and bruiſed, pour upon them 8 pound of* Brunſwick *Mum or Spruce-Beer, diſtill it in a cold Still, let the liquor be all mixt, and when uſed, ſweetned at pleaſure with ſyrup of the juice of Ground-Ivy; the doſe three or four ounces, three times aday.*

Take of the roots of Sarſaparilla ſix ounces, China two ounces, of each of the Sanders ſix drams, Shavings of Ivory and Hartshorn, of each half an ounce, Maſtick-wood one ounce, being cut and bruiſed infuſe them in 12 pound of Spring-water, boyl them to half, adding one ounce of Liquoriſh, Raiſins 4 ounces, let the ſtrained liquor be kept for ordinary drink.

Third Indication.

3. The vital Indication preſcribes Cordials, Anodynes, and a convenient courſe of diet. The ſame forms of Medicines for the moſt part are expedient here, which were preſcrib'd for an Empyema after inciſion, and alſo the ſame diet as was ordain'd in a beginning Conſumption; beſides, in this caſe Aſſes-milk often-times doth much good. As to the curing of this diſeaſe, I have obſerved, that an Iſſue made in the ſide, for the moſt part doth ſignally profit. I remember two ſuffering under this diſtemper, by coughing up plentifully mere ſtinking Pus or Corruption after the Impoſthume broke, to have been heal'd by this Remedy in a ſhort ſpace of time. The Hiſtorie of the Cures ſhall be afterwards annexed. In both theſe by a ſhallow orifice made in the ſide by inciſion, meer Pus began within three or four days to flow out, and then the Spittle began to be abated; and after that flowing, encreaſed from day to day, for ſome time continued, the Spittle altogether ceaſed, and the Patient recovered his entire health.

Fontinels in the ſide very often greatly help in this diſeaſe.

The reaſon of this admirable Effect ſeems to be, that the part affected of the Lungs, or that which is bordering upon it, while the diſeaſe was ariſing, or before, grew to the very ſide, and therefore Nature had endeavoured by this way the thruſting forth of the Pus or matter contained in the Impoſthume; and for that cauſe perhaps had made ſecret paſſages even to the ſuperficies of the ſide; wherefore, afterwards an iſſue being laid open by a knife, the excretion of the morbific matter was conducted thither. It is alſo probable, that a certain part of the Lobe of the Lungs at firſt grew to the ſide in the diſeaſed, and by reaſon of the cleaving thereto, afterwards the Impoſthume had its ariſe; for whereas the part being almoſt immoveable, could not be ſtirred like to the other parts of the Lungs, the morbific matter was depoſited there, and was the better able to reſide or form its neſt there.

Although the Impoſthume of the Lungs be thought a very rare diſtemper with ſome Phyſicians, and by *Tulpius* judg'd ſo mortal, that when it breaks it kills out-right; yet I have known many to have labour'd under this diſeaſe, and by the help of Medicines to have recovered their priſtine health. We may here deſcribe two or three of the more remarkable Hiſtories of them.

A Gentleman of a middle age, and before ſtrong and continually healthful, finding himſelf not well, without any apparent cauſe, contracted as it were a crazie diſpoſition; for being without Pain, without Vomit, Cough or notable Feaver, in a ſhort time grown weak, he became without any appetite unapt to ſleep, full of thirſt and hot about the Precordia; this perſon was handled a long while by ſome Phyſicians as Scorbutical, and by others as hectical; and after various methods of healing were aſſay'd in vain, at length the diſeaſe ſallying out as from an ambuſh, appeared manifeſtly. For whilſt on a certain night being more unquiet than uſual, he toſſed himſelf very much in his bed, all on a ſudden the Impoſthume breaking in his Lungs, a large quantity of ſtinking Pus was thrown out by Cough, ſo that in four or five hours he threw off about two pints. Moreover, after his Cough continuing about two months, he daily ſpit out purulent matter, thick and very ſtinking, untill his fleſh being conſumed, and he wholly ſpent, was reduced to languiſhing, and a notable Conſumption. From the ſtench of his Spittle and breath the whole Chamber was ſo filled, that his Servants or thoſe attending him, could not endure the ill ſcent thereof.

After the Impoſthume was thus broken, I and two other well-known Phyſicians being adviſed with, with all circumſpection we preſcribed Medicines to abſterge and heal the Impoſthume, and to cleanſe the Blood and Lungs, and redeem him from an imminent Conſumption. *A Tincture, and ſyrup of Sulphur, together with Pectoral and Vulnerary Decoctions and Diſtillations were taken; alſo Lohochs and balſamick Pills, day after day in a conſtant courſe, with Clyſters, gentle Purgatives and Diureticks, were taken between*

tween whiles: then these, *Vaporations and Fumigations, as well sulphureous as arsenical, were used morning and evening.* After these things being long and carefully used did help nothing, I often propounded the opening of the Thorax; but the sick man obstinately rejecting this operation, said he would rather dye than be murdered; yet at length, when I assured him that this remedy, or none, was further to be attempted, he began to deliberate with himself, and immediately baring his breast, he suffered me to search a place where I might apply a Cauterie; the business was presently put out of doubt, for a Tumour appeared on the left side of the Sternon, between the 5*th* and 6*th* Vertebra. Instead of a Cautery, I applyed thereto a suppurating Plaister, and within three days the top of that swelling became red and soft: out of which, being the next day opened, first a thin ichor, and a little after a yellow and concocted Pus flowed out, and afterwards it continued daily to stream out more plentifully: from that time his stinking Spittle began to abate, and within fourteen days it ceased quite; the morbific matter obtaining through that orifice both an easie and more convenient issue. Although by the effect it was manifest, that the passage of that orifice lay open into the breast, and perhaps into the middle of the Lungs, yet no liquor cast in by a Syringe, could either penetrate or be forced in thither: so secret and intricate are the conveyances which Nature forms for her last aids, that by the same passage by which the morbific matter is exterminated, nothing more hurtful can enter. This opening of the side was at length chang'd into an Issue, and a Pease or a wooden pill being put in, there came forth daily for half a year together plentiful ichor; and in the mean time this well-known person, all corruption of the breast being shook off, and the fleshy habit of his body being recovered, became healthful in all respects; and lastly, that issue being removed to his arm, he bears no sign of that nor any other disease in his breast.

After this Cure so by chance accomplished, it hapned I performed another like it, on purpose, not less successfully; for shortly I was sent for to a noble Lady which had been for many years obnoxious to the heat of the Precordia with a Cough. One day, when she coughed she was throughly sensible of something broke in her Lungs, and presently she voided abundance of meer Pus, and that stinking; after that, this kind of Spittle continuing with a Cough, for a week, notwithstanding the use of remedies, seemed rather augmented than diminished, I advised to have an Issue cut in her side, near the very place whence she perceived the Pus to ascend, which she readily granted: Within three days, from the orifice being opened meer Pus began to flow out, like that she discharged by Cough. Then after the morbific matter had issued out by that Fontinel, both the Cough and the Spitting of Pus wholly ceased, and within a Fortnight the Patient recovered her firm health.

After this I was sent for to another, *viz.* a strong man, and as strong a drinker; who being affected with an Imposthume of the Lungs, also spit up an abundance of Pus and very stinking matter. This Patient by a certain rude contumacy abhorr'd any Issue, wherefore he would not suffer any to be made in his side; notwithstanding he took any Medicines offered to him, by a long use of which Remedies he escaped free from that disease: the Medicines whereby he chiefly received help were prepared of Sulphur, as our Syrup and Tincture, taken daily and very frequently. To these for Vehicles were added one while a Decoction, another while a pectoral Hydromel, another while Lime-water, with an infusion of pectoral, as well as vulnerary Ingredients. Moreover Fumigations and Smoaks, especially of sulphureous and arsenical Ingredients, did contribute very notable help.

SECT.

PHAR. Part. II.

SECT. I. CHAP. XII.

Of an Aſthma.

An Aſthma a moſt terrible diſeaſe.

AMong the Diſeaſes whereby the Region of the breaſt is wont to be infeſted, if you regard their tyranny and cruelty, an Aſthma (which ſometimes by reaſon of a peculiar ſymptome is denominated likewiſe an Orthopnœa) doth not deſerve the laſt place; for there is ſcarce any thing more ſharp and terrible than the fits hereof, the organs of breathing, and the Precordia themſelves, which are the foundations and Pillars of Life, are ſhaken by this diſeaſe, as by an Earthquake, and ſo totter, that nothing leſs than the ruine of the whole animal Fabrick ſeems to be threatned; for breathing, whereby we chiefly live, is very much hindred by the aſſault of this diſeaſe, and is in danger, or runs the riſque of being quite taken away.

An Aſthma is denominated from ἀᾶμαίνειν (which is to breathe purſie, or difficultly) and may have this deſcription, that it is a difficult, frequent, and purſie breathing with a great ſhaking of the breaſt, and for the moſt part without any Feaver.

The cauſes of reſpiration hurt.

The act of breathing depends as well on moving the Lungs, the Structure whereof ought to be of that ſort that its paſſages, and all the pores may perpetually be open, for the free ſucking in and letting out air; as from the parts or organs moving them, which by alternate turns of Syſtole and Diaſtole, do cauſe the hollowneſs of the breaſt, and conſequently of the Lungs themſelves to be dilated, and contracted: whereas therefore there are many and divers reaſons of diſturbance, whereby reſpiration is prejudiced, for the moſt part they may all be reduced to theſe two heads; *viz.* that there is a fault either in moving the Lungs or in the parts or Inſtruments that ought to move them, and from hence the differences and kinds of this diſeaſe are beſt of all deſign'd; for according to the various nature and poſition of the morbific cauſe, it is called an Aſthma, either meerly Pneumonick, proceeding altogether from the paſſages bringing in air being obſtructed, or not enough open; or it is meerly convulſive, which only ariſes by reaſon of a defect or fault in the motive organs; or mixt, when either parts conſpire in the fault, which origine every great and inveterate Aſthma is wont to have; of each of theſe we will treat in order.

The Ancients allowed the cauſe of it only from the Bronchia obſtructed.

1. The ancient Phyſicians, and for the moſt part hitherto the Moderns have only acknowledged the firſt kind of Aſthma, judging the next cauſe, and almoſt the only cauſe of this Diſeaſe, to be the ſtraitneſs of the Bronchia, *viz.* inaſmuch as the ſpaces of thoſe paſſages, being either ſtraitned together by obſtruction, or compreſſion, as often as the uſe of breathing is required, do not admit of plenty enough of Air, wherefore, for the more free inſpiration of air, as ſhall be needful, the organs of breathing do moſt difficultly labour, with throes moſt frequently repeated.

Or vapors from the Spleen or Womb, but erroneouſly.

But that ſome are found obnoxious to fits of an Aſthma, without manifeſt taint of the Lungs, it was wont to be aſcribed to vapours from the Spleen, Womb, Meſentery, or ſome other bowel, undeſervedly enough; but ſurely that paſſion, without the ſtraitneſs of the Bronchia, or fault of thoſe bowels we have in another place ſufficiently evidenced to ariſe from Cramps of the moving parts, and ſhall be preſently clearly made out. But in the mean time by what means it may ariſe alſo from the paſſages of the Trachea, obſtructed, or compreſſed, it lyes upon me to declare.

After what manner the ſtraitneſs of the Bronchia ariſes.

The ſtraitneſs of the Bronchia, inducing the firſt kind of an Aſthma, is ſuppoſed to come to paſs by an obſtruction, as often as either thick humours and viſcous, or purulent matter of blood extravaſated, are forced in upon them; or that little ſwellings as Schirrus's or little Stones, ſtop up their paſſages; or finally that a Catarrh of a ſerous humour ſuddenly diſtils upon them. Moreover the ſame diſtemper is thought to be raiſed by compreſſion, as often as matter of that kind (and of every kind of them) ſhall cleave to the paſſages of the Pneumonic Arterie or Vein. Surely, an Aſthmatical diſpoſition depends upon theſe various cauſes and manners of diſturbance: but all invaſions of the diſeaſe, or at leaſt the greater fits are uſually provoked by reaſon of ſome accidents or occaſions. For while the ſtream of blood ſliding and running down gently can be content with a ſmall breathing, it paſſes through the Precordia without great labour either of Lungs or Breaſt. But being boyling and paſſing through the Lungs more impetuouſly, it requires a more full inſpiration of air; for the freer admittance of this through ſtrait paſſages preſently all the breathing organs are alarmed into moſt frequent throes. Whatſoever therefore makes the blood

to

PHAR. Part. II.

to boyl, or raiſes it into an effervescence, as violent motion of the body or mind, exceſs of extern cold or heat, the drinking of Wine, Venery, yea ſometimes meer heat of the Bed doth cauſe Aſthmatical aſſaults to ſuch as are prediſpoſed. It is uſual that thoſe who are obnoxious to this diſeaſe oftentimes dare not enter into a Bed, only ſleep in a Chair, or on a Bed, being covered with garments. The reaſon whereof is, that the body covered and heated with Bed-cloaths, the blood being a little raiſed into a more quick motion, and grown hot, requires a more plentiful ſucking in of Air than may be ſupplied from the paſſages of the Trachea being ſtraitned: for the more blood paſſes the Lungs each Syſtole and Diaſtole, by ſo much, for the enkindling and eventilation thereof, the Air ought to be more plentifully and quickly brought in and ſent forth: to which task (when by reaſon of the impediments it is not eaſily diſpatched) yet in ſome manner to be performed, the ultimate endeavors of all the parts appointed for breathing are made uſe of with a great contention of the whole breaſt. Moreover the blood being ſtirr'd, is not only an occaſion, but alſo in ſome part a cauſe in thoſe that are Aſthmatically prediſpoſed; for the veſſels bringing blood being thereby mere fill'd and diſtended within the Lungs, compreſs the Tracheal paſſages being already very ſtrait, and render them much more cloſe.

Whatever cauſes an effervescence of the blood is the evident cauſe of an Aſthma.

Why Aſthmatical Perſons are worſe in Bed.

II. A convulſive Aſthma (which we judged to be the ſecond kind of this diſeaſe, and to be raiſed without any great obſtruction or compreſſion of the Bronchia, from the mere Cramps of the moving fibres) is not limited to one place, or to any peculiar organ, but being of a diffuſed energy, it is extended to almoſt all the parts employed in breathing (whereof one while this, another while that, or ſome other is in fault.) For a Convulſive affection inciting an Aſthmatical invaſion, hath regard to the moving fibres of the veſſels of the Lungs, to the Diaphragma, to the muſcles of the breaſt, to the Nerves, which belong unto the Breaſt, or Lungs, nay to the origine of thoſe Nerves planted within the Brain; and whileſt the morbific matter dwells in every of theſe places, hindring or perverting the work of breathing, it brings on the fits of this Diſeaſe, as in another Tract we have ſomewhile ſince plainly demonſtrated. For the animal Spirits deſtin'd to the Function of breathing, if at any time they are very much moleſted and conſtrained into irregular motions, enter inordinately into the Fibres as well nervous as moving of the organs of breathing, and make them for that cauſe one while to be contracted, another while to be diſtended irregularly, as alſo their ſolemn and equal turns of Syſtole and Diaſtole to be variouſly diſturbed or hindered.

A Convulſive Aſthma.

Its Seat manifold and diffuſed.

The morbific cauſe or matter provoking the Spirits prepared for the Pneumonic work, as in divers places, ſo chiefly in theſe three, is wont to advance its force or power, *viz.* 1. Either in the muſcular Fibres themſelves, or 2. In the branches or nervous ſlips, or laſtly within the Brain by the Origine of the Nerves.

The morbific matter conſiſts in ſeveral places.

1. As to the former, the heterogene matter being inimical to the Spirits, is ſometimes ſhaken off from the Brain into the trunks of the Nerves, and from thence by their paſſages and ſlips, if perhaps it ſhall be in very little quantity, without very great or ſenſible hurt ſlides down to their lower ends. And when it falls in the nervous Fibres, and being heaped up daily, ſhall at length ſenſibly increaſe into a great quantity, it begins to trouble the inmate Spirits, and provoke them into Aſthmatical Convulſions; which forthwith infeſt, and are increaſed by reaſon of evident cauſes, neither do they utterly ceaſe, until the ſtock of matter ſo accumulated, be wholly diſpers'd, and conſumed; afterwards when it being renewed ariſes to a fulneſs, the fits of that diſeaſe return, and are for that cauſe moſt frequently periodical, as is manifeſt to common obſervation. According to this account we do deſervedly ſuſpect the cauſe of a Convulſive Aſthma ſometimes to lurk in the muſcular coats of the Pneumonick veſſels, alſo ſometimes in the Fibres of the Diaphragma, or the Proceſſes thereof towards the loyns. It is not very probable that the neſt of this diſeaſe conſiſts within the Fibres of this or that pectoral muſcle, although in Scorbutical perſons from theſe alſo poſſeſſed with a Convulſive matter, we have known pains to have riſen with breathing being hurt.

1. In the muſcular Fibres.

2. But truly (even as in another place we have not only demonſtrated by reaſon, but by the Obſervations and Hiſtories of the ſick) a Convulſive Aſthma is often incurred, as often as the morbific matter ſliding down into the Pneumonic Nerves, ſticks in ſome place within their paſſages, and eſpecially about their foldings: whence as often as it is accumulated to a plenitude it begins to be mov'd and ſhaken; wherefore the ſpirits lying lurking, and flowing into the Organs of breathing diſturbed, are forced into irregularity, and thoſe ſpirits preſently affect other inmates of the Fibres of the Lungs and breaſt, and provoke them into unnequal and Aſthmatical Convulſions. For this cauſe and the reaſon of the diſturbance, we have declared that not only

2. Within the Nerves and their enfoldings.

invaſions

PHAR. Part. II.

invaſions of this diſeaſe, but alſo the Precordia being diſturb'd thereby the Cardiack paſſions do ariſe.

3 Near the Origines of the Nerves.

3. We have clearly unfolded by anatomical obſervations that the cauſe of a convulſive Aſthma ſometimes conſiſts in the hinder part of the Head near the Origines of the Nerves. Surely I have obſerv'd ſome Patients, who when, lying ſick of other deſperate diſeaſes, they were alſo Aſthmatick, found it neceſſary to be whether in bed or chair with their head always erect, or looking down, but lying on their back or leaning backwards incontinently they gaped for breath as if they were dying, and hardly breathed; the cauſe whereof (as appear'd by diſſection after they were dead) was only a huge collection of ſharp Serum which was gather'd within the cavities of the brain; which, if by reaſon of the head inclining backwards, it fell into the origine of the Nerves of the eighth pair, preſently the Precordia, and chiefly the breathing organs were affected with horrid cramps. Moreover ſometimes for this very reaſon it ſeems that Orthopnoick perſons cannot lie down in their bed without danger of choaking, but are conſtrain'd to ſit up with an erect body.

3. A mixt Aſthma or partly Pneumonic and partly Convulſive.

III. Although an Aſthma is ſometimes ſimple from the beginning, *viz.* either meerly Pneumonical, or Convulſive, notwithſtanding after either diſeaſe hath for ſome time encreaſed, for the moſt part it gains the other to it ſelf: hence it may be concluded every inveterate Aſthma to be a mixt affection, ſtirr'd up by the default partly of the Lungs ill-fram'd, and partly by default of the Nerves and nervous Fibres appertaining to the breathing parts. For when the Pneumonic paſſages being ſtraitned or obſtructed from ſome cauſe, do not admit of a free ſucking in, and breathing out of the air, for that cauſe alſo the blood, yea and nervous humour, being hindred in their courſes, and compell'd to proceed ſlowly and to ſtagnate, do faſten their feculency and dregs upon the nervous parts; whence the paſſages of the ſpirits are obſtructed, or perverted, and at length a Convulſive taint accrues to them. Moreover the blood, being not duly inſpir'd and eventilated within the Precordia, at length being vitiated in its temperament ſupplies the brain and nervous ſtock but with a depraved juice, whoſe faults do chiefly puniſh the Organs of reſpiration before hurt and debilitated. In like manner alſo the evil is reciprocated on the contrary part, as oft as this diſeaſe begins by fault of the nervous ſtock; for as much as the motion of the Lungs is often ſtopt or hindred, by reaſon or Convulſions in the muſcular fibres, both the blood and the nervous juice being reſtrain'd from their uſual motions, do heap up dregs and filths, faſtening them to the parts containing them, by which not only viſcous humours and obſtructing of the paſſages, but even Tumours and other more ſolid concretes vitiating the ſtructure of the Lungs, are produced.

The cauſes of an Aſthma recited.

Therefore if when an Aſthma being for ſome time confirmed and become habitual, ſhall attain to frequent fits, and thoſe emergent upon every occaſion; the conjunct cauſe thereof, and alſo the Procuring cauſe is placed as well inwardly in the Lung it ſelf, as outwardly in the Fibres and Nerves, and in the ſpirits imploy'd for the function of breathing. Neither will it be difficult, by ſeeking diligently each of theſe things, to find in any caſe of the Patient, as well the chief neſts, as nouriſhment of this morbifick matter. But as to the evident cauſes they are very many, and alſo of diverſe ſorts. For hitherto ought to be referred whatſoever move, either the blood and the other humours, or trouble the animal ſpirits and force them into irregularities. Aſthmatical perſons can indure nothing violent, or unaccuſtomed: from exceſs of cold, or heat, from any vehement motion of body or mind, by any great change of Air, or of the year, or from the ſlighteſt errors about the things not natural, yea from a thouſand other occaſions they fall into fits of difficult breathing.

The Prognoſtiks of the Diſeaſe.

As to the Prognoſtick part, an inveterate Aſthma is difficultly or ſcarce ever cured; notwithſtanding the medicines and method of healing being rightly ordered, oftentimes great ſuccour is afforded, *viz.* the fierceneſs of the fits is diminiſh'd, longer reſpites are procured, yea, even the dangers of life it ſelf, ſeeming frequently to be imminent are removed.

The diſeaſe growing worſe, either threatens a Conſumption, or a Dropſie, or ſome drowzy, or convulſive affect; accordingly as the Serum by reaſon of perſpiration being hindred, being more abundantly accumulated (becauſe the ſick cannot ſleep enough in their beds) it is either fixed in the Lungs, or tranſerr'd into the habit of the body, or into the brain it ſelf. For this very reaſon the diſeaſed do find themſelves better in Summer, when they breath more freely, than in Winter; likewiſe better in hot countries than in cold, the South or Weſt-wind blowing, than the North or Eaſt.

Two chief Indications.

Of the curatory method of an Aſthma there will be two chief Indications, or rather ſo many diſtinct methods of healing, *viz.* Curatory and preſervatory. The firſt inſtructs

inſtructs what is to be perform'd in the fit it ſelf, that the Patient may be delivered from preſent danger; the other by what out of the fit, we ought to endeavour the taking away the morbifick cauſe, leſt that diſtemper be repeated more often or more heavily.

What is to be done in the fit.

1. Therefore a fit urging, there will be two chief intentions of curing, *viz.* firſt that a more free breathing be procured, as well upon the account of air, as of the Lungs, at leaſt ſo far as may ſuffice to ſupport life; and ſecondly, that the organs of breathing may be withdrawn, and reſtrain'd, as ſoon as may be, from the Convulſions begun, and uſually obſtinately continuing.

1. Intention to facilitate breathing.

1. As to what reſpects the former, let the Patient be placed in an upright poſition of body, in a more open place, and pretty airy, free from Smoak and breath of by-ſtanders; then let it be endeavoured that the Lungs being made free from all obſtruction, and inward oppreſſion, and alſo external compreſſion, may be able to draw and change the breath more eaſily. For theſe purpoſes leſt the bulk of the nether bowels compreſs or ſtraiten the Precordia, the belly is to be looſen'd by a Clyſter, the apparel & what ever binds about the Breaſt to be looſened; alſo when in this caſe either from the blood ſwelling up inordinately within the Pneumonic veſſels, or from the Serum diſtilling out of the Arteries and Glandules into the tracheal paſſages, they are wont to be oppreſſed, the impetuoſity and inſtigations of either humour ought to be reſtrain'd and appeaſed; inſomuch that if ſtrength endure and the pulſe be ſtrong enough, Phlebotomy is oftentimes convenient. Moreover thoſe things are carefully to be adminiſtred which diſpatch away the Serum and ſuperfluities of the boiling blood by urine, as well as ſweatings: to which Intention, Juleps, Apozemes, commonly call'd Pectora's, do notably conduce; yea powders of ſhells, millepedes prepared, Spirits and volatile ſalts, are ſucceſsfully uſed. In the mean time beſides let there be adminiſtred whatſoever opens and makes ſlippery the paſſages of the Trachea, and moves expectoration, and whatſoever, if need be, gives ſtop to a Catarrh diſtilling upon the ſame; for which purpoſes, Lambitives, Lohochs, pectoral Decoctions and ſuffumigations are good.

2 Intention to free from Convulſions the moving parts. Remedies which diſſipate the Spirit profit for this end.

2. As to the other intention of curing in theſe Convulſive fits, *viz.* that the organs of breathing may be reſtrained from the Convulſions begun, and may quietly return to their ordinary task, (unleſs this ſucceeds of its own accord, after the boiling of the blood and Serum in the Lungs be appeaſed) we muſt uſe Antiſpaſmaticks or remedies againſt Convulſions, and Anodynes: for medicines which are uſed to be adminiſtred in hyſterical paſſions, do conduce in a convulſive Aſthma,

Spirit of Harts-horn, of ſoot, and eſpecially of ſal Armoniac diſtill'd with gum Ammoniacum; alſo the tinctures of gum Ammoniacum, of Sulphur, of Caſtor, of Aſa fetida, Syrups of Ammoniacum, Sulphur; Oxymel of ſquils and ſuch like, which becauſe they are of an ingrateful taſt or ſmell, as it were diſſipate the ſpirits and withdraw them from tumults, do ſometimes help notably. But if the ſpirits being outragious cannot by this means be appeaſed, we muſt aſſay Narcotics, that ſome of them being ſubdued the others may be reduced to order: for ſurely unleſs a ſtuffing up of the Lungs, with a great oppreſſion of the Precordia do hinder, Opiates do ſometimes greatly profit. In the dreadful fits of this diſeaſe, when other medicines had effected leſs: I have often adminiſtred ſucceſsfully Diacodium, as alſo Laudanum Tartariz'd. But theſe may not be exhibited without great circumſpection, becauſe whereas more or leſs they hinder breathing (which already is difficult and too much hindred) they frequently bring the Patient into danger of life. Beſides this, that the Pneumonic ſpirits may be diverted from their Convulſions, it is many times expedient to moleſt the ſpirits in other places; for ſome of the ſpirits being in other places afflicted moſt commonly the reſidue as well as thoſe that are ſmitten do diſmiſs their irregularities: Wherefore Veſicatories, Cupping-glaſſes, ligatures, and painful frictions bring help; alſo for this reaſon vomits are ſucceſsfully taken in the midſt of a fit. The ſcope of healing being now deſign'd, after what manner the Patients in an urging fit of an Aſthma ought to be handled, it yet remains for us to propound ſome more ſelect forms of Remedies appropriated to the ſame ends.

Or do bring them aſleep.

In the firſt place therefore to give a ſtop to the flux of blood and ſerum, and to diſmiſs their ſuperfluities deriv'd from the Lungs by ſweat and urine, theſe enſuing are preſcrib'd.

Forms of Remedies.

Take the water of ground-Ivy eight ounces, of Rue, Pennyroyal, Dragons, of each two ounces, of ſal prunella one dram and a half, Syrup Byzantinus, red Poppies of each one ounce; make a Julep, take it three or more times in a day, the doſe three or four ounces. *An Apozeme.*

Take graſs roots three ounces, roots of Kneeholm two ounces, candi'd Enula-campane one

PHAR. Part. II.

ounce and a half, barly half an ounce, Raiſons of the Sun, one ounce, boyl them in three pound of water to two pound, adding to your ſtrain'd liquor ſal prunella one dram and a half; ſweeten it, if there be occaſion, with Syrup Byzantinus or of Violets.

A Tincture. *Take tincture of Sulphur three drams, the Doſe ſix drops to ten, evening and morning in a ſpoonful of Syrup of the juice of ground-Ivy, or Violets.*

A Powder. *Take of facula of Aron and Briony, of each one dram and a half, flower of Sulphur one dram, flowers of Benzoin half a dram, Sugar-candy half an ounce, Liquoriſh two drams; make a powder to be taken to half a dram or two ſcruples twice in a day with the former Julep or Apozemè: or,*

Mixtures. *Take of the powder preſcribed two ounces, honey or Oxymel what will ſuffice, make a Linctus, take about half a ſpoonful evening, and morning, and at other times lick it with a ſtick of Liquoriſh.*

Take Syrup of Horehound, of Garlick of each one ounce and a half, tincture of Saffron, Caſtor, of each two drams, mix them, take a ſmall ſpoonful in the fits.

Take of ſpirit of ſal Armoniack with gum Ammoniacum three drams, of ſnail water, and of Earth-worms of each three ounces, Syrup of Horehound two ounces, mingle them, take by a ſpoonful once in four or five hours.

Take of the powder of Hedge-muſtard, or of ground Ivy gather'd in the heat of the Sun one ounce, of Oxymel ſimple enough to make a Linctus.

2 The Indication preſervatory propoſes what is to be done out of the fit. 2. So much concerning the method, and medicines requiſite in the fit of an Aſthma. The other indication preſervatory deſigning the taking away of the whole procuring cauſes and the morbific matter contains two parts or diſtinct ſcopes of cure: both which for the moſt part are wont in the practice to be complicated and adminiſtred together. One of theſe endeavours to amend the conformation of the Lungs, if it be any way hurt or faulty, and the other to take off the irregularities of the moving parts and ſpirits, appointed for them. We ſhall beſt anſwer both theſe intentions if the remedies vulgarly call'd pectorals, are mixt with anticonvulſives, and the uſe of theſe with other medicines reſpecting the preparation of the whole body and emergent ſymptomes be apply'd between whiles. For which purpoſes the method and enſuing forms of remedies may be adminiſtred.

Forms of Remedies. *Take of Aloes roſata a dram and half, flower of Sulphur a dram, ſalt of Amber half a dram, Tar what will ſuffice, make 24 pills, take 4 every, or every other, or every third night: or,*

Pills. *Take of gum Ammoniacum, Bdellium diſſolv'd in venegar of ſquils of each half an ounce, flower of Brimſtone three drams, powder of hedge-muſtard and ſavory of each half a dram, make a maſs with Syrup of Sulphur or Oxymel of ſquills; make ſmall pills, take 3 every evening: or*

Take Hog-lice prepar'd two drams, flower of Benzoin half a dram, ſalt of Amber two ſcruples, extract of Enula-campane half a dram, Caſtor half a dram, Saffron a ſcruple, Venice Turpentine enough to make a maſs, form ſmall pills, take 4 every evening and morning except at the times of purging.

But if this form of Pills will not pleaſe, or the above mentioned Medicines profit little, afterwards the enſuing ſhall be eſſay'd to free the Lungs from obſtruction.

Mixtures. *Take ſpirit of gum Ammoniacum diſtill'd with ſal Armoniac three drams, the ſyrup of Ground-Ivy three ounces, magiſtral Snail and Earth-worm water of each an ounce, tincture of Saffron two drams, mingle them and take a ſpoonful evening and morning. Or,*

Take Tincture of Ammoniacum three drams, the doſe from 15 to 20 drops in a ſpoonful of Oxymel, or of ſyrup of Ground-Ivy. Or,

Take Tincture of Sulphur three drams, doſe from 7 drops to 12 or 20 in a convenient vehicle at the ſame hours.

In like manner other ſpirits endued with a volatile ſalt, and mixt with pectoral Syrups and Cephalick waters, may be preſcribed ſucceſsfully evening and morning.

In place of a mixture or an Aſthmatical Julep from diſtill'd-waters in the ſhops, let this following magiſtral be prepared for frequent and ſeveral uſes.

A diſtill'd Water. *Take roots of Enula-campane, Orris of* Florence, *Angelica, Maſterwort, of each four ounces, of Bryony a pound, the leaves of white Hore-hound, Hyſop, of Savory, Penny-royal, Ground-Ivy of each four handfuls, Juniper and Ivy-berries of each a pound, Bay-berries half a pound, ſweet Fennel, Carue, Amis, Lovage, Dill-ſeeds of each an ounce, Cubebs two ounces, Long-pepper, Cloves, and Mace of each an ounce, all being ſliced and bruiſed pour on them eight*

pound

pound of Brunswick *Beer, distil it in common Organs, mix the whole, and as you use it sweeten it with Sugar, or Syrup of Ground-Ivy, or with Oxymel.*

Moreover in lieu of Oxymel, or any common pectoral Syrups, the ensuing forms of Medicines appropriated to an Asthma are prescribed; and in the first place the Syrup of Enula-campane invented by *Horatius Augenius* and called by his name, and afterwards commended by *Platerus*, *Sennertus*, *Riverius* and other renowned Practitioners, ought to be observed in this place, and used frequently.

Magistral Syrups.

Take of Enula-campane, Polypodie of the Oak prepared of each two ounces, Currance two ounces, Sebestens 15, Colts-foot, Lungwort, Savory, Calaminth, of each a handful, a large leaf of Tobacco, Liquorish two drams, Nettle and Silk-worm seeds of each a dram and a half, boyl them in Wine mingled with Hony and diluted to a pound and half, and with a little Sugar make a Syrup: take it by it self in form of a Linctus or a spoonful evening and morning, or add a spoonful to the distilled water or Apozeme.

Take Florence *Orris-roots, Enula-campane of each half an ounce, Garlick peel'd four drams, Cloves two drams, white Benozin a dram and half, Saffron a scruple, slice and bruise them and digest them warm in a pound of rectified spirit of Wine for 48 hours; to it strained add fine Sugar a pound, put it in a Silver Bason upon live coals, stirring it till it flame, and let it burn as long as it will, then the flame being out make a Syrup of it to be taken as the former.*

The decoction of an old Cock.

Moreover hither may be referred the decoction of an old Cock so much magnified by renouned Physicians as well Ancient as Modern, for the cure of an Asthma; which although *Septalius* damn'd for gross and of no efficacy, notwithstanding *Riverius* after him vindicates; and to attest the efficacy of this remedy opposes his own experience to the others. These broths are of two kinds, *viz.* either with or without purgers; and various Recipes of each do remain in practical Authors, all which would be tedious to recount here, we shall propose one or two forms.

This is the common example without purgers.

Without Purgers.

Take of Orris and Enula-campane-roots of each half an ounce, Hysop and Hore-hound dryed of each six drams, Carthamus seeds an ounce, Annis and Dill seeds of each two drams, Liquorish scraped and Raisins stoned of each three drams; let them be prepared and sewed into the belly of an old Cock, which boyl in fifteen pound of water until the flesh depart from the bones, strain it and let it settle: of the clear liquor the dose six ounces, with an ounce of Oxymel simple. Or if the remedy be desired to be solutive, dissolve of fresh Cassia and Manna of each half an ounce in each draught, taken for many days together, and sometimes for a whole month.

Riverius prescribes a convenient form of such a kind of purging broth.

Take Enula-campane and Orris-roots of each a dram and a half, Hysop and Colts-foot of each a handful, Liquorish and Raisins of each two drams, Figgs 4, Senna cleansed three drams, Polypodie of the Oak and Carthamus-seeds of each half an ounce, Annis seeds a dram and a half, boyl them with the third or fourth part of an old Cock, make broth for one dose to be taken in the morning, let them continue it for twelve or fifteen days.

The first History of a Convulsive Asthma.

Of many examples of Asthmaticks I shall propound only two singular ones, *viz.* I will describe the History of one who hath been obnoxious to fits of this disease meerly Convulsive, and of another partly Convulsive and partly Pneumonic. A Noble Person, proper and well set, and formerly healthful enough, after that by chance he had struck his side against some solid body, from that time contracted a hurt, and afterwards an Asthmatical taint. For we may suspect, a certain folding of the Nerves belonging to the Precordia placed near was prejudiced by that accident, and from such a cause afterwards this distemper derived its Origine, *viz.* at some incertain times the pain at first troubled him about that place, and presently a most painful Dyspnœa ensued with a laborious and lasting contention of all the breathing parts; insomuch that while the fit lasted the Patient was thought to be in the agonie of Death. I was first sent for to him after labouring for two days with such an invasion of the Asthma that he was accounted in a desperate condition; Notwithstanding finding his Lungs without hurt, our Prognostic willed as yet to hope well, and immediately by a Consultation of other Physicians it was prescribed as followeth.

The Cure.

Take of Spirit of Gum Ammoniacum distill'd with salt of Tartar three drams, take from

PHAR. Part. II.

15 to 20 drops in a ſpoonful of the following Julep, drinking after it five ſpoonfuls, repeat it every ſixth hour.

Take elder flower, Cammomile, and Penyroyal water of each four ounces, Snail-water two ounces, Sugar one ounce, mingle them, between whiles he took a doſe of the following powder with the ſame Julep or Pectoral decoction.

Take Powder of Crabs-Eyes two drams, ſal Prunella a dram and a half, ſalt of Amber half a dram, mix them, divide it into eight doſes.

Large veſicatories were applied on the inſide of his arms near the Arm-pits, Clyſters daily adminiſtred, and frequent frictions. By the uſe of theſe he received ſudden and unexpected help, and within a few days became wholly free from that fit. Afterwards as often as he had any preception of the firſt motions of this diſeaſe, preſently he took a large doſe of that Spirit with the ſame Julep 3 or 4 times aday, by which remedy often uſed, one while for preſervation, another while for the cure ſake, he was void of any outragious invaſion from his habitual Aſthma for above two years, in the mean while ſuffering ſome more light aſſaults but eaſily blown off.

The ſecond Hiſtory of a mixt diſeaſe.

A very Honourable old Gentleman dignified by many great Titles, himſelf being greater than all them, after that for ſome years he had liv'd every Winter obnoxious to a Cough and a moderate ſpitting, and gentle enough, at the end of the laſt Autumn returning from a long journey he was leſs healthful: (as it was thought by cold he had taken) for he complained of a pain in the middle of his breaſt next the ſternon, which growing worſe in an evening, as ſoon as warm in his bed, wholly diſturbed his ſleep, and moſt part of the night was very troubleſome: notwithſtanding without any Dyſpnœa or evident ſign of an Aſthma. To take away this pain both Purging and Bleeding were uſed, pectorals and antiſcorbuticks were daily uſed, liniments or fomentations were applied to the place pained, yet without any great ſucceſs or eaſe: for the alteration which happened afterwards declined rather to worſe; for a difficult and obſtructed breath came upon the pain's growing a little more remiſs, ſo that from his firſt ſleep, or inclination thereto he became Aſthmatical and gaping for breath, and ſuffering about the Precordia he was conſtrained to ſit upright in his bed. Moreover a dyſpnœa of this kind and a Convulſive agitation of the breathing parts did not only return every evening, but from day to day were rendred more outragious and laſted a longer time; inſomuch that one night waking from his ſleep, for many hours he was aſſaulted with a moſt painful fit of an Aſthma which had almoſt kill'd him. The Phyſicians being at a great diſtance from him, although deſired about midnight came not while the morning following, mean while by reaſon of bleeding uſed by a Barber this worthy Gencleman revived, being redeemed from the jaws of death; but afterwards by the Conſultations of the Phyſicians that day a ſlender diet and looſening the Belly by a Clyſter were preſcribed: In the evening and early in the morning he took of Spirit of gum Ammoniac diſtilled with ſal Armoniac 12 drops in a proper vehicle, and continued the uſe for many days after; Veſicatories were applied on the inſide of his Arms near the Arm-pits; moreover Juleps and Pectoral Decoctions, Lohochs, Clyſters, and alſo mild Purges were taken by turns; alſo Phlebotomie was repeated after two days. Whereas formerly he was uſed to drink for his mornings draught a Pint of Ale with Worm-wood and Scurvy-graſs, in the room of that about eight a Clock he took 15 drops of Elixir Proprietatis tartariz'd in a draught of Coffee made with Sage. By theſe remedies his Aſthmatical fits preſently abated of their fierceneſs, inſomuch that the beginning and end of every night were quiet enough, but in the middle light troubles about the Precordia kept him from ſleep, ſitting upright an hour or two. Certain other Medicines were propounded by the Phyſicians, and others of diverſe ſorts privately offered by his friends, which notwithſtanding the Honourable Perſon utterly rejected, or ſoon loath'd; and that the rather, becauſe, Winter then being almoſt ſpent, his reſtauration was hoped for by the coming on of the Spring and enjoyment of the Country air without the help of much Phyſick. Wherefore of the Medicines above mentioned he uſed one while this and another while that a little by turns, and ſometimes kept holy-day from them all; but in the interim although his Aſthmatical invaſions little or nothing troubled him as formerly in the night, yet by reaſon his Lungs were very much obſtructed, and a ſerous humour fallen down into his feet, he was not able to walk faſt or aſcend ſteep places, without a painful dyſpnœa, being in danger of choaking; and now (while I am writing this) not ſo much an Aſthma or Conſumption, as a Dropſie is feared.

The reaſon of this cauſe.

The Ætiologie of this caſe is clearly enough manifeſt from the above mentioned things, *viz.* one procuring cauſe of this Aſthma was a lung greatly obſtructed, inſomuch, that whereas the blood boiling, paſſed through the precordia more impetuouſly

impetuously, the air requisite for its ventilation could not be admitted in plenty enough; wherefore to supply this defect there was necessity that the Lungs and their motive organs should be provoked into more frequent, and more vehement throes. Afterwards from thence ensutd a convulsive disposition of the fibres moving the breast: for the heterogeneous matter descending into those parts together with the nervous juice, and being gathered to a plenitude, first excited pain and afterwards fierce and periodical convulsions in the pneumonic organs: and now although this latter disposition cease (because the Elastick and spasmodical matter is blunted or extinguished by the serous illuvies) yet the other procuring cause still remains, and hath got another associate, *viz.* a worse Devil than it self, to wit a Dropsie.

PHAR. Part. II.

SECT. I. CHAP. XIII.

Of a Dropsie of the Breast.

A Dropsie of the Breast is easily known.

IT is clearly manifest by certain and manifold discoveries, that the Region of the Breast is sometimes affected with a Dropsie; for the sense and sound of water fluctuating, do most evidently demonstrate it in living bodies; and Anatomical inspection in the defunct. But yet concerning the cause of this Disease, and manner of coming to pass, to wit, by what ways, and after what manner disposed, the accumulation of water first begins within the hollow of the Breast, as also how it is sensibly augmented, and frequently insensibly continued until the Disease becomes desperate, is a thing yet in the dark. Whenas there is a general distemper of a Dropsie or an Anasarca appearing, and hath seized on the flesh and cavities, of the bowels every where, or in most places, we are not to admire if that illuvies of waters seize also upon the Pectorals: But besides, sometimes it happens, that the Region of the Thorax, is either first or only overflown, the other parts in the mean time remaining sound enough, or only hurt secondarily.

Its cause is hidden.

About the origine of this Disease, and the manner of generation it is much disputed whence, and by what passages that illuvies of water being found every where in the hollowness of the Thorax, doth come thither. Some Authors do derive it from above, *viz.* that it descends from the head by the Trachea; and others deducing its Spring from beneath, from the cavity of the Adbomen, also sometimes from the Liver and Spleen, by I know not what blind ways, judge those waters to be conveyed into the hollowness of the Breast. But neither of these Opinions challenge our assent, or deserve our arguments to disprove them: for none considering the passage of the blood and humours will acknowledge either this or that way of commerce We cannot but affirm, that the serous humour, raising a Dropsie of the breast, does arrive thither either in a kind of vapour. which being exhal'd from the Precordia, and sides of the Thorax is easily condensed into water; or secondly, that the Serum is there deposited under its own proper form, inasmuch as it flows into that cavity from the mouths of the Vessels, *i. e.* of the Arteries being open. We will anon enquire whether the Lymphaducts or vessels bringing chyle, being any where open, or broke, do sometimes produce that disease.

How many wayes it may be produced.

1. As to the former, it is so very probable that a Dropsie of the breast takes sometimes its origine from vapours condensed within its cavity, that it is a wonder how it should be otherwise at any time, or that any should live exempt from such an effect. For how much is there of vapour that separates from the boyling blood? and when it waxes cold in the precordia, how can it come otherwise to pass but that the abundant vapour should be condensed in this enclosure into water, even as if shut within a Still? And truly it will not be easie to determine, when the vaporous steams are so uncessantly heaped within the cavity of the breast, what may become of them, how they are consumed, or from thence discharged abroad. Surely we must affirm, they either penetrate the sides of the Thorax, or (which rather seems to be) they insinuate into the pores of the Lungs, and so fly away in breathing Certainly by either way, the vapours of the breast may exhale: and perhaps if either be defective, or hindred, by that means a Dropsie of the Breast may be caused.

1. By Vapours condensed there.

2. But moreover, I am apt to think, that this Disease also sometimes happens in another manner (inasmuch as the Serum distills from the vessels in its proper form.) For in a cacochymical constitution of body, or a person very scorbutical, where the watery

2. By Serum deposited there.

PHAR. Par. II.

watery and weak blood every where caſts off its ſuperfluous Serum from its own conſiſtence, and every where ejecting it from the little mouths of the Arteries being looſed and open, excludes it from the clew of circulation, nothing is more uſual, than for the cavities not only of the Bowels, but alſo of the Precordia, yea the Brain it ſelf, to be overflown with that watery collection; moreover in ſo general a diſpoſition to a Dropſie, that one while this region, another while that, or another ſhould be firſt and almoſt onely poſſeſs'd; and that alſo ſometimes the inmoſt parts being untoucht, the outward fleſh, *viz.*, the muſcles and their interſpaces are overflown with that ſerous illuvies.

Which ſometimes breaks out from the Arteries.

3. *And ſometimes from the Lympheducts.*

3. Among the veſſels that pour in the dropſical matter into the cavity of the breaſt, the Lympheducts and parts bringing the chyle, do juſtly fall under a ſuſpicion. What relates to the former, it appears by anatomical inſpection, that a great company of theſe do creep through the whole Lungs, and do tend from their outer parts, ſtretching out themſelves inwards towards the paſſages of the breaſt, and for the moſt part pour out into them their liquour, which being ſuperfluous, they every where ſuck up from the arterious Blood. Therefore whenas theſe veſſels are obſtructed, or are by any means impeded from diſcharging their function, it muſt needs be that a heap of water be accumulated in the Lungs, which afterwards falling into the cavity of the breaſt, will excite a Dropſie in that region. For in truth, this Lympha reſtagnating within the conſiſtence of the Lungs, it often happens that the little bladders called Hydatides, in the outer ſuperficies of the Viſcera are raiſed up, which afterwards being broke, diſcharging the waters into the cavities of the Thorax, they produce there an Aſcites. A diſtemper of this kind is often diſcovered in Sheep, when they dy by heaps of a Dropſie, by reaſon of a moiſt ſeaſon and watery paſture. And ſurely the following Hiſtory doth clearly ſeem to argue, that the Aſcites of the breaſt proceeds from the like cauſe ſometimes in a man, (there being yet a living example of this diſeaſe.) Lately a young man healthful enough and ſtrong, having accuſtomed himſelf to hunting and inſatiable riding, and other exerciſes of the body very immoderate, a while without detriment, at length he perceived a fulneſs in his Thorax as if it were a kind of ſwelling; inſomuch that the left ſide of his Lungs ſeem'd to begin to ſwell, and his heart to be thruſt out of its place towards the right ſide, for that he perceived the pulſation thereof to be on that part chiefly. After he had been for ſome time in this condition, on a certain day he felt as if a Veſſel had been burſt aſunder within the cavity of the Thorax, and from thence for the ſpace of half an hour, in that place, as it were the dropping of a humour falling from above into the bottom of his breaſt, was not only felt by himſelf, but could be heard alſo by the ſtanders by. Although he was at firſt ſurprized with the rarity of this affect, yet for that he was wellenough as to ſtrength, appetite, ſleep, and other natural functions, immediately after he became ſecure, and negligent of Medicines; But afterwards by any motion, bending or ſtirring of his Body, a fluctuation of water gathered within on his left ſide, was felt by him; moreover, the motion and ſound was evidently perceived by others, either by handling, or by the ear. As without doubt this Gentleman was affected with a Dropſie of the Breaſt, ſo it ſeemed moſt probable that the diſeaſe had its original from thence, in regard the lympheducts relating to the left ſide of the Lungs, being firſt obſtructed near their inſertions into the paſſage bringing the chyle, did ſwell up to a great bulk, and afterwards being broken diſtill'd their humour into the cavity of the Thorax.

A remarkable hiſtory of the like caſe.

The reaſon thereof.

When now an Inundation of the Precordia, and ſo of the vital Fort, was imminent, this Gentleman at length, thinking it time to provide for himſelf, entered into a courſe of Phyſick, and carried certain Medicines into the Countrey for his cure, yet without any ſignal ſucceſs. Afterwards coming to *London*, he firſt conſulted the worthy Dr. *Lower*, being of his former acquaintance. He propoſing the opening of the Thorax for his only remedy, took care that the worthy Dr. *Micklethwait* and my ſelf ſhould be ſent for to the conſultation. Immediately an inciſion was appointed by the conſent of us all: wherefore, after proviſion for the whole being made, a Chirurgeon applyed a Cautery between the ſixth and ſeventh Vertebra, and the next day he put his Pipe into the Orifice cut into the cavity of his Breaſt; which being done, immediately a thick liquor whitiſh like Chyle, and as it were milkie, flowed out. There was about ſix ounces only taken from him the firſt time, and the next day as much more. The third day when a little greater quantity was ſuffered to come out, being affected immediately with great fainting, and afterwards being feaveriſh, he was ill for a day or two. Wherefore it ſeemed good to ſtop the iſſue of that matter till he recovered his temperament and ſtrength: but afterwards a ſparing Evacuation of the ſame matter being daily made, the cavity of his Breaſt was wholly emptied: but as yet he wears a pipe in the orifice with a tap, which being opened once in a day and a nights ſpace,

The Cure by a Paracenteſis of the breaſt.

a very little of the humour flows out; in the mean while, being well in ſtomach, viſage, and ſtrength, he walks abroad, rides, and performs all exerciſes he was formerly accuſtomed to, vigorouſly enough. He uſed not (neither was there need of) much medicine, only after the Inciſion we adviſed temperate Cordials, *viz.* powder of Pearles, Juleps, and ſometimes Hypnoticks, and afterwards a vulnerary decoction to be taken twice aday.

By this method, and theſe forms of Medicines ſometime continued, this worthy perſon ſeemed to recover his temper, and his ſtrength, and the habit of his Body, and his breaſt exempt from the Dropſie. Notwithſtanding he ſtill wore a ſilver Pipe in the orifice of his ſide (out of which ichor daily flowed): and when after ſome months this being withdrawn, the Iſſue was ſhut up, a gathering of the ſame humour was made within the hollow of his Breaſt, perceivable by the ſound and fluctuation thereof: but when that the diſeaſe returning, the ſame medicine was to be uſed, and inciſion of his ſide appointed, (Nature by chance diſcharging the function of a Chirurgeon) the matter being prone to burſt out, and flowing to the place made its own way. He is now neceſſitated (for preventing the illuvies of his Breaſt) to keep that orifice conſtantly open like a ſink.

From theſe things I think it manifeſt enough, that an Aſcites of the Breaſt, ſometimes ariſes from the lymphatick veſſels burſt aſunder within the Lungs; neither doubt I leſs but that the ſame affection may be cauſed from the Chiliferous paſſages being broke within the Thorax; notwithſtanding, this chance ſo rarely happens, that as yet I have not known it by my own obſervation, or others relation. Moreover, it little avails to make inquiſition into the Ætiologie of ſuch a diſeaſe, becauſe it is not only apparently incurable, but in a ſhort time mortal; becauſe the Precordia are incontinently overflown by the inundation of the chyle, and alſo the blood and the animal ſpirits being defrauded of their wonted ſupply of nutritious Juice, are immediately diſſolved.

The differences of this diſeaſe.

From the various cauſes of this Diſeaſe even now ſet down, it will be eaſie to collect its differences: For firſt a Dropſie of the Breaſt, is either ſimple and primary, peculiar to this Region; or ſecondary, coming upon a general Dropſie, as it is wont often to be in cachectic perſons. Secondly, this Diſeaſe is diſtinguiſhed as to the places affected, *viz.* foraſmuch as water is either collected in the whole breaſt, or only in one ſide thereof. Thirdly, as to the matter accumulated in a pectoral Aſcites, which one while is limpid and plainly wateriſh, another while more thick, whitiſh, and as it were milkie, ſuch as we have deſcribed in the foregoing Hiſtory.

The Diagnoſtick ſigns.

The diagnoſtic ſigns do manifeſtly enough diſcover this diſeaſe: *viz.* the fluctuation of water is perceived by handling, and by feeling at every bending of the body, and the ſound is clearly heard. Moreover they are affected much with a dry and empty Cough, as alſo with a Diſpnœa almoſt continual and painful, eſpecially while they aſcend ſteep places; Beſides, they have a thirſt, with a feaver, and in the night after the firſt ſleep, great diſquiet and toſſing of the body, proceeding from the vapours being elevated by the heat being more intenſe. Sometimes there comes upon theſe a Palpitation of the heart, an intermitting or diſturbed Pulſe, and frequent faintings of the ſpittle. As to the Prognoſtick, this diſeaſe is always difficult to cure, and among the vulgar accounted incurable. And ſurely if it come upon an Aſcites of the Abdomen or an Anaſarca throughout the whole body, it is judged not without cauſe deſperate; But if the affection be primary, and happen to a body otherwiſe ſound, we are not altogether to deſpair of Cure.

The Cure.

What relates to the curatory part of this Diſeaſe, the chief Indications will be three, Curative, Preſervative, and Vital, according to the common method of curing in moſt other Diſtempers.

What Intentions of healing the firſt Indication ſuggeſts.

The firſt has regard that the water heaped up in the cavity of the Breaſt by any means be evacuated. The Second provides, that afterwards a new illuvies be not gathered in the ſame place. The Third procures the reſtoration of ſtrength, and the ſymptoms impairing it to be removed with expedition.

The firſt Intention.

To ſatisfie the firſt Indication, and that an Aſcites of the Breaſt may be emptied, there are but two ways or means of evacuation to meet with, whereby this collection of waters may be drayn'd, *viz.* Either that the veſſels of the Breaſt, and the paſſages of the humours, being emptyed, might ſuck up that Lympha being ratified, and afterwards by the paſſages of the blood or air convey them forth: or ſecondly, that by an inciſion of the ſide, thoſe waters may be drained forth plentifully in their own Species.

That former manner although more ſeldom, yet ſometimes ſucceeds; which I can atteſt out of my own obſervation. For the conſiſtence of the Lungs being ſpongy within

PHAR. Part. II.

within, and externally very porous, while by every turn of the Diaſtole, they are drenched in the underlying waters, they ſometimes imbibe them being turn'd into vapour; and ſo diſpatch them to the blood, or continually exhale them with air coming out at the mouth. That an effect of this ſort may more eaſily happen to cure this diſeaſe, medicinal aids are taken: For that intention therefore the paſſages of blood, air, and humours ought to be emptyed as much as may be, and to be kept ſo empty. For this purpoſe, Purges, Diureticks, and more mild Diaphoreticks are methodically, and alternately exhibited; alſo remedies for the breaſt, and expectorating, challenge here their place; let the Diet be ſlender and warming, and a government appointed as to all other things of that nature, that the blood may be made to exhale the more, and all the ſuperfluous humours to evaporate. I think good to annex ſome forms of Medicines accommodated to theſe uſes.

A Purging Hydromel. *Take of Chervil-roots, Knee-holme, Polypodie of the Oak, of each an ounce, Agrimony, white Maidenhair, Oak of Jeruſalem, Ground-Ivy, of each one handful, Carthamus ſeeds one ounce, Florence Orris half an ounce, ſeeds of Danewort 5 drams, Calamus Aromaticus half an ounce, boyl them in four pound of Spring-water, to the Conſumption of a third part, add to it being ſtrained Senna one ounce and a half, Agarick two drams, Mechoacan and Turbith, of each half an ounce, yellow Sanders a dram and a half, Galangal the leſs one dram, boyl them two hours gently, and cloſe covered, afterwards ſtrain it and add of Honey two ounces, clariſie it with the white of an Egge, make a purging Hydromel. The Doſe is from ſix ounces to eight, in the morning, twice or thrice in a week. Or,*

Take Mercurious Dulcis one ſcruple, Reſine of Jallap half a ſcruple, Balſam of Peru what ſuffices to make four Pills, to be taken in the morning, and to be repeated within five or ſix days.

Tinctures. *Take Tincture of Sulphur three drams, take from ſeven drops to ten, at night and in the morning, in a ſpoonful of the following mixture, drinking after it three ſpoonfulls.*

Julep. *Take of the water of Snails, Earth-worms, and compound Radiſh water, of each four ounces, water of Elder-berries fermented one pound, Syrup of Juice of Ground-Ivy two ounces, mix them for a Julep. Or,*

Take of Tincture of Ammoniacum, or Galbanum, take twenty drops evening and morning in the ſame mixture. Or,

Pills. *Take of Hog-lice prepared two drams, flower of Sulphur two ſcruples, flower of Benzoin one ſcruple, powder of wild Carrot and Burdock-ſeeds, of each half a dram, Turpentine of Venice, enough to make a maſs. Make ſmall Pills. Take four evening and morning, drinking after them a ſmall draught of the Julep.*

A Lime-water. *At Nine a Clock in the Morning, and Five in the Afternoon, let him take four ounces of the Compound Lime-water, by it ſelf, or with any other proper remedy.*

A Bochet. *For ordinary drink take the following Bochete.*

Take Sarſaperilla ſix ounces, China two ounces, white and yellow Sanders, of each ſix drams, ſhavings of Ivory and Hartshorn, of each three drams, Calamus Aromaticus half an ounce, Raiſins half a pound, Liquoriſh three drams, boyl and infuſe them in twelve pound of Spring-water to ſix pound, ſtrain it.

A Hiſtory of a Patient. Formerly about twenty five years ſince, when I reſided at *Oxford*, I was ſent for to a young Scholar, who ſuffered for three weeks ſpace under a pain of the Thorax, and a moſt grievous Dyſpnœa conſtantly troubling him in the evening, moreover, from a more quick motion of body, or going more haſtily than uſually up any ſteep place, he laboured extreamly, he could not lye down long on either ſide, but was neceſſitated to lye in his bed ſupine, and his head erect; if perhaps he attempted to lye on either ſide, immediately pain followed that poſition of body, and if perhaps he roll'd himſelf from one ſide to another, the pain being alſo preſently tranſlated, he felt as it were water to wave from place to place. Hence I had a juſt ſuſpicion of a Dropſie of the Breaſt, whereof that I might be more aſſured, I order'd that lying upon his back on his bed, he would ſuffer his head to bend backward from the bed-ſide to the floor, immediately he had a plain perception of water running towards the Clavicles, together with a change of the pain thither. Moreover if at any time he grew more hot than uſual, from motion, or in his bed, or by the fire, he preſently felt ſenſibly in his breaſt, as it were water boyling over the fire, and alſo complained of a Vertigo, and a ſmall decay of Spirits. Wherefore, when we might lawfully collect out of theſe things rightly conſidered, that he was affected with a dropſie of the breaſt, I preſcribed the following method and medicines with ſucceſs.

The cure of him. *Take of Mercurius Dulcis fifteen grains, Reſine of Jallap half a ſcruple, Syrup of Roſes ſolutive what ſuffices, make three Pills. He took them early in the morning and had twelve ſtools with great eaſe; afterwards on the third day by the ſame Medicine he had but four,*

but

but with greater benefit; he took afterwards for many dayes six ounces of the Pectoral and Diuretick Apozeme twice in a day, and lastly repeating the Purge he perfectly recovered. PHAR. Part. II.

SECT. II.

Of Splanchnick remedies, or those which respect the bowels of the lower Belly.

CHAP. I.

Of the Jaundies and the Remedies thereof, and the manner and reason of their operations.

Hitherto we have largely enough unfolded the Pathologie and curatory method of the Thorax; now it follows next to finish our task in like manner about the lower Belly. But we have in our former Tract for the most part described already the medicines belonging to this region, and the manner and reasons of their working, together with the Anatomy of the Stomach and Intestines: we have treated of remedies stomachical, dysenterical, and others belonging to the intestines, as also diureticks together with the reasons of them: Moreover we have sufficiently elsewhere handled the ætiologie of Hypochondriack, and Hysterical remedies. What therefore remains, of Hepatical distempers as well proper, as of those vulgarly ascrib'd thereunto, and of their remedies, we will discourse in this Section; notwithstanding in each of these, we will bestow more labour, about the curatory, than pathological part.

Diseases of the Liver.

The chief diseases by which the Liver and the Appendix thereof, are wont to be incumbred, are the Jaundies, and a Tumour, and under this latter many other affects, *viz.* obstruction, inflammation, induration, and schirrus are numbred; to all which are vulgarly appointed remedies commonly called Hepaticks, and which make up a great part of the Dispensatory.

The Jaundies is either a disease by it self, primarily beginning, which is here properly treated of: or it is an effect or product of another disease; as when it arises upon an intermitting Feaver, which oftentimes it puts an end to, of which also we will presently treat by the by.

The Jaundies.

An Icterical distemper by the common consent of most is judged to arise in as much as the yellow choler, not at all, or not enough received, from the ends of *vena porta*, into the passages of the cholerick pore, overflows into the mass of blood and polutes it with its greenness, whereby also the very skin is discolour'd.

The cause of it.

That obstruction is wont to happen after many manners and in various places. For sometimes it happens near the extream ends of either kind of vessels, *viz.* the end of the *vena porta*, and the *porus bilarius*; the interspaces whereof happen frequently to be compressed, and stopt by reason of the Parenchyma of the Liver being tumefied, or otherwise vitiated; wherefore the humour of the gall not being transferred out of the separating vessels of the *porta* into the other receiving vessels, turns back upon the blood. Secondly, the passage of the humour of the gall is sometimes intercepted in the middle passages of the cholerick pore; for that the cavities of these are filled either with a viscous, or sandy, and sometimes with a stony matter; as is plainly discerned in the Livers of beasts in the winter season, while they are fed with hay and straw. Thirdly, it is also manifest by Anatomical observation, sometimes an obstruction in the very bladder of the gall, or in the cystic passage is the cause of the Jaundies; for if at any time, it being filled with stones, receive not the choler, or being here shut up, or grown together, it restrains the descent of the choler towards the guts, that humour although well separated from the blood, is constrained to flow back into the mass thereof, and so propagates the Jaundies.

PHAR. Part. II.

The opinion of Sylvius of the cauſe of the Jaundies.

Againſt this moſt received opinion, by which it is judged, that the cauſe of the Jaundies for the moſt part conſiſts on this ſide the *veſica fellis* or about it towards the Liver, the moſt Renowned *Sylvius* altogether places it without this, *viz.* in the Cyſtic or common paſſage. For ſuppoſing the choler not to be ſeparated from the blood, within the paſſages of the Liver, but in the very bladder of the Gall to be propagated of a humour brought thither by the Arteries; He judged the greateſt part, being carried upwards by the paſſage of the *pori bilarii*, to be poured into the blood for ſome notable uſes, and alſo another part to deſcend beneath to the Inteſtines, alſo for neceſſary uſes: wherefore if this latter ſluce be ſhut, all the choler is carried upwards into the blood, and filling it too much with this humour, perverts it from its genuine temper into an Icterical.

But truly leſt the ſtopping of the paſſage of the bladder, or of the common paſſage, (neither of which eaſily happens, or from any light occaſion) may ſeem leſs efficacious to excite any Jaundies; therefore, *whether ſuch an obſtruction hath place, or no*, the moſt Renowned man ingeniouſly ſuppoſes beſides, *The choler while it is generated in the bladder does undergo ſometimes a notable change, by which it is moved, and is born about more plentifully and impetuouſly*, towards the blood, *with which yet it is leſs mingled than it was wont to be, but only confounded together with it, and ſo more eaſily departs from it and infects and tinges the ſolid parts with its colour.*

But that the *choler in the Jaundies may be rendred unfit to mix with the other humours, or to be nearly united*; he determines it to be done, *by a ſpirit too valatile, mixed plentifully with it, and ſo making it more ſpirituous and immiſcible with others.* He confirms this aſſertion by two inſtances, *viz.* in as much as the moſt ſpirituous poiſon from the biting of a Viper, and the too much uſe of the more generous drinks, *viz.* Wine and Strong-waters, cauſes ſometimes the Jaundies. Moreover he endeavours to procure credit to this Hypotheſis, for that this diſeaſe is wont to be cured, not only by medicines opening obſtructions, but by them which blunt the force of a raging volatile ſalt (of which *ſort are the decoction of Hemp-ſeeds, alſo* Venice *ſoape*, with many other things of the ſame ſort.)

The Authors opinion.

It belongs not to this place, neither is it to our purpoſe to deſcend to end this contention, nor dare I now raſhly determine it (ſince it hath tired ſo many Renowned Wits of the Moderns) whether really the choler be made in the bladder of the Gall, or whether it be only ſeparated from the blood in the Liver, the great organ of ſeparation; I confeſs this latter opinion beſt pleaſes me. And weighing theſe things ſeriouſly I am induced to think the cauſe of the Jaundies to conſiſt chiefly in this, that the choler being ſever'd in the Liver, is not, by reaſon of the ways being obſtructed, at all, or not enough conveyed to the bladder of the Gall, but that it muſt of neceſſity regurgitate into the maſs of blood; notwithſtanding in the mean while we deny not, but this affect may ſometime ariſe (although more rarely) from the Cyſtic paſſage or common pipe being obſtructed. But alſo we think the fault of the blood to proceed in part and perhaps ſometimes wholy for the morbific cauſe; when to wit from its ſulphurous and fixt Saline Particles above meaſure exalted, the choler is more plentifully, or quicklier generated in the maſs of blood, than can be ſeparated or diſcharged forth by the ordinary ways; wherefore this, ſeparating every where from the blood with the Serum, is affixed to the ſolid parts, and impreſſes its tincture upon them. And without doubt it is for this reaſon that ſome poiſons, and chiefly the biting of Vipers, and the dayly uſe of more generous drinks, induces the Jaundies in bodies before ſound, for whoſe cure ſometime Phlebotomie, and medicines reducing the blood to a right temper, are wont to profit more than thoſe opening obſtructions. Moreover it ſeems for this reaſon, that a tertian intermitting Feaver ſo frequently terminates in the Jaundies; for we may not ſuſpect the paſſages of the Liver can be by any means obſtructed, ſince in all fits, ſo great an agitation of the blood and humours, by cold, and heat, and ſuch an evacuation of them happens either by vomit or ſweat: and truly even as feaveriſh fits are cauſed, inasmuch as the ſulphurous part of the blood being too much advanced, in the firſt place perverts the nutritious juice into a morbific matter, and afterwards being inflam'd conſumes and exterminates it; ſo when the fixt ſalt is at laſt exalted together with the ſulphur in the blood, and for that cauſe meer choler is abundantly engendered, the feaveriſh enkindling of the blood ceaſes, by reaſon of the reſtrictive force of the fixt ſalt, and in place thereof the diſtemper of the Jaundies doth ſucceed. But as the blood being too much advanced to a ſulphureoſaline diſtemperature cauſes the Jaundies in any, though leaſt prediſpos'd to it; ſo in others very much diſpoſed thereto, having the ways of choler obſtructed and the ſulphur of the blood being too much depreſſed, it produces a freedom from that diſeaſe; for I have known many cachectick and phlegmatick perſons, to have been free from the Jaundies though they

The cauſe of this diſeaſe ſometimes in the blood.

they have ſuffered under obſtructions and indurations of the Liver, as to moſt of its paſſages.

The cure of the Jaundies.

It is not worth our labour to make more ample diſquiſition about the Ætiologie of this diſeaſe; as to what reſpects the cure, there will be three primary indications, all which (for what may be the chiefeſt of them, and firſt to be exhibited, for the moſt part is concealed) we ſhall proſecute together; wherefore the intentions of healing ſhall be, 1. That the obſtructions of the paſſages or choler-bearing veſſels be opened, if perhaps any ſhall be either in the *porus bilarius*, in the Cyſtic paſſage, or in any place about the Liver. 2. That the blood be reduced to its due temperament and mixture, leſt it ingender choler above meaſure, or render it unapt to be voided. 3. That the ſtrength may be ſuſtain'd, and the ſymptomes chiefly hurting them may be withſtood.

The 1. Indication.

1. That we may ſatisfie the firſt indication, Cathartic evacuations notably conduce, as well by Vomit, as ſiege, whereby the choler's deſcending towards the inteſtines may be furthered, and veſſels obſtructed, by the great ſhaking of them, freed from their obſtruction. 2. Sharp, bitter, ſalt Medicines and others indued with a certain briskneſs ought alſo to be given, which provoke the motion of choler gathered in the Liver, and ſtagnating; hither alſo ought to be referred, what by ſimilitude of ſubſtance, and as it were ſignature, in as much as they are indued with a yellow juice, have the report to help againſt the Jaundies; notwithſtanding many of theſe may fitly be numbred under the ſame claſſis of evacuators, as the former, becauſe they move Urine or Sweat.

The 2. Indication.

The ſecond indication altogether requires alteratives, *viz.* Medicines which may depreſs the exaltations, or ragings of the Sulphur and fixt ſalt, and in the mean time provoke the reſtitution of the volatile ſalt depreſſed; for theſe ends remedies endued with an acid or volatile ſalt, beſides chalybeats do principally bring help; from hence ſpirit of ſalt, of vitriol, juice of Lemons, alſo ſpirit of Harts-horn, alſo dung of Sheep and Geeſe, *Crocus Martis* and divers other preparations thereof, are frequently uſed with ſucceſs in the Jaundies.

The 3. Indication.

The third indication vital ſuggeſts more and ſundry intentions of cure, procuring the ſtrength to be reſtored, and the removing the ſymptomes whereby it is prejudiced, all or the chief particularly to enumerate, and prescribe would be a vaſt and tedious work; wherefore we will annex only certain general rules about diet, and ſome Cordials and Anodynes appropriate in this condition.

Forms of Remedies.

The curatory indications being appointed after this manner, it next lies upon us to accommodate the moſt ſelect Medicines, *viz.* as well the ſimple as the compound, to theſe now propoſed intentions of curing, and to unfold the manner and reaſon of the Operating of remedies which are accounted of ſpecial note in this diſeaſe. Therefore firſt we propound the forms of evacuating Medicines appropriate in the Jaundies.

1. *Vomits.*

Vomits.

Vomiting Medicines are frequently wont to help in the recent Jaundies, while the tone and ſtrength of the bowels are firm; in as much as they alleviate the ſtomach always oppreſſed in this diſeaſe with an unprofitable burden of viſcous Phlegm; and moreover do free their infarctions by irritating the *vaſa choledocha*, and by much ſhaking all the paſſages of the Liver, and make eaſie the paſſage of the choler by the former accuſtomed ways.

Take of the infuſion of Crocus Metallorum from half an ounce to ſix drams, Wine of Squils an ounce, Oxymel ſimple half an ounce, make a Vomit to be taken with Government.

Sometimes it is convenient to exhibit, the evening before, the following preparatory Medicine for the eaſier Vomiting.

Take of the Powder of Aſarum roots, facula Aronis of each a ſcruple, of Tartar vitriolated half a ſcruple, of Oxymel of Squils an ounce, mix them.

Take of Sulphur of Antimony ſeven grains, Scammony ſulphurated eight grains, cream of Tartar half a ſcruple, make a Powder, give it in a ſpoonful of Panada.

Take nine Aſarabacca leaves, cut and bruiſed put them into three ounces of White-wine, preſs out the liquor, let it be taken in the morning with regiment.

Take of Gambugia prepared eight grains, Tartar vitriolated ſeven grains, make a Powder.

PHAR. Part. II.

2. *Cathartick.*

Purgers. Purgers take place in this diſeaſe, be it recent or inveterate, *viz.* that as well a more plentiful ſtore of Excrements may be now and then withdrawn from the firſt paſſages, as that the *vaſa choledocha* may be excited to Excretions.

A Bolus. *Take of Electuary of juice of Roſes three drams, Rhubarb a dram, Salt of Wormwood, Cream of Tartar, of each half a Scruple, Syrup of Rhubarb, make a Bolus.*

Apozems. *Take of the roots of ſharp-pointed Dock prepared one ounce, the tops of Roman Wormwood, of Centaury the leſs, of each P. ij. Gentian and Turmerick roots an. two drams, yellow Saunders one dram, boyl them in a Pint and a half of Spring-water to a Pint, adding towards the end Senna ſix drams, the beſt Rhubarb three drams, Agarick a dram and half, Coriander-ſeeds two drams, White-wine two ounces, let them boyl cloſe two hours, after ſtrain it and clarifie it by ſettling; the Doſe from four ounces to ſix, with one ounce of Syrup of Rhubarb, the water of Earth-worms three drams; make a Potion to be repeated every or every other day, for three or four dayes.*

In a weaker Conſtitution.

A Potion. *Take of choice Rhubarb two drams, Agarick trochiſcated, half a dram, Cinnamon half a ſcruple, Ginger half a ſcruple, make an infuſion in White-wine and Chichory-water, of each three ounces, for three hours, in it ſtrained diſſolve one ounce of Syrup of Rhubarb, water of Earth-worms two drams. Or Rhubarb from half a dram to a whole one, Salt of Wormwood a ſcruple, make a Powder.*

Pills. *Take pil. Ruffi a ſcruple, Extr. Rudii half a ſcruple, make 4 Pills, take them in a morning with government, after 4 or 5 dayes repeat them.*

Deoppilative Medicines. In the third place follow Deoppilatives, which are alſo Diureticks, or Diaphoreticks, ſome whereof are accounted ſpecifick, by reaſon of ſimilitude of ſubſtance; Medicines of this ſort, both promote the ſeparation of choler from the blood, and urge the paſſages of it, being ſeparated, through the paſſages and pores in the Liver open but little. Moreover, in the mean time, by diſſolving the blood, they carry off the ſeroſities and cholerick recrements thereof, ſometimes by Sweats and Urine.

Elixir. *Take of Elixir Proprietatis one ounce, take 20 drops in the morning, and at Five in the afternoon, with a convenient vehicle: after the ſame manner are taken, Tincture of Antimony, or of Salt of Tartar, and the ſimple mixture in a greater Doſe: for vehicles, Apozemes, diſtilled Waters, and Juleps for this Intention of curing are convenient.*

Apozems. *Take of the roots of Celandine the greater, ſtinging Nettles, Madder, of each one ounce, tops of Roman Wormwood, white Horehound, Agrimony, Germander, of each one handful, Worm-ſeeds two drams, Shavings of Ivory and Harts-horn, of each two drams, yellow Sanders a dram and a half, Coriander-ſeeds two drams, boyl them in three pound of Spring-water to two pound, adding of White-wine four ounces, ſtrain it, and add Syrup of Chichory with Rhubarb two ounces, water of Earth-worms, an ounce and a half, make an Apozeme, the Doſe four or ſix ounces twice in a day.*

Take of white Horehound dryed, Centaury, of each one handful, Gentian and Turmerick-roots, of each three drams, Cinnamon one dram, Saffron half a dram, being ſliced put them into a Glaſs with two pound of White-wine or Rheniſh-wine; make an infuſion, the doſe three ounces

To this we will add *Geſners* famous Antictericum.

Take of the roots of ſtinging Nettles a pound, Saffron one ſcruple, bruiſe them well, and draw off the Tincture with White-wine, the doſe three ounces 4 or 5 dayes.

Empirick Remedies. Like to the former is that of *Fr. Joel. Take the Roots of Celandine the greater two handfuls, Juniper-berries a handful, bruiſe them and pour on them a pound of Rheniſh-wine, and draw out the juice, the doſe four ounces twice a day.*

The juice of White Hore-hound is mightily commended by Diaſcorides, *and the Syrup of the ſame by* Foreſtus, *for curing the yellow Jaundice.*

In lieu of an Elixir, and other Chymical liquors, which to avoid nauſeouſneſs are to be taken in very ſmall quantity; to others endued with a ſtronger Conſtitution, Electuaries, Powder and Pills may be adminiſtred with better ſucceſs.

Take

PHAR. Part. II.

Take of Conſerve of Roman Wormwood, of the yellow Rinds of Oranges and Limons, of each two ounces, Species Diacurcumæ one dram and half, powder of Ivory, yellow Saunders, of Lignum-Aloes, of each half a dram, Troches of Capers one dram, of Rhubarb half a dram, Salt of Wormwood two drams, with Syrup of Chichory with Rhubarb make an Electuary, the doſe the quantity of a Cheſnut twice aday, drinking after it three ounces of the following Julep. *An Electuary.*

Take of the greater Celandine-water, Fumitory, Wormwood, Elder-flowers of each five ounces, Snail-water, water of Earth-worms, compound, of each two ounces, Sugar half an ounce, mingle them and make a Julep. Or, *Diſtilled Waters.*

Take of the roots of ſtinging Nettles, Angelica, Gentian, of each four ounces, the greater Celandine leaves and roots, ſix handfuls, Wormwood, Tanſie, Southern-wood of each four handfuls, the outer rinds of twelve Oranges and four Limons, prepared Worms and Snails of each one pound, Cloves bruiſed two ounces, being all cut and bruiſed pour upon them eight pound of White-wine, let them be diſtill'd in a cold Still, and the whole water mixt. Or,

Take of filings of Steel one pound, freſh Strawberries ſix pound, put them into a glazed pot, ſtirring them together, and let them ſtand aday, afterwards add of Engliſh Rhubarb ſliced one pound, the rinds of four Oranges ſliced, pour upon them of White-wine ſix pound, and diſtil them according to Art; let all the liquor be mixt together. The doſe of this and of the former is three ounces twice in a day after the Electuary or any other Medicine.

Take of Turmerick-roots, Rhubarb, of each one dram and a half, the Bark of Caper-roots, of Aſarum-roots, of each half a dram, Extract of Gentian, and Centaury, of each one dram and a half, Salt of Wormwood four ſcruples, Water-creſs-ſeeds, half a dram, of Rocket half a ſcruple, Elixir Proprietatis one dram, gum Ammoniacum diſſolved in the water of Earth-worms what will ſuffice to make a maſs, form it into ſmall Pills, the doſe is half a dram evening and morning, drinking after it three ounces of the diſtilled water.

Sylvius *his Empyrical Remedies.*

Sylvius doth much magnifie for cure of the Jaundies, the Decoction of Hemp-ſeed in milk, and the ſolution of Sope, and from thence endeavours to eſtabliſh his own Hypotheſis (as we have above intimated) whereby he endeavours to deduce the Ætiologie of the Jaundies, rather from an alienation of the choler, than from the obſtruction of its paſſages.

The ſecond Indication. Remedies againſt the Jaundies endowed with an animal volatile Salt.

2. The Second Indication reſpecting the altering or tempering of the blood, by which it may breed but moderately, and duly ſeparate the choler, requires Medicines of that ſort, which depreſs the Sulphur and fixt Salt too much advanced. For theſe ends, I know not by what chance or conduct Medicines endowed with a volatile Salt, as Worms, Snails, Millepedes, yea Lice, Dungs of fourfooted Beaſts, and Fowl, are brought into practice for curing the Jaundies, and not only preſcribed by Empiricks, but the more famous Phyſicians: Theſe ſometimes by themſelves, but oft'ner joyn'd with Purgers and Deoppilatives, become the chief Ingredients in Compoſitions againſt the Jaundies.

Fonſeca preſcribes Gooſe-dung gathered in the Spring-time and dryed, as alſo the white excrement of Pullets, of both which let the powder be given in a convenient vehicle from half a dram to a whole one.

Various forms of them.

Take powder of Earth-worms prepared, of Gooſe-dung, of each three drams, Ivory, yellow Sanders, of each half a dram, Saffron one ſcruple, make a Powder, divide it into ſix parts. One to be taken every morning with ſome appropriate liquor. To the Apozeme, or Antiſcterical Tincture preſcribed above, Earth-worms, Gooſe-dung, *and alſo* Sheeps-dung *are profitably added.*

Take Millepedes freſh and alive from 50 to 100, Saffron half a ſcruple, Nutmeg a ſcruple, bruiſe them together, and infuſe them in Water of Celandine four ounces, of Earth-worms two ounces, expreſs them ſtrongly, and drink it: after this manner take it firſt once, then twice in a day for a Week.

The vulgar and Emperical remedy with us is, that Nine quick Lice be taken in a morning for five or ſix dayes, by which remedy they report to me many to be cured (whenas other remedies effected little) which truly can help by no other means than by reſtoring the volatile Salt depreſſed in the blood.

Alſo ſuch as are endued with a mineral volatile Salt.

Upon the ſame account of ſuccour even in this diſeaſe the flowers of Sal Armoniac, the volatile Salts of Amber, Harts-horn, Soot, in like manner their Spirits are frequently adminiſtred with great ſucceſs.

Take

PHAR. Part. II.

Take powder of Earth-worms prepared two drams, Species Diacurcumæ one dram, flower of Sal Armoniac half a dram, Salt of Amber a ſcruple, Extract of Gentian one dram, Saffron one ſcruple, Gum Ammoniacum diſſolved in water of Earth-worms what ſuffices, make a maſs, and form it into ſmall Pills; the Doſe is three or four, morning and evening, drinking after it three ounces of the Julep before preſcribed.

Take Spirit of Harts-horn tinctured with Saffron three drams; Doſe from 15 drops to 20. with the diſtilled water preſcribed above.

Steel remedies of ſeveral kinds.

In this Claſs of Medicines by which the icterical diſtempers of the blood are to be corrected, ſteel'd remedies do alſo challenge their place by right; for theſe afford notable help, not ſo much by unlocking the obſtructions of the bowels, as by depreſſing the rage of the Sulphur, and fixt Salt, and by volatilizing the blood, in the Jaundies, no leſs than in other cachectical diſtempers.

Wherefore, to the Decoction, or Tincture, or Infuſion above preſcribed, is properly added the filings of Iron, or the prepared powder thereof (its mineral conſiſtence being ſome ways opened) or the vitriolic Salt extracted; from hence it is, that Medicinal waters heal even to a miracle thoſe ſick of the Jaundies, that had been deſpaired of; although theſe drunk in a very large quantity, inaſmuch as they paſs through all the veſſels, do alſo open the paſſages of the Liver, however ſhut up.

Therefore alſo even Preparations of Steel are added to the Electuary, Pills and Powders above recited, one while this, another while that, in due proportion. Moreover the Syrup thereof given twice aday to one ſpoonful, in three ounces of Apozeme or water againſt the Jaundies; alſo tincture of Steel to twelve or fifteen drops may be adminiſtred in the ſame manner.

Outward and Sympathetick remedies againſt the Jaundies.

In the laſt place we may annex to this Claſſis of altering Medicines thoſe things which not taken inwardly, but outwardly applyed, and by contact, uſed to the very urine of the Patient are held to cure this diſeaſe.

As to the former, a remedy often tryed by the vulgar, is a living Tench-fiſh, whoſe ſcales and outer ſuperficies do reſemble a yellow colour, applyed to the right Hypochondria, or Stomach according to ſome, (to the ſoles of the feet, according to others) whence a ſudden flight of this diſeaſe is expected; hence although many promiſe themſelves a ſure cure, it hath often deceived me.

Another cure of the Jaundies at a diſtance is ſaid to be done by I know not what ſympathy or ſecret manner of working.

Take the freſh Urine of the Patient made at one time, of the Aſhes of the Aſh-tree ſearced, as much as ſuffices to reduce into Paſte, which may be formed into three equal balls, to be placed in a place ſhut, near the Hearth or Stove; as theſe dry and harden, the Jaundies will vaniſh; after this courſe, I have known this inveterate diſeaſe happily cured, although reſiſting many other remedies; the practice thereof is very familiar with the Vulgar.

The reaſons of ſome of them:

If of a certain it could be made manifeſt that this effect doth for the moſt part happen, and the reaſon of it be inquired into; in the firſt place we ought to ſuppoſe a conſent or ſympathy of the ſpirits and other particles in the animated blood, with other ſymbols inmates of the freſh Urine; and that they are immediately affected in the like manner with theſe. Notwithſtanding it is evident enough that a lixivial Salt mingled with Urine, doth preſently ſet free the volatile ſalt formerly ſubdued or enwrapt in other particles; as is plainly ſeen in diſtillation of Urine, which if you urge by it ſelf with a ſand-heat, nothing but Phlegm will ariſe; but add the calx of Tartar, or Aſhes, immediately the Spirit and volatile Salt will come forth: wherefore, that Empirical adminiſtration being adminiſtred, at the ſame time, both in the Icterical Urine, and alſo in the blood of the Patient, the volatile Salt eſcapes out of the power of the fixt Salt and the Sulphur, and for that cauſe the Icterical diſtemper of the Blood is put to flight. Alſo upon the ſame reaſon is built another ſympathetical cure of the Jaundies, whereof *Phil. Grulingius*, and *Felix Platerus* do make mention, *viz.* the ſick party piſſing upon Horſe-dung while it is hot, hath cured many of the Jaundies; inaſmuch as the fixt Salt of the Urine, and thereby the fixt Salt of the icterical blood of the Patient, is altered by the volatile Salt of the freſh dung, and reduced into its due temperature.

The third Indication vital.

3. The third Curatory indication vital inſtitutes a convenient courſe of Diet, and moreover Cordials and Anodynes, of both which there is frequent need.

As to what relates to the former, Food in this diſeaſe, more than in any other ought to be medicinal. For Vegetables and their parts, ſtyled commonly Hepatick remedies, are boyled in the broths of theſe Patients. And theſe alſo are wont to be made inſtead of other fleſh, of Worms, or Snails, (which are accounted Antidotes againſt

it

the Jaundies.) Moreover Ale, and other ordinary drinks are impregnated with infuſion of Medicaments. PHAR. Part. II.

Take of the roots of ſtinging Nettles, of Strawberries, of each an ounce and half, Eringo-roots candied one ounce, Ivory and Harts-horn, of each two drams, Earthworms cleanſed twenty, a Cruſt of White-bread, Mace two drams, boyled in two pound of water to one pound, ſtrain it through Hippocrates *ſleeve, to which add Diaſantalon half a dram, make broath, whereof take from four ounces to ſix, twice in a day: for ordinary drink, fill a Tub of four Gallons with Beer, after it hath wrought, put in the following Bag.*

Take the tops of Roman Wormwood, white Horehound dryed, of each two handfuls, the roots of ſharp pointed Docks ſix ounces, of the Bark of Aſh, of Barberries, of each 3 ounces, the outer Rinds of eight Oranges, and four Limons, being ſliced and bruiſed, let them be prepared according to Art.

Since many ſick of the Jaundies are uſually affected with a great languiſhing, and frequent faintings of the Spirits, they have alſo need of cordial Remedies.

Take of ſmall Aqua Mirabilis eight ounces, water of Earth-worms four ounces, Syrup of Orange-peels two ounces, mingle them, the doſe two or three ounces.

Moreover, they who are troubled with this diſeaſe, do very much ſuffer with pain ſometimes very troubleſome in the night, and are often obnoxious to waking; wherefore alſo Anodynes come into uſe for adminiſtration. *Forms of Cordials.*

Take of Aqua Mirabilis, water of Earth-worms, of each one ounce, Diacodium ſix drams, Tincture of Saffron half an ounce, the doſe one or two ſpoonfuls late at night, if ſleep be wanting.

Take of Landanum tartarizated two drams, Aqua Mirabilis two ounces, Syrup of Clove-gilly-flowers one ounce, mix them, the doſe is one ſpoonful after the ſame manner.

SECT. II. CHAP. II.

Of other Hepatick Remedies.

THe Liver is ſeldome or never found obnoxious to an Atrophie or extenuation, ſince truly it performs the office of a ſtrainer, and according to ſome, of a mingling bowel; but on the contrary by reaſon of many cauſes and occaſions it runs the hazard of being encreaſed as to its bulk, and to be ſtufft and ſwell'd with divers things gathered therein, and with concretions. Hence no ſmall account of health conſiſts in this, that the Liver having right conformation may freely convey the blood every where, without keeping back too much Cuſtome or proviſion for it ſelf.

Truly many faults, and indeed not altogether undeſervedly, are imputed to this Bowel, as alſo unto the Spleen; the chief Kinds of which we ſhall touch upon. The Liver frequently and chiefly is wont to be faulty in one of theſe two, *viz.* Firſt that intercepting the nutritious juice appointed for other parts, it beſtows it to its own proper uſe; this is plainly diſcerned in Children affected with the Rickets, and moreover in many others that lead a ſloathful and idle life. Anciently there was an art with the *Romans* ſo to feed a Gooſe that the Liver prodigiouſly encreaſed might weigh more than the whole body. Secondly, the other fault of the Liver is, that it too eaſily receives all the excrements and feculencies whatſoever of the depraved Blood, brought into its inward receſs, and by retaining them there, doth not only grow large, but is obſtructed in its paſſages, whence frequently comes the Jaundies, or a Dropſie; it contracts alſo tumours and preternatural Concretions of divers kinds of matter. *The Kinds of Remedies aſſigned to the Liver.*

Many and divers diſtempers of the Liver ought to be referred to theſe two heads: of each of which it is not our purpoſe to inſtitute particular pathologies. As to what appertains to the general pharmacie of this bowel, there will be one principal ſcope of curing, that its income be diminiſhed as much as may be, or altogether cut off. *Two general intentions of curing this bowel.*

Wherefore

PHAR. Part. II.

Wherefore it will behove us to procure theſe two things, *viz.* That the Liver augment not above meaſure, by taking the nutritious juice too much unto it ſelf; and that it retain not the feculencies of the Blood, whereby it may be affected with obſtructions and preternatural Tumours.

It will be much eaſier to prevent than cure either of theſe faults of this bowel. For truly the former may be done, reſpect being had only that the blood be well conſtituted in its Temperament, and enjoying a free Circulation, it may both diſpenſe its nutritious juice to the parts, and eſpecially its outward parts, and driving forth all its excrements to the particular Emiſſaries, it may put them away there. And ſurely, the Medicines vulgarly called Hepaticks, do firſt and more immediately exert their power by purging the blood, rather than by correcting of the Liver: thoſe namely conſiſt of particles of ſuch a kind, which entering into the blood, and not mixing with it, do ſo ſtir up the maſs thereof, and break it into pieces, that all the Coagulations and Concretions being taken away, all its dregs and impurities may eaſily depart, and being carried to their proper Emunctories may be caſt out of doors.

Medicines vulgarly called Splanchnick, firſt and chiefly operate upon the blood.

For truly all remedies which are called Splanchnick, firſt work upon the blood, and incite its conſtitutive parts into a kind of effervescency, and ſo toſs, divide, and move them rapidly to and fro, that the vaporous effluviums being ſent into the habit of the body, the ſerous excrements into the Kidneys, the cholerick into the Liver, the melancholy into the Spleen, and others to other Emiſſaries for which they are fitted, may be ſhut out, without impediment or adheſion.

What ſuch they are which more eſpecially reſpect the Liver.

Wherefore the ſame Remedies which help the Liver, help alſo the Spleen, the Reins, the Lungs, and other the Bowels in their ſeparations; and for the moſt part move ſweating and urine. If any be found to reſpect one part before the reſt by any ſpecifick power, it is therefore becauſe their particles being more ally'd unto the excrements to be ſeparated within that bowel, and from thence aſſociated to them are conveyed thither together with them. For this reaſon Rhubarb, Turmerick, the greater Celandine, with many others adjoyned to the bilious humour, do the more eaſily reach the paſſages of the Gall, and are wont to ſuccour in the Jaundies. We have obſerved before, the energies and manners of operating of Medicines of this kind. As to what appertains to the other, vulgarly called Hepaticks, firſt we will annex briefly certain forms of thoſe which are reported either to prevent or remove the unnatural augmentation of the Liver, and then thoſe which are held to provide againſt or take away the obſtruction and preternatural Tumours thereof.

1. Againſt the too much encreaſe, or improportionate nutriment of the Liver, firſt a more ſparing and thin diet, ſhort ſleeps, and moderate and frequent exerciſes are convenient: wherefore we preſcribe for Infants, and Children, when they are diſcovered obnoxious to this diſtemper, as in the Rickets, that they ſuck thin and ſerous milk, that they be ſhaken or toſſed in their Nurſes arms, and tumbled quickly to and fro, or be carried ſwiftly in a Chair or Coach, and as ſoon as may be, learned to go and to uſe their feet.

Some form of Hepaticks.

Take of the water of Snails, of Earth-worms, of each three ounces, Syrup of Chicory with Rhubarb two ounces, ſpirit of Sal Armoniac with Gum Ammoniacum one ſcruple, mix them, and take a ſpoonful evening and firſt in the morning.

Take of the roots of Maleferne, Chervil, candied Eringoes, of each one ounce, the leaves of Agrimony, Harts-tongue, male Speed-wel, of each one handful, Shavings of Ivory, Harts-horn, of each two drams, white and yellow Sanders, of each one dram, Raiſins ſtoned one ounce and a half, Barly three drams, boyl them in three pound of Spring-water to two, to it ſtrained add of Snail and Earth-worm water, of each one ounce and half, Syrup of Chicory two ounces, make an Apozeme, take two or three ounces in a day.

Take powder of white and yellow Sanders, Crabs-eyes, Lignum-Aloes, of each half a dram, Salt of Wormwood one Scruple, make a powder, the doſe half a Scruple to a whole one twice a-day.

Take Empl. Diaſaponis, Cerate of Sanders, of each what will ſuffice, make a Plaiſter to be applyed to the Hypochondrion.

Take Unguentum Splanchnicum two ounces, Oyl of Wormwood one ounce, mix them, and make a Liniment for the region of the Liver.

Hither many other methodical as well as Empirical Medicines being uſed for the Rickets may be referred, but we haſten to other things.

Their numbers enumerated.

2. Remedies ordained for moſt other diſtempers of the Liver are either ſimple or compound. Very many of the former ſort are reckoned by Authors, as if they were procreated for this particular uſe. *Heurnius* ſays, *That God Almighty hath offered to*

the

PHAR. Part. II. *First Simples.*

the World the greater plenty of Remedies of this kind, by reaſon of their notable neceſſity. And to this Rank may be referred in the firſt place all kinds of Chichories, the Sorrels, the ſharp pointed-Docks, and almoſt all Vegetables endowed with bitterneſs and ſomething of ſharpneſs, (wherein the deoppilative vertue is reported to conſiſt) as Wormwood, Germander, Ground-pine, Fumitory, Tanzy, Agrimony, Liverwort, Lignum Aloes, all the Sanders, Tamarisk-bark, and Aſh-bark, the roots of Capers, with many others, which commonly make up the greateſt part of Herbals; ſo that whilſt the Liver like a certain Goddeſs ruled ſanguification, very many Medicines were uſed to be aſcribed for its ſafeguard and ſuccour.

The fixt Salts of herbs, the acid Spirits of Minerals drawn by diſtillation, belong by right to this number, as they do chiefly exagitate the maſs of blood, diſſolve the Concretions thereof, diſpatch their obſtructions, and cauſe it every where to be paſſable, as to all the parts thereof.

Chalybeates.

If I here omit Chalybeats, moſt Chymiſts will cenſure me very unjuſt to the Liver; for truly as the Prerogative of *Venus* is vulgarly attributed to this bowel, ſo as to conſtrain to Love, we may hence expect that *Mars* will be perpetually kind unto it. And really it is manifeſt by Reaſon, as well as Experience, that Preparations of Steel are convenient in hepatical affects, as chiefly in the Jaundies, and oftner in the Dropſie; wherefore theſe are put into the Receipts of the Ancients and Modern, and among curatory Compoſitions. For what reaſon the Preparations of Steel, as in like manner the medicinal waters from Iron, as well natural as artificial, do purifie the maſs of blood, and by conſequence do relieve many diſtempers commonly call'd Hepatical, is ſhewn by us largely enough in another place, ſo that here is no need for repetition.

Medicines that are appointed by Phyſicians for the Liver are divided into various forms, but firſt into hot and cold, and alſo into moiſt and dry; accordingly as the temper of this bowel is ſuppoſed to conſiſt after divers manners, when in truth it is only a dyſcraſie of the blood, which being ſo diverſly faulty, deſires ſo various an energy of medicines. Neither is it a leſs vulgar error, that in the eſtimating of mens conſtitutions, the various temperament of every one due to the blood, is aſcribed chiefly to the Liver, as hot or cold, or otherwiſe diſpoſed.

The Shop compoſitions of Hepaticks.

In the Antidotaries of the Antients there are many Shop-compoſitions extant, which ſeem to be deſigned for the Livers ſake only, of which ſort are *Rhaſis* his Electuarie of the droſs of Iron, *Crocus ferri* of *Balchuſis*, which being mixt with Treacle is commended for hepatical affects; the *ſpecies Diatrion ſantalon*, *Diarrhodon Abbatis*, *Trochiſc* of *Rhubarb*, *of Agrimony*, *of Capers*, *Diacurcuma*, *Dialacca*, *Syrup of Wormwood*, *Chicorie*, *of the five roots*, *Byzantinus*, with many others, unto all whoſe forms, a vaſt Catalogue is annext for curing all the diſeaſes of the Liver. But theſe paſſed over, it pleaſes me now to propound ſome Kinds and Examples of Medicines which are counted deoppilative according to the practice of the Moderns.

Therefore for an opening Decoction,

Magiſtral Compoſitions.

Take of the roots of Ferne, Chervil, ſtinging Nettles, Dandelyon, of each one ounce, the leaves of Agrimony, Harts-tongue, Speed-well, Oak of Jeruſalem, *Liver-wort, of each a handfull, white and yellow Sanders, of each three drams, Ivory half an ounce, red Cicers an ounce, Coriander-ſeeds three drams, Raiſins two ounces, boyl them in four pound of water to two pound, adding towards the end White-wine four ounces, ſtrain it through* Hippocrates *Sleeve, to which add Species Diarrhodon Abbatis one dram, of our prepared Steel two drams, Syrup of Chicory with Rhubarb two ounces, the Water of Snails and Earth-worms, of each one ounce, the doſe ſix ounces twice in a day after a doſe of the following Electuary.*

Electuary.

Take of Conſerve of the yellow of Oranges and Limons, of each two ounces, of Wormwood and Fumitory, of each one ounce, ſimple Powder of Aron-roots, yellow Sanders, Lignum Aloes, of Caper-roots of each one dram and a half, Crabs-eyes one dram, Salt of Wormwood two drams, ſyrup of Fumitory what ſuffices, make an Electuary, the doſe the quantity of a Walnut twice in a day, drink after it a draught of the Apozeme now preſcribed, or of the following diſtilled water.

A diſtill'd Water.

Take the leaves of Wormwood, Centaury, Tanſie, both ſorts of Southern-wood, Tamariske, of each four handfuls, of green Walnuts four pound, of Aſhen keyes green two pound, the Rinds of ten Oranges and four Limons, Snails and Earth-worms prepared, of each one pound, all being ſliced, pour on them of White-wine eight pound, diſtill it in a cold Still, let all the liquor be mixt together, the doſe three ounces, ſweetning it with Sugar or a fit Syrup.

PHAR. Part. II.

If a form of Pills will pleaſe better, the enſuing Extract called in the Shops *Extractum Ecphracticum*, ſeems profitable.

Pills.

Take of white and clear Tartar, and of freſh Filings of Iron, of each 4 ounces, let them be ground together into powder, after boyl them in Fountain-water from four pound to two (ſome uſe White-wine) to the ſtrained liquor add the tops of Centaury, of Roman Wormwood, of Cardnus, of each one handful, Gentian-root half an ounce, Species Diacurcumæ an ounce and half, let them boyl ſhut cloſe for three or four hours, ſtrain it, and evaporate by the heat of a Bath to the conſiſtence of Pills, adding roots of Rhubarb or Species of Hiera Picra *two drams; the doſe is from one ſcruple to half a dram made into Pills, in the evening, with an appropriate vehicle.*

For the ſame intention, *viz.* to prevent or to remove the obſtructions of the Liver, a medicated purging Ale, to be taken many dayes in Spring and Autumn, is by ſome very much magnified, and exactly obſerved every year during their lives.

Take of the roots of ſharp-pointed Docks prepared, Polypodie of the Oak, of each 3 ounces, Madder-roots two ounces, Engliſh Rhubarb two ounces, of leaves of Senna four ounces, Epithymum two ounces, yellow Sanders one ounce, Carthamus and Coriander-ſeeds, of each one ounce and a half, ſlice them and bruiſe them according to Art, make a bag for 4 gallons of Ale, after ſix dayes let him take to 12 ounces more or leſs in the morning, expecting four or five Stools without regiment.

SECT. II. CHAP. III.

Of Remedies for the Dropſie called Aſcites.

After the Jaundies and the Remedies thereof, our method leads us to treat of a Dropſie; not becauſe of the Vulgar opinion, that it always ariſes from the fault of the ſame bowel; but becauſe that former diſeaſe having long continued, for the moſt part concludes in this: which happens ſo, not ſo much from the fault of the Liver, as from the whole Blood, for this and not that perform ſanguification, Wherefore, when the maſſe hereof hath for a long time been filled with cholerick excrements, and at length degenerating from its temper, accumulates alſo watery humours, then doth a Dropſical Diſpoſition come upon the Jaundies.

The more remote cauſes of an Aſcites.

But whereas three ſorts of Dropſies are vulgarly ſuppoſed, viz. *Aſcites*, *Tympanites*, and *Anaſarca*, we will at preſent handle only the two former, appertaining to the Splanchnick or Pathologie of the nether Belly. And firſt what relates to an Aſcites, this diſeaſe as to its matter and formal reaſon is manifeſtly known by the ſign of even many ſenſes together, *viz.* it is a Tumour of the Abdomen, from a wateriſh tumour contained within the cavity thereof. The water making this tumour, ſometimes encreaſes to a huge inundation, and ſcarce credible quantity. I have once ſeen a Tub would hold 15 gallons filled with water taken out of the Abdomen of a woman dead of a Dropſie. But whence that humour proceeds, alſo by what manner, and from what cauſes it gathers together in the belly firſt, and afterwards is ſenſibly augmented; and laſtly by what paſſages, and by what vertue and operations of Hydragogue Remedies, it may again be taken from thence, and evacuated, ſeems moſt difficult to be unfolded.

Firſt in reſpect of blood.

It doth not always proceed from the Liver and Spleen.

As to the former, *viz.* the encreaſe of water, ſome have thought it to deſcend from the Liver, and others from the Spleen diſtempered, into the cavity of the Abdomen; and ſo this bowel, or that being vitiated, always to be the cauſe of an Aſcites. But that this is otherwiſe, Anatomies of many dead of this diſeaſe, do manifeſtly declare: when after the inundation of the belly, the Liver and Spleen are found often without fault. And truly theſe bowels do not ſeem the Springs of any ſuch illuvies, being endowed with no cavityes, wherein waters might be accumulated together: wherefore the origine of an Aſcites, as of a ſtanding Pool or Lake, is to be derived from a River, or at leaſt a glutt or inundation of ſome Humour.

The

The humours that flow within the paſſages, or Veſſels as Brooks, are chiefly theſe three, *viz.* the Blood, the milkie Humour, and the Lympha. The ſhowering or diſtilling of water may come to paſs from the nervous Liquor which ſometimes ſlowly and inſenſibly ſweats out of the Fibres and Membranes, and from vapours condenſed within the hollowneſs, or ſome Cavity of the Body. Whether by theſe ways an Aſcites doth rather, and oftener proceed, we will now ſearch.

The humours by which it is produced are,

And in the firſt place as to what relates to the blood, it is without doubt, the Serum falling from the maſs thereof, too much diſſolved, as it doth excite Fluxions and Catarrhs of various kinds, ſo it ſometimes ſtirs up the greater illuvies of waters, *viz.* Dropſical: wherefore when an Anaſarca proceeds altogether from this cauſe, and when oftentimes an Aſcites comes upon that diſeaſe not immediately healed, we may well enough inferr that either diſtemper is induced from a watery humour, every where poured out from the little mouths of the Arteries. Moreover, it is not much improbable, that the Serum of the diſſolved Blood is firſt and ſolitarily poured out of ſome end of the Cœliac and Meſenteric Arterie being open into the Cavity of the Abdomen, and ſo brings on an Aſcites without an Anaſarca going before; and ſo eſpecially if perhaps it happen, that ſchirrhous Tumours, Ganglion's, little ſwellings, or preternatural Concretions of another manner, are firſt raiſed about the Meſentery, the Spleen, the Liver, the Womb, or any of the other bowels of the nether belly: for, becauſe the Circulation of the blood is hindred in thoſe places, that the blood being carryed through the arteries, may be ſome way brought back, the ſerous part being thruſt out from its company, falls into the cavity. For truly it is moſt evidently manifeſted, that it ſo comes to paſs, by this Experiment mentioned by us in another place, *viz.* If in a living animal, the jugular veins being taken up and bound with a thred, the reduction of the blood be ſtopt, the whole Region of the head ſwells in a ſhort ſpace, with a water between the skin, and clearly hydropical. And truly I have more frequently obſerved that an Aſcites hath followed upon ſecret tumours gathered and raiſed in ſome places in the lower belly: which certainly happens for the reaſon above recited. When the courſe of blood being obſtructed, the watery part is extravaſated in a ſhort ſpace, that humour is not meerly ſerous, but beſides, the nutritious Liquor, ordained to nouriſh all the ſolid parts, is emptyed into the belly: wherefore, while this Region ſwells up, the members are extenuated, and the Lympha taken out from an Aſcites, with heat thickens and grows white, like the white of an Egg.

Firſt the Blood.

It is alſo very probable, that the milkie Veſſels being burſt aſunder, pour out their humour into the cavity of the abdomen. Truly the moſt renowned *Sylvius* thought this diſeaſe moſt frequently engendered from ſuch a cauſe. And truly as out of the milkie or watery Veſſels, *viz.* one of them or both together, being divided or opened, we may well ſuſpect the illuvies of water or chyle ſometimes to overflow the bowels of the nether belly; ſo the following obſervation ſeems to confirm the ſame thing. Of late one that had been long ſick of the Jaundies, and in the mean time temperate and abſtemious of drink (to which he was not prompted by thirſt) contracted an Aſcites, increaſed in a ſhort time hugely. After that Medicines were adminiſtred in vain, a Paracenteſis is attempted according to the manner of *Sylvius*, with a hollow Needle; out of the orifice, not icterical water, but lympid and thin flowed out abundantly; from whence we may inferr, that Hydropic humour flowed not out of the maſs of blood, for then it had been coloured, but diſtill'd out of the lymphic or milkie veſſels into the cavity of the abdomen. We have join'd together as akin the ways of the milkie and lymphic Veſſels in propagating an Aſcites, becauſe both veſſels do convey the chyle, or what is analogous to it, to the common Receptacle; and many branches or leading Pipes of either kind, are diſtributed about the bowels of the nether belly; in the mean time, it is not improbable but that a ſolitary fault of either veſſel may ſometimes produce an Aſcites.

2, & 3. The milkie and watery humour.

As to the other ways of generating an Aſcites, propoſed in the beginning, I am ſcarce induced to think, ſuch an inundation of the belly can eaſily ariſe from the diſtilling of a nervous humour, or by reaſon of vapours there condenſed: although perhaps in a Tympany where the cavity of the abdomen is enlarged, and tranſpiration hindred, the effluvia that were wont to exhale, being forced inwards, are changed into Lympha or water, wherefore for the moſt part an Aſcites is ever conjoyn'd with that diſeaſe.

The immediate or conjunct cauſes of an Aſcites being deſign'd after this manner, which indeed ſeem to be, either a watery humour poured out of the Veſſels bringing Blood, or Lympha or Chyle poured out of the proper paſſages of them both; now we muſt in the next place inquire about the more remote cauſes of this diſeaſe, *viz.*

An Aſcites often the product of the Jaundies.

PHAR. Part. II.

for what occaſions and after what manner, the veſſels affected of either ſort depoſite their burdens into the cavity of the belly.

The kinds of a Dropſie.

Firſt therefore, that the watery part of the blood ſweats out into the *Aqualiculum* or belly, either the very Blood, or veſſels containing it, or both together, are in fault. The Blood is in fault, when being depraved in its Craſis it doth not rightly contain within its conſiſtence the conſtitutive parts, but being apt to be diſſolved, it every where rejects its ſeroſities from the mixture; which either it drives out by Urine or Sweat, or permitting them to reſide within, pours them out into the Pores of the fleſh, or the cavity of the bowels. The veſſels bringing blood grow faulty for a ſecond reaſon, for that their extremities or little mouths either are too much looſe, or altogether ſhut up. In the former ſtate the clew or Circulation of blood is not entirely and firmly continued; but the thinner and more crude part of the blood being apt to depart, is ſuffered to flow out near to the interſpaces or inoſculations of the Arteries and Veins; likewiſe on the other ſide, when the courſe of blood is hindred, by reaſon of a tumour or obſtruction of ſome veſſels, their little mouths being thoroughly cloſed; to this being ſo ſtraitned that a paſſage may be made open by ſome means that which is thin and watery is extravaſated, and ſent away into the neighbouring places, as we have ſhewed above.

The Deſcription of an Aſcites.

2. In reſpect of the Lymphaducts.

2, & 3. But an Aſcites beginning alone, doth often ariſe, by reaſon of the milkie or lymphatic veſſels being depraved; wherefore ſeeing we ſuppoſe the cauſe of this kind of diſeaſe to be oftentimes conjunct, we muſt enquire, by what means, and for what occaſions, theſe veſſels are wont to be ſo opened or burſt aſunder, that they pour out their liquor into the cavity of the belly.

Firſt therefore as to what belongs to the Lymphaducts, theſe veſſels may be in fault after a diverſe manner, but chiefly, either that being obſtructed or compreſſed near their origine, they do not receive the humour, or being burſt about the middle or extream parts, do pour it out into the belly. There are many cauſes and reaſons of effecting of either of theſe, for it may be viſcous matter obſtructs their beginnings, or glandulous, ſcirrhous, and other preternatural Tumours compreſs them, as alſo a vaſt inundation of Lympha flowing out, moreover vehement motions of the Body, or paſſions of the mind, may burſt them aſunder.

3. In reſpect of the milkie veſſels.

2. The milkie Veſſels, no leſs than Lymphatick, are in danger to be broke, and ſo by pouring out their liquor into the cavity of the Belly, do excite the Dropſie called Aſcites; and truly they are wont to be hurt for the like reaſon, in regard their middle paſſages, or their ends, either are obſtructed by a more viſcous chyle brought into them, or by Phlegm from the inteſtines, or they are compreſſed by Tumours bred in the Meſenterie: for forthwith the chyle entering into the beginnings of the veſſels, and not finding a paſſage, firſt very much diſtends them, and afterwards breaks them. There are many cauſes and occaſions, for which the thicker and obſtructing humours are driven forwards into the milkie Veſſels; for beſides an irregular Diet, and for the moſt part from meats hard to be digeſted, this evil is frequently cauſed by too much drink, or immoderate exerciſe immediately after Food, alſo from cold drink while the Bowels are very hot; for ſo the paſſages of the Veſſels before gaping are ſuddenly ſhut, and afterwards more narrowly cloſed, wherefore the chyle ſticking within their ſtraitned chanels, doth throughly fill and obſtruct them in a ſhort ſpace.

The differences of this diſeaſe.

As to what belongs to the differences of this Diſeaſe, beſides them already cited, *viz.* that it comes after an Anaſarca, or comes ſolitary; that this alſo is manifold and after a diverſe manner, according as the Veſſels bringing blood, or water, or milk, are found in fault; Moreover we obſerve, that the Dropſie called Aſcites ſometimes proceeds from a meer watery homour filling and diſtending the parts of the nether belly; but ſometimes there happens to this diluge an extenſion of the membranes, or inflations made by the irregularities of the inmate ſpirits, and ſo they do encreaſe the ſwelling of the Abdomen; and in this caſe a certain Tympanites comes upon an Aſcites, even as more frequently on the contrary, this is the offſpring of that.

Moreover, in an Aſcites meerly watery, ſometimes the Lympha only fluctuates within the Cavity of the Abdomen, ſo that in the mean time the bowels being ſoakt in it, continue ſtill entire, or little or nothing encreaſed in their bulk; but ſometimes beſides the inundation of the Lympha in the hollow of the Belly, the blood being ſlowly circulated there, and almoſt ſtagnating it is much diluted with water. Moreover the Parenchyma of the bowels, and the ſides of the Veſſels and of the membranes, and chiefly the Glandules every where numerous, being moiſten'd, do ſwell with the flowing water

water, and ſo the tumour of the belly conſiſting as it were of many pools of water and mooriſh Contents, riſes into a vaſt bulk.

The Prognoſtick of this Diſeaſe, is always ſuſpected and accounted of an ill omen: for none of the vulgar but will pronounce the obſtinate tumour of the belly to be very dangerous and difficult to cure: If any ſeem to be affected with a Dropſie, or a Conſumption, with them preſently the next queſtion is, Who ſhall be his heir. *The Prognoſtick.*

An Aſcites beginning after an Anaſarca (which proceeds commonly from the whole maſs of blood being pour'd forth into ſeroſities, and ſweating them out of the little mouths of the Arteries into the cavity of the Abdomen) is accounted of eaſier cure, or at leaſt of more promiſing hope, than that ſolatary diſeaſe coming from tumours about the Bowels, or from the Lymphatick or Lacteal Veſſels being burſt aſunder; for as well the conjunct as procatarctick cauſe of the former Diſeaſe, oftentimes is uſed to be removed wholly, or in part; but in the other caſe, both for the moſt part exiſt incurable. A reddiſh Urine, lixivial, and little, in an Aſcites is of ill ſignification, for 'tis a ſign that the maſs of blood, being repleated with a ſcorbutick Salt and Sulphur boyled together, is too much bound up in its ſubſtance; inſomuch that it doth not well ſeparate the feculencies, nor diſcharge them by fit and convenient Sinks, which notwithſtanding it doth evilly diſpoſe by conſtraint into the Cavity of the Belly, forasmuch as it is hindred in its Circulation in the very ſame place. For in an Aſcites the blood is not always diſſolved as in an Anaſarca, but ſometimes appears too much compacted in its temper, yet ſo, that the ſalt Serum being denied to the Pores of the skin, and to the Urinary paſſages, by reaſon of the Obſtructions of the Bowels is forced to break out within the abdomen.

If in an Aſcites, by a Purge taken, the waters are evacuated with eaſe plentifully by ſtool, and from thence the ſwelling of the belly is ſomewhat diminiſhed, we are not to deſpair of the Cure; but if Purgers bring out little or nothing of the Serum, or Lympha, and thence by reaſon of the Nervous Fibres being irritated, and driven into extenſions or inflations of the Bowels and Membranes (as it uſes frequently to be) the belly ſwells the more, and grows like a Drum, we may expect only a fatal event of the Diſeaſe.

About the curing of the Dropſie called *Aſcites* it behoves us chiefly to conſider by what ways the waters heaped within the Abdomen, may be thence brought out, and evacuated, for ſuch an evacuation ought to be attempted only by poſſible ways. And here preſently is to be obſerv'd, that the remedies uſed for Hydragogues according to the ordinary practice of Medicine, intend to accompliſh that end by purging, by Urine, by Sweating, and by inſenſible tranſpiration: In ſome caſes of the Sick you ought to proceed by this way, and in other caſes rather by that way, or another, and if none of theſe ſeem feſiable, or ſucceed well, let mature conſultation be had for a Paracenteſis. It will be worth our labour to weigh every of theſe kinds of Medicines, and the reaſons of every one, and the manner of their operations, and with how much vertue Hydragogues are endowed. *The cure of an Aſcites.* *By what and how many remedies the eduction of the water is to be endeavoured.*

Firſt, therefore as to what relates to Purging, we have in another place ſhewed that, from the irritation of the Phyſick made in the belly and guts, as well the Contents and wind of theſe bowels, as moreover the humours driven into their Coats and Glandules, and which are heaped up in the Veſſels and Pipes in the neighbouring parts, are diſquieted, and partly ſtreined into the paſſages of the guts, and partly returned into the maſs of blood; inſomuch that the tumour of the abdomen ariſing from the ſtoppage, and as it were a wateriſh affection of thoſe kind of Parts, is often abated by Purgatives ſeaſonably adminiſtred, and ſometimes wholly removed; but it doth not ſo ſucceed when it proceeds from a Lympha fluctuating within the cavity of the abdomen, or from an inflammation of the Membranes, or from a tympanitic extenſion: becauſe Hydragogues do little or nothing bring out thoſe waters, and if they be of the ſtronger ſort, they increaſe this paſſion and exaſperate it by inflaming the part. *Firſt by purging.*

Catharticks uſed for Hydragogues, are either Vomits, or Purges; they exert their power in the ſtomach, and theſe rather in the Inteſtines; inſomuch that they powerfully provoke and twitch the Nervous Fibres; and together pour forth the blood and nervous liquor by a certain ſeptick force, and do cauſe the ſerous humours wherever impacted to be ſtirr'd, and do cauſe them plentifully to be ſent away by the paſſage granted. Either are reckon'd of a various kind, *viz.* either ſimple or compound, gentle or ſtrong, by the Ancients as well as by the Moderns; ſome of which that are moſt chiefly noted, we will here briefly obſerve. *Catharticks are either Vomits or Purges.*

1. *Emetick Hydragogues*, chiefly famous, are Gambugia, Eſula, Spurge, and their ſeveral Preparations, as alſo the *Hercules* of *Bavius*, and the *Pilulæ Lunares*.

2. *Purgers*

PHAR. Part. II.

2. *Purgers* are Elder, and Dwarf-Elder, Soldanella, Gratiola or Hedge-hyssop, the Juice of Orris, and Elaterium. We will briefly prescribe some methods either of preparing or compounding or administring each of these.

The chief medicines of either kind.

1. *Gambugia*, first an *Indian* Medicine, being from thence brought by our Countrey-men, from the Painters Shops coming into the Apothecaries, began to be in use, and is much magnified for Purging out serous humours. But forasmuch as taken by it self it vehemently disturbs the Stomach, and often weakens it, therefore, that the outragious and violent Vomiting force may be somewhat abated, there are divers ways of its Preparation invented; but truly it is best corrected with an acid Spirit, or with an alcalizate Salt, or by thoroughly mixing and correcting it with aromaticks.

1. *Gummi gutta.*

Its various Preparations.

Adrian à Mynsicht, extolls the magistery thereof, which is made by a dissolution in Spirit of Wine, and after drawing it off, and precipitating it with Spring-water; also dissolving it with Spirit of Wine vitriolated, and with Tincture of Roses, and red Sanders, and after by evaporating it: others prepare it with the fume of Sulphur after the manner of Scammonie sulphurated; others grind it on a Marble, moistening it with Oyl of Cinnamon, or Cloves, or other Chymical Aromaticks. I use most the *Solution thereof made with a tincture of Salt of Tartar, the dose from* 15 *drops to* 20 *or* 30.

The forms of Hydragogues prepared thereof.

Take of Gum-gutta, gr. 6. Mercurius dulcis, gr. xv. Conserve of Violets, a dram and a half, make a Bolus.

Take of Gambugia twelve grains, Salt of Wormwood fifteen grains, Oyl of Mace one drop, Conserve of Damask-Roses one dram, make a Bolus: and it is wont to be given with Tartar vitriolate or Cream of Tartar, and powder of Rhubarb.

Take of Gum-gutta sulphurated, or vitriolated, fifteen grains, Cream of Tartar half a scruple, Extract of Rhubarb one scruple, Oyl of Cinnamon, gut. 2. make 4 Pills.

Lately, a Woman afflicted with a most painful Ascites, and most desperate, as it seemed to me, the ensuing Medicine being taken for 6 days successively, she began to be much better, and in a short time afterwards recovered her health entirely.

Take of powder of Gum-gutta twelve grains, Oyl of Cinnamon one drop, with syrup of Buck-thorn, make a Bolus, the dose daily to be augmented, ascending from twelve grains to twenty.

Take of our Tincture of Gum-gutta one scruple, water of Earth-worms one ounce, Syrup of Rhubarb half an ounce, mix them, and let it be taken with government.

2. *Spurge. The Preparations thereof.*

2. Whereas there are several species of Spurge, or *Tithymalus*, and all of them work more violently either by Vomit or Stool, by reason of the notable provocation they make in the bowels; and for that cause do abundantly bring out serous humours; yet by reason of the too outragious force of many of them, the lesser Spurge for the most part only is now in use, and the preparations thereof most of all magnified are, the powder of the bark of the Roots, and the Extract, and we think fit to add the tincture inferiour to none of the rest.

Take of Spurge with the Roots cleansed four handfuls, Lignum-Aloes and Cloves, of each one dram, bruise them and boyl them in four pound of Spring-water, to half, the strained Liquor clarifie by separation or settling in a long glass, afterwards evaporate the clear liquor in a Bath heat, to the consistence of an Extract, the dose one scruple.

Forms.

Take of this Extract half an ounce, pour upon it into a matrass of the Tincture of Salt of Tartar 6 ounces, digest them in a Sand-bath to the Extraction of a Tincture, the dose from 20 *drops to* 30 *in a convenient vehicle.*

Take of the Powder of Spurge from seven grains to ten, Cinnamon half a scruple, Salt of Tartar eight grains, mix them together in a glass mortar, give it by it self or mixed with a fit Conserve, or Syrup, make a Bolus or Pills.

The Hercules *of* Bovius.

2. *Precipitate* of Mercury with Gold, or the *Hercules* of *Bovius* which is much extolled by the Author for curing Dropsies; it is described in a former Treatise in the Chapter of Vomits, and the manner of preparing, and the working thereof, and the Reasons are there delivered. This Medicine, inasmuch as it twitches the stomachical fibres by its acrimony, and pours out the blood by reason of the mercurial and salt particles, causes or stirrs up a fierce Vomit, and thereby causes the serous humours, violently strained into the Cavities of the bowels, to be ejected.

3. The Pills called *Lunares* produce the same effect in like manner, by reason of the

the vitriolate particles of Silver ſharpened with other ſaline menſtruums, *viz.* by wrinkling of the fibres of the Bowels very much, they force the ſerous humors to be ſtrongly ſtrained into their paſſages, and ſo to be evacuated. PHAR. Par. II.

A Solution of Silver made in Stygian water, and well cleanſed, and by a little evaporation is reduced into pleaſant Cryſtals, which by themſelves (or with an addition of Salt Nitre to abate the fierceneſs of the Lunar Vitriol) are made into Pills with crums of bread: the doſe is one Pill, ſometimes two or three, reſpecting the ability of ſtrength and working. Medicines of this kind are exhibited ſometimes with ſucceſs in a ſtrong conſtitution, and bowels ſtrong, and a good habit; but they are ſcarce ever conveniently or rarely without prejudice taken by tender and cachectical perſons. *Pilulæ Lunares.*

Hydragogues meerly or chiefly purging, are either of a more mild ſort, as Elder, Dwarf-Elder, Soldanella, and juice of Engliſh Orris, which ſeldom being adminiſtred by themſelves, do want the ſtirring up of ſharper Medicines, and on the other ſide they blunt their too much fierceneſs; or they are of a ſtronger ſort, as *Gratiola* or Hedge-hyſop, Jallap, and Elaterium. *Purging Hydragogues.*

The ſeeds or grains of Elder and Dwarf-Elder being dryed, are reduced into a powder, which being taken to the weight of one dram, doth gently bring forth ſerous humours by ſiege; Water and Spirits are diſtilled of the juice of either ſorts of Berries fermented, alſo Robs and Syrups are made of them; which with many other Preparations of thoſe Vegetables, are much magnified for all hydropical Diſtempers, *Elder and Dwarf-Elder.*

Soldanella and *Gratiola*, are rarely uſed by themſelves in our age, neither are any neat and very efficacious Medicines prepared out of thoſe Simples; they are frequently mixt with certain other Hydragogues, and chiefly are ingredients in compounding Apozems. *Soldanella.*

The Juice of *Engliſh Orris* is a very profitable Medicine, and becauſe to be eaſily procured for the Poor, is the more to be eſteemed: It is given from ſix drams to an ounce and a half, or two ounces, either by it ſelf in a fit vehicle, or with other things appropriated thereunto. Jalap is a moſt known Medicine againſt every Dropſie, and common enough. And one of the common People ſuffering under that diſeaſe, preſently takes of the powder of the root of Jalap a Pennyworth, mixt with Ginger and White-wine, and the deſired effect doth frequently follow this remedy uſed with intermiſſion. *The juice of Orris.*

Elaterium is rightly eſteemed the moſt powerful Hydragogue, for that it moſt painfully provoking the ſplanchnick Fibres and together melting the blood and humours by a certain corroſive force, compells whatſoever ſeroſities the Coats of the Bowels, Membranes, Veſſels, alſo the Glandules, and fleſh do contain in themſelves, to be poured out into the cavities of the Stomach and guts: by which Medicine happily working, the aſſwaging of the Abdomen doth ſometimes ſucceed. Truly this is the chief weapon of the Empirical Magazine againſt any Aſcites; which they notwithſtanding uſing in all caſes, do oftener adminiſter to the hurt than benefit of the Patient: the doſe is from three grains to ten or fifteen, taken either by it ſelf, only with correcting ſpices added, or it is given with other hydragogues in form of a Powder, Pills, or Electuary. The tincture and eſſence of it are extracted with Spirit of Wine, or with tincture of Salt of Tartar. *Elaterium.*

Theſe are the chief ſimple Hydragogues, from which being prepared with the addition of others, many compounded ones as well Magiſtral as common in Shops are made, and are every where in uſe; moreover, very many more might be preſcribed extemporarily, as occaſion ſerves. Of theſe we will here annex a few more ſelect forms, and chiefly thoſe that are taken in the form of Potions, Powders, Electuary and Pills. *The forms of Hydragogues.*

Take of Dwarf-Elder, Engliſh Orris, of each an ounce and half, leaves of Soldanella and Gratiola i. e. *Hedge-hyſſop of each one handful, Aſarum, and Aſſe Cucumber-roots of each two ounces, roots of leſſer Galangal ſix drams, choice Jalap half an ounce, Elaterium three drams, Cubebs two drams, ſhred and bruiſe them, and pour upon them three pound of ſmall Spirit of Wine tartarizated, digeſt it ſtopt cloſe in Sand for two days, ſtrain it clear and depurate it by ſettling. The doſe from two ſpoon-fuls to three, in a convenient vehicle.* *A Tincture.*

Take of Elaterium, Soldanella, Ginger, of each one ſcruple, Galangal, Cloves, Cinamon, of each half a ſcruple, Salt of Tartar fifteen grains, make a powder for two doſes. *Powder.*

Take powder of Jalap one dram, Ginger one ſcruple, Cream of Tartar 15 *gr. make a powder to be given in a draught of White-wine.* *Pills.*

Take of Rhubarb one ſcruple, Elaterium 5 *grains, Tartar vitriolated half a ſcruple, Spicknard three grains, with Syrup of Buckshorn make four Pills.*

Take

PHAR. Part. II. *Take of Pill Aloephangina half a dram, Elaterium half a Scruple, Oyl of Cloves gut.* 3. *make four Pills.*

Bontius hydropick Pills are given from half a ſcruple to half a dram, prepared thus:

Take of Aloes two drams and a half, the preparation of Gum-gutta one dram and a half, Diagridium corrected one dram, Gum Ammoniacum diſſolved, one dram and a half, Tartar vitriolated half a dram, make a maſs, and form it into Pills.

Electuaries. Certain hydragogue Electuaries are now every where in uſe, and celebrated by practiſers. Of which ſort are, 1. One deſcribed by the renowned *Sylvius*, and the other by *Zwelfer*, This following pleaſes us.

Take of Reſine of Jalap two drams, Tartar Vitriolate one dram, Extract of Rhubarb two drams, of Spurge a dram and a half, leſſer Galangal one dram, beat them in a mortar, and laſtly add of Conſerve of the flowers of Engliſh Orris, four ounces, and with Syrup of Peach-flowers make an Electuary, the doſe from half a dram to a dram and a half, or two drams.

2. Diuretick Hydragogues. I might here ſet down or deſcribe many other purging Hydragogues, but Cathartick do not always cure an Aſcites, yea oftentimes exaſperate it, and (if they be long continued) render it incurable; hence it is neceſſary to have recourſe to other Remedies for the Cure of this diſeaſe. Wherefore, let us next enquire whether Diureticks do here profit or not?

And truly any one may eaſily think that Remedies moving Urine conduce very much for draining waters out of every place or cavity of the body. In truth it is manifeſt by frequent experience, theſe do often cure an Anaſarca before any other Remedy; let us ſee what they may effect for the emptying the Cavity of the Abdomen.

What Profit they bring in an Aſcites. As to this it firſt appears, that there is no paſſage immediately open from an Aſcitick pool to the Reins, although contiguous; but that whatſoever waters are transferred from hence thither, muſt of neceſſity firſt be drunk up in the maſs of blood, and from thence be poured out of its boſom into the ſink of Urine; and truly it is but a little which the gaping little mouths of the veins about the ſuperficies of the bowels can receive (if perhaps they are open at all) and Diureticks can but effect this one thing, that by pouring forth the blood, and forcing its ſeroſities more plentifully to the Kidnies, they cauſe the waters fluctuating in the belly to be allured to it being ſo emptyed; in the mean time there is no leſs danger, leſt Diureticks being unſeanably adminiſtred, while they diſſolve the blood too much, they conſtrain the ſerum to depart into the ſeat of the Aſcites, more than into the Reins, and ſo rather augment than remove the inundation of the belly. For that it ſometimes ſo happens, I have often found by experience; wherefore when Diureticks are preſcribed to cure an Aſcites, we muſt chiefly provide againſt ſuch a contrary effect. For this reaſon indeed Aſtringents and Corroboratives are always mixt in Remedies for the Dropſie (founded on experience, and the Authority and Practice of the Ancients) not that ſuch (as is commonly ſaid) do confirm the Tone of the Liver, but conſerve the temperature, and mixture of the blood, leſt it be wholly diſſolved by too great a fuſion. Wherefore in an Aſcites which chiefly or in part happens by reaſon of the frame of the bowels and veſſels, and chiefly the Coats, Glandules, and their little ſtrings, and their interſpaces being ſtuffed by a ſerous humour, and therefore very much ſwell'd up, as Cathariks ſo alſo Diureticks profit, and are frequently taken with ſucceſs; forasmuch as by the uſe of theſe the maſs of blood being emptyed, (the ſerum being more plentifully derived to the Kidneys) doth eaſily receive unto it ſelf thoſe waters every where ſtagnating about their little mouths, and conveys it towards the urinary ſink: but on the contrary, in a meer Aſcites where the heap of waters do overflow the Cavity of the Belly, the Textures of the bowels being free from the ſerous ſtuffing; Diureticks are given in vain, or incommodiouſly; inaſmuch as they expreſs nothing from this Lake of the belly, and moſt frequently by diſſolving the blood more impetuouſly drive together the waters apt to be inſtill'd there.

With what choice and difference they ought to be adminiſtred. Not all Diureticks of every kind are equally convenient in an Aſcites, neither ought they indifferently to be adminiſtred; for we muſt obſerve, the affected in this diſeaſe for the moſt part make a little, reddiſh Urine, and as it were lixivial; which truly is an indication that the temperature of the blood is too much bound in them

them, by reaſon of the fixt and ſulphureous Salt exalted and combined together: and therefore that the Serum is not duely ſeparated within the reins; which notwithſtanding is ſhook off about the windings of the obſtructed bowels, and ſo is depoſited in the Cavity of the Belly. Wherefore in this Caſe it will be convenient to drink only thoſe things to excite Urine, which ſo reſtore and amend the Conſtitution of the blood, that the enormities of the fixed Salt and Sulphur being taken away, the ſerous part might be ſeparated within the reins, and more plentifully diſcharged; for which purpoſe, not acid or lixivial things, but thoſe endowed with a volatile Salt are appointed. For I have often obſerved in Patients of that kind, when the Spirit of Salt, and other acid drops of Minerals, and when the Diſſolutions and Deliquiums of Salt of Tartar, Broom and other things, have done more hurt than good, that the Juice of Plantane, Brooklime, and other Herbs abounding with a volatile Salt, have much helped, as alſo the expreſſions of Millepedes: for the ſame reaſon Salt of Nitre throughly purified or Cryſtal Mineral doth often profit. Forms of Medicines more accomodate for this uſe are extant in our former Treatiſe, where, *viz.* examples of Diureticks are deſcribed, in which both volatile and nitrous Salts are the Baſis. Moreover, hither ought to be referred the notable experiment, by which *Joannes Anglus* affirms himſelf often to have cured the Aſcites from a hot cauſe, which Medicine alſo that expert Phyſitian Dr. *Theodore Mayern* was wont to magnifie and preſcribe in the like caſe.

John Engliſh his Empyrical remedy.

Take of the juice of Plantane and Liverwort, and fill an Earthen pot to the top, which being ſtopt cloſe, put in a hot Oven after the Bread is drawn, and make a little fire on the ſides of the pot to continue the Heat of the Oven; after it is ſo boyl'd ſtrain it, and being ſweetned with Sugar, drink of it Morning and Evening, and it cures. In imitation of this I have often with ſucceſs preſcribed as followeth.

Take of green Plantane-leaves four handfuls, Liverwort, Brooklime, of each two handfuls, bruiſe them together, and pour upon them half a pound of ſmall compound Radiſh-water, or other appropriate Magiſtral, expreſs it ſtrongly, the doſe three ounces three times in a day.

How beneficial Diaphoreticks are in an Aſcites.

Although Diaphoreticks are moſt efficacious in an Anaſarca, yet in an Aſcites they are rarely or not at all uſed: for being unſeaſonably offered, they impreſs oft-times great hurt on the Patient without any avail; foraſmuch indeed as by heating the blood, they cauſe the fluctuating waters to grow hot, and as it were to boyl in the hollowneſs of the belly; ſo that the ſpirits and humours are diſturbed by vapours raiſed from thence; and ſo a diſorder of all the functions follows, and the very bowels being as it were boyled, are much prejudiced. Moreover from ſweating unadviſedly inſtituted, the blood being forced into a fuſion and precipitation of the Serum throws it off the more into the neſt of the Aſcites. Wherefore when ſome preſcribe fomentations, and liniments, and bathing, to be applyed to the ſwelling Paunch of the Belly, for the moſt part it turns to the worſe in ſuch Patients; for beſides a little Feaver, a Vertigo, fainting of the ſpirits, and other ill ſymptomes of the brain and heart, being moſt frequently ſo raiſed, even the belly alſo doth from thence ſwell the more: foraſmuch as the Blood being agitated and poured out, depoſits in that place more largely the Serum; and for that cauſe the mouths of the Veſſels are more looſened and opened, ſo that they may more readily let fall water prone to depart from the maſs of blood. But the Remedies which are chiefly wont to be adminiſtred with ſucceſs near the places affected (when a Cure is intended without a Paracenteſis) are Clyſters and Plaiſters.

Clyſters and Plaiſters.

The former draw the Serum out of the Veſſels and Glandules of the Guts and Meſentery without fuſion of the whole maſs of blood, (which the ſtronger purging Medicines do excite,) which being ſo emptyed do imbibe a little the extravaſated Lympha. For this purpoſe the enſuing Clyſter, wont to be preſcribed by us in this caſe, is moſt fit, in regard it contracts the inteſtinal fibres together, and draws the Serum imbibed by the blood, or contained formerly therein, towards the Reins.

Forms thereof.

Take a pint of Urine of a ſound man that drinks Wine, Venice *Turpentine diſſolved with the Yolk of an Egg, an ounce and a half, Sal Prunella one dram and a half, make a Clyſter, which repeat daily.* Sometimes Plaiſters yield help in an Aſcites, yet let them be ſuch, as by a certain reſtringent and comfortable virtue ſtrengthen the bowels and bind together the mouths of the Veſſels, leſt they too much ſpue out their ſeroſities: for this purpoſe, I uſe to apply the Plaiſter *Diaſaponis* with ſucceſs. Or,

PHAR. Part. II.

Take of the Plaiſter of Minium, Paracelſus *Plaiſter, of each what ſuffices, make a Plaiſter to be applyed to the Abdomen.* If this diſeaſe is accompanied with a Tympany, Epithemes of another manner are fit, as we ſhall hereafter declare.

The great and moſt preſent Remedy of an Aſcites, is, that the waters may be drawn out by a Paracenteſis being made; which adminiſtration however doth not oftner cure the diſeaſe, than kill the Patient; wherefore there is need of exact caution to whom, and at what time of the diſeaſe it ought to be adminiſtred: to perſons of an ill habit, who have been long ill, in whom the conformation and temper of the bowels is wholly depraved, it will be in vain to have the Lympha drawn out by the Paunch being pierced; for thereupon immediately the Spirits faint and the ſtrength is diſſolved, and after a while a new illuvies of the morbific humour ſucceeds. But thoſe who being formerly of ſound bowels, and healthful enough, as to other parts, when they fell into an Aſcites from ſome great and evident cauſe, as we are not at firſt preſently to make a Paracenteſis, ſo neither if it be needful ought we to defer it too long: for an incorrigible depravity of the Bowels is contracted by a longer delay, while they remain a long while drowned, and as it were boyled in water.

When and to whom a Paracenteſis is convenient in an Aſcites.

It is beſide our purpoſe to deſcribe here the adminiſtration of a Paracenteſis, whether it be done after the ordinary manner, or by a hollow Needle according to *Sylvius*; this part of Chirurgery, as dangerous, when Phyſitians ſeldom preſcribe, yet Quacks and Empiricks raſhly and unluckily eſſay it, Artiſts not being conſulted: we will relate here for concluſion the Hiſtory of a true and huge Aſcites, lately cured without any Paracenteſis.

A hiſtory of a cure.

A young Woman wife to a Merchant, being ſlender and proper, while ſhe gave ſuck to her Child, to encreaſe her milk day and night did immoderately guzzle one while plain Ale, another while Poſſet drink. After having uſed this kind of dyet for a fortnight, ſhe contracted a vaſt Aſcites in a ſhort time, the beginning whereof ſhe was not in the leaſt ſenſible of; for her Abdomen being great with water fluctuating within, did much ſwell up, and its bulk when ſhe turned from one ſide to the other, fell without the Ileon and borders of the reſt of the body: when in the mean while the fleſh of all her Members was very much conſumed, that ſhe ſeemed no leſs in a conſumption than a Dropſie.

The Child being weaned, and a better courſe of Diet being appointed, ſhe betook her ſelf to Medicines, and took in the firſt place the more mild Hydragogues, as well purgative as diuretical, but without any advantage; alſo ſhe was worſe after every purge; but being committed to our care, and almoſt deſperate, I handled her after the enſuing method.

I preſcribed theſe Medicines, for the moſt part forbidding Ale, and any potulent liquor (medicines excepted.)

Take of the leaves of Plantane, Brooklime, Clivers, of each 4 handfuls bruiſed, and pour upon them of water of Earth-worms and Rhadiſh compound of each three ounces, preſs them, take it twice aday, viz. *at Eight in the Morning, and at Five in the Afternoon. She continued long in the uſe of this Medicine, but did ſometimes vary the Compoſition, ſometimes changing the herbs, ſometimes the Liquor poured on them.*

Take of the reddeſt Tincture of Salt of Tartar an ounce and a half, ſhe took 20 drops at night, and early in the morning, in two ſpoonfuls of the following Julep, drinking ſeven ſpoonfuls after it.

Take water of Elder-flowers, Saxifrage, of each ſix ounces, water of Snails, Earthworms, and Rhadiſh-compound, of each two ounces.

She wore a Plaiſter of Minium and Oxycroceum upon her Belly.

The following Clyſter was given firſt daily, afterwards every two or three days.

Take Urine of a healthy man one pound, Turpentine diſſolved with the Yolk of an Egg an ounce and a half, Sugar an ounce, Sal Prunella one dram, make a Clyſter.

By the conſtant uſe of theſe things her Belly aſſwaged within a fortnight, but her fleſh daily waſting, a Conſumption was threatned. Wherefore, going into the Countrey to avoid this, ſhe drank Aſſes milk; by the benefit of which Nutriment and of purer Air, coutinually taking the above-mentioned Medicines, ſhe recovered her entire health within three or four weeks, and lives yet in health.

SECT.

SECT. II. CHAP. IV.

Of a Tympanie.

A Tympany vulgarly, although not properly, is eſteemed a kind of Dropſie, from which rank, *Proſper Martianus* alleadging the teſtimony of *Hippocrates*, rejects as well this Diſeaſe, as an Anaſarca. But the former infeſting the region of the Abdomen, and raiſing it up into a bulk, now comes under conſideration next after an Aſcites, (to which it is ſomething a-kin) : where firſt of all it is obvious, that this Diſeaſe as it is moſt difficult to cure, ſo alſo to be known; for although its outward form, *viz.* a ſomewhat hard ſwelling of the belly, very ſtiff and yielding a ſound like a Drum, upon touching it, is evidently perceived by many ſenſes together; notwithſtanding what may be the morbifick matter inducing that Tumour, or after what manner it is generated in the belly, or from what place it comes thither, is altogether unknown: therefore thoſe who have a Tympanie, as though they were big with wind, are ignorant both of the manner and time of its conception. Truly I therefore judge the nature and cauſes of this diſeaſe to lye concealed, becauſe whereas its firſt beginnings are not obſerved, it ſuddenly augments prodigiouſly; ſo that they who are affected, do ſcarce ſooner perceive themſelves to be ſick, than that they are become almoſt incurable. Moreover, a Tympanie, its ſtation being accompliſhed, degenerating into an Aſcites, or rather procuring it to its ſelf, ſeems to loſe its own nature; and truly after death Anatomical inſpection ſcarce diſcovers any thing more in bodies dying with a Tympany, than with an Aſcites. But that many Phyſical Authors do readily declare this Diſtemper to be raiſed by wind encloſed within the cavity of the abdomen, doth not at all ſatisfie a mind deſirous of the truth; becauſe it ſeems altogether improbable that winds ſhould be produced ſo ſuddenly, and in ſo great plenty in that place; or admit they were, that ſo hard, unmoveable and conſtant a tumour ſhould be raiſed.

A Tympany not properly a kind of Dropſie.

Wherefore its cauſe is occult.

Commonly aſcribed to Wind.

Moreover they do not eaſily agree concerning the ſeat of the diſeaſe, where the wind is ſuppoſed to be included; for ſome affirm that this place is determinate in the concave of the Peritonæum, and by the convex ſuperficies of the Inteſtines, and other bowels of the lower part of the belly; but after what manner ſuch a heap of winds can be therein collected, in my opinion it cannot be manifeſted by any reaſon, example, or parallel inſtance. Beſides, if the caſe were ſuch, it might be more eaſily cured by pricking, than an Aſcites by a Paracenteſis; which yet I never heard accompliſhed. *Helmont* reports a ſtinking wind was vented by a Paracenteſis, in one eſteemed Hydropick; that ſuddenly his Abdomen ſunk, and the man dyed immediately. But *Platerius* and *Smetius*, no leſs worthy of credit, do affirm, *They diſcovered in ſome who were thought to have the Tympanie, and diſſected after death, that no wind broke forth out of the hollow of the belly, neither that it fell, but that eſpecially the ſmaller guts being diſtended, and ſtrutting with wind, burſt out ſo, that they could not be put up again into the ſame belly.*

Authors do not agree about the ſeat of the Winds.

Not without the guts in the cavity of the Abdomen.

But truly neither is this obſervation an argument to me, that the cauſe of the diſeaſe (of which we treat) remains within the Cavities of the guts, and that the winds accumulated in that place, do often or moſt of all raiſe a Tympanitick ſwelling of the belly. For beſides that, a diſeaſe taking riſe from ſuch an occaſion, would not be ſo immovable, and frequently incurable; moreover, I am induced to think, that the Inteſtines are not ſo greatly dilated by winds ſhut up in them, but that they often of their own accord ſwelling out, give occaſion to thoſe winds conſequently and ſecondarily to be produced, by which the ſpaces enlarged might be filled, as we ſhall by and by more clearly demonſtrate.

Nor within their paſſages.

But what is aſſerted by others, that the winds which are the cauſe of a Tympany are engendred amongſt the Coats of the Meſentery, and Guts, ſeems yet much more improbable; becauſe when there is no cavity in that place preexiſtent, after what manner can the winds ſo tear thoſe parts and ſeparate them from one and another, ſo that from ſuch formed Denns, the whole region of the Belly ſhould grow into ſo vaſt a bulk by accumulated winds there laid up? Certainly ſo many and ſo great divulſions could not be made without continual torment and moſt ſharp pains.

Not between the coats of the bowels.

PHAR. Part. II.

By what and how many cauſes the Belly ſwells.

Wherefore, omitting theſe opinions already ſpoken of about a Tympanie, let us proceed another way to the more aſſured ſearching out its Pathologie; *viz.* by thorowly weighing by what means, and by what evident cauſes, the Abdomen is wont to ſwell up. Wherefore, we advertiſe there are four kinds of things contained, from which proceeds a tumour in the nether Belly of the living, (why the Abdomen ſwells in dead perſons, the reaſons follow hereafter) which kinds, are, ſolid, humid, wind and Spirits.

1. From tumours of the Bowels in that place.

Firſt, It is obvious enough, that the inward tumours of the bowels, *viz.* ſcirrhous, ſtrumous, cancrous and glandulous, and ſome perhaps of another kind, when they riſe to any notable bulk, do ſwell the whole belly; yet in the mean time as long as they are ſimple, and new, they may be perceived and circumſcribed by the touch; yet afterwards growing inveterate, they cauſe other evils to the neighbouring parts, yea over the whole Region of the Abdomen. Truly theſe as they are ſometimes the procuring cauſe of an Aſcites, ſo of a Tympany from the beginning, to which afterwards for a complement of either diſeaſe, another conjunct cauſe gains acceſs, *viz.* an illuvies of waters, or an irregularity of the Spirits.

2. From waters gathered as in an Aſcites.

Secondly, a watery humour gathered within the Cavity of the abdomen, or being impacted in the membranous or glandulous parts thereof, frequently produces an Aſcites, the reaſons whereof, and the manner of its coming to paſs, are at large ſet down before.

3. From winds.

Thirdly, Winds within the bowels of Concoction being raiſed from crudities, ill concoction, or fermentation of heterogeneous humours, do frequently puff up the Cavity of the guts, and for the moſt part produce a ſhort and tranſitory tumour of the belly. For the fermentation of the Juices ceaſing, and eruption of wind being procured, immediately ſucceeds an aſſwaging of the Belly. To this cauſe, both the Colick and Tympanie, not only by the vulgar but by Phyſitians of great note are imputed; but in our judgement, when it is ſolitary it produces neither of theſe diſtempers.

4. From the inflation of the Fibres, by reaſon of the Spirits being diſturbed.

Fourthly, There yet remains another ſudden, and vaſt ſwelling of the belly, which the animal Spirits (not for nothing ſtyl'd by *Hippocrates* violent) ſeem to procure. For when theſe in heaps, and inordinately, ruſh into the nervous fibres belonging to the bowels of the lower belly, preſently the parts that theſe weave together are cauſed to be puffed up, and extended every where round about. For truly, from this cauſe (as we have often ſhewed in another place) a ſwelling, and as it were a tympanitical puffing up of the whole abdomen, as well in the Colick as in Hyſterical fits vulgarly ſo called, doth often happen. And truly theſe diſtempers are ſo allayed to a Tympany, that they frequently end in it; for I have oft obſerved, that thoſe who have been obnoxious to the Colick and hyſterical paſſion long and grievouſly, unleſs they receive cure, do become Tympanitical. And then the greateſt of the difference will be, that the ſwelling of the belly, which before was a wandring Symptom, and ſoon paſſing over, at length grows to be a fixt and permanent diſeaſe.

Wherefore, it ſeems material in this Caſe, to accommodate the Ætiologie of theſe paſſions delivered by us in another place, to unfold the Nature and Cauſes of this preſent maladie.

An Affection of what ſort a Tympany is.

VVhich truly will not be of any great buſineſs or difficulty. For ſuppoſing (what we have in another place more largely ſet down) the extenſions and inflations of the membranes and hollow bowels, take their origine from the impetuous invaſions of the Spirits into the nervous fibres (of which they are interwoven) it will be obvious enough to conceive even a Tympanie to be produced from ſuch a cauſe, but being more fixt, and longer or unceſſantly in the act; into the reaſon of which difference, we will by and by inquire.

Its cauſe and formal reaſon explicated.

In the mean time I am induced to believe a Tympanie not to be ſtirred up from winds ſhut up within, or without the Cavity of the guts, (for ſuch an accumulation of winds in thoſe places, is an effect, but not a cauſe of this diſeaſe) but that it does ariſe, inaſmuch as the animal Spirits, in the bottom of the belly, belonging to the membranous bowels, being forced into diſorder by ſomething incongruous, do tumultuouſly ruſh every where into the nervous fibres, and puff them up, neither do they immediately recede back from them: from hence the Peritonæum ſwells, and the guts being blown up and enlarged, they are as it were inflated, the Meſentery, and other membranous bowels, being turgid with an impetuous Spirit, are as it were raiſed up into a bulk; moreover, while theſe come thus to paſs, that the vacuities cauſed from the ſwelling of hollow Bowels might be filled, a portion preſently of every humour within contained, being rarified into vapours, forthwith turns into wind, wandring about thoſe empty ſpaces.

Truly, we have clearly enough ſhewn, by reaſons and inſtances in our Pathologie of

PHAR. Part. II.

of Convulſions, that the animal ſpirits puff up the membranous parts by their irregularity, and ſo produce as it were this windie Diſtemper. Moreover the ſame is demonſtrated by Anatomical obſervation made in diſſecting a living Creature; *viz.* inaſmuch as the Trunk of the eighth Pair of Nerves deſcending on each ſide by the Neck, if it be taken out and bound with a thred, forthwith all the ſtomach ſwells up, as if it were puffed with wind; which certainly can proceed from no other cauſe than that the animal Spirits of the fibres of that bowel, and others flowing through the nervous paſſages, (inaſmuch as they being cut off from their origine, are driven into confuſion) do tumultuouſly enter thoſe parts, and puff them up. Beſides theſe, for the further illuſtrating of this Hypotheſis, I will relate a Hiſtory cited by the moſt renowned *Smetius*, of an univerſal Tympany (as he calls it) in a certain young man of *Liege*: *Who when he had received, in a conflict, under his right arm-pit, a wound, made by a prick, penetrating into the Cavity of his breaſt, next day and night being paſt, he appeared in the morning after ſwell'd throughout his whole body, not only in his breaſt, but alſo in his back, belly, loins, and in the cods, beſides both in his arms, ſhoulders, neck and face, that he could not open his eye-lids, alſo on the crown of his head, the skin being every where ſwolne and tumefied, the tumour was every where extended with great pain.* The Author calls this wonderful affection, an Univerſal Tympanie. The moſt renowned *Sennertus* relates a Caſe like this from his own knowledge: Moreover, I remember I have heard or read of the like from a wound of the breaſt being received near the arm-pit.

And proved by arguments and inſtances.

An univerſal Tympanie.

Notwithſtanding, the reaſon of this Symptom, deliver'd by *Smetius*, and approved by *Sennertus*, doth not at all pleaſe me: for they aſcribe the cauſe of that general Tympanie, *to the puffing up of the breaſt, by the axillary wound, made all that night under the skin, as we ſee a new and moiſt bladder to be blown up by boyes with a quill:* which truly doth not only ſeem improbable, but alſo we think ſcarce poſſible, that the wind to be blown out of a wound of the Thorax, by reaſon of the hole one night ſtopt, can enter the skin, and from thence paſſing through the whole body, ſhould make it become every where Tympanitical: For beſides that the wind cannot ſo ſuddenly paſs from thence into all parts, although it ſhould be blown with a quill from the mouth, under the skin; beſides, while the orifice of the wound is ſtopt, no wind can altogether be blown out from the Cavity of the breaſt, becauſe none in the mean time enters. But aſſuredly the cauſe of that wonderful affection is this; (whence alſo the formal reaſon of a Tympanie is illuſtrated) In the Breaſt near the Arm-pits, are many and eminent foldings of Nerves, (as we have deſcribed in our Treatiſe of Nerves,) by which the nerves of the whole body communicate among themſelves: *viz.* the Trunk of the eighth Pair unites with the intercoſtal Nerve, and both with the nerves of the *Spina Dorſi*, by branches and ſprigs ſent here and there. Wherefore, this nervous folding, perchance being pierced by the point of the Sword, firſt of all the ſpirits reſiding in that place being provok'd, run into diſorders, afterwards a conſent being immediately made thorow ſo many notable Nerves, and tranſmitted to and fro every where, other Spirits, and then again others, are ſenſible of the like irregularities, and puffing up the membranous and nervous Fibres (which every where they enter tumultuouſly) they induce as it were a tympanitical affection through the whole body. By reaſon of the like fury or virulent madneſs impoſed upon the Spirits, in any place, and from thence immediately diffuſed far and wide, certain Poyſons being drunk, the ſtrokes of weapons, or of wild Beaſts, or a venemous bite, do frequently induce a ſwelling together of many parts, or of the whole body; which ſwelling diſtemper of the Spirits, is ſtyl'd by *Helmont* to be *Indignatio Archæas.* There are many other Caſes and Inſtances, by which it is moſt clearly evinced, that the Animal Spirits being provok'd and driven into angry inclinations, inaſmuch as they do more impetuouſly enter into the nervous Fibres, are wont firſt to ſwell the membranous parts, and to excite many paſſions out of thoſe, which are vulgarly but falſely aſcribed to winds: ſo that in truth no other cauſe of a Tymyanie can be aſſigned more like truth.

The Cauſe of an univerſal Tympanie enquired into.

The true cauſe aſſigned.

If it be objected, that the Paunches of the defunct after ſome time are raiſed by wind into a bulk, and ſwell like as in a Tympany: I pronounce this to proceed from the putrefaction of humours, and the extream diſſolution of the mixture, wherein all the active particles depart, being freed one from the other, and flying about ſeek vent in every place, and diſtend greatly all obſtacles, and chiefly the ſides of the Cavities, (which doth not at all happen in living bodies;) wherefore, as all Carkaſes do not putrifie alike, ſo their bellies ſwell ſooner or later, more or leſs: But while life endures, no rottenneſs or diſſolution of particles is made in an animated body, that can bring about a ſplanchnick fermentation or ſwelling. In the mean while we deny

Why the belly ſwells in the dead.

PHAR. Part. II.

deny not, that winds are generated within the offices of concoction, ſanguification, and ſeparation, yea within all the particular cells and receſſes of our whole body; notwithſtanding from them all, unto the winds whereſoever engendred (whilſt the Spirits have their due influence, and actuate the nervous as well as moving fibres, that the ſides of the bowels be not kept diſtended and rigid) an eaſie vent does every where lye open. And the truth is, in a Tympany, we allow the wind to fill up the empty ſpaces, but the ſpirits, inaſmuch as they extend the bowels by their irregularity, do firſt cauſe thoſe vacuities, (wherein the winds ſecondarily and conſequently are engendred) and they (inaſmuch as the ſame bowels are ſtill kept ſtrutted and diſtended) do hinder thoſe winds from being removed.

The Animal Spirits and not wind the cauſe of the Tympanie.

And now I judge it is plain enough by what we have ſaid, that the animal ſpirits rather than the wind do raiſe ſwellings of the belly in that ſort; at leaſt ſuch ſhort and tranſitory ones, as happen in Hyſterical and Colick fits. Notwithſtanding there yet remains a great difficulty, after what manner the Tympanitical ſwelling of the Abdomen, which is fixt and permanent, yea for the moſt part immoveable, can proceed from any ſuch cauſe; eſpecially, becauſe the Animal Spirits being of their own nature active and very apt to motion, do for the moſt part ſo affect removal, that unleſs they be wearied or become defunct, they ſcarce ever lie ſtill.

That I may looſen this knot by reaſoning, it becomes us to conſider the Nervous Juice together with the ſubſtance of the Animal Spirits, which is every where a vehicle to them, and alſo a bridle: for the Spirits enjoying the moſt ſubtile ſtream thereof, do freely expatiate, and leſt being diſſipated from one another, they might fly away, they are contained in an entire ſeries. When therefore that Juice is faulty as to its temper or motion, immediately the animal ſpirits become diverſly delinquent, or are preverted in the exerciſes of their functions, as we have at large expounded in our Treatiſe of Paſſions. And leſt by repeating them now I ſhould make long Preambles, I will contract into a few words what belongs to the preſent purpoſe.

This happens by the fault of the Nervous juice.

Wherefore in the firſt place, it is to be obſerved, that the contents of the nether belly (excepting only the Liver, Spleen, and Kidneys) are furniſhed with many membranous bowels, (which the nervous fibres for the moſt part weave together) whence it follows that the nervous Juice (whoſe journey is longer, and the paſſages ſtraiter in theſe parts) doth find here many remora's: which alſo may be proved from the effect, foraſmuch as the convulſive invaſions, every where ſtirr'd up in the Hypochondriack Colick, Nephritical and Hyſterical Paſſions, do ſo grievouſly infeſt the Abdomen. When therefore that Juice watering the nervous fibres of theſe parts, ſhall be either viſcid or tenacious of it ſelf, or fill them with very many feculencies, for that cauſe it will come to paſs, that all the animal ſpirits will not eaſily return from thence as oft as they are hurl'd into theſe fibres, in ſome part obſtructed: and when in this manner there is a full incurſion, and a ſmall return of them, at length it will happen that great abundance of the ſpirits remain in theſe fibres every day more and more impacted, and hold them alwayes diſtended and very much pufft up; and at length by reaſon of the ways of their ingreſs and regreſs in thoſe fibres being obſtructed, they become immoveable in that place, and keep the affected parts always extended and ſtiff: in the mean time becauſe theſe Spirits there impacted within the nervous paſſages, and cramm'd thick, have commerce with others that flow to them in their dens, therefore the affected part although it be ſtiff and almoſt immovable, yet however enjoys ſenſe. This Pathologie although it may ſeem to ſome a Paradox, and uncouth, I doubt not but it will deſerve aſſent from many, if it be throughly weighed, that thoſe who have been a long time obnoxious to Hypochondriack Colick, and other convulſive diſtempers of the nether Belly, do at length become ſick of a Tympany.

By the obſtruction whereof the Spirits within the fibres are detained and made immovable.

The formal reaſon and conjunct cauſe of a Tympanie being delineated after this manner, before we proceed to trace out diligently the more remote cauſes thereof, it may be lawfull for us from what we have ſaid to deliver a definition, or at leaſt a certain deſcription of this diſeaſe, viz. *That it is a fixt and conſtant Tumour of the Abdomen, equal, hard, ſtiff, and yielding a noiſe upon ſtriking, taking its origine from a convulſive inflation of the parts and membranous bowels, by reaſon of the Animal Spirits being driven into thoſe fibres in too great abundance, and through the fault of the nervous juice obſtructing, being hindred from their return back; to which diſeaſe conſequently an accumulation of winds in the empty places, accrues as a complement.*

A deſcription of the diſeaſe.

Its procuring cauſes.

As to what appertains to the procuring and evident cauſes of this diſeaſe, it very ſeldome happeneth that they are altogether obſerved, but that inſinuating it ſelf by ſilent beginnings, it frequently is finiſhed, or becomes deplorable before it is perceived; inſomuch that againſt this diſeaſe ſcarce any antidote can be appointed; for while the ordinary functions are not much prejudiced, the ſwelling of the belly is preſumed

PHAR. Part. II.

preſumed only to have its origine from wind, and while it is expected to vaniſh ſpontaneouſly, it often grows into a Tympanie. Wherefore that we may have timely notice of its beginning, we may take notice, that ſome previous affects diſpoſe to it; of this ſort is firſt an Hypochondriack, Colical and Hyſterical diſpoſition, yea and ſometimes an Aſthmatical; whoſe fits when they are uſed to be frequently raiſed, if at length a tumour of the Abdomen follow it, though it be ſmall in the beginning, a Tympany forthwith may be feared. Of the former of theſe affects caſes every where are to be met with, and ſtand fair to common obſervation: of the later *Scherichius* reports, *That a man of Sixty years of age was infeſted with this ſymptome ſome months before his Belly was ſwell'd into any manifeſt tumour, that as often as he ſate at meat, beginning to eat, alſo when compoſing himſelf for ſleep, he began to ſleep ſoundly, he was ſurprized with ſuch a difficulty of breathing, that the frequency of it threatned the danger of choaking; at which time alſo he perceived a certain palpitation about the Hypochondria, as if ſome living Animal were underneath the midriff; this diſtemper afterwards ended in a Tumour of the Abdomen, by which he died.* In this and others caſes now cited the ſame reaſon holds, *viz.* that the animal ſpirits being uſed to make irregular excurſions into the nervous Fibres of the lower belly, at length do not only more often and abundantly enter into them, but being impacted and hindred they abide in them, and ſo at length induce tympanitic inflations of the bowels. Truly this morbific beginning happens ſooner or later, if thereupon do come the evident cauſes, which diſturb the Spirits in the bottom of the belly, and compel them to frequent diſorders, and alſo do either ſtop the motion or prevert the temperature of the nervous Juice flowing within thoſe Fibres; in which rank are accounted irregularities in the ſix Non-naturals, immoderate Paſſions, and chiefly of grief, and uſual evacuations ſuppreſs'd, drinking of cold water after ſome great heat, or any ſudden cold induced on the belly, either from air or water.

Other previous convulſive affections.

The caſe of an Aſthma ending in a Tympanie.

The evident cauſes of this diſeaſe.

As to the Prognoſticks, this diſeaſe is always accounted of ſo bad an omen that commonly the name is abhorr'd, inſomuch that frequently when there is no ſuſpicion of ill from the tumour of the belly, if perhaps that ſwelling be call'd by the Phyſitian, a Tympanie, forthwith it is concluded deſperate. Notwithſtanding this Diſeaſe rarely kills of it ſelf, but being protracted a long ſpace of time, that it may at length more certainly kill, it gains to it ſelf an Aſcites, as an Harbinger of Death. That we may ſearch into the reaſon thereof, it will be obvious enough to conceive, while all the bowels are diſtended in the lower belly, and are held as it were ſtiff, the paſſages of the blood, and nervous and lymphatic humours, being too much extended, or compreſſed are much ſtraitned, and for that cauſe cannot freely and readily tranſmit its Juice; from whence it follows that every humour being ſtraitned in the paſſage, that at length it may paſs by ſome means, it ſhakes off a certain ſeroſity from its maſs wherever way is given; and thoſe droppings of the humours falling into the hollow of the Abdomen, excite an Aſcitick Dropſie.

The Prognoſticks thereof.

What relates to the Curatory part of this Diſeaſe, the whole ſcope of healing is commonly bent againſt wind, *viz.* Indications inculcated by practical Authors ſuggeſt the matter to be evacuated, from whence the winds are raiſed, and to remove the cauſe that lifts them up, and the winds to be diſcuſs'd and diſſipated, which do already diſtend the belly.

The Cure.

For theſe ends Purgers appointed againſt the humour chiefly ſuſpected are wont to be preſcribed with great confidence, although with ſmall or ill ſucceſs; that is to ſay, Phlegmagogues ſo called, another while thoſe that purge Melancholly, another while thoſe that purge Choler, whereto alſo are joyn'd purgers of water (as weapons intended againſt every enemy.) For this diſeaſe (as is manifeſt by our obſervation) is wont for the moſt part to be exaſperated with ſtrong Purgers, and ſeldom alleviated; the reaſon whereof is evident enough, becauſe the nervous fibres being provok't by a ſharp Medicine, the animal Spirits renew their irregular excurſions, and do every where more and more ſtretch them out, rather than give any remiſſion to them; wherefore, although frequent and abundant watery and flatulent ſtools are procured, notwithſtanding the Belly ſwells the more. Moreover, to diſpell, diſcuſs, and bridle the wind, there is a more than Æolian power preſcribed; Medicines commonly call'd *Carminatives*, almoſt of every kind or form are ſedulouſly adminiſtred, within and without, above and beneath, and upon the part affected; notwithſtanding this diſeaſe for the moſt part is untamed by all theſe; whence we may ſuſpect, that the true cauſe of the diſeaſe lyes as yet conceal'd, becauſe Medicines profit not that are adminiſtred, indicated or ſuggeſted according to the ordinary Ætiologie or reaſon of it.

Remedies deſigned againſt Wind profit not.

Although

PHAR. Part. II.

Although I cannot challenge a better ſucceſs in curing this diſeaſe, or a more certain method of healing, atteſted from experience, notwithſtanding in the mean while we will here proffer another way of curing, accommodated to our Hypotheſis, and eſtabliſhed by reaſons ſtrong enough.

3. Curatory Indications.

Wherefore in a Tympanie, as in moſt other affections, there will be three chief indications; Whereof the firſt, and chiefly inſiſted on, is the Curatory, that by recalling the Animal Spirits from their Convulſive affection, and reducing them into order, endeavors the removal of the ſwelling of the Belly. The ſecond preſervatory which reſtrains thoſe or other Spirits from their irregular excurſions into the lower Belly, and together corrects the faults of the nervous liquor, watering it, both as to its temper, or motion. The third Vital, by removing the Symptoms urging, doth ſuccour and ſuſtain all the functions oppreſſed or weakened, as much as poſſible may be.

The firſt Indication hardeſt.

I. The firſt Indication is of greateſt moment, on which the hinge of the whole Cure turns; but it is moſt difficultly performed, for it doth not eaſily appear by what remedies or ways of adminiſtration it ought to be attempted, when moſt weapons or medicines do little or nothing prevail againſt this inviolable enemy. Phlebotomie aſſumes no place here, but is declined for the moſt part as prejudicial; alſo Catharticks, inſomuch as they provoke the affected Fibres, and diſturb the Spirits, and hurry them more impetuouſly, do increaſe rather than diminiſh or cure the Tumour of the Belly, in like manner Diaphoreticks impell the Spirits, and the morbific Particles deeper into them, whereas they ought to be allured, and call'd out of the Fibres. The chief order of healing ſeems to be placed in Diureticks and the uſe of Clyſters; and alſo great things are expected from topical Applications, becauſe they are more immediately exhibited to the diſeaſe, and as it were by contact, and becauſe they do beſt diſcuſs Tumors in other places. Yet not all Diſſolvents are here fitting, nor thoſe which profit moſt in other Tumours; for the more hot being given for diſcuſſing, whether they are applyed by Fomentation, Liniments, or in the form of a Cataplaſm or Plaiſter, oftner afford hurt than ſuccour in a Tympanie; for they both open and dilate the paſſages of the Fibres, that from thence they may lie more open to the incurſion of the Spirits; and alſo rarifie the Particles impacted, ſo that while they occupy a larger ſpace, an inflation and intumeſcency of the Belly is augmented. Laſtly, what appertains to Alteratives which ſuccour againſt other affections of the nervous kind, only a certain few are fit in a Tympanie; for where the morbific matter ſticking within the ſtraiter paſſages cannot be impell'd ſtraight or throughly, Elaſtick medicines render the ſtoppage greater and more fixt, by enfixing the matter deeper; wherefore Spirit of Harts-horn, of Soot, of Sal Armoniack, yea alſo Tinctures, Elixirs, and other Medicines endowed with a volatile Salt, or active Particles of another kind, do not only acquire heat, and a troubleſom thirſt in the ſick Perſon troubled with a Tympanie, but alſo cauſe the Abdomen to ſwell the more, inaſmuch as they melt the blood and nervous Juice, and ſtirr the Spirits, inſomuch that the Particles depoſited by each of theſe, are compell'd in the parts affected.

What, and what ſort of Medicines are good or hurtful in this Diſeaſe.

Only mild Purgers and Clyſters are convenient.

But truly although Medicine doth ſo little avail againſt this diſeaſe, it is not altogether to be neglected, (as if either it affected nothing, or what is ill,) but it behooves us to turn every ſtone, that by ſome means we may ſuccour the Patient, and at length may obtain a cure for him, or at leaſt an alleviation. Wherefore in the firſt place (becauſe it is the cuſtom to begin with Purgatives) although the ſtronger do ever hurt, and the gentler ſcarce ever prevail to diſcharge the conjunct cauſe, notwithſtanding theſe latter, inaſmuch as they do ſomething ſubſtract the nouriſhment of the diſeaſe, alſo make a way by which other Medicines do exert their powers, they ought to have their turns in Phyſical practice once in ſix or ſeven days; and at the other times let Clyſters (whoſe uſe is much better) be frequently adminiſtred. Hydroticks being prohibited, we muſt reſt upon moderate Diureticks, whereto are adjoyned things reſpecting the alteration and reduction of the Spirits and Humours, which truly make up the Tympanitical Pharmacy. Moreover in the mean time the uſe of Topicks is not to be neglected. We will annex certain ſelect forms of Medicines appropriated for every of theſe purpoſes. For a Medicine mildly ſolutive, let the laxative Wine be uſed, preſcribed by the renowned *Greg. Horſtius* for a Tympanie, in his Book of Obſervations, *lib.* iiij. *Chap.* xxx. or in its place let the following be preſcribed with greater eaſe.

Forms of Medicines.

A ſolutive liquor.

Take the leaves of Peach-flowers, of Damask-roſes, of each two Pugils, Broom, Elder, Centaury the leſſer, of each Pugil. 1. *the leaves of Agrimony, Roman Wormwood of each one handful, Senna one ounce, Rhubarb ſix drams, Carthamus-ſeeds half an ounce, Dwarf-Elder two drams, yellow Sanders three drams, Galangal two drams, ſlice them and bruiſe them,*

them, put them into a ſilk Bag in a Glaſs, with two pound of White-wine, Saxifrage-water, one pound, Salt of Tartar one dram and a half, let them ſtand 48 hours, let the Patient drink four ounces to ſix, every third or fourth day. PHAR. Part. II.

In a hotter Conſtitution let the following form be taken, which I have proved with ſucceſs in this diſeaſe.

Take of purging Mineral waters eight pound, Salt of Wormwood two drams, let it evaporate in a gentle Bath to two pound. To this I uſe to add four ounces of Water diſtill'd from Purgers with Wine; the doſe from four ounces to ſix.

Or to the two pound of evaporated water add of Mechoacan, Turbith, of each half an ounce, Rhubarb ſix drams, yellow Sanders two drams, Cloves one dram, digeſt them cloſe and warm for two hours: filtre it through Paper, the doſe 3 or 4 ounces.

Clyſters are of frequent uſe in this Diſeaſe, inaſmuch as they looſen the Belly without any great irritation of the Fibres.

Take of the infuſion of Stone-horſe dung with Cammomile-flowers a pound, Mellis Mercurialis two ounces. After the ſame manner Decoctions and Infuſions are prepared, with Carminatives, from Dogs-dung. *Clyſters.*

Take of the Emollient Decoction one pound, Sal Prunella, or Sal Armoniack from one dram to a dram and a half; make a Clyſter.

Take of ſound Urine one pound, Sal Prunella one dram, Venice *Turpentine diſſolved with the yolk of an Egge, an ounce and a half: make a Clyſter.*

2. Diureticks, if any other Remedies promiſe help in this Diſeaſe. *Diureticks.*

Take of Millepedes living and cleanſed three ounces, one Nutmeg ſliced, bruiſe them together, and pour upon them one pound of the Diuretick-water preſcribed below: Preſs them ſtrongly, the Doſe from three ounces to four twice aday.

Take of green Juniper-berries, and Elder-berries, of each ſix pound, of Firr-tops four pound, green Walnuts two pound, Cortex Winterani four ounces, the outer Rinds of ſix Oranges and four Limons, Seeds of Ameos, Rockets Creſſes, of each an ounce and half, Dill-ſeeds two ounces, ſlice them and bruiſe them, and add of Poſſet-drink made with White-wine 8 pound, diſtil it in common Organs let the whole liquor be mixed. *Diſtilled Waters.*

Take of Cryſtal mineral half an ounce, Volatile Salt of Amber, two drams, the powder of Carrot-ſeeds one dram, Turpentine of Venice *what ſuffices to make ſmall Pills, the doſe Numb. 3. in the evening and morning, drinking after it three ounces of the diſtilled water.* *Pills.*

Take of the ſweet Spirit of Salt half an ounce, take ſix drops to twelve, twice in a day, in a draught of the ſame water, with a ſpoonful of Syrup of Violets. *Spirits.*

Take of ſpirit of Salt of Tartar one ounce, take one ſcruple to half a dram, twice aday, after the ſame manner; So alſo ſpirit of Nitre, and Tincture of Salt of Tartar may be taken. *An Expreſſion.*

Take of Plantane, Chervil and Clivers-leaves, of each four handfuls, bruiſe them, and pour on them a pint of the former diſtilled water. Preſs them ſtrongly, the doſe three ounces, twice or thrice in a day with other Medicines.

Take of Graſs-roots three ounces, of Butchers-broom two ounces, Chervil and Eringo candied, of each one ounce, ſhavings of Harts-horn, Ivory, of each two drams, of burnt Harts-horn two drams and a half, Burdock-ſeeds three drams, boyl them in three pound of Spring-water to two pound, in it ſtrained hot, infuſe the leaves of Clivers, Water-creſſes, bruiſed, of each one handful, adding of Rheniſh-wine ſix ounces, make an infuſion cloſe and warm for two hours, after ſtrain it again, and add of Magiſtral-water of Earth-worms two ounces, Syrup of the five opening Roots an ounce, and a half. Make an Apozeme, the doſe four ounces twice aday, with ſome other Medicine. *Apozems.*

While theſe are taken inwardly, alſo Topicks and outward Applications may be carefully adminiſtred; not thoſe which are hot and diſcuſſing, but thoſe which are endowed with Particles of a volatile Salt, and Nitrous, to wit, thoſe which deſtroy the Combinations of other Salts, and diſſolve the impactions of the Spirits, for which we propound the enſuing things. If Fomentations ought at all to be admitted into uſe, let not them be not applyed too hot, alſo let them be prepared not of thoſe that are uſually call'd Carminative, but chiefly of Salts and Minerals. *Gabrotius* (cited by *Helmont*) *Topicks.*

PHAR. Part. II.

Helmont) ſays, *That he cured one of* 80 *years of age, whoſe Belly he fomented twice aday with a Lye, in which he boyled Salt, Alum and Sulphur, and after applyed Cow-dung for a Cataplaſm.* I uſe to preſcribe theſe enſuing.

A fomentation. *Take of flowers of Sal Armoniack one ounce, Cryſtal mineral two ounces, Spirit of Wine ſmall and imbued with much Phlegm two pound, mix and diſſolve them in a glaſs.*

Let a woollen Cloth dipt into this warm be applyed upon the whole Abdomen, and then let it be changed, wetting it again; let it be done for the ſpace of half an hour twice aday, afterwards let there be applyed a Cataplaſm of Cow-dung, with the powder of Dogs turd, or the following Plaiſter.

A Plaiſter. *Take Empl. Diaſaponis, that is,* de Minio, *with* Venice *Soap, let it be ſpread thin upon limber Leather, and applyed to the whole Belly, to be renewed once in ten or twelve dayes.*

The ſecond Indication. II. The ſecond *Indication* requires moſtly alterative Remedies, to wit, thoſe which ſtop the fermentations of the humours in the bowels of the nether Belly, and the Orgaſms and irregular excurſions of the Spirits, alſo thoſe which procure equal mixtions and due motions of the Chyle and nervous Juice: for which end Chalybeates are chiefly in uſe. And truly it is wont not only in this, but in many other ſplanchnical Diſeaſes, to have reſort to the Medicines of Iron, as if from thence to fetch the ſharpeſt weapons; when as many Empiricks and Quacks, who preſcribe theſe things confidently and dogmatically, obſerve not by what way ſuch a Medicine doth operate, or what alterations for the better may be lawfully expected from thence: wherefore, while Iron, changed into Medicine, although the Sword of *Goliah*, is ſnatcht and brandiſht by a blind man, it is no marvel if it prove in vain, or if in the ſtead of the diſeaſe, which is an Enemy, Nature it ſelf is ſometimes hurt; and truly frequently it happens ſo, when Chalybeats, of which there is great variety, and diverſity of operations, are adminiſtred without any choice or difference either of the temperament or conſtitution in the Patient, and reſpect to the ſtate of the Diſeaſe.

Of Chalybeate Medicines..

What preparations of Iron are not convenient. Of Medicines prepared of Iron or Steel, and of their vertues and manner of working, we have in another place treated, and there is no need here to repeat the ſame things. For this diſeaſe, if any of them, not all of them are fit; for thoſe in which the frame of the mixture being opened, the Sulphur remains ſtill, and being looſened predominates over the reſt, they are altogether to be excluded from this number; for they do much ferment the Juices of the bowels with their notable fermentation, and do ſo exagitate the Blood and Spirits, that the whole Region of the nether Belly is lifted up into a greater bulk, as if by a certain Spirit thronging violently into it.

Neither here are they fit, from which the ſulphureous particles together with the ſaline are chaſed away, as in *Crocus Martis* prepared by long and ſtrong Calcination. For this Medicine as it is conducing to ſtop all fluxes, rather fixes any impaction of Humours and Spirits, and renders them more obſtinate.

What ſort may be admitted. But there remains a Martial Remedy of a middle kind, wherin the Sulphur being wholly or for the moſt part expell'd, a vitriolic Salt remains and predominates: as indeed it is in the ſolution of the filings of Iron, or in a ſimple Infuſion, or Mineral water, in the Salt or Vitriol of *Mars*, in our preparation of Steel, with many others; out of which medicines, being prepared or compounded, we find by often Experience that in ſome caſes, they contribute notable help. For theſe deſtroy the exotick ferments of the bowels, and reſtore the native ferments; they open their obſtructions, they fix the blood, and reſtrain its conſiſtence from too much diſſolution; wherefore Chalybeat remedies, after the ſame manner as certain other alteratives, do perhaps ſomething profit againſt the procatarctick, and more remote cauſes of a Tympany; but as to the conjunct cauſe, they contribute little or no ſuccour.

Forms of Chalybeates. *Take of our Steel finely prepared two drams, the diſtilled water above preſcribed two pound, Syrup of the five Roots two ounces, mix it in a glaſs; let it clarifie by ſetling, the doſe three or four ounces, in the morning, and at five afternoon.*

Take of the Powder of Aron-roots, Crabs-eyes, of each three drams, Cryſtal Mineral two drams, Vitriol of Mars *a dram and a half, Sugar of Roſemary-flowers two drams, mix them, the doſe half a dram twice in a day with a convenient vehicle.*

A liquor of the flowers of Tapſus Barbatus. *Hartman* doth wonderfully magnifie the liquor of the flowers of *Tapſus Barbatus* or Mullein, as a ſpecifick remedy in this diſeaſe, by putting the freſh flowers into a Veſſel

Veſſel, being ſtrongly preſs'd, and put into an Oven with bread being cloſe ſtopt, afterwards the Liquor being ſtrained, let it be diſtill'd *in Balneo*, the doſe one Scruple in the Decoction of Fennel-ſeeds and Roots. Surely this Medicine, if it doth effect any thing, ought to be given in a larger doſe. PHAR. Part. II.

Johannes Anglus commends an Electuary of *Roſata Novella* with *Diatrion Santalon*, and *Eggs of Ants*, which remedy ſeems to promiſe ſomething probable enough. In imitation of this I here propound this enſuing.

Take Conſerve of Chichory flowers, of Indian Creſſes, of each three drams, powder of Aron-roots, Lignum Aloes, yellow Sanders, of each one dram, Crabs-eyes one dram and a half, Salt of Wormwood one ounce, Ants Eggs one ounce, the liquor of Tapſus Barbatus half a dram, with a ſufficient quantity of Syrup of Citron-rinds make an Electuary, the doſe two drams twice in a day, drinking after it of the former diſtilled water, or of the following Julep three ounces. *An Electuary.*

Take the water of the leaves of Aron, of the Juice of Elder-berries, of the water of Juniper and Elder-flowers, of each ſix ounces, the magiſtral water of Snails, and of Earth-worms, of each two ounces, Syrup of the Juice of Elder-berries two ounces, mix and make a Julep. *A Julep.*

III. The third Indication Vital preſcribes Remedies againſt fainting of Spirits, and difficult breathing, and againſt Watching and Thirſt. We will briefly annex certain forms of either kind. *Third Indication.*

1. Cardiacks.

Take of the water of Napha, *Marygolds, Camomile, of each three ounces, of Dr.* Stephen's *water two ounces, Tincture of Saffron two drams, Sugar one ounce, Pearls one dram, make a Julep, the doſe four or five ſpoonfuls three times a day or oftner in faintings.* *Cordials.*

Take Conſerve of Marygolds two ounces, Confection of Alchermes, and de Hyacintho, *of each two drams, prepared Pearl one ounce, ſyrup of the juice of Citrons, enough to make a Confection, take the quantity of a Nutmeg evening and morning, drinking after it a draught of the Julep.*

2. Hypnoticks.

Take of Aqua Hyſterica *ſix drams, ſyrup* de Meconio *half an ounce, mix them, and take late at night.* Or, *Hypnoticks.*

Take of ſmall Cinnamon-water one ounce, Diacodium three ounces, Tincture of Saffron two drams. Mix them, and take one ſpoonful at night, if ſleep be wanting. Or,

Take ſyrup of Cowſlip-flowers three ſpoonfuls, compound Pœony-water one ſpoonful, Laudanum tartarized one dram, take one ſpoonful, if Watchings require it.

3. Extinguiſhers of Thirſt, in this Diſeaſe being very thirſty, ought frequently and in ſmall quantities to be adminiſtred, that that troubleſome ſymptom may be reſtrained without much drink, which is perpetually pernicious. For which purpoſe, *Things mitigating Thirſt.*

Take of Conſerve of Wood-ſorrel paſſed through a Sieve three ounces, Pulp of Tamarinds two ounces, Sal prunella one dram, with a ſufficient quantity of ſyrup of the juice of Wood-ſorrel, make a Lohoch, of which let him lick often.

PHAR. Part. II.

SECT. II. CHAP. V.

Of an Anaſarca.

NOw two kinds of Dropſies, *viz.* Aſcites and Tympanie (according to common reckoning) being finiſht, although the third, to wit an *Anaſarca* (for that it is an affection rather of the whole body, than of the nether Belly) appertains not properly to this place, notwithſtanding the Pathologie thereof having ſome affiance with the former, we think fit to deliver here alſo its Cure in ſhort. An Anaſarca is deſcribed after this manner, *That it is a white ſoft Tumour of the whole outward Body, or of ſome of its parts, yielding to the touch, and leaving a dent upon compreſſion,* proceeding from a watery humour extravaſated, and accumulated as well within the interſpaces of the Muſcles, as within the pores of the fleſh and skin, yea of the Glandules and Membranes.

The deſcription of an Anaſarca.

How it differs from an Aſcites.

It differs from an Aſcites as to its outward form and appearance, yet not as to its morbific matter, which being the ſame in both diſtempers, as it is heaped within the greater or leſſer hollowneſſes, it gains divers Appellations of the Diſeaſe.

The Original from the blood.

The watery humour procuring an Anaſarca, doth proceed altogether or for the moſt part from the blood; for it being continually produced within the maſs of blood by the fault and defect of ſanguification, it is poured out in greater abundance from the extremities of the Arteries, than can be received, or brought back by the Veins, or the Lymphaducts, or can be diſcharged by the Reins or pores of the skin, and other vents of the ſerous Juice.

The material and efficient cauſe.

From theſe it follows, that the material cauſe of this Diſeaſe is a watery humour, and the efficient is blood, which engenders waters and depoſits them in the places affected. We will exactly weigh the reaſons of either of them, and the manner of becoming and effecting it, and firſt we will treat of the efficient Cauſe of an Anaſarca.

The Blood its efficient cauſe in a double reſpect.

1. The affection of the Blood, or rather the Hydropical brood, conſiſts in theſe two things, to wit, Firſt by reaſon of a failure or fault of ſanguification, it doth not rightly aſſimilate the nutritious Juice perpetually infuſed into its maſs, but ſuffers it to degenerate into a watery humour: Then ſecondly by reaſon of the too looſe mixture thereof, it doth not retain that humour, ſo degenerated, ſo long within its conſiſtence, until it might be diſcharg'd through fit Emunctories or Emiſſaries, but lets it out every where near to the ends of the Arteries, into the inter-ſpaces of the Veſſels, and there leaves it. Either of theſe vices of the Blood we will conſider a little more.

Firſt that it doth not rightly ſanguifie.

In the firſt place as to the former, for the moſt part it is confeſſed by all, that the Blood it ſelf and not the Heart or Liver ſanguifies, by what of late is plainly underſtood concerning the functions of theſe parts; yet by what means the Blood aſſimilates Chyle infuſed to it ſelf, and converts it into freſh blood, to be beſtowed to ſo many and diverſe ſorts of uſes, doth not eaſily lie manifeſt to us. But what ſome affirm, that it is made only by the exact comminution and commixtion of particles, and for that cauſe the particles of either kind being confuſed together, they think, that within the ſtraiter paſſages of the Liver and Lungs they are kneaded and wrought together as it were with little peſtils, ſeems little probable to me; but on the contrary, I think theſe bowels (as I have ſhewed already) are conſtituted the Organs rather of ſeparation than of mixture; but the reaſon of ſanguification altogether conſiſts in this, that the active particles of the old blood, to wit, the ſaline and ſulphureous, being placed in vigour with the ſpirituous, immediately act upon the like particles of the infuſed Chyle as yet exiſting in an inferiour ſtate, and do ſo ſtir them up and ferment them that thereupon being extricated from the coverings of the thicker parts, they are carryed into a like degree of exaltation or perfection with the former, and being at length aſſociated with them, and made alſo homogeneous, they put on the ſame nature of Blood; the more thick and heterogeneous particles being removed thence to another place, from thoſe which they had deſerted and gone away from. For truly Sanguification is altogether finiſht by Fermentation, even as the maturation of the Muſt into Wine or Ale; but the reaſon of the difference is, that Wine being ſhut up in the Tub, ſtill remaining entirely in the ſame Maſs, is ſlowly fermented, as to its whole

The reaſon whereof enquired into.

whole conſiſtence, and is not accompliſhed but in a long ſpace of time; but the Blood conſtituted in a perpetual flux by the loſs of ſome parts and the reparation of others, is fermented by the parts ſtill received freſh, and is generated anew.

The reaſon and manner of ſanguification explained.

The old Blood for the moſt part affords the ſame thing towards the freſh Chyle, as Ferment from the flower or fæces of old Ale, being put into new Ale; notwithſtanding as it were by a contrary manner; becauſe the huge maſs of blood being formerly fermented, doth ſuddenly ferment and alter the ſmall portions of the Chyle continually brought in; but the fermenting liquor in Ale in a very little quantity is put to the great maſs of the other liquor to be fermented; which it brings not to maturity under a long ſpace of time. After the rudiments of blood are ſo caſt by fermentation, the concluſion and perfect aſſimilation, into blood, is acquired by accenſion; (for ſurely that it is ſo enkindled (as I think) I have formerly ſhewed by demonſtration which arguments chiefly taken from its proper paſſion, although many have cavill'd at, none have been yet able to overthrow.) Wherefore, while the whole maſs of blood conſiſts of Blood and Chyle confuſedly mixt together, it is fermented while it is circulating; and being divided into moſt minute portions, is ſpread through the whole Lungs, that it might be kindled ſucceſſively according to all its parts, by the nitrous air ſuckt in: for by that means both the vital flame is continued, and all the particles of Blood having as it were paſſed the fire, become more purified, and more agreeable among themſelves; moreover, they are ſo diſpoſed of whileſt they are kindling, that while ſome go into Nouriſhment of the Spirits, of the Nervous Juice and the ſolid parts, and others leſs uſeful depart into the ferments or recrements of the bowels; mean while others being more fixt, abide longer in the maſs of blood, and ſuſtain its conſiſtence, and by fermenting the Nutritious Juice, ſtill engender new Blood, until themſelves being impoveriſhed, are at length diſcarded, and give place to others that are freſh and luſtie.

An Hydropick temper of the blood ſprings from a double reſpect.

Having ſhewed after this manner by what courſe Sanguification ought to be finiſhed, as well by fermentation as accenſion of the Blood; it will be eaſie to conceive wherein the fault conſiſts producing an Hydropick diſpoſition: To wit, this uſually aſſumes its riſe whenſoever either or both thoſe Conditions requiſite to Sanguification either fail, or are preverted.

Viz. Firſt from the defect or fault of its Fermentation;

Firſt therefore this happens more frequently and rather, for that the blood being depraved in its temperature, doth not rightly ferment the Nutritious Juice poured into it, that ſo it might be changed into laudable blood. For when the watery particles predominate with the earthy in the maſs of Blood, the Salt and Sulphur being depreſſed with the Spirit, as all the functions, both Vital and Animal, from thence languiſh and waver, ſo eſpecially Sanguification it ſelf fails and is perverted. For the Juice of the Chyle commixt with the Blood, when it cannot be diſſolved and fermented, with the particles thereof, (after the faſhion of other liquors, as often as being mixt they want ferment,) it degenerates perhaps into a watery, acid, or ropy, or otherwiſe faulty humour, which being afterwards daily encreaſed, and at length riſing to its fulneſs, lyes heavy on the blood, and oft-times almoſt ſtifles its heat; from whence there is a neceſſity that it be forthwith diſcharged by ſome means, and whereſoever it can get vent; but afterwards for that the offices of ſeparation fail in their functions (the ſtock of the animal Spirits languiſhing by reaſon of the diminiſhed proviſion from the influx of Blood,) the abounding Serum is depoſited every where into the pores, and next vacuities whether greater or leſſer, out of the little mouths of the Arteries; from whoſe daily and great encreaſe, after all the pores are filled, ariſes that as it were fenny habit call'd *Anaſarca* of the whole body outwardly, or of ſome of its Members.

Secondly, from defect of Accenſion.

Secondly, not only the defect or fault of Fermentation, but alſo of the accenſion of the Blood, induces ſometimes an Hydropical diſpoſition on the maſs thereof: which is clearly diſcern'd, inaſmuch as ſome perſons inhabiting Maritime or Mooriſh places, fall into the Dropſie without any other cauſe or occaſion, than that they draw a thicker air endowed with heterogeneous vapours, by which the Nitre is either driven away or obſcured. Therefore the blood becoming degenerate, and vitiated as to its temperature, becauſe it is not duely kindled, nor perfected by efflagration within the Precordia, doth not rightly diſſolve and aſſimilate the Juice of the Chyle, but ſuffers it to be preverted into a watery liquor. But although in the firſt place, the blood being depraved for this reaſon, ſometimes loſes its fermenting vertue, and therefore the rather and more immediately procures a Dropſie; notwithſtanding it is manifeſt, the firſt fault thereof aſſumes its origine from unwholſom air ſuckt in, and not duely enkindling the Blood; becauſe ſuch Hydropicks removing their reſidence into Sunny and Mountainous places, recover their health without any other Medicines.

Hitherto

PHAR. Part. II.

Hitherto of the neareſt Cauſes of an Anaſarca and which are conjoyned to the Diſeaſe it ſelf, which namely are the depravation or defect of the maſs of blood, chiefly as to its fermentation, and in ſome meaſure as to the enkindling thereof; which latter is ſcarce wont to be effective but when it follows the former: but what remains as to the more remote and procuring cauſes of this Diſeaſe, to wit, from which the defermentative affection ariſes (that I may ſay no more of the defect or depravation of its enkindling;) I ſay that theſe appear ſo diverſe and many, that I judge it hardly poſſible to recite them all particularly; notwithſtanding, very many or at leaſt the chief may be reduced to theſe three heads: to wit, For that the watery diſtemperament of the blood doth ariſe, inaſmuch as its active Principles, *viz.* Spirit, Salt and Sulphur, are not inveſted with their fermenting and ſanguifying force or vertue, I account this to come to paſs, either Firſt becauſe thoſe particles are too much waſted by their great Expences; or Secondly becauſe they are not repaired by convenient and proportionate Refections; or Thirdly, for that they are overwhelmed or obſcured by ſome other duller or heterogeneous Particles being too much accumulated in the maſs of Blood: We will a little weigh the Reaſons and ways of each of theſe their coming to paſs.

Reduced to three heads.

Firſt, becauſe the active particles of the blood are too much conſumed.

In the firſt place, the former of theſe is evidently diſcerned in frequent and inordinate Hæmorrhages, whereby many men, although ſtrong and formerly healthy, are immediately enclined to a Dropſie, more than from any other accident or occaſion; the reaſon whereof is, that the blood is ſo impoveriſhed, through its more noble Particles iſſuing out in great abundance, that afterwards it can neither duly ferment nor enkindle the Juice of the Chyle brought into it. Moreover, ſometimes the ſame effect ſucceeds (although in a more ſlow degree) from Feavers and other long maladies and languiſhings; to wit, inaſmuch as the blood ſuffering under a long depreſſion, is ſo extenuated and robb'd, that at length it becomes watery and defermentative.

Secondly, becauſe they are not enough repaired.

Secondly, the Blood ſometimes deſerting its genuine diſpoſition, declines into an Hydropical one, for the nouriſhment being more ſlender than it was wont, or ought to be beſtowed upon it, its active and ſanguifying Particles are not enough repaired within its maſs; for ſo we have obſerved, that ſome who have uſed themſelves to Wine and ſtronger Drink, after they have been reduced to homely Diet, and ſmaller drink, of water or ſmall beer, ſuddenly have become Hydropick. It is a common obſervation, and frequently true, although of ill omen, that Drunkards, and daily drinkers, if that wild Cuſtom be left, at length becoming ſober and abſtemious, are much in hazard, leſt by reaſon of the uſual fermentation of the blood being depreſſed, they become obnoxious unto that Diſeaſe. I knew a notable Drunkard, who declared that a Prieſt very learned and Pious was guilty of his death, becauſe he gave him admonition to Temperance, and to leave his Drunkenneſs, and he complying therewith, incontinently fell into a mortal Dropſie.

Thirdly, becauſe they are buried in duller particles.

But the third cauſe or occaſion diſpoſing to that Diſeaſe, the moſt common and notable, conſiſts in this, that the active Particles of the Blood, being involved with other more dull or heterogeneous ones, or being diſſipated from one to the other, loſe their fermentative power, or cannot enough exerciſe it. But ſuch an affection of them, as it is wont to be raiſed from various cauſes and accidents, ſo chiefly from theſe three, one while ſolitary, another while united together; to wit, Firſt from the Non-naturals immoderately received: Secondly from the Naturals unduely retain'd; or Thirdly, from the Preternaturals corruptly generated in the body.

Whereof there are three cauſes.

Firſt from Non-naturals immoderately ingeſted.

The errors of Diet deſervedly may be referred to the firſt rank of theſe (whereby the ſtock of that Diſeaſe is alwayes moſt abundant.) For it is a common Prognoſtick and in every bodies mouth, that Gluttons and great Drunkards dye at length of a Dropſie: to which moreover, not only Surfeits and immoderate and daily Tiplings incline, but alſo frequent and unſeaſonable Treats; and moreover the continual pouring in of abſurd and hard to be digeſted Nouriſhment. For from the evil courſe of Diet of each kind uſed any while, whenas the Juice of the Chyle, oftentimes crude, incongruous, and above meaſure plentiful, is poured into the maſs of blood; it of neceſſity follows, that it is firſt burdened, and afterwards its Conſiſtence being looſened, the more noble Particles being forced aſunder, it is ſo involved, or abated by the other heterogeneous ones, that being hindred, it deſiſts from its fermentative or ſanguifying virtue; inſomuch that the bowels being in a ſhort time hurt by its aſſaults, a Cachexia, and then a Dropſie follows, whereof that is always a forerunner.

Secondly, From Naturals unduely retained.

Secondly, in this place are put all ordinary, accuſtomed and ſolemn Evacuations ſuppreſſed. It is obſervable enough, that a Cachexia, and often a Dropſie, doth ariſe from a menſtruous or Hemorrhoidal flux diminiſhed or ſtopt, no leſs than from

from a too immoderate one, (by reaſon of the fermentation of blood impeded by the heterogeneity of Particles.) Moreover, the ſame is often wont to be affected from Iſſues ſuddenly ſtopt, or eruptions of the Skin ſuddenly repercuſs'd. Laſtly, ſuppreſſion of Urine, and ſweating much hindred, do render the blood more watery, by an immediate and neceſſary affection, and encline to the Dropſie. Alſo it is an obſervation frequent enough of healthful Perſons, who being compelled for ſome time to abſtain from going to Bed, that their feet have ſwoln.

Thirdly, From Preternaturals generated in the Body.

Thirdly, Preternatural things generated within the Body, but eſpecially Tumours and Humours do hinder the motion of the blood, or pervert its temper, and ſo induce an Hydropical diſpoſition. Tumours ſtirred up in ſome place about the Bowels, inaſmuch as they hinder or ſtraiten the circuit of the Blood, do cauſe its Serum to be there extravaſated, and poured out; by the accumulation whereof within ſome cavity, in the firſt place an Aſcites (as we have ſhewn above) and at length an Anaſarca, a conſequent of that doth frequently enſue. Moreover, Humours of divers ſorts being engendred in divers places within, and transferred into the blood, do firſt pollute the maſs thereof, and defile it with heterogeneous Particles, whereby at length it is ſo depraved in its temperament, that it perverts the Juice of the Chyle brought in (when it cannot further ferment and aſſimilate it) into an hydropical liquor. For this reaſon, nothing is more uſual than that Conſumptive perſons, and thoſe that are affected with ſtrumous and cancrous Ulcers, nay of any ſort within the Reins, Meſentery, Guts, or other Bowels of the lower Belly, after they have been long conſuming, dye at length hydropical.

Different manners hereof are reckoned.

The material cauſe of an Anaſarca is partly the Serum of the Blood, and partly the nutritious Juice.

Hitherto concerning the next efficient cauſe of this Diſeaſe, alſo of the chief remote ones, as well procuring, as evident. But as to what appertains to the material cauſe, it is obvious unto the Sence, that it is a meer Lympha accumulated within the pores of the Skin, and of the other outward parts; which being depoſited there by the blood (the liquor thereof being partly ſerous, and partly chylous Juice) but failing in Sanguification and Nouriſhment of the body, to which it was deſtinated, it is caſt of like recrements into the vacuous ſpaces of every veſſel. And though the matter of the Dropſie proceed from the Blood and Chyle, yet it is no wonder if it appear neither like blood, nor milkie, but only limpid; becauſe the Urine even of healthful people, after more plentiful drinking, is rendred crude as well as watery; and therefore it is manifeſt, it is nothing changed by the blood, but leaves in that place, whatſoever of colour or thicker conſiſtence it brings to its maſs. And although a reaſon may be given in either caſe, that the Urine, inaſmuch as it is ſtreined through the Kidneys, and the hydropic matter thorough the pores of the ſolid parts, even ſo become limpid and watery; notwithſtanding it is evident by obſervation, that the watery part of Chyle, even while it is confounded with the blood, is not intimately mixt with it, but being deprived of its colour and conſiſtency, it remains under the form of Lympha, within the pores of the blood; the ſure ſign of which is, that the blood taken from any Animal by Phlebotomy, after being cold it is divided into parts, exhibits a watery liquor (which conſiſts of Serum and Nutritious Juice) plainly limpid, and ſeparate from the other blood. It will be from our preſent purpoſe to enquire any further into the reaſons hereof, and manner of being ſo, and wherefore blood, which being poured into water doth preſently tinge the ſame, and bloodies all ſolid bodies whenſoever it is ſprinkled thereon, yet dyes the Serum of no colour with which it is intimately confounded and a long time circulated.

Why the hydropick humour is limpid and not milkie nor bloody.

The differences of the Diſeaſe.

From the Ætiologie of this diſeaſe now delivered, the differences of it may eaſily be collected; to wit, firſt it is either univerſal, when the whole habit of the body and all the members ſwell up: or it is particular, wherein for the moſt part the inferiour members only ſuffer, in the mean time the reſt of the body pining away for want of Nouriſhment, which kind of diſtemper, and not a Tympanie, *Proſper Martianus* will have *Hippocrates* ſtyle the dry Dropſie, in which what is reported of the Syren, the dry is joyned to the watery.

Secondly, an Anaſarca whether univerſal or particular, is either ſimple or complicated with an Aſcites; and then either an Anaſarca enſues an Aſcites, or this diſeaſe follows that. Moreover an Anaſarca may be diſtinguiſhed many ways in reſpect as well of the procatarctick as evident cauſes, as we have before intimated; and ſuch differences thereof are found to be frequently of great moment about duely inſtituting the Prognoſtick and Cure.

The Prognoſticks of it.

Wherefore, what relates to the prognoſtick part, this diſeaſe while it is ſimple, proves leaſt dangerous among all the kinds of Dropſies; and a particular one ſeiſing only the inferiour members, ſo that the belly doth not together ſwell with them, is much ſafer than an univerſal one.

And

PHAR. Part. II.

An Anaſarca bringing on an Aſcites, wherein for the moſt part the Urine is plentiful enough, and the thirſt not very intenſe, is far more ſafe than an Anaſarca brought in by an Aſcites, wherein the diſeaſed do very much thirſt, and make little, red, and thick, and for the moſt part a lixivial Urine. In like manner it is, or worſe, when an Anaſarca comes upon a Tympanie or a Phthiſis (as ſometimes 'tis wont.) Laſtly, no ſlight Prognoſtick of this diſeaſe is taken from the complyance, or the obſtinateneſs of the Patient, about Diet and Medicine. For whatſoever the condition of the diſeaſe may be, if the hydropick perſon refuſing medicine will indulge his fancy, we may not hope any good from thence.

The Cure of it. Two Indications.

About the Curatory part to be deſigned in order, two chief Scopes of Healing do occur, *viz.* Firſt, that the water between the skin be conſumed by ſome means; Secondly, then proviſion muſt be made, leſt it be continually generated and accumulated afreſh; for which purpoſe a Phyſitian is to emply his labour, both that the bowels of Concoction being emptyed of their Superfluities, and free from obſtructions, may always procure laudable Chyle, and ſupply the maſs of blood in due plenty; as alſo that the blood (the principles thereof being reſtored to its fermentative power) may orderly ferment the Juice of the Chyle continually poured into it and aſſimilate it into Blood. The vital indication ſeems not at all neceſſary in this diſeaſe as in many others, for that very rarely in this appear ſwoonings of the Spirits or Watchings, for which Cordials and Hypnoticks are required; and there is little need of reſtoring Diets, becauſe Faſting and Abſtinence rather help, and oftimes make up the greateſt part of the Cure: the reaſon whereof is, that the Veſſels being emptyed through want, do ſwallow up the waters between the skin, or ſtagnating in other places, and do diſcharge them forth partly by the Kidneys, by the pores of the Skin and other Emunctories, and partly do advantageouſly employ them being yet turgid with alimentary Juice, to the nouriſhing of the body.

The firſt intends the evacuation of the morbific matter.

Firſt, That the firſt, *Indication* being Curatory, intending an Evacuation of the morbific matter, may be performed, there ought to be exhibited all Hydragogue medicines, as well ſimple as compound; and alſo the forms of medicines recounted and preſcribed in the former Chapter of an Aſcites. Moreover, hereto belong not only Catharticks and Diureticks, but alſo Diaphoreticks, which though in other ſorts of Dropſies they are very much forbidden, often take place in curing of an Anaſarca.

By Purgers.

In a ſimple Anaſarca we may lawfully adminiſter ſtrong Purgers, and frequently they much profit. And truly this diſeaſe being cured ſometimes by means of a Cathartick, Empiricks do much glory of their Cures, and certain of their medicines become much cryed up for curing hydropical perſons; for if at any time it happens that they have healed one or two labouring with an Anaſarca, by their ſpecifick Hydragogues and Elateriums, it is enough wherewith they may always magnifie themſelves and their Art, although by the ſame medicine they have murdered a hundred Aſcitical perſons. Wherefore, although, Preparations of Spurge, or *Elaterium*, *Pilulæ Lunares*, *Herculeſ Bovii*, and other Hydragogues, have ſometimes profited in ſome caſes; notwithſtandiug if they be indifferently exhibited to all Hydropicks, or at all to any endowed with a weak Conſtitution, and Bowels of a brittle tone, or of evil conformation, they oftener cauſe death than remedy: wherefore let it always be committed to the judgment of a prudent Phyſitian, the time when, how long, and what ſort of Catharticks are to be uſed.

Strong Purgers are convenient, but not to all.

We have before deſcribed forms of Hydragogue Purgers of every ſort, to wit thoſe that exerciſe their power upwards and downwards, and as well mild as ſtronger workers, ſo that they may be referred hither, and accommodated to the method of healing now propoſed.

The manner of their working.

But if the reaſon be enquired, after what manner Purgers do operate in this diſeaſe, and why they more happily, and much more efficaciouſly bring out waters than in any other ſorts of Dropſie; I ſay, in an Anaſarca the morbific matter (which is the Lympha) ſubſiſts partly in the maſs of blood, partly in the habit of the body, within the pores and vacuities between the ends of the veſſels; wherefore, a ſtrong Cathartick being adminiſtred, preſently troubles and diſſolves the maſs of blood, and ſtirrs it up to the excretion of any ſuperfluous or heterogeneous thing; and irritates alſo the little mouths of the Arteries gaping towards the Cavities of the Inteſtines, that the humour ejected from the blood may eaſier find vent through theſe Emunctories. From hence in the firſt place, the waters fluctuating within the blood are abundantly drained out, afterwards the veſſels being emptyed, do preſently ſwallow up again the waters between the skin, and preſently diſcharge them forth partly by ſiege, and partly by Urine, or Sweat; in the mean time there is no fear leſt, as in an Aſcites, the morbific matter being driven and poured from the

blood

blood, by the Medicine, ſhould be further forced into the places affected, whence not eaſily flowing back again, it ſhould be more largely increaſed; nor leſt, as in a Tympany, by reaſon of the Fibres of the Stomach and Guts being too much irritated by the Phyſick, thoſe bowels might be provoked into convulſive ſwellings. For as long as the bowels are firm and well conſtituted, the particles of the Medicine inflict them with no hurt; but preſently being brought into the blood, they do not only allure waters out of it, but by exagitating the maſs thereof, they raiſe the active particles formerly overwhelmed, and diſpoſe them towards their fermentative power.

Secondly, By Diureticks. Secondly, Hydragogues working by Urine, as well ſimple as the compound, as alſo forms of Medicines prepared from either of them, and the manner of their adminiſtration, we have alſo deſcribed above, which alſo may be transferr'd hither to ſave repetition. But becauſe not all Remedies of this kind do help alike in all the Diſtempers, it is here obſervable, that for curing an Anaſarca *Lixivials* (as has been frequently manifeſt by our obſervation) do far excel other Diureticks. For indeed now it is a common and thredbare Remedy, for any one having ſwell'd members, after a previous Purge, to take twice or thrice in the day, from ſix to eight ounces of a Lye made of the Aſhes of Wormwood or Broom, made in White-wine, and to continue the uſe of it for ſome dayes. This Medicine moves potently the Urine, as I have obſerved in many, yea ſometimes in ſuch abundance, that piſſing the quantity of half a gallon in a day and a night, the Patients have recovered their healths in a ſhort time even to a miracle.

And chiefly Lixivials.

The reaſon and manner of their operation enquired into. We have unfolded in a former Treatiſe, by what manner and faſhion Diureticks of ſeveral kinds do operate, and after what manner they affect the bowels, blood and other humours: But that in thoſe that labour under an Anaſarca, Medicines endowed with a fixt and lixivial Salt, expel Urine more than thoſe of an acid, alcali, or volatile Salt; the reaſon as I judge is this, *viz.* in thoſe affected with this diſeaſe, after the fermentation and ſanguifying vertue of the blood failing, the watery and crude humours heaped up as well in its maſs as in the habit of the body, do there remain almoſt immoveable for a long time, till at laſt they (as the manner is of watery Juices long ſtagnating) do wax ſoure; wherefore the lixivial particles of the Medicine ſpread abroad in the blood preſently boyl up with the acids of the waters, which while they ferment and move, they ſtir up in the whole maſs of Blood, a notable and excretive fermentation; inſomuch that all the particles being put into motion, not only the watery and ſuperfluous being thruſt from the reſt, are diſcharged by the Reins; but alſo the innate and active particles of the blood it ſelf, unfold themſelves from the more groſs with which they were involved, and laſtly riſing up, they begin to reſume their fermenting power, and to ſanguifie.

Forms of lixivial Diureticks.

Take of the Aſhes of Broom or Wormwood, or of the twigs of a Vine laccined to whiteneſs and ſifted, four ounces, put them into a glaſs bottle with a quart of White-wine, let them digeſt cloſe ſtopt and warm for three or four hours, after ſtrain it; the doſe from ſix to eight ounces twice aday.

Take of white Tartar calcined with Nitre, and after melted in a Crucible to blueneſs three ounces, ſmall Spirit of Wine a pound and a half, water of Snails and Earth-worms, of each four ounces, digeſt them in a Sand furnace for two dayes: the doſe of the clear liquor from two to three ounces, with four ounces of the decoction of Kneeholm and Burdock-roots in Ale.

For ordinary Drink:

Take of the white Aſhes of Broom cleanſed two pound, put them into a little Bag, with three ounces of Saſſafras, one ounce of leſſer Galangal, an ounce and a half of Juniper-berries, and as much of Carrot-ſeeds, make a bag for four gallons of Ale, after ſeven or eight dayes begin to draw it.

Diaphoreticks. 3. *Diaphoreticks* do often very notably help in a Leucophlegmatia (which is the commencing or declination of an Anaſarca) but in this diſeaſe confirmed, they are wont to be more convenient than in other kinds of Dropſies. And although from the beginning they cannot cauſe Sweats, by reaſon of the habit of body ſurrounded as it were with a more thick marſh, however while they exagitate the blood, they cauſe the innate active particles thereof, being before dormant, and half overwhelmed, to be raiſed up and diſpoſed towards fermentation, and alſo they cauſe all the excrementitious, and chiefly the watery, to be raiſed into motion, ſo that preſently flowing out of their Receptacles, they may the more readily and eaſily find way by ſiege or Urine, and oftentimes in ſome part by tranſpiration. But truly after the

PHAR. Part. II.

waters being poured out by purgation, the morbific matter is diminiſhed ſo much, that the bulk of the body and the ſwelling of the members begin to abate, the reliques of the humour are beſt conſumed by a moderate tranſpiration and conſtant ſweating.

Diaphoreticks profit which are taken in a larger doſe.

We have deſcribed before the number and forms of Hydroticks; as to the preſent purpoſe for curing an Anaſarca, thoſe chiefly are fit which are given in a larger doſe; for they whoſe quantity is very ſmall, their active particles being overwhelmed in the waters, are loſt before being infuſed into the blood they can exert their ſtrength. Wherefore, Spirits, whether armoniac or vinous, as alſo Tinctures and Elixirs, yea and powders, are more rarely uſed in this diſeaſe, becauſe they effect little in a leſſer doſe, and if they be exhibited in a very large one, they often hurt the bowels by their outrage; But thoſe things are rather choſen, which being taken hot, and in a full draught, are able to paſs into the whole blood not weakned; of which ſort, in the firſt place are Decoctions of Woods, and Roots, whoſe particles being agreeable enough to the Blood, and not to be tamed thereby, do paſs through the whole maſs thereof, and do exert their Elaſtic power by moving together all the humours.

Forms thereof.

Take of the Shavings of Lignum Vitæ ſix ounces, Saſſaphras two ounces, of each of the Sanders ſix drams, ſhavings of Ivory, Harts-horn, of each three drams, let them be infuſed and boyled in eight pound of Spring-water to half; adding of Calamus Aromaticus, leſſer Galangal, Burdock and Butter-Bur-roots, of each one ounce, the leaves of Sage, Germander, dryed, of each two handfuls, let the ſtrained liquor be kept for uſe; the doſe from eight to ten ounces twice in a day warm; to every doſe may be added 20 or 25 drops of Spirit of Sal Armoniac drawn with Amber, or of Spirit of Soot, or half a dram, or a dram, of Tincture of Salt of Tartar.

External Hydragogues.

Hitherto of inward Hydragogue Medicines, which cauſe the Lympha to be drawn forth, either by alluring it inwards towards the guts, or by driving it forth to the Reins or pores of the Skin. Beſides, there are certain outward adminiſtrations in uſe, by which the water accumulated within the habit of the body are moved together, and ſo are either generally diſpoſed to go forth by ſweating, or Urine, or particularly are ſent out forthwith, a vent being made in ſome private places.

The chief Kinds of them, and the manner of their Adminiſtration.

In the firſt rank are placed Frictions, Liniments, Fomentations and Baths as well dry as moiſt: Then thoſe particular things that bring out waters are, Veſicatories, and things that bring the Skin to an Eſchar, and prickings by a Needle. We will treat briefly on each of theſe, or at leaſt of the principal of them, as far as they have reference to this diſeaſe.

1. *Frictions.*

1. Frictions do frequently afford advantagious ſucceſs in a Leucophlegmatia and an Anaſarca: for when the habit of the body is not only filled with a watery illuvies gathered there together, ſo that nothing can evaporate, but that the extern parts grow cold by reaſon of the approach of blood towards them being ſtopt, often and ſtrong frictions do move together the ſtagnating waters, and diſſipate them from thence in ſome meaſure, and alſo recal again the blood by opening the paſſages into thoſe parts from whence it was baniſhed; wherefore, not only the ſwoln members, but alſo the whole body once or twice in a day, is expedient to be rubbed with a courſe Cloth, or with a little Bruſh now ordinarily prepared for that purpoſe.

2. *Liniments, and,* 3. *Fomentations.*

2. 3. With or after Frictions, Liniments and Fomentations are ſometimes convenient. They are prepared either of Salts, and other Minerals diſſolv'd, or from hot and diſcuſſing Vegetables, with the fæces of Wine boyl'd in water, the hot application whereof opens the pores, moves together more amply the accumulated waters, and diſcuſſes them, and alſo enlarges the compaſs of the bloody Circuit, the watery heap being ſomewhat diſſipated. Let the Liniments conſiſt of Sulphur, and Salts of a diverſe kind, or of Quick-lime, and other Minerals, which being powdered and mixed with the mucilaginous Extracts of ſharp Herbs, are reduced into the form of an Unguent; to which let a fit quantity of Oyl of Scorpions be added, for the better conſiſtency. Moreover this Oyl (ſo it be genuine) applyed by it ſelf, doth frequently afford notable help. I knew a Boy much ſwell'd with an univerſal Anaſarca, who was cured by this Remedy alone: for his mother (I know not by whoſe advice) anointed his whole body morning and evening with Oyl of Scorpions, ſtrongly rubbing all the parts with her hot hand; by which act within three days he began to pour forth abundance of Urine, and when he had continued piſſing ſo for ſome days, the ſwelling vaniſhing by little and little, he became ſound.

4. *Baths.*

4. Baths are not convenient in any Dropſie but an Anaſarca, and not for this unleſs in a Diatheſis or Declination. For ſeeing the Blood from the heat thereof, encompaſſing

compaſſing the whole Body, being made boyling and ſtirr'd up, every where puts in motion the waters formerly ſtagnating, and ſwallowing them up into it ſelf, conveys them variouſly away; the danger is, leſt (as frequently it falls out) receiving them out of the habit of the body into its own maſs, it ſhould depoſe them preſently into the Præcordia or the Brain: for there is nothing more uſual than an affection of thoſe parts, *viz.* an Aſthma or Apoplexy to come upon Hydropicks by unſeaſonable bathing. But when the conjunct cauſe of the diſeaſe, (*viz.* a Swelling) becomes moderate, or not much, a Bath of water impregnated with Salts and Sulphur, or a Hot-houſe, by which a gentle Sweat is promoted, is frequently adminiſtred with ſucceſs: As for the Stew it is more expedient, and oft-times notably helps, that the Patients be placed in fitting Seats in Salt-houſes, near the Furnaces wherein Mineral Waters are boyled into Salt.

5. Veſicatories ſend out abundantly the waters between the skin, and often too profuſely. Touching the manner how they operate we will treat more ſpecially hereafter; in the mean time we adviſe, that they are very cautiouſly to be exhibited to Hydropicks, for that Epiſpaſticks of this kind, applyed to the ſwell'd places, do make the Emiſſarie too open, by which apertion the water in the firſt place burſting out, draws oftentimes a great illuvies after it from the neighbouring parts, whence immediately enſues a great proſtration of the Spirits. Moreover, ſometimes the place is ſo ſuddenly emptyed, that being deſtitute of heat and ſpirits, it is in a ſhort time ſphacelated or mortified; wherefore this Medicine is ſeldom applyed to the Legs, or the Feet of Hydropical perſons, where the heat is weak, and the humour greateſt, but ſometimes to the Thighs and Arms with ſecurity (as often as there ſhall be need.)

5. *Veſicatories.*

6. *Eſcharoticks* are adminiſtred a little ſafer than Veſicatories, to the ſwell'd places, becauſe from this Emiſſary the flux of waters happens not ſo headlong and abundant at firſt: but commencing moderately grows up by little and little to a great ſtream, which Nature (after that by degrees it is accuſtomed thereunto) endures the better. Moreover, there is leſs fear of a Gangrene from an Eſcharotick than from a Veſicatory, becauſe in that application the part, whoſe union is diſſolved, is defended by the Eſchar againſt the loſs of heat. I have known ſometimes an illiterate and rude Empirick, who frequently by an Eſcharotick did evacuate with ſucceſs the members of hydropick perſons, however ſwell'd, by the enſuing manner: to wit, he fomented the legs evening and morning with the Decoction of Dwarf-Elder, Wormwood, Cammomile and other hot herbs put into the Lees of Ale or Wine; and between the times of the Fomentations he applyed a Cataplaſm prepared of the maſs of that Decoction with Bran; after he had uſed theſe for three dayes, he covered both legs and feet with a Plaiſter of *Burgundy* Pitch, leaving only a ſmall hole on each Calf, about the bigneſs of a Nut, in which places he put an Eſcharotick, on the bare skin, of the Aſhes of Aſhen-bark: which after twelve hours being removed, a ſmall Eſchar was left, from whoſe pores water was wont at firſt ſlowly to ſweat out, afterwards day by day a little more plentifully to drop out, and afterward (the Eſchar falling off) it uſed to flow out more abundantly as from an open Spring untill it had drein'd the whole leg both beneath and above.

6. *Eſcharoticks.*

The empirical manner of Eſcharoticks.

7. There remains another manner (not inferiour though leſs uſed than the former) of draining out the waters between the skin, *viz.* by the pricking of a Needle; which likewiſe ought cautiouſly, and minutely to be uſed, leſt a headlong and too great efflux of waters be provok'd thereby. Take an ordinary Needle (ſuch as Taylors uſe) and let it be thruſt into the skin, pricking over the place chiefly ſwelled, only ſo far that blood follow not: and ſo at one time let ſix or ſeven little holes be made, a thumbs breadth diſtant from each other; from every little hole the water will iſſue forth by drops, and ſo it will continually drop out untill all the ſwelling vaniſh about the place ſo pricked; afterwards, the next time after twelve hours, another while after 18 or 24 hours, let the ſame pricking be exerciſed in another part of the ſame thigh, or of the other; and afterwards once or twice aday in this or that member, or in both together, or in more places, let ſuch Emiſſaries of the water between the skin be excited. For in truth after this manner the hydropick illuvies may be exhauſted more plentifully and ſafely than from any other outward Chirurgery; In the mean time if the new proviſion thereof be provided againſt by inward Phyſick, the diſeaſe will be the eaſier cured. Moreover in a deſperate Dropſie life is beſt prolonged by ſuch an adminiſtration, for that the waters being exhauſted continually by thoſe outward Emiſſaries the inner inundation of life is longer protracted. Not long ſince an old man aged ſeventy years, overwhelmed with a Dropſie over his whole body, by the help of this Remedy only, remained living for many months beyond expectation, and raiſed his head above the waters.

7. *Pricking with a Needle.*

PHAR. Part. II.

The second Indication preservatory what kind of Remedies it suggests.

Forms of them.

Hitherto of the Kinds of Forms of Remedies suggested by the first Indication, *viz.* the Curative; what belongs to the other, to wit, the Preservatory, which respects the temperature and sanguifying power of the Blood to be restored, it offers Medicines of that sort which being endowed with more hot and Elastick particles, revive the active or depressed Principles of the mass of blood, or cause those consumed to be repaired, for which end Remedies commonly called Altering are wont to be prescribed under the form of an Electuary, Powder, Pills, distilled Water, Julep, Apozeme and Diet, to which also Spirits, Tinctures, Elixirs, are sometimes added, for the better efficacy. We will propound one or two Examples of each of these.

1. *Electuary.*

1. *Take of Conserve of Roman Wormwood, Scurvy-grass, the yellow Rindes of Oranges, of each two ounces, Winters-bark two drams, Species Diacurcumæ a dram and a half, of Steel prepared with Sulphur three drams, Syrup of Citron-peels what suffices to make an Electuary, the dose two drams morning and evening, drinking after a draught of the Julep, or three or four ounces of the distilled water.*

Chalybeates profit much in this Disease.

But only those endued with Sulphur.

Chalybeate Medicines notably help in this Disease, as in the green sickness of Virgins, insomuch that frequently the whole or chief scope of curing depends upon this kind of Remedy; yet we are to observe, that not all Medicines of this kind are equally convenient in these cases: for those which are chiefly in use, *viz. Salt of Steel*, or *Vitriol of Mars*, and others prepared with acids, and deprived totally of Sulphur, do not help, inasmuch as they do not promote the fermentation of the blood, but rather on the contrary fix it, being too wild or elastick. But for an Anasarca or any watery tumours, in a cachectick habit of the body, Chalybeates of that sort are given, wherein the sulphureous particles are left, and are predominant; as in the first place the Filings of Iron, and the Scales, reduced into a fine Powder, also Steel dissolved with Sulphur, and powdered. The powders of this being taken, are presently dissolved by the acid Salts within our body, whence the sulphureous metallick particles being set free, and brought into the blood, they ferment the whole mass thereof, and revive the like particles in the same, which before lay dormant, and being conjoyned therewith, they give vigour to the blood, and renew its sanguifying power being formerly depressed. Wherefore we may observe by using but a little Chalybeates of this sort, the green and yellow colour of the face is converted into a florid.

2. *Powders.*

2. *Take of the compound Powder of Aron-roots, of Winters bark, of each three drams, lesser Galangals, Cubebs, of each a dram and a half, of Steel prepared with Sulphur half an ounce, Sugar of Rosemary flowers six drams, make a Powder, divide it into twenty parts. One part is the dose, morning and evening, with a draught of the sudoriferous Decoction before prescribed.*

3. *Pills.*

3. *Take half an ounce of the gummous Extract residing after the distillation of the Elixir Vitæ of Quercetane, powder of Earth-worms two drams, lesser Galangal, Winters-bark, of each one dram and a half, Salt of Wormwood two drams, of Rust of Iron two drams and a half, Balsam of Peru one dram, Tincture of Salt of Tartar two drams, Balsamum Capivii what suffices to make a mass to be formed into small Pills, the dose half a dram evening and morning, drinking after it three ounces of the Julep or the distilled water following.*

4. *Julep.*

4. *Take of the water of Elder-flowers, of the juice of their Berries fomented, of each one pound, water of Earth-worms magistral, of Rhadish compound, of* Aqua Mirabilis, *of each two ounces, Syrup of the juice of Elder-berries two ounces, mix them and make a Julep.*

5. *Distilled water.*

5. *Take the leaves of Garden Scurvy-grass, of Hedge-Mustard, of Pepper-wort, of each six handfuls, of the Roots of Calamus Aromaticus, Galangal, of* Zedoaria, *Orris of* Florence, *of Elder, Aron, of each six ounces, Winters-bark,* Jamaica *Pepper, of each three ounces, Juniper-berries four ounces, Cloves, Ginger and Nutmegs, of each one ounce, slice and bruise them, and pour upon them eight pound of old Rhenish-Wine; distill it in common Organs, let the whole Liquor be mixt.*

6, 7. *Decoction.*

6, 7. An Anti-hydropick Decoction is described above, among the Diaphoreticks. A Diet-drink is to be taken instead of Ale, and is to be made according to the ensuing form.

Diet-drink.

Take of Shavings of Guaiacum, Sassafras, of each four ounces, Florence *Orris-roots, Calamus Aromaticus, Galangal, Enula-campane, of each one ounce and a half, of Juniper and Bay-berries, of each two ounces, Anniseeds, Carue, Sweet-fennel, Coriander and Dill-seeds,*

ſeeds, of each one ounce, long Pepper and Cubebs, of each an ounce and a half, Cloves, Nutmegs and Ginger, of each half an ounce, Jamaica *Pepper two ounces, the dryed leaves of Sage, Wood-ſage, Calamint, Agrimonie, of each one handful, Liquoriſh four ounces ſliced and bruiſed, boyl it in four gallons of Spring-water to half, the ſtrained liquor being cold, let it be kept in glaſs Bottles for uſe; with the conſtant uſe of this drink, I have known many labouring with a deplorable Anaſarca to be made well. Among many Examples of Dropſies cured, I ſhall propound but one.* PHAR. Part. II.

An Example of the Cure of an Anaſarca Dropſie.

A certain ſtrong man of a middle age, after he had contracted an Epidemical Quartan Feavour, and being evilly handled from its beginning, had laboured with it above a year, and in the mean while had uſed an ill courſe of Diet, fell into an Anaſarca, which afterwards in a ſhort ſpace augmented hugely, by reaſon he indulged himſelf more freely to drink for quenching his thirſt (which was outragious) ſo that all his members being ſwollen from head to foot, and over the very Abdomen it ſelf, he could not turn in his bed from ſide to ſide without help.

The Prognoſtick and Cure of the Diſeaſe.

When I firſt viſited this man, and deſpairing of a Cure (as the Phyſitian in *Celſus* lib. 3. Chap. 21. *who denyed that any intemperate Hydropick could poſſibly be cured*) I immediately affirmed this Prognoſtick, *That he would dye in a ſhort time unleſs he abſtained from drink.* Whereunto he replying, profeſt he would not drink in a weeks ſpace, provided he might be helped; and indeed did as he ſaid, although being very thirſty, for ſix or ſeven days he ſcarce took any liquid thing in his mouth, but what was Medicine; and during that time, when in the mean while he took Hydragogues, Catharticks and Diureticks, and any other things preſcribed carefully, he became much better, and afterwards the method (before deſcribed) ſomewhile being adminiſtred, he was reſtored to his entire health, and even now though five years ſince lives and continues ſound.

The Concluſion of this Section.

There remain certain other ſplanchnical Affections, touching the Remedies whereof, according to the enſuing method, we ſhould here have treated, notwithſtanding I have performed this task already for the moſt part under other titles; for as is above intimated, Remedies which concern the Kidnies we have for the moſt part unfolded under the rank of Diureticks, and thoſe which concern the Stomach and Guts, under that of Vomits and Purges; what relates to the Spleen we have finiſhed in the Hypochondriac Pathologie; and what to the Womb in the Hyſterical. As to what appertains to the Genital parts and their Diſeaſes, and help, I reſerve for another time and place; it behoves me now next of all, after treating hitherto of the inward Pharmacie, to diſcourſe ſomething of the outward, and of the Reaſon or Ætiologie of the adminiſtrations thereof, which ſhall be done in the next Section, beginning with Phlebotomie, that great Remedy.

SECT. III. CHAP. I.

Of Phlebotomie.

Phlebotomie a very general and ancient medicine.

AMong the univerſal Documents of Philoſophie, or aids of Phyſick, none either in Theory or Practice hath been more ancient or general than the ſpeculation of the Blood and letting it out by opening a Vein. As to the former we have in other places often explicated the nature and conſtitutive parts of the Blood, we have unfolded the Virtues and Energy of the ſame, and have demonſtrated that it is in truth enkindled, and that from the burning thereof the flame of animal life, as of a Lamp, doth begin and receives continuation: But as to what relates to Phlebotomie, all Authors of every age have made mention thereof: Moreover the ſame was ever in Medicinal uſe with all Nations howſoever barbarous or rude. Neither is it a wonder, for truly Nature it ſelf in the firſt place hath taught the neceſſity, and way of that part of Chirurgery; Even the Divine Law commanding the Rite of Circumciſion, as a Symbol thereof, ſeems to intimate that the innate impurities of Humane Nature ought to be purged in ſome manner by letting out the blood.

That

PHAR. Part. II.

That we may methodically diſcourſe of this great Remedie, we ought to conſider, by what means, alſo for what cauſes and ends, the letting of blood either happens ſpontaneouſly to Nature, or is indicated by the Phyſitian; then ſecondly we will annex the chief effects of this Evacuation, as well good as bad, whether advantageous or diſadvantageous, and together propound certain Rules and Cautions to be obſerved, but due adminiſtration of Phlebotomie.

Nature ſhews it by Hæmorrhagies.

Critical either with or without a feaver.

As to the former, ſpontaneous Hæmorrhagies (which ſuggeſt the uſe of Phlebotomy) whereas they are manifold and of diverſe kinds, they are uſually reduced to theſe two heads or ranks: to wit, they are denominated either critical, Nature endeavouring ſomething good and wholſome; or ſymptomatical, which for the moſt part happen, ſhe being dejected from her government, and being altogether out of order. The bloody eruptions of the former kind are again diſtinguiſhed; that they are either raiſed without a Feaver, and are either periodical, which happen often at ſet ſeaſons, as the Flowers in Women, and the Hemorrhoids in ſome, and in others the ſolemn or otherwiſe accuſtomed opening of the Noſtrils; which very often ſucceed according to the great changes of the Year, or alterations of the Air: or they are fleeting and uncertain, as when blood doth advantageouſly break out of thoſe places, and of many others, one while in this part, another while in that part of the body. Moreover, bloody Criſes do ſometimes happen in a Feaver, and do often put an end to it, as *Hippocrates* long ago obſerved, and is now manifeſt by very common obſervation. The blood breaks out in all theſe caſes, inaſmuch as being turgid, and above meaſure rarified within the veſſels, it deſires a larger ſpace, wherefore, unleſs ſome portion thereof give way, the whole maſs runs the hazard of being conſtipated, and as well the motion thereof to be hinderer, as the enkindling to be ſuffocated, and the temperature to be perverted.

The cauſes thereof proceed either,

For there are two chief Reaſons or Cauſes, wherefore ſuch turgeſcencies of the Blood do ariſe: inaſmuch as its liquor is as well inflammable, as fermentative.

1. From the kindling of the blood.

1. As to the former of theſe, that the Blood may be duely enkindled for the ſupporting Life, and the due exerciſe of the functions thereof, it behoves that the innate ſulphureous particles of it be proportion'd unto the Nitrous adventitious ones from the Air. Therefore as often as the Blood being very boyling and rarified, is much opened and looſened in its one conſiſtence, ſo that the Sulphur being diſſolved, is kindled in great plenty, there is a moſt frequent and painful breathing inſtituted for the drawing in of a more plentiful Nitre. Now if the Sulphur abounding in this manner, cannot be waſted by burning, nor the vital flame regulated, the next courſe immediately to diminiſh the ſulphureous fuel, is, that a certain portion of the rarified Blood have vent. From hence, not only in Feavers, but after drinking Wine, Bathings, being in the Sun, and other accidents by which the Blood grows very turgent, either an Hæmorrhagia, of its own accord ſucceeds, or there is often need to ſupply the defect of ſuch a ſpontaneous evacuation by Phlebotomie. But that ſuch kind of effuſions of Blood, whether made by Nature or Chirurgery, are commonly reported to bridle its heat or raging; really they do this only inaſmuch as they diminiſh the kindling of the blood, by withdrawing part of the ſulphureous fuel, as Oyl from a Lamp.

2. From its Fermentation.

2. But moreover in the ſecond place, the Blood inaſmuch as it is a fermentative liquor, it is apt alſo to be extravaſated. Namely, if at any time any heterogeneous thing, and not miſcible, be confounded with its liquor, it grows hot very much, like Wine in a Veſſel, and boyls up in the Veſſels to exclude that diſagreeable thing, which if it can neither ſubdue, nor turn off by Sweat, Urine, or otherwiſe, the Blood it ſelf excludes part of it ſelf as a Vehicle for carrying that matter forth, whereſoever a vent is to be found. For this reaſon, (*viz.* that any diſagreeable or indomitable thing, may be turn'd out of the maſs of blood) divers ſorts of Hemorrhagies happen, as well in feavers as without them; all which are excited by Nature for an intention of good, as alſo thoſe by which the too much enkindling of the Blood is depreſſed: But that frequently it happens otherwiſe, ought to be imputed to divers accidents and circumſtances. But for the moſt part the failure about the ſpontaneous Hemorrhagies critically inſtituted, is either in the firſt place becauſe the blood while it is boyling knows no meaſure of flowing out, and therefore being ſtirr'd into violence, it flows out too much; or ſecondly, becauſe the mouths of the veſſels once opened do not preſently cloſe again, nor are able to be ſhut; or Thirdly, becauſe Nature endeavouring an excretion of blood, doth it by places more open, but often inconvenient; as when an Hemorrhage happens through the Lungs, the Kidneys, Guts, or other Bowels which therefore paſs from a Critical into a Symptomical and often into a malignant Hemorrhage.

1. Critical Hemorrhagies ſometies turn into ſymptomatical.

Neither

PHAR. Part. II.

Neither only by theſe means, but by many other failings of Nature, or impediments, do Symptomatical Hæmorrhages happen, in all which either the Blood it ſelf, or the Veſſels containing it, or both of them together, are wont to be chiefly in fault.

2. Symptomatical Hemorrhagies ariſe, either,

1. In the firſt place, the Blood, beſides the reaſons above mentioned, (to wit, foraſmuch as it becomes inflammable or fermentable above meaſure) is apt alſo to be extravaſated, becauſe either its liquor being empoiſoned, or otherwiſe corrupted, cannot retain its due mixture, but being apt to coagulate or putrifie, divides it ſelf into parts; and whilſt ſome of them being here and there planted, ſending forth ſpots, wheals, and other brands of Malignity, do diſcolour the Fleſh and the Skin, and obſtruct the proper paſſages; others otherwiſe running out and breaking forth whereſoever there is a vent found, do produce bloody Excretions in divers places, as is commonly diſcerned in the Plague, Small-pox, Meaſles, and Malignant Feavers; yea perhaps this in ſome meaſure is the reaſon why in ſcorbutick Diſtempers, as ſpots and marks, ſo alſo Hæmorrhages are ſo familiar.

Firſt by the fault of the blood.

Secondly, The fault of the Veſſels, for that they are ill formed.

2. Secondly, The Veſſels bringing Blood being faulty many and divers ways, but chiefly in theſe three, do appear the cauſe of a ſymptomatical Hæmorrhage, *viz.* In the firſt place, if perhaps any where ſome of them are obſtructed, as often as the blood aſſumes a more rapid motion, either in the ſame place, or in the contiguous parts, and alſo ſometimes in remote parts it is conſtrained to burſt out. Frequently from ſuch a cauſe an Hæmoptoe proceeds; moreover Spitting of blood, and the Hæmorrhage of the Noſtrils do often follow the ſuppreſſion of the Terms and Hemorrhoids. Secondly, the little mouths of the veſſels (by reaſon of the fleſhy Fibres being looſned or reſolved by which they are clos'd) ſometimes are ill formed, ſo that when the ends of the Arteries do gape too much, the little mouths of the veins do cloſe. By reaſon of this affection, Scorbutical and Cachectical perſons, are found obnoxious to Hæmorrhagies, as we have remarkt in another place. But Thirdly, it frequently comes to paſs that the Veſſels, being ſo evilly formed, are alſo convulſively affected, and ſo the morbific cauſe being as it were doubled, this evil is much encreaſed, inſomuch that the muſcular fibres of the Veſſels being inordinately contracted, cauſe ſudden and violent fluxes of the blood, one while towards the upper parts, another while towards the lower; and ſo their little mouths being open in the mean time, they provoke prodigious Hæmorrhagies. For I have obſerved in ſome perſons, when the current of blood was ſmall enough, with a ſmall and weak pulſe, the Convulſions of the Veſſels generated in ſome place, and propagated under the likeneſs of wind running to and fro in the body, to drive more impetuouſly the blood, however ſlow of it ſelf, and to conſtrain it into violent eruptions; and in caſes of this ſort, when Phlebotomies and Medicines refrigerating and tempering the blood have not at all profited, the greateſt relief hath been found from Narcoticks, Antiſpaſmodicks and Ligatures.

Thirdly, Foraſmuch as they are convulſively affected.

3. From the blood and veſſels being both in fault.

3. Thirdly, If perhaps it ſhall happen that theſe faults of the Blood and Veſſels are complicated, and put forth their miſchiefs joyntly at once; from thence it will be of neceſſity that this evil will be more intenſe, and more frequent and prodigious Hæmorrhagies will be raiſed: the reaſons of which as they appear plain enough by what goes before, it will be neither neceſſary nor ſeaſonable here longer to dwell upon explicating of them; but rather whereas we have deſigned hitherto the acts of Nature, about ſpontaneous effuſion of Blood and its courſes both rightly inſtituted, and alſo wrongfully and evilly conſtrained; now it behoves us next to declare, how far Art (for the moſt part the Ape of Nature, and ſometimes Miſtriſs or Moderatrix thereof,) can act likewiſe well, or better about letting of blood, and how ſometimes it is wont to ſucceed worſe.

Emiſſion of the Blood procured by art.

We advertiſe of theſe things in general, that a Phyſitian imitates Nature in ſome caſes of letting blood, exceeds her in other caſes, and frequently regulates and reduces her when acting amiſs. Moreover, there are ſome caſes wherein nature excells far the efficacy of Art concerning bloody excretions; briefly of each of theſe.

1. It either imitates Nature.

Therefore in the firſt place, in whatever affects, ſpontaneous Hæmorrhagies are wont to bring help, when theſe are wanting, Phyſick the Handmaid of Nature rightly ſubſtitutes Phlebotomie. Therefore, if perchance the Blood be immoderately kindled by reaſon of its Sulphur being too much looſned and advanc'd, by breathing a vein, what is ſuperfluous of that inflammable fuel will flow out, as alſo the immoderate turgeſcency of Blood, by reaſon of ſomewhat untamable being mixed with it, will be allay'd by this courſe. Wherefore letting of blood is advantageouſly adminiſtred, as well againſt continual Feavers, which proceed from the former cauſe, as intermittent Feavers, whoſe fits proceed from the latter cauſe. Alſo in like manner, as often as an accuſtomed evacuation being ſuppreſſed, or a humour driven back from the

PHAR. Part. II.

the outward parts, or a ſudden ſtoppage of the pores, or if a Surfeit, drinking of Wine, or other accidents of this nature, cauſe a turgeſcency of blood (inaſmuch as they daſh heterogeneous particles againſt it) Phlebotomie is uſually the moſt ready Remedy.

2. Or excells and regulates it.

Secondly, Phyſick in Blood-letting, not only imitates Nature, but often excells it; and alſo ſuccours her being weakned, and reduces her often erring. For if at any time the blood ſtruck with violence, ruſhes in a heap againſt any part, and either preſently breaks out in the ſame place, or abundantly gathered together engenders an Inflammation, a vein being pierced in a remote place, ſtops that preternatural tendency of the blood, and frequently carries away the bleeding, or inflammation. Wherefore, in a Pleuriſie, a Squinancy, a Peripneumonie, in ſpitting or vomiting of blood, when Nature is vanquiſhed, or being outragious, ſeems to caſt violent hands upon her ſelf, Chirurgery recalling the blood to another part, and ſending it out, reſtores the matter that was almoſt deſperate.

Moreover Phyſick frequently reſtrains or reduces Nature, when too prodigal or prevaricating in pouring out of the blood: for in truth all immoderate Hæmorrhagies do want Bridles, not Spurs. But in the Plague, Small-pox and Meaſles broke out, and in Malignant Feavers, ſometimes the blood ſpontaneouſly flowing out, portends for the moſt part evil; therefore in thoſe affects Styptic Remedies, or things ſtopping the eruption of Blood, are more convenient than breathing of a Vein.

3. Or Art outdone by Nature.

Thirdly, Notwithſtanding on the contrary there are caſes of ſhedding blood by Nature, which phyſick can no way imitate, neither if they chance to fail, can be ſupplyed by Phlebotomy. In Feavers about the Criſis of the Diſeaſe, to wit, after the digeſtion of the matter, that is to ſay, the preparation for Excretion, ſpontaneous Hæmorrhagies if coming in time, do far excell any Phlebotomie which none knows the beſt ſeaſon of; Moreover, the Fluxes of the Terms and Hæmorrhoids happening by Natures inſtinct, are more advantageous than the miſſion of blood provok'd by Art in any of thoſe places.

Phlebotomy and ſpontaneous Hemorrhagies differ as to the ſubject and matter.

Between Phlebotomie and ſpontaneous Hæmorrhagies, there is yet a notable difference, (although not of great moment in Phyſical practice) *viz.* both as to the Subject and Matter of either of them; for in this the blood being florid, and throughly Scarlet, doth for the moſt part only flow out of the Arteries, but in the other Evacuation the Blood being of a black purple with a Scarlet Cream, is only drawn out of the vein. Whence the ſtream of Blood, which is one within all the veſſels and throughout continuous, acquires ſuch a diverſe kind of appearance, ſeeing we have ſhewed in another place, it is not our preſent purpoſe to make any further ſearch into this Ætiologie; becauſe it concerns not much to the curing any diſtemper, out of what veſſel the blood be let, provided it flow out largely: But that the ancients do in ſome caſes commend Arteriotomie, and prefer it to an inciſion of a vein, the Circulation of Blood not being then known, we have elſewhere diſcourſed how well it may be done.

The uſe and effects of Phlebotomy.

Hitherto of Phlebotomie compared with a ſpontaneous Hæmorrhage; now our next buſineſs is, to deſcribe the uſe and effects thereof, as well good as bad, in Phyſical practice. Wherefore we will firſt ſhew in general what alteration of the maſs of Blood this Evacuation brings; then what diſeaſes it more immediately reſpects, either of the whole body, or its particular parts.

How it affects and alters the Blood.

About the former, it is obvious enough that the blood is altered by breathing a vein, both as to its quantity and temperament, and as to its diſpoſition and motion.

1. Diminiſhes its quantity.

The firſt and moſt common Indication of Phlebotomie, is, that the plenty of blood be diminiſhed by this Adminiſtration. And truly this is a vulgar Remedy, to remove or provide againſt a Plethora. Any one, though of the vulgar ſort, growing to a full habit of body, lets blood without the advice of a Phyſitian; Moreover Ruſticks and Country men for healths ſake, once or twice in a year cauſe blood to be drawn from themſelves and their Beaſts. But although this cuſtom is grown ſo much in uſe with ſome prodigal of their blood, that they breath a Vein on the ſmalleſt occaſion, and ſometimes without any manifeſt cauſe; notwithſtanding we may find many others no leſs obſtinate againſt this cuſtome, inſomuch that for no cauſe will they loſe any blood, unleſs the greateſt neceſſities be urgent.

Emiſſion of the Blood is not to be either too prodigally, or too ſlenderly made.

The reaſons of the former hinted at.

Upon this matter (whereas Arguments are alleadged on either part,) that I may in few words determine what ſeems fit to be ordained, in the firſt place it is requiſite we grant, that letting blood is convenient againſt a Plethora either made, or beginning: for by no other Remedy are the evils of that Affection wont to be better removed or provided againſt. Notwithſtanding, the neceſſity of this evacuation ought to be declined as much as may be; becauſe from thence (as we have intimated elſewhere) the blood becomes more ſulphureous, and leſs ſalt, and for that reaſon it moſt

moſt commonly diſpoſes all men to be feaveriſh and to be fat. Moreover the Great Remedy Blood-letting, if it be proſtituted to every little occaſion, becomes leſs efficacious to any grand affections when need requires: To which we may add, that according to the vulgar obſervation, by how much the more familiarly any one uſes Phlebotomy, he will the more frequently ſtand in need of it: for blood being emitted to avoid a Plethora, the reſt of the maſs will the ſooner riſe to a Plethora: far otherwiſe than is the opinion of ſome, who dread leſt the ſtore of blood be conſumed by frequent Phlebotomy; for that on the contrary by this means the quantity is more encreaſed, although the Craſis be the worſer: for ſo the blood having loſt much of its balſamick Salt, and preſervative againſt putrefaction, inſtead thereof, is filled with a pinguifying and more fiery Sulphur.

2. Phlebotomie amends the mixture of the Blood.

Secondly, Phlebotomy doth frequently correct the mixture and temperament of the blood in a manifold reſpect. For in the firſt place, if any thing heterogeneous be confounded with its maſs, which cannot be rightly digeſted, nor eaſily excerned and ſent away, a Vein being opened, the blood flowing out conveys frequently much of the portion of that matter forth with it, inſomuch that the reſt may be either ſubdued or expell'd. For the orifice of a veſſel being opened, preſently the blood fermenting gathers together the extraneous particles as much as poſſible, and excludes that portion of it ſelf wherein many of them are heaped up: From hence we may obſerve the blood flowing out firſt and laſt to be well enough, when that emitted between appears corrupt. Alſo ſecondly, the blood declining from its temperament, is frequently reſtored by Phlebotomy. For when the maſs thereof by the Sulphur or fixt Salt, or both together being exalted, ſhall degenerate into ſharp Salt, or ſaline-ſulphureouſneſs, a portion of the blood being withdrawn, immediately a new fermentation thereof ariſes, and very often there is a tranſpoſition made of all the particles of that ſort, that afterwards the Spirits may a little emerge with the volatile Salt, and recover their dominion, the Sulphur, and fixt Salt (as is fitting) being ſubdued. For this reaſon it is that letting Blood doth not only confer great help in Feavers, but alſo in the Scurvy, Jaundies, and beginning Conſumption; for the blood after the Veſſels are emptyed, like the Stomach disburden'd, doth better digeſt and aſſimilate any humours ingeſted, and the more eaſily throws off and ſeparates whatever is heterogeneous.

It reſtores its temper.

Some diſtempers of the blood admit not Phlebotomy.

But if the mixture of Blood begins to be much looſned and become very bad, as in the Plague and malignant Feavers, we muſt altogether abſtain from Phlebotomy; for the blood being withdrawn, the ſtore of Spirits (whoſe only part it is to vindicate the maſs of blood from putrefaction and corruption) is diminiſhed, ſo that immediately all things tend to a deadly diſſolution. Moreovor, if the Dyſcraſie of the blood ſhall be of that manner, that the more noble Principles, to wit, the Spirit, the volatile Salt and Sulphur, being depreſſed or conſumed, the watery and earthy particles predominate, the blood ought not to be ſent out, but preſerved even as the treaſure of life; for when the abundance of Spirits are ſo ſmall, any loſs of them doth cauſe all the functions to ſtagger, and gives way to the diſeaſe; wherefore in a Dropſie, Cachexia, Conſumption, and other Diſtempers, where the active Principles are greatly depreſſed, the opening a vein is almoſt the ſame thing as cutting a mans throat.

In ſome caſes about Phlebotomy it is very doubtful.

In the before mentioned caſes, where the temperament of blood is reſpected, it is eaſie to determine, whether Phlebotomy be convenient or not; but in ſome others, as in a putrid continual feaver, when upon this hinge Life and Death are turned, there is need of the greateſt deliberation: and ſo much the rather becauſe the event of the Diſeaſe, and the ſucceſs of all the accidents in its whole courſe, whether good or bad, is uſually imputed to Blood-letting, or its omiſſion: and from hence it is, that Phyſitians being ſolicitous to preſerve their own repute, do chiefly raiſe doubts in their conſultations of this matter. But truly in this difficult knot that we may not be led by the rumour of the vulgar (as it chances to happen) one while approving, another while condemning Phlebotomy, but with more certain advice: we muſt conſider the ſtate of the Blood, the tendency of the morbific matter, and the ſtrength of Nature. Firſt as to the former, if in a putrid Feaver, the blood very much growing hot ſhall raiſe a great heat, with thirſt, watchings, and burning of the Jaws, and no eruption of abundant ſweat, nor puſhes appear, or is ſuddenly expected, opening of a vein is ſo clearly demonſtrated, that it is a wickedneſs to omit it; but on the contrary, if in a languid body, a ſlow and a remiſs Feaver, but continual, ariſes, with a weak Pulſe, let Blood-letting be ſpared, and the cleanſing thereof be procured by breathing Sweats, Urine, and bliſtering. Notwithſtanding, in a middle ſtate of Blood, and of a Feaver, Phlebotomy almoſt indifferent in it ſelf, is determined by other things. Therefore ſecondly we muſt weigh the tendency or flux of the morbific matter, which

And chiefly in a continual putrid Feaver.

How the doubt is to be determined.

PHAR. Part. II.

if it remain dull in the maſs of blood, and unfit to be ſeparated, and ſo (as it is frequently wont to be) inſtead of a Criſis, a tranſlation towards the head be made, and threaten the brain and nervous ſtock, the cutting of a vein ought ſeaſonably to be adminiſtred, whereby theſe evils may be provided againſt. Notwithſtanding, if that this matter being ſoon raiſed into a rage, and either ruſhing inwardly to the bowels of the nether Belly, provokes a huge Vomiting, or Dyſenterical affections, or being driven outwardly, ſeems to be about to bring the Small-pox, Meaſles, and other puſhes, every ſuch force of Nature, if good, ought not to be diſturbed, if evil, not to be made worſe by Phlebotomy; for in theſe caſes it is not only dangerous to let blood, but alſo very ſcandalous. Thirdly, about Phlebotomy to be adminiſtred in a doubtful caſe, we are to take heed to the ſtrength of the Patient; for in a healthful Conſtitution, a vigorous Age, the commencing of a Diſeaſe, and the functions both vital and animal being yet in a florid or indifferent eſtate, we may confidently preſcribe letting of blood, unleſs ſomething indicates the contrary. Notwithſtanding, when it is otherwiſe, as to thoſe conditions, we may not raſhly proceed to that Evacuation.

Thirdly, Phlebotomy corrects or ſtays the inordinate motions of the Blood.

Thirdly, the inordinate motions of the Blood, when being very much moved, as it were with fury, it either ruſhes impetuouſly one while into theſe parts, another while into thoſe, or tranferrs the noxious matter, are beſt reſtrained or reduced by Phlebotomy; wherefore in great Cephalalgies, in all ſoporiferous or convulſive invaſions, for Catarrhs, Opthalmia's, and a Cough, Aſthma, fits of the Gout, and Stone, or Phlegmons, Eryſipelas's, alſo for many other Diſtempers, raiſed by the flowings of the Blood or Serum, an inciſion of the vein is commonly preſcribed, and indeed for the moſt part as with good ſucceſs, ſo altho upon right Reaſon; for the Veſſels being emptyed, the blood having obtained a more free ſpace, is circulated pleaſantly and undiſturbedly, beſides, whatever is extravaſated of the Blood or Serum, is wont to be ſuckt up again and reduced into its courſe.

What Diſeaſes, and of what parts Blood-letting chiefly reſpects.

The effects as well good as bad being thus ſhewn, which happen to the blood in the manifold ſtate thereof, by Phlebotomy, we will next make ſtrict examination what Diſeaſes chiefly, either of the whole body, or of any private Region that kind of Remedy doth more immediately regard. And firſt as to what relates to general Diſtempers, it is commonly enough known, that letting blood is indicated by a hot and dry temperament, and interdicted by a moiſt and cold. It is uſually propounded in every Feaver, but never in a Dropſie. Moreover, if we conſider particular Diſeaſes, there is no region or part of the Body, but as they rejoyce in the influence of vital as well as nutritious blood (as long as it is well) ſo as often as it is diſturbed in any place, or reaches out any diſagreeable or provocative thing, in place of benign Juice, it requires avocation and a letting out thereof. If I ſhould take notice of every ſingle caſe of this Indication, we ſhould here rehearſe almoſt the whole Pathologie of the humane body. An aking Head, a Brain oppreſs'd with blood, or overflowed with Serum (whence ſpring a world of evils) burning of the eyes, inflammation of the face, mouth and throat, all the diſeaſes of the Breaſt and Præcordia, (in as much as the diſorder of Blood affords a riſe or fuel to each of theſe) likewiſe obſtructions or inflammatory affections of the Liver, Spleen, and other Bowels; moreover, as a Plethora, and Athletick habit of the whole body, ſo alſo the tumours of each member, painful and convulſive paſſions, ſeem to accuſe the blood as Author of all the evil, and require its ſending out, as a certain kind of revenge.

After Phlebotomy being indicated theſe four things following ought to be conſidered. Firſt the place from whence Blood is to be taken.

In theſe and very many other diſtempers, if at any time Bleeding be clearly indicated, before it be performed four things ought to be conſidered, *viz.* In what place, by what manner and inſtrument, at what ſeaſon, and in what quantity the blood ought to be taken away.

Firſt, as to the former, although according to the Laws of the Circulation of the Blood, as often as the maſs ſhould be diminiſhed, it differs little from what veſſel a part thereof be taken, provided it be large enough; notwithſtanding, for that beſides a general evacuation of the blood, ſometimes a particular one properly called Derivation (as when the blood is to be brought out of a private place where it is accumulated) and moreover a Revulſion, when it is to be called into this or that part, are intended; for that reaſon, in a humane Body there are appointed as it were various Boundaries, out of which, now by this, now by that, or by another vein, the blood may be emitted as occaſion is given, and for the uſes chiefly requiſite.

If therefore at any time an univerſal Evacuation of the blood be indicated, the median vein of the Arm is beſt to be opened, for this is eaſily opened being large enough, and whereas it equally flows from the whole body to the orifice thereof being open enough, by whoſe more free efflux not only a Plethora is taken away, but the greater veſſels being every where emptyed after this manner, the blood ſtagnating in any place,

place is brought into motion, and being extravasated is again swallowed up into the veins; wherefore, in great distempers when the blood being heaped in the Brain, or Præcordia, does threaten sudden destruction, the best way not only of general Evacuation, but of a Revulsion, is to send the blood by a full current out of the vein of the Arm, being largely open'd. *In some cases from the Arm.*

But if without any great Plethora the blood ought to be evacuated from the whole, and pulled back from the upper part of the body towards the inferiour, as in the suppression of the menstrual Flux or Hemorrhoids, it will be rather fit to bleed in the Foot or sedentary vessels by Leeches. But if after the blood being evacuated from the whole, it be also to be derived from any private part where it is accumulated, let its drawing off be near the place affected. Hence in Cephalick Diseases, we open the vein of the Forehead, of the Temples, or of the Throat. To cure Tumours, or pains raised in the Joynts, we cut a vessel either beneath or near them, or draw out the blood by Cupping-glasses or Leeches. In like manner in distempers of the Thorax and nether Belly, either Cupping-glasses are applyed to the region suffering, or Leeches to the sedentary vessels. *In others from the vein of the Forehead, Temples or Throat.*

But that some Vessels are reported to bear a peculiar respect to certain Bowels, and that they ought to be lanced in their distempers; *viz.* such are the outward brachial vein, which is said to respect the head, and the inward the Liver, also the outer vein of the Hand tending to the Ring-finger, which is said to respect the Spleen, and for that cause this is called the Salvatella, and the former of them the Cephalick, and the other the Jecorary; all this is meerly a vulgar error, which being propt by no reason or Anatomical observation, I am ignorant whence it took its origine; Therefore as soon as it is agreed on to cut a vein and its place, let a large Vessel be chosen, and very conspicuous, that it may the more easily be opened; and being remote from an Arterie, Nerve, and Tendon, may be the more securely lanced; wherefore in the Arm the median vein is commonly chosen, although the Cephalick being less environed with other Vessels, is the more safely opened. *The Cephalic Vein of the Arm, the Liver Vein, or the Salvatella erroneously so called.*

The Jugular Vein is almost always opened as often as blood is let in Beasts, it is a wonder it hath not obtained the same Custom in Man, when the large and eminent Pipe hereof may most easily and safely here be cut, because it neither hath an Arterie for its companion, and lies a great way from any Nerve. Moreover, from this Vessel as from any other whatsoever opened, an universal evacuation of blood is made from the whole body, and together the best derivation thereof from the head, so that all the stagnations or aggestions of the blood and Serum are discharged thence. *The Jugular Vein is most safely opened.*

Concerning Vessels in the foot or the hand there is no great reason of choice, but take the Vein which chiefly swells: it matters little concerning the Place, unless that if incision be made above, or near the Ankle, there is great care to be taken lest a Tendon be hurt, which sometimes by unskilful or rash Chyrurgeons happens to the damage of the Patient. Moreover, let care be taken lest a Vein be cut near its Anastomosis with an Artery, for if this be committed, the blood being entirely Scarlet, will impetuously skip out, and the flux thereof is not easily stayed, nor the orifice of the vessel soon stopt. *Of Veins in the hand or feet.*

The chief places being thus designed of letting forth the blood, and the choice of the Vessels being shewed, we ought next to treat of the Manner or Instruments by which blood is drawn out; which is used to be done either by a Lancet, in cutting the Vein, or by suction by Leeches, or by Cupping-glasses after Scarification. But there is no need of discoursing these, because each of these parts of Chyrurgery are every where in familiar use by Quacks, Barbers and Women, and all things relating to them so commonly known, as a man his own house; wherefore we will speak but one word. *We ought to consider by what means or by what instrument the Blood ought to be drawn forth.*

Helmont of late, and still certain followers of him, Pseudochymists and Fanaticks, have ejected Bleeding out of all Physick, because they think this evacuation to be a great injury to nature, (which being aided either by her own strength, or by their Panacea's, they will have to overcome every offensive thing of her self;) Surely, this is no less ridiculous a thing than that long since *Chrysippus*, *Apæmantes*, *Strato*, and some others, (as *Galen* reports) damn'd this Remedy, because a Vein is difficultly known from an Artery. Truly it is manifest enough by sad experience, that in cutting a vein sometimes an Artery hath been pierced; whence either death or loss of the member sometimes ensues: the reason whereof is, not as is commonly alleadged, that the coats of an Artery being more nervous or membranous than the coats of a Vein, can scarcely or not at all be healed, when in truth that Vessel is endowed with more and thicker fleshy fibres; but the cause is, that an Artery like the Heart it self, ought incessantly to shake and beat, the fibres thereof repeating perpetual turns of Systole and Diastole; wherefore, a little hole being made in its *Some of the Ancients as well as Moderns have ridiculously exclaimed against letting of Blood.* *Wherefore in opening a Vein the pricking of an Artery is so dangerous.*

PHAR. Part. II.

Pipe for the moſt part remains uncurable by reaſon of the continual motion of the Veſſel, and the efflux of blood. It is otherwiſe in a Vein whoſe opening is immediately ſtopt of its own accord; for but little of contractive work lies in its Coats, yea this only, that its fibres being lightly opened as occaſion ſerves, the blood flowing back of its own accord, is gently moved forwards; and after Phlebotomy, the veſſel being empty, they are permitted to be quiet, ſo that in the mean time the little hole made by inciſion is eaſily glewed together. Wherever Phyſitian or Patient do dread the opening of a vein to be adminiſtred, drawing of blood by Leeches or Cupping-glaſſes, will aptly enough and with like advantage ſupply the defect hereof. Moreover theſe adminiſtrations to remove the conjunct cauſe of a diſeaſe, where there is need rather of partial than general Evacuation or Derivation, are frequently preferr'd to Blood-letting it ſelf. There is no need to dwell longer on explicating the manner and reaſon of the effects of either of theſe operations, commonly enough known, but proceeding to other things, we will next throughly weigh the Time and Quantity of letting Blood.

Thirdly, The Time of letting Blood comes into conſideration.

The opportunity of letting blood is often of ſo great moment, that whereas this Evacuation ſucceeds well at one time, at another it highly prejudices: But there are diverſe reſpects of time to be conſidered about the due performance of Blood-letting, but chiefly theſe four: The Time of the Diſeaſe, the Age, the Year, and Day: The firſt concerns chiefly the Cure of the Patient, the others the Preſervation of him.

1. *In reſpect of the Diſeaſe.*

Firſt therefore if blood ought to be let in any Diſeaſe, it will be chiefly ſeaſonable about the beginning or encreaſe thereof, but not at all or very cautiouſly in the ſtate or declination. For at that time whilſt Nature is buſied, endeavouring a Criſis, ſo that the Spirits are in great labour, and the blood ferments very much, that great endeavour of it ought not to be diſturbed; and in the height of the diſeaſe, either Nature being Conquereſs doth not want ſuch a relief, or being ſubdued will not endure ſuch an Evacuation.

2. *In reſpect of age.*

Secondly, If at any time for preſervation it be deliberated touching letting blood, Infants, Boys, and Old men, by the Cuſtom of all Nations obtain an exemption; alſo this evacuation was wont to be interdicted to pregnant Women, but now moſt commonly preſcribed. Men of a vigorous Conſtitution and middle Age, do well enough endure Phlebotomy, and oftentimes want it. Notwithſtanding the firſt and ſecond time it ought not be done without great occaſion, for that being once begun and afterwards repeated, it will ſoon proceed into an inevitable Cuſtom.

3. *In reſpect of the Year and its parts.*

Thirdly, Hence they who uſed to let blood Spring and Autumn, afterwards cannot omit this evacuation without hazard. But to whom it will be either profitable or neceſſary to breath a Vein once or twice a year, the chief ſeaſonable times will be in the beginning of Spring and Autumn, *viz.* when the Blood being prone to ferment anew, is in danger to change its Craſis. Phlebotomy ſeaſonably adminiſtred, provides leſt the Sulphur and Salts being exalted, it ſhould contract a feveriſh, ſcorbutical or other peccant diſtemper; likewiſe, leſt ſuffering a flux, it ſhould pour forth the ſerous Recrements, and other Feculencies upon the Brain, the Lungs or Bowels of the nether belly. About the Solſtices, when our bodies are very cold, or hot, the blood, as the juice of all Vegetables, conſiſting in a more fixt ſtate, and unapt to ſwell up, ought not to be let out, unleſs upon ſome urgent cauſe.

The Aſpect of the Moon and Stars are here of no moment.

But whereas ſome preciſely, or rather ridiculouſly, obſerve about Phlebotomy, (even as the Countrey-men about Gelding Cattle,) the poſition of the Heavens, and the Aſpects of Moon and Stars, it appears altogether frivolous; and for that chiefly is this Cuſtom condemned, inaſmuch as counterfeit Aſtrologers have a Figure in their Almanacks wherein every ſign of the Zodiack, is allotted to every particular member of our bodies; and for that cauſe, under what ſign the Moon is converſant, they forbid blood to be drawn from the reſpective part of man. They who obſerve without reaſon the Heavens, do err (as the ſaying is) the whole compaſs of the Heavens. Moreover, this vulgar error is not only abſurd, but frequently malevolent, inaſmuch as many of the common people will abſtain from Phlebotomy whatever indication makes for the ſame, if (as they ſay) the Sign be in the place of lettting blood.

4. *The time of the day about letting of Blood.*

Fourthly, As to what relates to the time of the Day, in acute Diſeaſes when a Phyſitian is ſent for, and there be indication for Phlebotomy immediately to be performed, after the body is prepared, he may preſcribe that operation any hour in day or night; but otherwiſe, if any interval may be allowed, then breathing a Vein rather is to be celebrated in a morning when the Stomach is faſting, the veſſels emptied by ſweat in the night, the ſtream of blood being quieteſt, and appearing free from any ſerous filth. Yea although neceſſity urge, it may be deferr'd a little until the new

Juice

Juice of things eaten be passed into the blood; for the vessels being emptied will not only snatch the crude Chyle into themselves, but frequently what is disagreeable or unproportionate into the blood, whence not only its motion is disordered, but also the vital flame runs the hazard of being extinct. I have known some by Phlebotomy adminiſtred presently after plentiful Drinking, or pouring in of vinous liquors, to have fallen into dreadful swounings away, which have lasted very long, until the vital spirit being almost overwhelmed recovered it self again.

5. The Quantity of the Blood to be taken away ought to be considered.

Moreover in the fifth place, the opening the vein being indicated, and its time appointed, there remains still no little consideration to be had, what Quantity of blood is to be let out, in which point there is most commonly a fault committed, while some being too audacious, and others no less timerous, they affix those bounds on this or that side of which for the most part consists the Right. For that I may omit those who scarcely or not at all admit of Phlebotomy (as I have before hinted) so I cannot easily assent to their practice who fear not to draw blood to swounings: Besides, an error of no light moment is committed within the moderate bounds, while in some cases blood is drawn by too sparing a hand, and in others with too free. In a burning Feaver, Pleurisie, Peripneumonia, Squinancy, Frenzie, Apoplexie, and other great diseases, that have their origine from a turgescency or phlegmonic incursion of the blood, a sparing Phlebotomy doth always more prejudice than advantage. For besides that it doth not remove the antecedent cause of the disease, to wit, the Plethora, it further causes the conjunct cause, *viz.* the inflammation and bursting out of the blood to be augmented. For truly it is a constant observation, that upon blood too sparingly drawn, the whole mass doth boyl up more notably, and doth acquire a new flux into the part affected; the reason of which is, that in a great Plethora many portions both of the Blood and Serum being thrust forward into recesses and strait places, are there constrained to abide; which, after the Vessels being a very little emptied, do impetuously regurgitate into the mass of blood, and do much disturb it, and force it more impetuously to and fro. Wherefore also in this respect the vessels ought to be very much emptied, *viz.* that besides freeing the former Juice from straitness, also space may be given to the Juice reduced from exile, which otherwise being not congruous, coming upon the blood, troubles it, and provokes it into effervescencies and eruptions. From hence we may observe, that almost all men grow more hot presently after Phlebotomy, and yet the blood being sufficiently evacuated, a little after they enjoy a more temperate condition.

Too much Phlebotomy to be avoided.

But a more sparé Bleeding often hurts and fixs a feavour.

The Reason of which is declared.

But as a slender withdrawing of blood in some cases is not only vain, but is performed with prejudice, so in other cases too much effusion is rarely committed scot-free, and sometimes brings notable detriment of health. For when either strength languishes, or the body labours under a notorious Cachexia, we must spare Blood-letting, and its taking away is either prohibited, or being indicated by some accident, is allowed but in a small quantity. Wherefore in men endowed with a weak, tender and cold Constitution, and in consumptive persons, those affected with a long or malignant Feaver, also in Hydropicks or Cacochymicks a vein is not rashly to be breathed, at least if it be, much blood is not suffered to be taken away. It will be an impossible thing to prescribe general Rules, according to the particular cases of every individual person, whereby the quantity or letting Blood may be exactly proportion'd according to the strength of the Disease and the ability of the Patient; but let this be left to the judgment of the prudent Physitian present, and let his Commands be ever exactly observed; And let not (as it every where is) such leave be given to Quacks, Empiricks and Barbers to play with humane life, who every where rashly and wickedly use Phlebotomy; and if the blood spring more freely and appear discolour'd, therefore bragging of the vessel being well pierc'd, they say it must be let out more plentifully, because it appears bad, when oftentimes on the contrary it ought to be spared.

In some cases the mission of Blood must be altogether avoided.

As soon as the Quantity of Blood to be taken away is determined, our next care ought to be, that a more large orifice being made, the blood equally mixt may flow out as soon as may be; for otherwise, if it go out from a small hole, or drop by drop, or with a little stream, the mass of blood fermenting will separate into parts, and what is more subtile and spirituous will burst out, the thicker and feculent remaining behind. Hence it is to be observed, that the blood being let out of a large orifice with a more full stream, if it be a little stopt with the finger clapt on it, and a little after suffered to flow out, the blood going out the second time becomes much purer and brighter than the former, because in the interval of flowing, the more subtile particles being unfolded from the thicker, and accumulated together, have prepared themselves to fly away. Wherefore, if *Hippocrates*'s Precept shall be observed, *viz.* to let

Phlebotomy ought ever to be done with a large orifice.

PHAR. Part. II.

let it run to the change of its Colour, it behoves us to procure that it ſpring out quickly, with a full and not interrupted ſtream. Beſides all this, as to what appertains to the alteration of the blood let out, and cold, and to the inſpection and the judgment thereof, for that we have often diſcourſed it in other places, we now paſs it by, haſtening to other things; and now the thread of Method leads us to entreat of Remedies oppoſite to Blood-letting, to wit *Iſchæmones*, that is, thoſe which are convenient to ſtop immoderate Hæmorrhagies, whether engendred by Nature or by accident.

SECT. III. CHAP. II.

Of Remedies reſtraining or ſtopping of Blood.

Every Hemorrhage is not to be ſtopt.

EVen as Art imitates Nature in letting forth the blood by Phlebotomy offending in plenty, or temperament, or in its motion, ſo it ſuccours her being diſeaſed or working wrong, by ſtopping the flux of blood whenſoever it is immoderate or hurtful. Whereas there are various and many ſpecies of an Hemorrhage, there is no need of Phyſick for them all. If perhaps a great effuſion of blood happens by a ſolution of unity, excited by an outward accident, as a wound, or ſtroke, Chirurgery ſuggeſts the manner of Adminiſtrations whereby it ſhould be reſtrained. Moreover an Hemorrhage as long as it ſhall be Critical, ought to be diſturbed by no Medicine, but left to the meer government of Nature (as long as ſhe does aright uſe her power;) and as to the Symptomatic, whileſt it is little or not much troubleſome, there is required no Phyſick: notwithſtanding there is great need of it, if at any time the Flux of blood be either immoderate, or flow out by unapt places.

But only the immoderate and inconvenient.

Eruptions of blood of this laſt kind chiefly challenge a Cure, if perhaps the blood be caſt upward by Coughing or Vomit, or downwards by ſeige, or thrown off through the Ureters. For in theſe caſes, though the quantity of the Blood excreted, be not much to be dreaded, notwithſtanding becauſe often a dangerous or mortal Ulcer enſues the ſolution of the Unity ſo made in the Lungs, or in the Stomach, Guts, or in a Vein; therefore we muſt induſtriouſly rancounter thoſe Hemorrhagies from their firſt appearance. Therefore amongſt the Diſeaſes of thoſe parts, ſuch bloody excretions are accounted; but we have already in another place delivered the Theories of Spitting Blood, and of the affection Dyſenterical, and the reaſons of healing them, ſo that there is no need to repeat them here; neither alſo to propound here a remedy for bloody Urine, for that it belongs to the Nephritic Pathology; wherefore we will paſs to thoſe Paſſions, for which by reaſon of an immoderate efflux of blood, there is great need of reſtraining Medicines.

The chief Caſes of the latter are reckoned.

And alſo of the former.

The kinds of theſe Affections are chiefly three, *viz.* Hæmorrhage of the Noſtrils, of the Flowers, and the immoderate Flux of the Hemorrhoids: The Cure of which laſt doth belong more to Chirurgery than Phyſick, and I think it beſt to referr the other to the hyſterical Pathologie. Here properly belongs to this place the blood flowing out of the Noſtrils, being the moſt general kind of paſſions of that ſort, and common to every Age, Sex, and Temperament, ſo that from the Diagnoſtick and Therapeutick of it duly aſſign'd, the uſes and efficacies of Medicines ſtopping blood will beſt appear: for what we proffer for the unfolding the Cauſes and Cure of this bloody eruption, may be accommodated unto all other dreadful Hemorrhagies.

For the preſent the Cure of the Hemorrhage of the Noſtrils is only propounded.

It is obſervable enough, that the Flux of blood from the Noſtrils doth happen to moſt men from extraordinary occaſions; for as oft as the blood, about to break out through its own turgeſcency, or through laxity of the veſſels, is apt in ſome place to make or find its way, it is, by a certain inſtinct of Nature, very often directed to the Noſtrils, as to the part moſt eaſily opened. The veſſels, from whence it flows in that place, are ſlips of the arterial Branch going from the Carotides, after having paſs'd the Cranium, it comes to the baſis of the Cerebrum; for this proceeding near to the mamillary Proceſſes, ſends very many twigs from it ſelf every where about, of which ſome eminent ones paſſing the hole of the Sieve-like Bone with the ſmelling Nerves, are diſtributed through the glandulous membrane inveſting the windings of the top of the Noſe. Theſe naſal Arteries departing firſt from the Trunk of the Carotides within the skull, anticipate part of the blood chiefly ſerous from the brain, and lay aſide the Serum it ſelf and other watery recrements into

A deſcription of the Veſſels from which Blood flows.

into the glandules of the Noſtrils, as into the proper Emunctories of that Region, whence they diſtill into the cavity thereof. Wherefore, if the mouths of thoſe little Arteries do always gape ſomewhat by reaſon of the ſweating out of the Serum, it is no marvel if the blood it ſelf being made more turgid, opening them a little more (which often are too looſe of themſelves) burſts forth of doors. Indeed this Emiſſary both of the Serum and of the Blood, being apt ordinarily to open, or on any occaſion, prevents or cures great incommodities of the brain, or of the Præcordia, yea and ſometimes of the whole body.

They are the ſame by which the Serum diſtills to the Noſtrils.

For in the firſt place, this way the Serum (as I ſaid) is derived from the head, and when the mouths of thoſe Veſſels are vellicated or provoked by any ſneezing Medicine put into the Noſtrils, the Serum is from thence more abundantly drawn out; which yet doth not deſcend from the Brain (as is commonly thought) but is anticipated by theſe naſal arteries, leſt it ſhould go to it; from which when it is more plentifully drained and brought forth by the uſe of Errhines, for that cauſe the Brain becomes more ſerene and exempt from vapours. Then ſecondly, leſt the Brain ſhould be overwhelmed at any time by blood more impetuouſly overflowing, a portion hereof paſſing through theſe veſſels and breaking out, eaſily prevents it.

The Blood flowing forth in too great plenty from theſe Veſſels, is very hurtful.

But ſometimes it happens that an Hæmorrhage of this kind, rather becomes a Diſeaſe than a Remedy; for whenſoever the blood flows out more often and more abundantly than is fit from the Noſtril, if life be not immediately hazarded by reaſon of too great loſs, yet the remaining maſs of the blood being impoveriſhed thereby, and loſing its temper, acquires a cachectick and frequently an hydropick diſpoſition; even as we have clearly intimated before, where we alſo have ſhewn the Ætiologie of this diſtemper in common with other two great Hæmorrhagies, either to conſiſt in the fault of the blood, or of the veſſels, or of both together.

The cauſes of ſuch an immoderate flux.

Firſt, the blood bringing an Hemorrhage of it ſelf offends either in Quantity or Quality; and therefore while occaſionally it boyls up, it cannot be contained within the veſſels, but either opening their mouths by diſtending them, or unlocking them by its acrimony, it skips out: To which happens that the blood being ſometimes diſſolved in its conſiſtence, and as it were infected, becomes unfit to continue the courſe of Circulation, inaſmuch as portions thereof ſeparating from one another, are partly fixed in the fleſh or skin, having ſuffer'd death; and partly breaking out, ſtir up frequently dreadful, and ſometimes mortal Hæmorrhagies, as every where is diſcovered in malignant Feavers, and ſometimes in the Scurvy. Notwithſtanding the blood offending by meer Quantity or Acrimony, unleſs the fault of the Veſſels happening thereon provoke the flux thereof, or too eaſily permit it, ſeldom breaks out into a great Hemorrhage.

1. *From the fault of the Blood.*

Therefore ſecondly, the veſſels bringing blood, as often as they conſpire to produce that affection, are uſually in the fault, either firſt inaſmuch as their ſmall mouths gaping, by reaſon of the fibres being too looſe and weak, do not readily enough tranſvaſate the blood out of the Arteries into the Veins; which fault happens to ſcorbutick and cachectical perſons; or ſecondly inaſmuch as by reaſon of the ſame moving fibres being affected with the Cramp and Convulſion, the blood being ſnacht impetuouſly to and fro, and chiefly towards the Head, is conſtrained to break out to continue the thread of circulation, even as it will plainly appear in the caſe of a Patient which ſhall be ſhewn below.

2. *From the fault of the Veſſels.*

Prognoſticks.

1. As to the Prognoſticks, although an immoderate flux of Blood, in the Small-Pox, Meaſles, malignant Feavers, and in the Plague, doth ever preſage evil, and is expedient to be ſtopt, notwithſtanding it ought to be reſtrained not by meer cooling or revulſory things, but to be chang'd by temperate Hydroticks into ſweating.

2. An Hæmorrhage of the Noſtrils, though not great, is more dangerous in Cachecticks with a weak Pulſe, and a cold ſweat, than a plentiful Hemorrhage in men endued with a Pulſe ſtrong enough, and blood very fervent.

3. They who are obnoxious to this Diſeaſe, by reaſon of a Dyſcraſie of blood and looſneſs of the veſſels, if there come upon both theſe a convulſive diſpoſition of the fibres of the little Arteries, they receive a far more difficult Cure and frequently are reduced to extream languiſhings by reaſon of the great loſſes of blood.

4. From thoſe who are feaveriſh, when much blood ſhall flow out of the Noſtrils, and does not terminate the diſeaſe, oftentimes in the place of a Criſis a delirious or a ſoporiferous affection ſucceeds. There are many other prognoſticks about a Hemorrhage accurately remarkt by *Hippocrates*, which notwithſtanding properly belonging to the diſcourſe of a Feaver, we omit in this place; for truly, the Cure in general of this Diſtemper is here almoſt only intended.

About

PHAR. Part. II.

About which there will be three primary Indications, to wit, *Curatory*, *Vital*, and *Preſervatory*; the two former reſpect immediately the ſymptom to be ſtopt, as often as it ſhall be urgent; and the laſt is buſie about removing the Cauſe of the Diſeaſe, that ſo the aſſaults of the Hemorrhage may be ſmall, or not at all. Beſides, an Hemorrhage ought to be handled one way without a Feaver, and after a different manner if preſſed with a Feaver.

The Curatory Indication ſuggeſts three intentions of healing.

Therefore whenſoever without a feaver much blood ſhall flow out of the Noſe, preſently as there ſhall be need of ſtopping Remedies, there will be three chief intentions of Curing, all being together aſſumed into practice, *viz.* Let the turgeſcency of blood be bridled, that it may be leſs diſpoſed into inordinate tendencies. Moreover in like manner let it be endeavoured, that as well its fluxion being withdrawn from the Noſtrils may be diverted to another place, as that the mouths of the Veſſels gaping within the Noſtrils be ſhut: for which purpoſe Remedies as well external as internal very many and of diverſe kinds are wont to be exhibited; of the former we will entreat in order briefly.

Outward remedies to ſtop the flux of blood.

1. Ligatures.

Firſt therefore let the Patient be quiet, plac'd with his head upright, then let many of the Joints of his Arms and Thighs, but not all, be bound with ſtrait Ligatures, which ought now and then to be looſened and removed to other parts; for all being bound together and long, by reaſon of the blood being held in the outward parts, and too much detained from the heart, hath cauſed moſt dreadful ſwoundings; but otherwiſe this Remedy being prudently adminiſtred, frequently helps. For when the blood by this means running into the members by the Arteries is ſtopt, that it preſently returns not by the veins, its more impetuous ſpreading it ſelf into the head is impeded. Moreover, by the painful Ligatures of the Joints, the muſcular Fibres of the Carodites Arteries are preſerved from Cramps which oftentimes come upon them.

2. Bletding.

Secondly, for diverting the tendency of blood from the Noſtrils, it is ſometimes expedient to breath a Vein in the Arm or in the Foot. For by how much more blood is carried by the Arteries to the vein cut, by ſo much leſs will the afflux be towards the Noſtrils. Yet this adminiſtration does not always ſo help, but ſometimes a contrary effect thereof happens, as we have already obſerved in ſpitting blood. The reaſon whereof is, that the veſſels being ſuddenly and not ſufficiently emptied, ſuck up again the diſagreeable humours formerly ejected, and ſtagnating within the pores, whereby the blood incontinently is ſtirred up into a greater eruptive turgeſcency.

3. Application of cold things.

Thirdly, Cold things applyed to the Forehead and Temples, alſo to the Nape of the Neck, where the vertebral Arteries aſcend, cauſe the veſſels to be bound together, and the flux of blood to be ſomewhat ſtopt or repelled. Notwithſtanding it is ill which ſome adviſe, that cooling Topicks be applyed to the Jugular Veins; for ſo the blood being retarded in its recourſe, flows the more plentifully out of the Noſtrils. Moreover, what is uſual, to apply linty Cloaths, or a Spunge moiſtened with Vinegar, to the Pubes and Teſticles, helps by no other means than the ligature of the members, to wit, inaſmueh as the flowing back of the venous Blood is impeded. A ſudden and unexpected ſprinkling of cold water on the face, frequently ſtops an Hæmorrhage, inaſmuch as it gives an impreſſion of terror.

4. Cupping-glaſſes.

Fourthly, Cupping-glaſſes applyed upon the Hypochondres, Flanches, inner part of the Thighs, and the ſoles of the feet, are accounted a famous remedy as well with the ancient, as with modern Phyſitians, for diverting a tendency of the blood from the Noſtrils. And the reaſon is plain, *viz.* becauſe a Cupping-glaſs being put on, the impulſe of air being prohibited by the ſpace of the orifice, and encreaſed every where about, preſently the blood and humours, yea and vapours, and ſolid parts, being call'd from any other tendency, are driven towards the empty ſpace of the Glaſs.

5. Frictions.

Fifthly, Rubbing of the extream parts are commended in this diſtemper by ſome Practitioners, which we judge not always uſeful, nay ſcarce ſafe; becauſe, although they ſolicit a greater appulſe of the blood to the feet or hands, yet they ſo haſten the return thereof, that the whole maſs of blood being raiſed into an effervеſcence, it hazards a more violent tendency towards the Noſtrils.

6. Cauterits.

Sixthly, *Zacutus Luſitanus* among his revulſory Remedies, propounds an actual Cautery to the be applyed to the ſole of either foot; and *Crato* the bending the little finger of the ſame ſide, which becauſe done with no trouble we may try; but we adviſe not ſo of the former, unleſs the way of helping were more certain, which might compenſate the pain and lameneſs, that would enſue thereon.

Seventhly,

Seventhly, Swounding raiſed by any means, preſently ſtops an Hæmorrhage, however contumacious it be; wherefore when ſuch bleeding perſons are taken out of their beds, or when they do timorouſly admit of Phlebotomie, though but ſparingly, or have their members bound for a longer time, or are ſuddenly affrighted with ſome feigned rumour, or by ſome other occaſion fall into a ſwouning or fainting of the ſpirits, the flux of blood ceaſes thereon preſently. The reaſon whereof is evident enough, for that as ſoon as the motion of the heart fails, preſently the blood and ſpirits ruſh thither, and ſo every outward flux is ſtopt on a ſudden, and what was immoderate before, doth not again return. 7. *Faintings.*

Eighthly, In the laſt place, for repreſſing the flux of blood from the Noſtrils, Remedies ought to be recited, which are ſaid to operate after an occult manner, by Sympathy or Antipathy, of which ſort firſt is the ſympathetick powder, made of Roman Vitriol calcin'd to a whiteneſs by the Summer Sun; alſo a piece of wood cut from a young Aſh firſt ſprouting about the time the Sun enters *Taurus*; the efficacy of which remedy in the late Civil Wars many worthy of credit atteſt to have been approved for ſtopping the Hemorrhages of wounded Souldiers: Yea ſome ſtill with much confidence preſcribe it in all eruptions of blood. I confeſs the reaſons of effects of this kind are concealed from me, if ſo be they happen often. Beſides, it ſeems not a leſs Empirical and irrational Remedy, that a ſilk Bag with a dry Toad in it, worn on the pit of the Stomach, ſtops any kind of Hemorrhage, and prevents its return: unleſs (according to the Ætiology of *Helmontius*) that the application terrifying the *Archæus*, compells the blood being aſtoniſhed, either to go back, or deſiſt from its inordinate excurſion. *Remedies by Sympathy and Antipathy.* 1. *Sympathetick-powder.* 2. *Young Aſh-wood.* 3. *A dry Toad.*

There remain very many famous Medicines whoſe Operations are wont to be referred to hidden Cauſes and ſecret vertue; as are Necklaſes of Blood-ſtone hung about the Neck, alſo the moſs of a humane Skul carryed in the hand; Epithemes of the leaves of Nettles bruiſed and applyed to the ſoles of the feet, and the Palms of the hands; the Empirical adminiſtrations of which kind, when they may be adminiſtred without trouble or coſt, we make no refuſal of; ſince in a dangerous caſe every thing is to be attempted; and applications of that ſort do help ſometimes in reſpect that they fortifie the imagination of the Patient. 4. *A Blood-ſtone.* 5. *Moſs.*

While ſuch like outward Adminiſtrations are uſed, for repreſſing or calling aſide the flux of blood out of the Noſtrils, alſo other Topicks are put up into the Noſtrils, which may ſhut the gaping mouths of the veſſels, for which uſe the injections of liquid things, Pledgets, Powders to be blown in, and Fumes are wont to be preſcribed, which not helping, in the laſt place we deſcend to Eſcharoticks. *Topicks cloſing the mouths of the Veſſels.*

Ninthly, Among Liquids, not only firſt, but as good as all others is eſteemed the ſolution of Vitriol in Fountain-water. Some boaſt this for a great ſecret, and a moſt certain Remedy. Indeed the ſame being applyed to a freſh wound, foraſmuch as it ſhuts the ends of the cut veſſels, by wrinkling them up, it reſtrains and preſently ſtops the flux of blood. But that application in Hemorrhages of the Noſtrils, where the blood being brought to the gaping mouths of the little Arteries, ought to be received by the Veins, in regard it ſhuts them as well or rather than thoſe, it ſucceeds little, and ſometimes not at all, as I have known it frequently experimented. This Medicine is prepared of Green Vitriol, *viz.* of *Hungary*, or of our Country, alſo of the fictitious Vitriol of *Mars* diſſolved in a ſufficient quantity of Spring-water. I know ſome commend the ſolution of Roman Vitriol, which they, not only apply by injection, but alſo to a linnen cloath dipt in the blood are wont to adminiſter it ſympathetically. Moreover the water of the infuſion of white Vitriol prepared with Bole and Camphire, I have known to be uſed ſucceſsfully as well in wounds, as often in other Hemorrhagies. 6. *Eſcharoticks.* *The injection of Vitriol water.*

Tenthly, Since water caſt into the Noſtrils, doth not adhere enough to the mouths of the Veſſels, but is waſhed away by the breaking out of the blood, before it can exert its Vertue, it is therefore more expedient either that a Styptick powder be blown in, or that a Pledget dipt in the water of Vitriol, either by it ſelf, or ſtrewed with an aſtringent powder, be thruſt into the upper part of the Noſtril. For this purpoſe many and ſeveral kinds of ſtyptick powders have been preſcribed, I have frequently uſed either *Crocus Martis* calcin'd to the higheſt redneſs, or the powder of Camphorated Vitriol, or the vitriolic Soot ſcrap't from the bottom of an old Braſs Pot, the powder whereof I have often uſed with ſucceſs in this caſe. In obſtinate Hemorrhagies not yielding to other remedies, let Pledgets, whoſe tops are dipt in Cauſtick Colcothar, be put up deep into the Noſtrils, that the mouths of the Veſſels being burnt, and covered with an Eſchar, all flux of blood may be preſently ſtopt. Many other Errhines to ſtop bleeding are accounted famous with Practitioners, as Hogs-dung, 10. *Pledgets.* *Hogs-dung.*

PHAR. Part. II.

Burnt Blood.

Hogs-dung, thruſt into the Noſtrils, which by the meer ill ſavour is thought to repell the blood; alſo the ſmoak of Blood dropping on hot Iron, repercuſs'd into the Noſe, the Powder being burnt is alſo taken inwardly. The moſs of a humane Skull unburied, put into the Noſtrils, is commended by many for this effect: but theſe latter applications ought to be referred to the ſympathetick Ætiologie, if they avail any thing.

Theſe things concerning outward Remedies ſtopping blood, the vertue and efficacy of which ought at the ſame time to be promoted by intern Remedies, ſeaſonably exhibited and cooperating.

Inward Remedies, whereof are two intentions.

Therefore a ſlender Diet being inſtituted, and the Patient ordered to keep himſelf in an upright poſture, or not much ſupine, while the aforeſaid Adminiſtrations are orderly adminiſtred, medicines appropriated to the ſame end are alſo preſcribed to be taken inwardly. There will be two ſcopes of Remedies of this ſort, *viz.* 1. That the effervescency of Blood whether incentive or fermentative being ſuppreſſed, the liquor thereof being reſtrained within the veſſels, may pleaſingly circulate. 2. That the more impetuous motion of the heart driving about the blood too rapidly, may be depreſſed by apt Sufflamina's.

1. Things appeaſing the effervescency of the blood.

1. The firſt Intention requires Medicines that ſuppreſs the too much kindling of the blood, and appeaſe the undue fermentation thereof, for which intents I uſually preſcribe the enſuing Remedies.

Juleps.

Take of the water of Plantane, red Poppy, Purſlain, and frog-Spawn, of each four ounces, Syrup of water-Lillies two ounces, Sal Prunella one dram, mix them for a Julep, the doſe three ounces three or four times aday.

Tinctures.

Take Barly-water two pound, Red-roſe leaves one handfull, Spirit of Vitriol what ſuffices to make it gratefull, or about half a dram, make an Infuſion warm for extracting the Tincture, add Syrup of St. John's*-wort two ounces: the doſe three or four ounces, as oft as they pleaſe day or night.*

Take leaves of ſtinging Nettles, of Plantane, of each three handfuls, pour upon them being bruiſed Plantane-water 6 ounces, preſs them ſtrongly, let the ſtrained liquor be taken.

2. Intention, to cool the motion of the Heart,

2. For the ſecond Intention, to wit, for the cooling of the heart too vehemently beating, Hypnoticks and Opiates are convenient.

Is done by Hypnoticks.

Take water of red Poppies three ounces, Syrup of Diacodium half an ounce, make a draught to take at night. Or,

Take Conſerve of red Roſes an ounce and a half, Powder of Henbane, and white Poppy-ſeeds of each two drams, Syrup of Poppeys, enough to make an Opiate. The doſe the quantity of a Nutmeg every ſix or eight hours.

Take of Laudanum Cydoniatum one dram, the doſe fifteen drops twice aday in a convenient Vehicle.

Of a Hemorrhage in a malignant Feaver.

Theſe things touching an immoderate Hemorrhage, and the Remedies thereof, when it happens without a Feaver: but that which coming in a feaver ought to be ſtopt in regard of the too great loſs of Blood, is either Critical making an immoderate excurſion, by reaſon of ſome accident, for which the Method and Medicines even now preſcribed with caution and reſpect had to the Feaver may be accommodated; or meerly Symptomatical, which being excited in a malignant and Spotted Feaver, Small-pox, Meaſles, or the Plague, neither ſcarcely can, nor ought to be ſtopt with the Remedies above recited. For letting of blood is not convenient, repelling Topicks, alſo cooling Juleps, or Decoctions, and Narcoticks, have no place here: The chief intention of Healing will be to change the Hemorrhage into Sweating, for a gentle Sweat being raiſed, the flux of Blood often ceaſes, if it be not very dangerous.

Remedies.

Take water of Meadow ſweet, Tormentil, of each four ounces, Saxons cool Cordial two ounces, Treacle water an ounce and a half, Acetum Bezoardicum three drams, Syrup of Coral an ounce and a half, Confection of Hyacinths two drams, make a Julep, the doſe ſix ſpoonfuls, every third hour.

Take of the Powder of Toads prepared half a dram, Camphire two grains, take it every ſixth hour, with the forementioned Julep. Or,

Take Powder of Scarlet-cloth from half a dram to two Scruples, as before.

Take confection of Hyacinths three drams, Powder of Scarlet-cloth one dram, Syrup of Corals enough to make a Confection; the doſe the quantity of a Nutmeg every other hour.

Take

Take of Biſtort and Tormentil-roots, of each one ounce, the leaves of Meadowſweet, Pimpernel, Wood-ſorrel, of each one handful, burnt Harts-horn two drams, Shavings of Ivory and Hart-horn, of each two drams, boyl them in Spring-water from three pound to two, adding about the end Conſerve of red Roſes three ounces; the doſe three ounces being ſtrained, often in a day. PHAR. Part. II.

2. Hitherto of the firſt Indication Curatory, together with the ſcopes of healing and forms of Remedies, appointed for a Hæmorrhage of the noſe happening with or without a feaver. The ſecond Indication Vital only preſcribes a ſlender Diet, temperate Cordials, and a fit handling of the Patient. The Proviſion of the firſt is ſo ſmall and eaſie, that there ſeems no need to appoint a Meaſure and Rules for it particularly. About the latter the chief queſtion is, whether we ought to retain them within or out of their beds. Without doubt the languiſhing, and thoſe obnoxious to often ſwoonings, are not to be rouſed up, unleſs (as we have already hinted) it be for a Curatory attempt: as to others leſs weak, it ſeems ſo to be determined. Thoſe whoſe Blood does not eaſily tranſpire by reaſon of the conſtipation of the pores, and is incited into a greater turgeſcence from the heat of the bed, and proner to break out, it will be expedient they not only remain out of bed while bleeding, but alſo ſometimes through extern applications to be cooled in the whole habit of their body, or at leaſt in moſt of their members. Wherefore, *Fabritius Hildanus* relates he ſuddenly cured one of a great Hemorrhage of the Noſtrils, after many things tryed in vain, by putting him into a veſſel of cold water. Alſo with like ſucceſs *Riverius* cured another affected in like manner, being taken out of his bed, and laid on a woollen Matt on the Pavement, he bathed his whole body with Linnen dipt in Oxycrate. Yet this method is not alike convenient for all perſons, or at all ſeaſons; but on the contrary, thoſe whoſe blood is halituous, and enjoying more open pores doth evaporate eaſily, and being wont to be diſſolved by a more moderate heat encompaſſing them, into Sweat, and from thence find themſelves more quiet, it is more convenient that they remain within the bed, not only while the blood breaks out, but as long as there is danger of its return. For this reaſon it is, that many obnoxious to dreadful Hemorrhagies, during the Summer, when they tranſpire more freely, live exempt from that diſeaſe, but the Winter cold preſſing them, by reaſon of their pores being bound up, they ſuffer under more frequent and dreadful Invaſions.

Second Indication vital.

The Poſition of the Sick.

Sometimes in bed, and ſometimes out.

3. The third Indication Preſervatory, which regarding the removing the Cauſe of that diſeaſe, either ſtops the eruptions of blood, or renders the ſame more rare, or leſs, and ſuggeſts theſe two Intentions of healing, *viz.* 1. That the blood being reſtored to its due temperament and mixture, may quietly circulate within the veſſels, without turgeſcency and breaking out. 2. That the Veſſels carrying Blood, as to the ſtructure of their little mouths, and the tenours of the muſcular fibres, may be contained in their due ſtate; ſo that they neither cauſe thoſe inordinate tendencies of blood towards the Head, nor ſuffer effluxes out of the noſe: For both theſe ends, too great plenty and an impurity of the Blood are carefully to be provided againſt by Phlebotomy and purgation ſeaſonably uſed; afterwards for procuring and conſerving its good temperature, the following Alteratives may be given at fit ſeaſons of healing.

Third Indication Preſervatory hath two intentions of healing.

Take of Conſerve of red Roſes, of Hipps, an. three ounces, powder of all the Sanders an. half a dram, Coral prepared one dram, of the reddeſt Crocus Martis *two drams, Sal Prunella four ſcruples, with Syrup of Coral, make an Electuary, take the quantity of a Cheſnut early in the morning and at night, by it ſelf, or drinking after it three ounces of the following water.*

Forms of Remedies.

Take the tops of Cypreſs, Tamaris, an. eight handfuls, St. Johns-wort, Tamariſk, Horſetail, an. four handfuls, of all the Sanders bruiſed, an. one ounce, of the Crum of White-bread two pound, ſlice them ſmall, and pour on them of new milk eight pound, diſtill in a cold Still, ſweeten each doſe when taken with Syrup of the juice of Plantane.

Take leaves of Plantane, Brooklime ſtinging Nettles, of each four handfuls, to them bruiſed pour half a pound of the foregoing water, of ſmall Cinnamon-water two ounces, preſs them ſtrong, the doſe three ounces to four, at Nine in the Morning, and at Five in the Afternoon.

Medicines of this ſort are taken in Spring and Autumn for twenty or thirty dayes, with ſometimes a gentle Purge coming between. In Summer let them drink Mineral Steel-waters for a Month, than which in this caſe there is not a better Remedy. Out of many Examples of perſons labouring with an Hemorrhage, we only propoſe this one ſingular caſe.

PHAR. Part. II.

An Example of a rare Hemorrhage.

I was lately conſulted at a diſtance for a certain Gentleman that had ſuffered frequent and great eruptions of Blood, one while at the Noſtrils, another while at the Hemorrhoid veſſels. He had frequently uſed Phlebotomy by perſwaſion of his friends, without benefit; yea frequently falling into cold Sweats and Swounings after breathing a vein, and notwithſtanding obnoxious to eruptions of blood, he was wont to be much worſe. I preſcribed Juleps (having not yet ſeen him) and cooling Decoctions, and Anodynes, alſo the juicy expreſſions of herbs, and other things cooling the blood, but even from theſe, (as if all ſtill far enough from the ſcope) he was nothing the better. At length being ſent for into the Country to viſit him, I found the affection under which he ſuffered to be meerly or chiefly convulſive; for whereas he daily bled, his Pulſe was weak, the extreme parts cold, and all his Veſſels as being too much emptyed fell flat; alſo the Patient was affected with a continual Vertigo and trembling of heart, and by and by with a ſwouning or fear of it. Really the Blood was ſo far from breaking out by reaſon of turgeſcence, that rather the ſtream thereof being depreſſed and ſmall, it ſeemed ſcarce enough to ſuſtain the current of Circulation. Notwithſtanding the truth of the matter was, he was often ſenſible of ſomething in his body creeping one while upward, another while downward like wind, and for the moſt part the flux of blood out of his Noſtrils or Hemorrhoids, followed the tendency of that motion: hence it was eaſie to conclude, that the moving fibres of the Veſſels carrying blood, by which they are contracted, being affected with a Convulſion, did diſorderly convey the ſtream of blood however ſmall and low, to and fro, and ſo compell it into Eruptions: which alſo happen'd the eaſier, inaſmuch as the mouths of the veſſels being laxe and gaping, ſuffered the blood forc'd into them to flow out without any due reſiſtance. The inſtituted method of Curing did plainly approve of this Ætiology, inaſmuch as it happily ſucceeded, leaning on this ſuppoſition; for Bloodletting, and the uſe of Medicines ſtopping blood being at laſt omitted, I preſcribed the uſe of the enſuing Powder, a doſe whereof he took every ſixth hour with a fitting Julep.

Its Ætiologie.

His Cure.

Take the powder of male Peonie, red Coral, Pearles, of each one dram, Ivory, Crabs-eyes, Blood-ſtone of each half a dram, Lapis Prunellæ one dram, make a Powder, the doſe half a dram.

Take of Black-Cherrie water eight ounces, Balm, Barly Cinnamon-water, of each two ounces, Treacle-water one ounce, Syrup of Coral an ounce and a half.

But I commanded that Ligatures ſhould be applyed to certain places by a conſtant courſe, and by and by to other places as occaſion ſhould be given, as well to ſtop as to intercept the Convulſions of the veſſels, and by remedies of this kind, and means of adminiſtration, he recovered his health in a ſhort ſpace, without any return of the diſeaſe.

SECT. III. CHAP. III.

Of Veſicatories.

OF loſing Blood by Phlebotomy, whenſoever it is troubleſome and injurious, and ſwells too much, and tumultuates within the veſſels; alſo of retaining it by Medicines ſtopping Blood, as often as being outragious it rages too much of its own accord and flows out, we have hitherto largely diſcourſed. There remain other certain humours, *viz.* Nervous and Nutritious, as alſo Serous, and other recrementitious ones which are wont to flow within the Brain and Nerves, and as well in the nervous fibres, as the fleſhy, yea and within the Pores of the skin and of the ſolid parts, which being often depraved or hindered in motion, require emiſſion. being otherwiſe about to raiſe great troubles or pains, and frequently dangerous Diſeaſes. Wherefore, that we may ſeaſonably rencounter diſtempers that are about to riſe or take their origine from thence, Phyſick hath found out certain other Emiſſaries, mediately or immmediately deriving the forecited humours out of the parts and places where they ſhall offend. And thoſe are either continual, *viz.* Fontinels of diverſe kinds, which are as it were perpetual Drains, and pour out continually the

Ichor;

Ichor; or they are temporary, when as occaſion requires, the Scarf-skin being taken away in ſome part of the body, the extremities of the veſſels in the skin are made naked, and withall ſo provok'd, that they ſpue out in great abundance the ſerous humours of a various deſcent and diſpoſition, and ſo continue to evacuate the ſame for ſome time, one while longer, another while ſhorter. But ſuch a manner of drawing out the ſerous humours from the outward ſuperficies of the body or any part thereof, is wont to be procured by Medicines called by the Ancients *Phœnigms*, or *Sinapiſms*, by Moderns *Veſicatories*: of which in the firſt place we will treat here, (becauſe the knowledge of theſe leads the way to the Doctrine of Fontinels) and we will chiefly inſiſt on unfolding theſe three things; *viz.* Firſt, It ſhall be ſhewn, from what Bodyes, and after what manner diſpoſed, Veſicatories are wont to be prepared. Secondly, Whereas they are of diverſe kinds, it ſhall be declared what is the manner and reaſon of their operation in every one, or at leaſt in the chief of them: Thirdly and laſtly, we will make ſearch for the curing of what ſort of Diſtempers they ought to be appointed, and in what places applyed.

Veſicatories anciently called Phenigms and Sinapiſms.

1. As to the firſt, the moſt ſimple Bliſterers are either Fire, or ſolid Bodies, or Liquors endued with fiery particles; (which are ſeldom adminiſtred for this uſe by reaſon of the terror which they impreſs, and the imminent danger, leſt being more ſtrongly apply'd, they do not only bliſter the Scarf-skin, but burn the skin and other parts.) Let therefore what is ſafer and leſs dreadful, Epithemes out of Concretes having more ſharp and (as is affirmed) potentially fiery particles, be applyed to the places to be bliſtered, which are either milder, and by the Ancients were call'd *Phœnigms*, becauſe they made the part red, the Scarf-skin taken away; or were call'd *Sinapiſms* in reſpect of the matter, and were wont to be prepared of Muſtard, Pidgeons-dung, Squills maſht, Garlick, Milk of Figs, and the like; or they were ſtronger, and conſiſted of *Euphorbium*, *Cantharides*, *Flammula Jovis*, Crows-foot, greater Plantane, with many others, which being endued with a certain burning and cauſtick quality, are uſed outwardly, for the uſe above recited, but taken internally, they prove venemous and frequently mortal.

1. *Of what prepared.*

1. *From actual Fire, or things imbued with it.*

2. *From things potentially burning.*

The compoſition and forms of things drawing bliſters are reported to be manifold and of ſundry kinds, although one or two may here ſuffice, and by how much the more ſimple, the better; and in moſt caſes for the moſt part 'tis all one which you uſe: notwithſtanding we ſhall after our manner annex ſome ſelect Preſcriptions of theſe kinds of Remedies. And that we my ſay little of *Dropaces*, *Sinapiſms*, and *Phœnigms*, whoſe uſe is almoſt exploded; almoſt all Veſicatories now in uſe have Cantharides for their Baſis.

Take powder of Cantharides half a dram, to a dram, powder of Ameos-ſeeds one ſcruple, of old Leaven kneaded with Vinegar, enough to make a Plaiſter, ſpread ſome of it on Leather, apply it twelve hours to the place to be bliſtered. This works certainly and ſtrong enough: but becauſe it is long compact and ſticking, and may fall from the place to which it is put, or is apt to crumble, therefore for the more commodious application, this following is very convenient, and now in uſe with moſt.

Forms of Veſicatories.

Take of Cantharides three drams, Euphorbium half a dram, powder of Ameos-ſeeds one dram, let be incorporated with Melilote-Plaiſter by a warm hand, as much of this powder as it is capable to receive, then ſpread it on Leather, and apply it for twelve or ſixteen hours.

Some do uſe to incorporate the foregoing powder with *Burgundy* Pitch, and ſpread it upon Leather, afterwards to cover the ſides with red Sanders incorporated with *Burgundy* Pitch, and ſo adminiſter both a Dropace and a Veſicatory. Alſo by applying ſtill the ſame Plaiſter, the Scarf-skin being bliſter'd and taken off, and the place being red, and ulcerated, and only wiping it once or twice in a day, and putting it on again, they cauſe the little Ulcer raiſed by the Veſicatory, to flow at pleaſure, yea ſometimes above a month, and to throw off a plentiful Ichor.

A more delicate Veſicatory with a Dropace.

Others incloſe Cantharides bruiſed, and ſprinkled with Vinegar in Silk, and apply to the place.

Some Empiricks uſe in the room of Cantharides a maſs of the leaves of Crow-foot, or *flammula Jovis* bruiſed on the place, by which the Scarf-skin being bliſtered, or rather eaten, the skin it ſelf, as if toucht with an actual fire, is much inflam'd and deeply ulcerated; whence not only profuſion of Ichor but an inflammation of the whole member, and a feaveriſh diſpoſition ſometimes follow: wherefore theſe things are not to be uſed raſhly.

2. If it be enquired of the manner and reaſon how theſe and other Veſicatories operate; in the firſt place we ought to ſhew by what manner actual Fibres, and things endued

2. *How they operate.*

PHAR. Part. II.

endued with particles proceeding from Fire, do raise a blister; then by an easie Analogy the force and manner of working of those sorts of remedies will be known, which are reported to be endowed with a potential fire. Wherefore we observe of the former, that the fiery particles not being too vehemently applyed, penetrating the Scarf-skin without dissolution of unity, enter under the skin it self, where the extremities of the vessels bringing blood, of the Nerves, and of the nervous Fibres are terminated; and there do variously twist together these, altering them from their position, and pervert the structure of the whole texture of the skin: insomuch that from all the vessels being made angry in a high degree, the watery humour being imbued with igneous particles, and therefore rejected, as well by the blood as by the nervous Juice, is spued out in great abundance: This Lympha, because it cannot pass through the Scarf-skin, separates it from the skin, and raises it into a bladdery bulk, from which at length being broke of its own accord, or occasionally, it flows out. Moreover as long as the igneous particles adhere to the skin, and the mouths of the Vessels, being covered with an Eschar, are not closed up, these being continually twitched by them, do continue to spue out the Ichor. This kind of ichorous flux will the sooner cease, if immediately upon the hurt inflicted, the fiery particles be drawn out, by the application of some proper Antipyretick, as Fire it self, Nitre, Soap, Onions, and the like. Moreover it runs the longer, if omitting an Antipyretick, medicines hindering the generation of a Cicatrice, or of the outer-skin, and unlocking the mouths of the vessels, be worn upon the place affected.

Shewed by the example of Fire.

How Cantharides excite Blisters and draw forth water.

By these it is easie to understand by what manner Vesicatories perform their operation, *viz.* Cantharides (as likewise any other of the same vertue) being outwardly applyed, and being heated by Effluvia's of the parts subjected, and so being provok'd to exert their power, do plentifully dispatch sharp and as it were fiery particles from themselves, which penetrating the Scarf-skin without any tearing it, they are dashed against the *Cutis* or other skin, where first they act upon the Spirits, and then by the affecting these, upon the Humours and solid parts. They very much provoke the Spirits, and drive them into painful Convulsions of the Fibres, dissolve the Humours, and constrain them to separate into parts, so that the watery part being very much embued with those sharp, and as it were venemous particles, is rejected every where by the other Juice; and when in the mean time the ends of the Vessels and Fibres are either eaten by the burning, or opened by twitching, and as it were drained, that Ichor conveying the hurtful particles is plentifully spued out of their little mouths; which then separates the impervious *Cuticula* or the Scarf-skin, from the other skin or *Cutis* it self, and raises it into a little bladder, and after this being broken and taken away, it is for some time poured out by the ulcerated skin (as we shewed it to come to pass by reason of the particles of fire.)

Why they bring a fervent Dysury.

But this is not only done, because the serous Juice imbibing the sharp parts of the Medicine, and conveying them out, doth not alwayes bear them all back the same way by which they entred, but sometimes this being endued with these stings, regurgitates into the mass of Blood; and afterwards being circulated with it, and ejected with its infestous burden through other Emunctories, offends some weak or tenderer Channels in its passage or going forth; from whence very many contract a Strangury, from great or many Vesicatories, by reason of the urinary passages being affected for that cause with Acrimony or Erosion, which in some becomes most sharp and intolerable. Also that application sometimes brings bloody Urines to others afflicted with the Stone; hence a suspicion also arises, that those who have tender Lungs, or who are subject to a Consumption, are much endangered by this Medicine outwardly applyed; which notwithstanding I have not known happen to any; but can rather attest by frequent experience on the other side, that it redounds to advantage rather than hurt. For the more sharp particles of Cantharides, if they be long applyed, being sometimes imbibed more plentifully by the blood, infect its whole Serum: which Juice so sharpened, as long as it is confounded with the Balsamick blood, hurts no part; but being separated from it by the Kidneys, it sometimes brings hurt to them, and frequently not only twitches the neck of the Bladder by its Acrimony, but sometimes corroding it, causes filth, and little skins, nay and blood to come away: but in the mass of blood, the same more sharp, saline-volatile particles do often most notably help; inasmuch as they destroy the fixt or acid Salts in it, and unlock the consistence of the blood too much bound up, and so do cause the serous and other morbific recrements before wrapt up with it, to be separated from it, and to be more easily dispatched by Urine and Sweat; hence Vesicatories being applyed long in Feavers do call forth plentiful Urine and a more easie Sweat. Also they open the obstructed wayes, and move together the portions of Blood or

Vesicatories move Sweat and Urine.

Serum

Serum, ſtagnating or being extravaſated in any place, and reſtore them to their Circulation. Wherefore they are not uſed only to help in ſerous maladies, but alſo in thoſe of the blood, yea in a Pleuriſie, Peripneumonia, and in any other Feavers.

Having hitherto ſhewed after what manner Veſicatories operate firſt on the Spirits and then on the Humours and ſolid parts, it is now our buſineſs in the next place to ſhew both the good and evil effects of them, as alſo the manners of uſing them. But that they in the firſt place operate on the Spirits is manifeſt from hence, that they exert no Power on the diſeaſed, and it is an ill Omen in thoſe that are languiſhing, when Veſicatories have no operation, becauſe it is an Indication that the Animal Spirits are much dejected, or abundantly diminiſhed.

Therefore, it behoves to conſider about the due unfolding the energy, force or virtue of this remedy, what humours it either immediately or mediately evacuates or alters; and afterwards in what Diſeaſes, and bodies how diſpoſed it either profits or hurts. *The effects of Veſicatories.*

Firſt, As to the former, the humours that are immediately ſent out by a Veſicatory, drop forth partly from the pores and glandules of the Skin, and partly out of the mouths of the little Arteries, and partly out of the extremities of the Nervous fibres; perhaps ſome little of the Juice newly received, out of the mouths of the veins, though not much, ſeems to be carryed. The humours mediately drawn out by a Veſicatory are thoſe which the aforeſaid parts being emptyed receive elſewhere, and derive them forth. 1. *As to humours of the Skin.*

1. The Skin is a thick Membrane conſiſting of a double Coat, very porous, alſo thick ſet about with moſt numerous glandules, with fat, as alſo the ends of the Veſſels and fibres being terminated therein, and thickly woven one within another. Wherefore, while a portion of it is made bare, the Scarſ-skin being taken off with a Veſicatory, and the nervous fibres being twitched, do bind together, and wreathe the glandules and pores, the ſerous humour contained in both, is moſt plentifully ſqueezed out. And whereas ſome pores are previous into others, the Serum doth not only flow out of the place bliſter'd, but ſometimes into the little holes firſt ſo emptyed, a portion of the Serum coming from the neighbouring pores ſucceeds, and thence by and by ſweats out: wherefore in Patients affected with an Anaſarca, the little ulcers raiſed by a Veſicatory, exhauſt the waters every where in great plenty, and draw them out of the neighbourhood, yea and ſometimes at a great diſtance.

2. The little mouths of the Arteries being uncovered and twitched about the bliſtered place, do not only vomit out a portion of the Serum brought to them, by ordinary cuſtom, but the ſerous liquor being imbued with the Stimula of the medicine in the whole maſs of blood, immediately is ſeparated more plentifully from the blood; and at every turn of Circulation a greater plenty thereof is thrown out by the ſame mouths of the Arteries continually irritated: Moreover together with the Serum as it were ſo ſtagnating, and therefore removed from the whole blood into the little ulcers of the skin, other recrements and ſometimes the morbific matter it ſelf depart in plenty, and are diſpatched forth by the ſame Emiſſaries; and for this reaſon in malignant feavers, yea in ſome putrid, that are difficult to be judged of, when the recrements and corruptions of the blood, unapt to be thrown off, do threaten the Præcordia or Brain, Veſicatories continually and leiſurely draining it, do frequently yeild notable relief; whereunto we may add, that they do alſo alter and reſtore (as we before mentioned) the blood degenerated or depraved as to its Salts, and alſo by opening or ſubtilizing its conſiſtence, diſpoſe it towards an Eucraſie; wherefore, not only in a feaveriſh ſtate of Blood, but alſo in a ſtate otherwiſe peccant, or of ill Juice, this kind of remedy is often extreamly convenient. 2. *In reſpect of the blood.* *Which they purge and alter.*

3. Both reaſon and experience have enough proved, that Veſicatories evacuate a certain humour from the Nerves and nervous Fibres, and for that cauſe profit very much in convulſive diſtempers: For ſurely we have in another place clearly enough demonſtrated, that the watery liquor of the Brain and Nervous ſyſtem, doth ſometimes abound with heterogeneous Particles. Alſo it is manifeſt by frequent and familiar obſervation, that the impurities and recrements of that liquor, together with the watery Juice, do ſpontaneouſly ſweat out from the Nerves and Nervous Fibres, when the fluor is raiſed, and either reſtagnating within the maſs of blood, are carryed off by Urine or by Sweats, or being depoſited within the Cavities of the bowels, are diſpatched by Vomit or Stool. Wherefore, when a Veſicatory is applyed, the extremities of the Nerves and Nervous Fibres being made bare, and very much angred, immediately a humour abounding near their ends is voided; and alſo the whole Juice planted within their paſſages by a long ſucceſſion, is chafed, and delivered from 3. *In reſpect of the Nerves and of the humours abounding in them and in the nervous parts.*

PHAR. Part. II.

from ſtagnation; and the heterogeneous particles mixt with that nervous Juice, being every where agitated and derived from the Brain, ſlide towards their newly opened Emiſſary, by degrees, and at length are removed wholly forth.

For the curing of what Diſeaſes Veſicatories are convenient.

From theſe things we may collect, for the cure of what Diſeaſes this kind of remedy doth chiefly conduce; for by reaſon of its evacuation out of the pores and glandules of the skin, as often as any ſerous, ſalt, ſharp, or otherwiſe hurtful humour is collected in thoſe parts, or their neighbourhood, and being excluded from the Circulation of blood, ſhall obſtinately ſtick in that place, ſurely there is no more ready or eaſie way afforded for drawing it forth, than by applying a Veſicatory, upon or below the place affected. Wherefore, it is not only indicated by an Anaſarca or by any foulneſs or eruptions of the Skin, but moreover a Veſicatory is required for pains either arthritical or ſcorbutical, fixt any where in the extern habit of the body, or in any certain member.

1. In all cutaneous Diſtempers.

2. They take away the impurities and ill temperament of the blood.

Secondly, In reſpect of the Blood, Veſicatories are always uſed in malignant Feavers, as well to purge out leiſurely any heterogeneous or morbific matter, as to change it from a diſpoſition either too acid, or ſalt, or otherwiſe peccant, into a right temperament; yea they are of moſt excellent uſe in all putrid feavers of ill habit and hard to be judged of. Alſo for that cauſe in the Scurvy, Leucophlegmatia, *Pica Virginum* or Green Sickneſs, alſo in any other ill habit of body, this kind of remedy affords frequently notable help. Moreover not only for the ſake of correcting the blood it ſelf, but beſides as often as it being depraved ſpreads its corruption on other parts, and ſo doth firſt beget diſeaſes in the Head, the Cheſt, the nether Belly, or Members, and then excites their Fits, Veſicatories are uſually exhibited with ſucceſs. Wherefore it is a common remedy, in Head-aches, a Vertigo, and ſoporiferous affections, no leſs than in a Catarrh, or any defluxion either into the Eyes, Noſe, Palate, or Lungs, in which every one without conſulting a Phyſician, will preſcribe to themſelves Cantharides for Revulſion. I confeſs, when I have often been ſurprized with a great Cough, with abundant and thick Spittle (whereto I am originally obnoxious) I have received relief from no other Remedies more than from Veſicatories; wherefore I am wont, while that diſtemper doth urge, to apply Medicines drawing bliſters firſt upon the Vertebra's of the Neck, then thoſe little Ulcers being healed, beneath the Ears, and afterwards if need require it upon the Scapula's; for ſo the ſerous filth looſened from the conſiſtence of the blood ſweating forth, is derived from the Lungs, and alſo the mixture of the blood ſooner recovers its temper, inaſmuch as after this manner its enormous ſalts are deſtroyed.

This Remedy is profitable in thoſe Diſeaſes which the blood produces in other parts.

3. Alſo in all Diſtempers of the Brain and of the nervous Stock.

Thirdly, In reſpect of the Humour, *Epiſpaſticks*, as they are of moſt common uſe, ſo they are wont to confer great help, in ſoporiferous, convulſive and painful diſtempers, for deriving and evacuating it out of the nervous ſtock and the brain it ſelf. Was ever any ſurprized with a Lethargy, Apoplexie, or Epilepſie, but that immediately Friends and Attendants however unexpert, have tormented his Hide with the application of Cantharides? In ſtupendious convulſive motions, aſcribed uſually to nothing leſs than Witchcraft, I have applyed Veſicatories with great benefit in many parts of the body at once, and I have continued them above a Month, preſently renewing them in freſh places. And alſo pains that are fixt and moſt fiercely tormenting in the membranous parts, are ſeldom cured without this adminiſtration. For ſometimes morbific humours and Particles which being deeply radicated, yield nothing at all to Purgers or ſweating Medicines or Diureticks, yet have ſeemed to have been pulled up by the roots by Veſicatories, as it were remedies laying violent hands on the diſeaſe.

For what diſeaſes, Veſicatories are intended.

But this Remedy although moſt general is not uſed to operate ſo eaſily and happily in ſome Diſeaſes and Conſtitutions; wherefore we may not raſhly or indifferently uſe it towards all perſons. For thoſe who are Nephritick and obnoxious to a frequent and painful Strangury, ſcarce ever endure the application ſcot-free; wherefore, on thoſe that are ſo affected we muſt not uſe Veſicatories, unleſs in malignant Feavers of acute Cephalick Diſeaſes, for avoiding the greater Evil.

In what Conſtitutions they agree beſt.

As to what relates to the various Temperaments and Conſtitutions of men in reſpect of which Veſicatories are uſed to be more or leſs convenient or advantageous: Concerning theſe, this threefold notable difference occurs. In the firſt place, ſome perſons for the moſt part endure well the uſe of this Medicine, and the little Ulcers raiſed thereby in the skin, ſweat out an Ichor ſufficiently plentiful without any Dyſurie, or great inflammation of the place bliſtered; and then heal of their own accord; which effect ſucceeds only in blood of a good temperament, where, to wit, the Salt and Sulphur being moderately and rightly conſtituted, there is preſent and abundant plenty of Serum; whoſe Juice eaſily and more largely ſeparating from the reſt

of

of the blood, carries away the ſharper particles of the Medicine imbibed with it ſelf, and partly ſweats them out through the place bliſter'd, and partly conveys them out without prejudice by the Urinary paſſages; therefore alſo the advantagious effects now recited are produced in the maſs of blood.

Alſo in whom not.

2. But ſecondly this remedy with ſome doth neither well agree, nor operate profitably; becauſe it rubifies the place very much to which it is applyed, or rather excoriates it with moſt fierce pain and great inflammation; notwithſtanding the little ulcers made in the ſame place, although they do for ſome time torment the Patient, yet pour out very ſmall or ſcarce any Ichor: Alſo to theſe always bliſter'd with torment, for the moſt part a violent Strangury happens. The uſe of theſe Veſicatories being troubleſome and unſuccesful, doth frequently happen to men of a choleritk and hotter temperament; whoſe blood is endowed with a plentiful Salt and Sulphur, and a ſmall quantity of Serum, being more throughly concocted with the reſt. Wherefore, when the Juice that ought to carry away the more ſharp particles of the Medicine, doth neither eaſily nor plentifully paſs from the reſt of the blood, (that it may ſpeedily waſh them out) thoſe particles ſticking ſtill in the skin, do as it were infect and impoyſon the blood it ſelf, paſſing thorough, and for that cauſe being impeded from its circuit, they cauſe it to ſtagnate, and to be gathered together about the extremities of the Veſſels, whence they are inflamed. Moreover the ſerous Juice being ſeparated by the Kidneys when of it ſelf it is little and ſharp, and beſides becomes ſtinging from the particles of the Medicine, it irritates the Neck of the Bladder, and frequently corrodes it by its acrimony.

In men of a more hot temperament they torment the part, and do not draw forth the water.

3. There remains a third Caſe although more rare, relating to bliſtering, to wit, in whom little Ulcers being raiſed in the skin, preſently pour out the ſerous humour in ſo great abundance, that in a little time it will be neceſſary to give repelling Medicines, and that ſhut the mouths of the Veſſels; otherwiſe, from too much flowing out of waters, a diſſolution of ſtrength, and a fainting of the Spirits are in danger to enſue. This I have known ſo conſtantly happen to ſome Patients, that afterwards I was fain to reſtrain their uſe of Cantharides although there was need of them; the reaſon whereof ſeems to be, that the blood being endowed with a ſalt Serum, and more ſharp than it ought to be, hath a conſiſtence too eaſily diſſolved: wherefore, that ſerous juice being ſharp, and fretting of it ſelf, as ſoon as it is provok'd by the particles of the Medicine looſening the conſiſtence of the Blood too eaſily diſſolv'd, immediately breaking out with violence from the maſs of blood, whereſoever there is a paſſage afforded, it flows out with a full torrent through the mouths of the veſſels gaping in the bliſtered place. Beſides this too much flowing out of the Serum, raiſed from the firſt application of the Veſicatory ſometimes happening late in malignant Feavers, and in others ill, or not at all judged, and remaining a good while, wholly conſumes the morbific matter, and delivers the Patient from the jaws of Death. In ſuch a Caſe after the little Ulcers for the firſt days have poured out little or a very ſmall quantity of Ichor, at length Nature attempting a Criſis by this way, a vaſt Illuvies of Serum flows out from the ſame, and ſo ſometimes for many dayes, nay weeks, continues to flow out until the Patient before accounted deſperate, recovers his entire Health. Little Ulcers ſo abundantly flowing, as it is not eaſie, ſo it is not ſafe to ſtop them before the whole Mine of the Diſeaſe be conſumed. Not long ſince, a famous Doctor of Phyſick in *London*, ſcarcely recovering from a malignant Feaver, did copiouſly ſweat out Ichor daily from places bliſtered in ſeveral parts of his body; after ſome time (they being troubleſome and tedious) he did apply ſtronger Repercuſſives to them all, and immediately reſtrained their flux. Thoſe fluces were ſcarce two days ſtopt, but his diſeaſe revived, and on the ſudden he was affected with fainting of Spirits, and often ſwooning, a cold Sweat, and a low weak Pulſe: and whereas he could not be relieved by any Remedies, however cordial they were, he dyed within three days; the cauſe of which ſeems to be, that the malignant matter being ſuddenly repercuſſed, fell into the Cardiac Nerves, whoſe action being hindred, the vital function quickly failed.

In others, inaſmuch as they draw forth too much Ichor, they are not profitable.

The ulcers of Veſicatories do ſometimes plentifully flow in Feavers, and give Judgement of the Diſeaſe.

They are not to be cured.

An Example is ſhewn.

SECT.

PHAR. Part. II.

SECT. III. CHAP. IV.

Of Fontinels, or Iſſues.

BEſides Veſicatories, which being as it were the extemporary Emiſſaries of the Serum, and other humours externally to be brought forth, are only raiſed upon ſome occaſions, and then after their efficacy a little ſhewed, are permitted to be dryed up; there are others eſteemed as it were continual Fountains, therefore named *Fonticuli* or Iſſues, out of which the Ichor or ſerous humour flows with a conſtant Spring. Thoſe former, as they are requiſite for the moſt part for Cure-ſake in acute or other Diſeaſes, whoſe morbifick matter requires a quick diſpatch, in the firſt place reſpect the conjunct cauſe of the Diſeaſe to be removed; and therefore being more broad, are made only ſuperficial, that ſuch little Ulcers being large, may evacuate much, and then eaſily be healed: but on the other ſide, Iſſues being chiefly indicated for preſervation, are ordained to remove or vanquiſh the procatarctick cauſe of the Diſeaſe: wherefore they conſiſt of a more narrow orifice, but made more deep through the thickneſs of the whole skin, to the end, that while they ſend out the morbifick matter in leſſer quantity, they may derive it further, and continue longer to purge it out.

Iſſues rather a preſervatory than curatory Remedy.

About theſe three things are to be enquired into.

There are three chief heads of diſquiſitions concerning Iſſues, *viz.* Firſt, what humours theſe Emiſſaries chiefly evacuate, and whence they bring them: Secondly, in what Diſeaſes or Conſtitutions they better or worſe agree: Afterwards, Thirdly, in what places, in what form, and with what inſtruments they ought to be made.

1. What humours they evacuate.

1. As to the former, Iſſues, like Bliſters, purge out all humours fixt within the skin, (although in a leſs compaſs,) or brought through it as well by the ſanguiferous, as nervous Veſſels, not only as they provoke, or as it were ſuck the outer ſuperficies of the skin, but by piercing through the whole hide or skin, they convey out whatſoever flows from the ſides of the orifice through the broken Veſſels, alſo whatſoever ſlides down elſewhere beneath the orifice. Wherefore not only humours accumulated within the pores of the skin, or glandules, or brought thither by the Arteries, or Nerves, have conflux to Iſſues; but moreover the ſerous recrements under the skin, that are wont to be transferr'd, or creep between the interſpaces of the muſcles and membranes from place to place, tend every where unto them and find paſſage. Moreover an Iſſue appointed in the way anticipates morbifick humours, which were formerly wont to be conveyed to other weak and long afflicted parts, and by ſuch means exempts one while this part, another while that, from their invaſion. Hence either a Gouty, or Nephritick, or Colick matter, and ſometimes a Paralytical, or otherways ſcorbutical, are frequently intercepted by Fontinels, in their paſſage from their Source to their neſts or places of reſidence, and ſo are conveyed forth, and the uſual aſſaults of a diſeaſe declined: Neither doth this Emiſſary leſs purge from thence by drgrees the humours impacted in any part or region of the body, and there cauſing preſudice, than water-furrows made for derivation of moiſture, and ſo prevent or cure a ſickly diſpoſition.

2. In what diſeaſes they chiefly prevail.

2. From theſe ſeveral accounts of aſſiſtance, whereby Iſſues in general are wont to help, it is eaſily collected, for what diſtempers they are chiefly required; for although there is ſcarce any diſeaſe happens, wherein this remedy is either hurtful or unprofitable, notwithſtanding it ſeems rather more neceſſary in ſome caſes than in others. It is commonly preſcribed for almoſt every diſeaſe of the head, whether outward or inward: Every one of the ordinary people procures an Iſſue as equal to all other Remedies, for the Convulſions of Infants, or Youths, for Sore-Eyes, Kings-Evil, as alſo for Head-ache in perſons adult or ancient, for drouſie, vertiginous or Cramp-like diſtempers. Neither is it leſs celebrated againſt diſeaſes of the Breaſt; As who is obnoxious to a Cough, bloody or conſumptive Spitting, or an Aſthma that long enjoys his skin whole? In like manner Iſſues are commended in affects of the lower Belly; ſcarce any Hypochondriacal perſon or Hyſterical woman, in like manner no Gouty or Cachectical perſon, but hath his skin pierc'd in many places like a Lamprey. It would be a vaſt work to recount here particularly all the Diſtempers for which Fontinels are helpful.

3. In what Bodies they agree not.

3. But really this Remedy, however advantagious and benign of it ſelf, does not agree with all perſons, nor is it indifferently to be preſcribed to every one. For there are two ſorts of men, which though ſick, are to be excuſed from Iſſues, inaſmuch as

as this Emiſſary evacuates too much in ſome, and too little in others, or leſs than is convenient; and in the mean while remains very painful and intolerable. PHAR Part. II.

Sometimes a Fontinel is not convenient, becauſe it too much evacuates or conſumes the Humour or Spirits. For I have obſerved in ſome, that an Iſſue made in any part of the body, pours out an immoderate quantity of Ichor, and peccant in quality: for out of it by often turns, if not continually, a watery, thin and fetid Juice, oftentimes diſcolouring the Pea and Coverings with blackneſs, flows out in great abundance, and ſo the ſtrength and fleſh is impaired by too great an Efflux thereof. *Viz. Firſt where they evacuate too much.*

The reaſon whereof ſeems to be this, that in ſome perſons endued with an ill diſpoſition of blood and humours, a wound being made and hindred from healing up, degenerates ſtraight ways into a filthy and malignant Ulcer; the ſides whereof put on the nature of acid corruptive ferment, whereby the portions of blood continually forced thither, are ſo tainted and diſſolved, that the Serum thereof imbued with the diſſolved Sulphur, and other Corruptions, being refuſed by the Veins, flows out there copiouſly. Moreover, this putrifying pollution of an Iſſue being communicated to the blood, depraves in ſome part the whole maſs thereof, and ſo at leaſt (as alſo by too much loſs of the ſerous Juice) it is rendered leſs nutritious: Beſides, from the Sulphur of the blood diſſolved near the ſides of the Iſſue and flowing out with the Serum, the ſtreaming Ichor doth ſo ſtink, and black the Covering. Sometimes an Iſſue pouring out the ichor not immoderately, conſumes the ſpirits and ſtrength more than it ought, which really we take cogniſance of from the effect, and ſometimes not till afterwards; inaſmuch as ſome, while they bear about them one or more Iſſues, remain feeble and lean; but they being ſtopt preſently become vigorous and more plump. Moreover, it is a common obſervation, that many from an Iſſue raiſed near the head, have been preſently ſurprized with a certain defect, and weakneſs of ſight, inſomuch that they have been conſtrained immediately to heal it up: which ſeems to happen for this cauſe, for that where the proviſion of ſpirits is ſmall, and their conſiſtence very thin, the ſmall loſſes of them, or of the Juice from whence they are procreated, if ſo be they are conſtant, are difficultly endured. *Why they often pour out the humour too much.* *Why they expend the Spirits too much.*

But in another and different reſpect, Iſſues like Veſicatories are forbid to ſome, or very cautiouſly preſcribed, for when they evacuate little or nothing at all, they very much vex the place, where they are made. For in perſons endued with a cholerick, or hotter conſtitution, the maſs of blood being thicker than it ought to be, and leſs diluted with Serum, becomes more bound in its conſiſtence; in theſe the ſolution of Continuity being made and kept by reaſon of the Iſſue, the blood it ſelf (for that it doth not ſufficiently diſcharge its Serum, whereby it may go away) ſticks in the paſſage, and ſo being extravaſated, cauſes a very painful inflammation; and in the mean while, as it pours out little Ichor, it remains as well unuſefull as troubleſome. The operation and uſes of Fontinels and their indications being deſigned, we ſhall ſhew in what place, in what form, and with what inſtruments they ought to be made, and after what ſort to be managed. *Iſſues are likewiſe inconvenient when they evacuate leſs than they ſhould do.*

The places are appointed according to the ends or intentions of Curing by them, which chiefly are theſe three, *viz.* 1. A general Evacuation of humours from the whole body. 2. An Evacuation and alſo a revulſion from ſome particular member. 3. An Evacuation and alſo a derivation from ſome particular member. In reſpect of the firſt it is expedient that an Iſſue be made in the left arm; The ſecond Intention requires it far from the part affected, and the Third near the part. *The places of Iſſues are deſigned, according as the ends are Evacuation General, or Secondly, Evacuation and Revulſion, or both that and derivation.*

For theſe ends, *viz.* one while for this, another while that or the other Fontinels are made in all parts of the Body, *viz.* in the Head, Breaſt, Abdomen, in the Arms and Thighs, and in moſt parts of each of theſe, either by Inciſion, or Cautery, or piercing through, and in their holes or orifices Peaſe, or wooden Peaſe, Pellets or Pledgets, are put to keep them open. We will obſerve the principal places and kinds of Iſſues by running through the members of our body.

1. A Fontinel is preſcribed by ſome to be burnt by a Cautery in the Coronal Suture, and is commended for exhauſting and evacuating humours out of the brain and its outer Coverings. Although ſome uſe this in familiar practice, yet I have found by experience in ſome it doth leſs happily ſucceed, inſomuch that I have ordered many Iſſues to be ſtopt that have been made on the top of the head, being inſtructed herein from Reaſon and Experience; for that the blood transferrs more feculency towards the place where it was wont to lay aſide its recrements, and depoſites them in the whole vicinage, and chiefly in the part affected, (as being the weaker and more ſuſceptible part) whence a Diſeaſe is oftner augmented than cured. For the ſame reaſon, *viz.* for the derivation of the humours from the inner head outwards, 1. *In the Coronal Suture.*

PHAR. Part. II.

some form Iſſues in the fore-part of the Head over the ſagittal Suture, others in the hinder part of the Head about the beginning of the Lamboides, but the ſame exception remains againſt both as the former. And doubtleſs more rightly doth an Iſſue in the Arm anticipate the morbifick matter that is wont to be depoſited about the head, or makes revulſion in the Thigh, and raiſed a little beneath the head, derives from thence. For this reaſon in painfull diſtempers of the brain, and Meninges, we cut a deep hole in the Nape of the Neck in Children and Youths; but for thoſe grown up, and Old men, we apply Cauteries on either ſide the Spine between the Shoulders or the Homoplates, and in the ſame places we make inciſion for two Fontinels capable of many Peaſe, often with very great ſucceſs. As to holes cut or burnt behind the Ears, or a Seton with a skane of Silk drawn through the Lobes thereof, I have ſeen them rarely with any ſucceſs, but often very troubleſome: Inaſmuch as a ſolution of Unity made in theſe places, neither diſcharges much Ichor, nor for any long ſpace; for though the hole or orifice be fill'd with a Peaſe, or Pill, it will be covered in ſpite of all endeavours to the contrary by the Cuticula, or skin growing under.

Iſſues in the fore and hinder part of the head.

Between the Shoulders.

Which are profitable in many diſeaſes.

Iſſues in the back do notably help diſeaſes not only of the Head by Evacuation and derivation of the morbifick matter, but alſo in all Gouts, Stone and Colicks, by anticipating the fuel of the Diſeaſe, and by intercepting it while it tends to its ſeats: which really is plainly proved by experiments and obſervations taken from the help of the Patients.

Fontinels between the Shoulders, alſo in the Arm or Thigh, conduce to the evacuating or anticipating, in pectoral Diſeaſes, the humours flowing to the Lungs, and to the drawing back thoſe depoſited there. How an Iſſue cut in the Cheſt between the Ribs doth ſometimes more immediately derive the conſumptive matter from the Lungs, we have elſewhere ſhewed.

An Iſſue in the left Hypochondrion.

The Region of the Abdomen ſeems unapt for bearing an Iſſue in any part thereof; notwithſtanding the practice of ſome, although it be more rare, is much fam'd for a large Iſſue capable of many Peaſe to be burnt with a Cautery upon the Region of the Spleen for any hypochondriac affection. I have known it of ſmall benefit to ſome, at leaſt not recompenſing the trouble and pain of ſuch a remedy.

In the Groin.

Some time ſince I ſucceſsfully cured a weakneſs in the Loyns obſtinate to all other remedies, by a Fontinel in the Groin, and in another Patient an inveterate Sciatica. For ſurely the glandulous Emunctories ſettled in that place, do imbibe very many recrements of the blood and nervous Juice; which if they be throughly and continually diſcharg'd from them by a fit vent, it will much conduce to exempt the contiguous parts from any morbifick Mine.

In the Thigh.

The Thigh being a member ſoft and large in bulk, ſeems apt enough for enduring many and great Iſſues, to wit, thoſe which may purge away plentiful humours from the whole body. Yet it doth not ſucceed ſo with many Patients, partly becauſe of its figure too much declining, like a Cone invers'd, the Ligature containing the Peaſe in the orifice is not eaſily kept on, and partly becauſe a ſolution of the Unity being made among the concourſe of ſo many Tendons, it frequently becomes inflamed and painful; inſomuch that ſometimes it hath been neceſſary that it ſhould immediately be ſtopt up, to withdraw the trouble of pain and of lameneſs. Notwithſtanding it ſucceeds better in ſome Patients, for that an inflammation doth not always enſue upon the place where the inciſion was made, and that the Ligature has remained immovable to thoſe that tye their hoſe above the knee.

A fit place in the member to be choſen that it may be made far from Veſſels and Tendons.

Moreover, as concerning Iſſues, it is requiſite to chooſe a convenient place not only in the body, but alſo in the very member where inciſion is made, which chiefly calls for the judgment of an expert Phyſitian or Chirurgeon; for careful proviſion muſt be made, leſt a Cautery or inciſion be made upon, or too near the Tendons or greater Veſſels; but let the Fontinel be made not in the very body of the muſcle, but in the interſpace or diſtance between the muſcles where the orifice, as *John Heurnius* learnedly obſerves, ought to paſs through the whole skin ſo far, untill the little membrane of the muſcle underneath be penetrated. Wherefore this part of Chirurgery is not raſhly to be allowed to Quacks and others ignorant of Anatomy, for that from this being ill done, not only a fruſtration of the benefit, but from thence frequently great miſchief happens, and ſometimes to the hazard of life.

Symptoms accidental to Iſſues how to be cured.

It is not needful to deſcribe the figure and uſe of the cutting Inſtrument, together with the manner of preparing and compounding Cauſticks for making Iſſues, inaſmuch as it is notorious to the common people; yet it behoves us to handle in what manner the ſymptomes which happen to theſe Emiſſaries after they are made, may be cured, and it will not be beſides the matter to diſcourſe, what do either impede or pervert their powers.

Whereas

PHAR. Part. II.

Whereas many and ſeveral diſtempers happen to Iſſues, help is not required for them all, but only for ſuch as are of greateſt moment: Wherefore there will be need of help. 1. Whereſoever an inflammation enſues upon the part or place where it is. 2. If the Orifice vent more or leſs Ichor than it ought. 3. If the Ulcer ſhall be apt ſpontaneouſly to be dryed up, and cover'd over with a skin: or if it be prone to abound with ſpongious fleſh growing about the ſides. As to leſſer faults, as when the Ulcer ſhall break forth into frequent Hemorrhagies, or change its place creeping into another leſs convenient, with many other ways by which it prevaricates, it will not be worth our labour to diſcourſe here. *What chiefly require help.*

1. An inflammation frequently happens to an iſſue, and that ſo painful ſometimes, that it threatens a Sphacela, yea and ſometimes cauſes one. But ſuch an affection enſues either upon the orifice new made, or happens afterwards by reaſon of the blood and humours, occaſionally agitated and ruſhing frequently and in heaps to that part. *1. Inflammation.*

When a Fontinel is made, immediately by reaſon of ſolution of the Unity, and conſequently by reaſon of the circuit of blood ſomewhat hindred in that place, a certain inflammation and ulcerous pain happens to ſome Patients; but in ſome endued with a fervent blood, and whoſe Serum is leſs diluted, this enſues much fiercer. For the blood being brought thither by the Arteries, the ends of the Veſſels being cut off and obſtructed, it can neither go out nor be returned immediately by the veins, but ſticking there in the paſſage it is accumulated more and more, and being at length extravaſated, and filling and ſtopping all the Pores of the contiguous skin and fleſh, it raiſes a tumour with redneſs, and heat moſt intenſe, which coming to paſs, either the blood ſo heaped up, and extravaſated, in a ſhort ſpace of time becomes immovable by reaſon of conſtipation, and for that cauſe being as it were divided from the reſt of the maſs, it is extinguiſhed; and ſuffering death produces a Sphacela upon the part: Or ſecondly, the blood ſo ſtagnating, is after a ſort agitated as to its particles, and enjoying always a vital flame, and made more intenſe by the ſame, it is as it were boyled throughly, and ſo is changed into a Pus, to be evacuated by an abſceſs: Or thirdly, which happens more frequently, and ought always to be procured in our caſe, the blood provoking an inflammation is reduced into the Veſſels and reſtored to Circulation by other paſſages whereunto it is conſtrained. *Which happens to a new Iſſue, the reaſon of it and Cure propoſed.* *An Inflammation hath three manner of Criſis's.*

But that it may be reduced, theſe two things will be neceſſarily requiſite: Firſt, That it be much diluted with the Serum flowing thither abundantly, or rather thruſt forward into the part: Then ſecondly, that the Veſſels behind the Tumour being emptyed, may ſwallow up the blood diluted, and driven back by the Serum; for the blood being forced towards the Tumour, when as it cannot advance forward, yet its bulk being diminiſhed; that it may be able to return back, it diſcharges the Serum plentifully from it ſelf, and drives it forwards into the places obſtructed; which entring under the ſtagnating blood, dilutes it, and ſucceeding into its places, forces it back into the paſſages of the Veſſels, and in the mean while that Serum tending forward exhales by the pores; inſomuch that the blood which was extravaſated being diluted and forced back by the Serum, and the Serum it ſelf evaporated, the ſwelling with the Inflammation vaniſhes leiſurely away. But if (as in more hot temperaments it comes often to paſs) the blood being extravaſated and impacted in the pores, be not diluted by the Serum brought to it in great plenty, it will not only ſtick there pertinaciouſly, but it will irritate a fiercer Phlogoſie with a Feaver, and ſometimes other dreadful ſymptomes. So, not long ago, when a renowned Divine, endowed with a thicker and hot blood, had an Iſſue cut in the inſide of his Leg, although the skin only was cut, an inflammation followed preſently, which within few days ſo cruelly encreaſed, that it could hardly be impeded by any Remedies from degenerating into a Gangrene. Wherefore, when the blood being extravaſated through the ſolution of the Union, and wanting the afflux of the Serum whereby it may be diluted and brought back, proceeds into an Inflammation, Fomentations and Cataplaſms of Emollients being outwardly adminiſtred, do often-times bring help; inaſmuch as the moiſt and ſoft particles falling from theſe, go under the blood ſtagnating, and dilute it, and ſo pleaſingly moving it together, cauſe it to return the more eaſily into the Veſſels; hence it is, that the moiſt applications of this kind being adminiſtred outwardly, do ſupply the defect of the intern Serum requiſite to dilute the blood; notwithſtanding that the blood being ſo diluted and irritated into motion, might be rendered fit for its Circulation, there is alſo need that the Veſſels which ſhould receive it ſhould be enough emptyed, for which purpoſe Phlebotomy and Purgation are frequently of neceſſary uſe, beſides a ſlender Diet. And indeed according to uſual cuſtom, we purge Cacochymicks or Plethoricks a little before, or after the Iſſue is made, and frequently breath a vein in thoſe Patients. Neither are theſe Remedies only fit in *The ordinary and beſt of theſe is, that the extravaſated blood may be reduced.* *How it is done.* *What Remedies there is need of.* *For this end oftentimes purging and bleeding are required.*

PHAR. Part. II.

in an Issue made, to provide against or discharge an Inflammation, but also they are advantageous as often as that distemper ensues upon an old Orifice of the skin. For as often as the blood being very impure, and together growing feaverishly hot, doth enter into a separating turgescence, it frequently happens that it discharges its recrements and feculencies, otherwise unapt to be purged out, about the Fontinel, and there being impeded in its Circuit by them accumulated together, it is extravasated, and for that cause brings on a fierce Phlogosis. Such an affection not long since happening in a renowned ancient person, and being neglected from its commencing, within a short space of time degenerated into a Gangrene; notwithstanding from which by the help of appropriated remedies carefully exhibited, as well inward as outward, he escaped not without great danger of life. At some other time hereafter perhaps, when treating of Cutaneous diseases, we will speak more largely of the Ætiologies and Remedies of an Inflammation, and of an Abscesse or Impostumation and Spachela. At the present we will consider the other Symptomes of Fontinels.

An Inflammation sometimes happens to old Issues.

2. Whenever an Issue throws out too much Ichor, which for the most part is thin and very stinking, and sometimes discoloured, so that the so vast loss of humour, and that stinking, not to be endured, do require a Remedy; in such a case there will be two chief Therapeutick Intentions, *viz.* First, that the mixture of blood be strengthened, lest its consistence should be too prone to dissolution and serous efflux: Secondly, That the tone of the place ulcerated by the Fontinel be preserved, and rendred exempt from any putredinal ferment, so that no taint being there lodged in secret, do impart any pollution on the blood passing through in Circulation, whereby it being infected, might presently go into parts, and the Serum be constrained there to discharge it self more abundantly.

2. An Issue pouring out too much and stinking Ichor requires remedy.

Of which there are two Intentions.

This former scope of Curing enjoyns scarce any thing but moderate purging by intermission, and a regular Course of Diet, *viz.* that the Patient be restrained from all surfeit and excess, as to the plenty of Nourishment, the quality, and seasons of receiving it; likewise more especially from small Wines, Cider and other acid liquors, whereby the blood is wont to be dissolved into effluxes. For indeed those that are so affected, do smartly pay for any error or irregularity in Diet, pain being immediately irritated about the Issue.

First, that the Temperament of the blood be restored.

For due preservation of the tone of the place where the Issue is made, and exempting it from putrefaction, let sedulous care be endeavoured, that all nastiness be declined, that both the solid things put into the orifice, as also the Coverings, whether Plaisters or Leaves of Ivy, or Oyl cloaths, be changed twice every day; for in some persons any of these will quickly contract a stench, and presently cause the Ulcer of the Issue to putrifie. But if this tends to putrefaction, immediately in place of a Pease or wooden Pill, let a Pill of Virgins Wax be put in, incorporated with red Sanders and Verdigrease: Moreover, let a Fomentation withal, Morning and Evening, with the Decoction of St. *John*'s-Wort, Yarrow, Centaury, *&c.* be made use of.

Secondly, to preserve the tone of the part ulcerated.

3. Sometimes a Fontinel like a dry Fountain pours out little or no humour; the reason whereof is usually, either for that the orifice being not deep enough, doth not penetrate the whole skin, which is cured by piercing it deeper; or the Ulcer though hollow and large enough, yet remains always dry, because the Serum doth not easily nor in plenty separate from the mass of blood, by reason of its consistence being too much bound up; and then the only remedy is, to wear solid things within the Orifice, which may more provoke or twitch the mouths of the Vessels, for which purpose Pease made of Ivy-wood, or Box, or of the roots of Gentian or Hermodactyls, are often used with success.

Thirdly, a dry and troublesome Issue requires help.

4. It often happens, that the Orifice of an Issue being too shallow, and sparingly sweating out Ichor, is grown over with a thin skin with the Pease included therein, and the deep hole is healed up quite; for which fault there is scarce an apt remedy to be administred. Wherefore it is better to close that Issue (rather than always in vain to fret the skin) or transfer it to some other place.

An Issue sometimes will heal up notwithstanding all endeavours to the contrary.

5. The sore of an Issue tending to healing, and being forbidden, often procures a spongious flesh about the edges, and sometimes in the hollowness it self; the reason whereof is, because the nutritious liquor being conveyed to the ends of the Arteries and nervous fibres, and being not immediately washt away by the serous Ichor, fixes there, and beginning to be assimilated stretches out both these vessels to fill the cavity with flesh, and into these rudiments of flesh both the blood and Animal spirits flow most copiously; and the blood in the mean time being conveyed thither, forms sprigs of veins within that bulk for its return: Notwithstanding this flesh as yet rude and without shape, being excluded for the most part from the hole, grows up over the edge; and when in this manner it rises higher than that it may possibly be covered

Sometimes it hath spongy flesh growing about the lips.

covered and cloathed with skin and Cuticula, it remains always naked and ſpongious. This excreſcency is eaſily enough cured by ſprinkling thereon Eſcharotick powders, of burnt Alum, Colcothar, or Mercury precipitate; for remedies of this kind do eat away the fleſh ſo luxuriating by their acrimony as well as ſtiptickneſs, repel the nutritious humour, and lock up the mouths of the Veſſels. As often as that ſuperfluous fleſh encreaſes about the ſides of the Iſſue, it is a ſign that the nutritious humour flows thither more plentifully than the excrementitious; and for that cauſe in Patients ſo affected that vent proves not always ſo benign. Wherefore, under pretext of this reaſon many are averſe to that remedy (though ſurely it is harmleſs to moſt, although not alike uſeful and advantageous to all.) We have before conſidered the chief diſadvantages thereof, as likewiſe the ſcandals objected thereunto; yet there remains another thing according to the opinion or rather error of the Vulgar, a notable objection againſt Iſſues, which we will here diſcuſs for a Concluſion.

PHAR. Part II.

The reaſon there of delivered.

With many in *England* a contumacious opinion is grown up (I know not whether it be ſo in other Countreys) That one or more Fontinels diſpoſe to barrenneſs. Wherefore this kind of remedy, however otherwiſe conducible to health, is ſcrupulouſly forbidden to all marryed Women that deſire Children; of which Prohibition there is no reaſon as yet made out, but only Stories related of certain Women that have been barren having Iſſues; when it were as eaſie to enumerate more barren women without Iſſues, and many others that have been fruitful with them: and truly I uſe to retort (whenas there is no need of any other refuting) this as a chief Argument againſt that opinion.

The common error is, that Iſſues diſpoſe to barrenneſs.

SECT. III. CHAP. V.

Of the Diſeaſes of the Skin, and of their Remedies.

After Attractive Remedies of the *Cuticula* and Skin, namely Iſſues and bliſtering Medicines delivered before, by a certain Law of Method we are induced to handle Diſeaſes of thoſe parts; and other kinds of Remedies of divers ſorts the true Ætiology of which will afford matter of moſt pleaſant as well as profitable ſpeculation.

As for the fabrick and uſes of thoſe parts, it needs not that I ſhould here repeat all things already accurately deſcribed, and well known in Books of Anatomy. It may ſuffice us to note concerning the *Cuticula*, that this outward skin is thin, and denſe, without blood and without ſenſe, as deſtitute of Veſſels and Fibres, which cleaving to the inward skin, covers and defends it from outward injuries. This is every where full of pores, into what orifices the Veſſels diſcharging ſweat do open, which *Malpighius* viewing more accurately with a Microſcope, a little before their gaping or opening, affirms to be endued with little Valves, for the retaining or free breathing forth of ſweat: but I confeſs they lye hid to me.

A Deſcription of the Cuticla.

The *Cuticula* being taken away by Fire, or Phœnigmons, the skin appears naked, and looks red by reaſon of the ſanguiferous veſſels. But this is a thicker membrane, as to its greateſt parts, formed of filaments of Veſſels bringing blood, of Nerves, and of nervous Fibres, variouſly interwoven and complicated among themſelves, among which numerous Glandules and Lymphaducts, or Veſſels diſcharging Sweat and Vapours, are thickly interpoſed. The ſubſtance hereof is related to be double by moſt Anatomiſts, the outer is nervous, the inner fleſhy, or rather glandulous; for an example of which the Rind of an Orange is brought. If the skin be viewed naked by a Microſcope, by the renowned *Malpighius*'s obſervations, Firſt there preſents it ſelf a body in form of a Net, in whoſe thick holes are contained not only paſſages of Sweat, but alſo very many Teats in form of a Pyramid, riſing out of the skin in parallel ranks and paſſing into the *Cuticula*, where being ſtretcht out in length, they are divided as it were into many little Fibres; which the ſame Author hath determin'd to be the ſenſe of touching. Beſides theſe, the ſubſtance of the skin contains very many Glandules, by which means the Lympha or watery matter is carried by the Lymphaducts or excretory Veſſels, out of the Arteries to the Pores. For indeed the moſt accurate *Stenon* hath obſerved, *that its Glandules lye under every pore*; which become either greater or leſſer, according to the uſe of ſweating: the ſweat or vapours continually

Of the Skin.

The Pyramidal Papillæ the Organ of feeling.

The Pores and Glandules of the Skin.

PHAR. Part. II.

continually ſtreaming out of theſe by the excretory veſſels, avoiding the excrements, do moiſten the nervous Teats in their paſſages, leſt perchance they ſhould grow dry.

The Pores two-fold, greater and leſſer.

As to the pores or paſſages of Sweat they are diſcovered by a Microſcope to be of two kinds, *viz.* The greater, in moſt of which the roots of the hairs are implanted, and by interſpaces on both ſides of each wrinkle of the skin, are diſpoſed in a parallel rank: Or, ſecondly, they are the leſſer Pores, which being numberleſs, do fill up all the ſpaces between the former in moſt thick Punctums or pricks. For indeed the whole skin with its wrinkles, appears like a Field furrowed by a Plow, and afterwards harrowed with the ranks turned, or rather oblique; ſo that its ground being eminent above the furrows of either kind, there remain in its plain, Figures very much of a Rhomboidal or a Diamond-faſhion; and accordingly as thoſe furrows, with their banks or flattes, are either ſhorter and leſs, or deeper and greater, the texture of the skin appears either delicate and thin, or thick and courſe. This kind of Conſtitution although it be moſt owing to ones birth, and to the primogenial growing together of the humours, is however manifoldly altered by reaſon of the various accidents of the enſuing life. A more groſs Diet, difficult labour, injury of Air, and chiefly exceſs either of heat or cold, render a skin more rough: alſo contrariwiſe a nice and delicate education renders its tone more fine and ſoft.

The wrinkles and furrows of the Skin.

From whence the Roughneſs or Fineneſs of the skin.

Depends much on the Humours filling the Pores.

That the skin may become more neat, ſmooth and equal, it avails much that all its pores be filled with a benign, mild and unctuous humour; for ſo, whileſt all its pores become full and extended, the level of the whole skin appears more ſmooth: Notwithſtanding if a vicious humour furniſh thoſe pores, or the benign humour that was in them be too much exhauſted, for that cauſe the skin will become rough and full of wrinkles. Wherefore if any endowed with a moſt ſoft and even skin, ſhall wet their hands in a Soap Lather, Lie, or Lime-water, or alſo for ſome time in warm Blood, preſently the furrows and wrinkles will grow greater and deeper, the ſaline humour being drawn out by the other Salts out of the pores; wherefore more delicate women ſcrupulouſly decline waſhing with Soap, or any other things that furrow the skin.

From the ſudden ſhutting up of the pores.

Neither only the humour being too much exhauſted out of the pores, but alſo retained in the ſame either unduely or above meaſure, doth render the skin rough and unequal. The hairy pores (which though they are not the only, yet are much the paſſages of Sweat) do conſtantly ſend out more plentiful Effluvia's for the ſake of tranſpiration, wherefore they ever ſeem greater and more open; but if it ſhall happen that theſe are ſuddenly obſtructed by any outward cold, the Vapours being reſtrained within, they do every where ſwell up the skin about the places where they break out, and lift it up into little heaps: from hence if at any time our bodies are expoſed naked to the Northern wind, or are plunged in a River, the exterior Superficies before ſmooth and ſoft, will become rough and rugged like the skin of a Gooſe new pull'd. Without doubt thoſe greater pores, being, according to the furrows of the skin, planted parrallel, and as it were in a rank after the manner of a *Quincunx* or exact Square, are made as ſo many pitts for the planting of hairs as it were trees; for ſo they appear in four-footed Beaſts, and in ſome hairy parts of men.

In the larger pores are the roots of the hairs.

Theſe things being thus briefly declared concerning the *Cuticula* and Skin, as touching their frame and uſes, there is way enough made to ſearch and unfold the Diſeaſes of the ſame parts, and the reaſons of healing them.

No Diſeaſes of the Scarf-skin.

Wherefore firſt ſcarce any Diſeaſes properly belong to the *Cuticula*, it being devoid of life and ſenſe. This ſometimes being too thick hinders Tranſpiration, and alſo ſometimes by reaſon of accidents in ſome places it grows too thick and callous: but it ſelf being clearly unſenſible it is never ſick, notwithſtanding this is a cauſe that ſome diſtempers which might be blown off by Tranſpiration, do cleave to the ſuperficies of the skin, inaſmuch as the dregs of the blood, and humours, and recrements being thruſt forward outwards, having paſſed through the whole skin, when they cannot evaporate wholly by reaſon of the thickneſs of the Scarf-skin, being faſtened in the outer skin, produce various diſcolourations, and ſtains thereof; of which ſort are thoſe ſpots called Heat-ſpots, Freckles, or Ephelides, as alſo ſcorbutical and malignant ſpots, alſo Pimples and whatſoever other ſtains without any ſwellings or roughneſs do ſeem to beſprinkle the skin or outward Scarf-skin, with marks, or ſome little disfigurings.

The cauſe of ſome.

The Cutaneous diſtempers reckoned up.

But truly as to what belongs to the diſtempers of the Skin it ſelf in general, ſince they are various and manifold, they are wont to be diſtinguiſhed under a various reſpect, and chiefly that they are either with or without a Tumour; we have but now taken notice of theſe latter ones.

Diſtempers in the skin with or without a tumour.

Diſtempers of the Skin with a Tumour, are either univerſal, diſperſed throughout the whole body; or are particular, being raiſed in theſe or thoſe members, diſperſed or as it were by chance.

The

The former either happen upon a Feaver, as chiefly the Small-pox, Meaſles, or other malignant wheals, whereto alſo may be added the fleeting puſhes of Infants; or happening without a Feaver, as the Itch, Tetters, and leprous diſtempers.

The outward particular Tumours, or diſperſed ones, for the moſt part do not ſeize upon the skin only, but alſo upon the parts ſubjected, *viz.* now the carneous, another while the tendinous, or membranous or glandulous, and for that cauſe do exiſt of a ſundry diſpoſition, and of a diverſe form. To diſcourſe particularly concerning all theſe, and to aſſign the reaſons of their Cauſes, and Cure of every one, would be a matter not only of an entire Tract, but of a great Volume: Wherefore, for the preſent we will only briefly ſpeak of the Diſtempers merely or for the moſt part Cutaneous (of which ſort are all Spots and Pimples, as alſo the Scab, or Itch, Tetters, or leprous Maladies:) perhaps, an opportunity may happen, when I may treat more ſpecially of Tumours of every kind.

1. Spots call'd Ephelides.

Firſt then (that we may begin with Spots as Affections of leſſer moment) theſe offer themſelves called *Ephelides*, becauſe they are chiefly cauſed from the Suns heat; for that cauſe frequent in the Spring, and increaſe moſt in Summer, again in Winter they ſoon vaniſh. Moreover, whereas they happen in the more beautiful perſons, and of a thinner skin, they break out chiefly in thoſe places where the *Cuticula* is moſt thick, and is expoſed to the Sun and Air, *viz.* the face and hands, of a colour yellowiſh or brown, in magnitude of a Flea-bite, but they exiſt unequal and irregular as to their Figure. *The diſcription of the Ephelides.* Theſe differ little or nothing from thoſe browniſh or yellowiſh ſpots which ſome call Lentigines or Freckles, which conſiſting of the bigneſs of a Lentil, mark the parts of the face as it were with many drops.

The matter and cauſe thereof.

The matter of theſe ſeems to be a more thin portion of the cholerick humour, allured outwards by the force of the Sun attenuating it, and opening the pores of the skin; which beginning to be evaporated, is fixt to the inſide of the outmoſt skin or *Cuticula*, which it cannot paſs through. Surely it is a ſign theſe ſpots proceed from Choler, or other yellow ſcums of the blood, becauſe they are chiefly familiar to them whoſe hair is yellow. Moreover, the reaſon is manifeſt enough, becauſe they ariſe more often in a fair Complexion, and in thoſe parts expoſed to the Sun and Air; for their more thin skin tranſmits the humour rarified by the ſolar heat ſo far until it is retained by the thicker Scarf-skin, near the places of iſſuing out. This affection preſages or indicates no evil, as to the ſtate of health; and although in appearance it repreſents ſomething of deformity, notwithſtanding that is made good again, inſomuch that it ſignifies them ſo ſpotted, to be endued with a more pure Conſtitution.

Lenticular Spots.

Beſides theſe ſmall freckly ſpots there are others much larger, above a hands breadth in magnitude, which deform the skin in divers places, eſpecially about the breaſt and back, one while with brown, another while with pale or blackiſh ſpots. Theſe at certain times, as I have obſerved in many, being wont to ariſe in certain parts and vaniſh again, are commonly called Liver-ſpots, and thoſe moſt markt with them are thought to have a Liver leſs ſound, or at leaſt not well ſanguifying; which notwithſtanding is not true on this account, but only inaſmuch as the cholerick humours, when they are not enough ſeparated from the maſs of blood within the Liver, being thruſt forward to the skin do ſo diſcolour it: which fault alſo is imputed to the Spleen; for truly this deformity ariſes, becauſe that the feculencies and excrements of the blood, when not enough received by the Veſſels of ſeparation, are together diluted with the Serum, with which they are conveyed to the skin, and in the ſame place being caſt off by the blood, and deſerted by the ſerous Juice while it is evaporating, they are faſtened about the outer little holes or pores, even as a moſſie down cleaving to the ſtrait places of a River.

Liver Spots falſly ſo called.

The deſcription and cauſe of them.

Theſe ſpots chiefly appear in Summer, and moſt upon the Breaſt and Back, *viz.* at which time and in thoſe places men are moſt apt to ſweat: for that ſerous Juice which brought out thoſe dregs from the maſs of blood, into the ſtrait places of the skin, leaves them there, altogether unable to evaporate. This indiſpoſition hath nothing of evil joyned to it, nor is it a ſymptom of any preſent diſeaſe, nor doth it preſage any ſuddenly approaching; Moreover, when for the moſt part it happens to places that are covered, and brings no deformity or trouble, there ſeems little or no need of Cure: but becauſe an opinion is frequent with the Vulgar, that the Liver is eminently endangered by theſe ſpots, and neceſſarily requires Medicine, for this cauſe to ſatisfie the importunate, craving Medicines, we are wont to preſcribe, beſides extern Coſmeticks, even inward hepatical Remedies; whoſe uſe although not very neceſſary, yet becauſe from thence the depuration of blood, and opening obſtructions of the bowels are diſpatcht, they are not altogether in vain. The inward Medicines profitable to this de-

PHAR. Part. II.

ſign, are deſcribed before among the hepatical Remedies: The Topical or outward are altogether the ſame in theſe as in any other kind of ſpots; ſome ſelect forms of which we will annex.

Peſtilential and ſcorbutick ſpots.

Concerning Peſtilential, as alſo Scorbutical ſpots, of which we have purpoſely in another place ſpoken, there is no need here to repeat the ſame; eſpecially becauſe for theſe another method is required, than for thoſe but now deſcribed; inaſmuch that in one kind of ſpots, Medicines for the moſt part outward are wont to be adminiſtred, without Splanchnic or Cordial medicines, but in the other kinds only inward medicines, without any that have reference to the Skin.

The Cure of the Spots.

Wherefore, as to the ſpots called Freckles, Lentigines, and thoſe commonly called Hepatical, they properly belong to the Art of Beautifying; and for the taking away theſe Deformities, of the Skin, only Coſmetick Remedies are preſcribed, without any method of healing. There is every where a plentiful harveſt of theſe with curious Ladies, and others, that are ſolicitous of cleanſing their skins; yet all theſe, foraſmuch as they only reſpect two Intentions of healing, may be reduced to theſe two heads; *viz.* either by opening the pores of the skin and Scarf-skin, and ſometimes by excoriating this, they do endeavour to have the humour drawn outward, and alſo to be evaporated; or on the other ſide, and not with leſs ſucceſs, thoſe things are adminiſtred that may drive back the ſpotty matter, and force it inward. We will annex here in order ſome uſual Forms of the Topicks of either ſort, being rationally found out, and frequently made uſe of happily enough; becauſe it is not lawful without offence of the Great Ones to detect the more ſecret myſteries of the Coſmetick Art, and to profane it among the Vulgar.

Forms of Coſmeticks.

1. Which cleanſe the skin.

Firſt therefore for cleanſing the skin, and drawing forth the matter of Spots:

Take of a ſmall ly of Salt of Tartar four ounces, Oyl of bitter Almonds made by expreſſion, as much as ſuffices, in ſuch a proportion let it be mingled, that the liquor turn preſently white, and ſo remain; with this mixture let the parts be anointed morning and evening, and gently chafed.

Take of Aron-roots, Bryony, Solomons-Seal, of each one ounce, Powder of Fenugreek-ſeeds one dram, of Camphir half a dram, theſe being beat together, pour on them three ounces of Oyl of Tartar per deliquium, *let it be preſſed and applyed with a rag twice aday.*

Take of quick Brimſtone in powder one ounce, black Soap two ounces, tye them in a rag, and hang them in a pint of Vinegar for nine dayes; after let it be uſed by waſhing the part twice aday, and chafing it.

2. Which repell the ſpotty matter.

Secondly, for the other intention of diſcuſſing the ſpots from the skin, and repelling their matter inwards, *Lac Virginis* was a renowned Remedy among the Ancients, and is as yet commended and made uſe of by many: The Preparations are well enough known, *Viz. A Solution of Litharge made in diſtilled Vinegar, by pouring of Oyl of Tartar* per deliquium, *it is precipitated into a white liquor like milk, with which let the face and hands be waſhed twice aday, and gently chaf'd. A remedy like this or of the ſame vertue is prepared out of the ſolution of red Lead or Ceruſe made in the ſame Menſtruum, and precipitated with Alum Water, or a Solution of Sal Gem. Or,*

Lac Virginis.

Take of Camphir ſliced two drams bruiſed in a glaſs Mortar, pour thereon leiſurely the juice of one Lemmon, then add one pint of White-wine, ſtrain it, and let the remaining Camphir tyed in a rag be hung in the Glaſs.

Take Verdigriſe four Ounces, pour thereon two pints of White-wine Vinegar, being put into a Cucurbite-glaſs, let them be diſtilled in Sand, let the Phlegme be kept for uſe, with which let the face be anointed twice aday.

For this purpoſe alſo the Phlegm of Vitriol doth notably conduce. It ſuffices ſome to uſe the diſtilled ſimple water of Bean-flowers, or of Fumitory, or the liquor of a Vine diſtilling from the Boughs cut in the Spring-time. Notwithſtanding the more nice, and thoſe who chiefly boaſt to underſtand this Art, are ſcarce content with any Remedies but Mercurial, wherefore the following water is commended and ſold by Empiricks at a great rate againſt all foulneſs of the face whatſoever.

A Mercurial Coſmetick water.

Take of Mercury ſublimate one ounce powdered, put it in a Tin Veſſel with three pints of Spring-water, let them ſtand twenty four hours ſpace, ever and anon ſtirring it with a wooden Spatula until the whole liquor grows black, which notwithſtanding being philter'd through brown Paper, becomes clear; with a rag or a feather dipt in this, let the face be gently done over once or twice in aday.

This

PHAR. Part. II.

This Remedy doth moſt notably help againſt all cutaneous Deformities, *viz.* inaſmuch as it drives away the humours within the little pores, and thoſe impacted within the little holes howſoever ſmall, diſſolves the inveterate and ſtubborn combination of Salts or Sulphurs, and reſtores the whole skin, (where it is applyed) though evilly framed as to its pores, and makes it well coloured. Wherefore it is uſeful not only to cleanſe the ſpots of the face, but alſo to take away wheals and its redneſs, as alſo the Diſeaſe of the Eriſypelas. Moreover, ſometimes it happens that many parts of the face, eſpecially the Noſe and Forehead, are markt with moſt thick Specks looking black, as if burnt by Gun-powder, which proceeds from hence, becauſe the ſudatory pores are ſometimes fill'd with a more thick black humour, another while with little worms with black heads (which little Inſects being ſqueezed out of the pores, and expoſed to the Sun, are eaſily ſeen to live, and to move themſelves) and in ſuch a malady of the skin, no Lotion or Oyntments are wont to profit, but what are Mercurial; notwithſtanding to this Hony there is a Thorn at hand more than enough malignant. For the particles of the Mercury together with its Salts (by which they are divided and ſharpened into ſmall bits) being applyed to the face, do ſhake off the pecant and uncleanly matter out of the Pores, and expel it thence, but having driven it back, they purſue it in, and readily inſinuate with the Blood and nervous Liquor, whoſe temperaments they prejudice. Yea by meeting with theſe they imprint very often on the Brain and ſometimes on the Præcordia and other parts, their virulency that can never be wiped out. From hence it is frequently obſerved, that women or men that have long uſed Mercurial Coſmeticks, are troubled with a Vertigo, and convulſive Diſtempers, or are obnoxious to paralytical, and their Teeth grow black, and ſometimes fall out.

Its Vertue.

Its familiar uſe is not ſafe.

SECT. III. CHAP. VI.

Of the Mange or Scab with the Itch.

After the more ſimple maladies of the skin, *viz.* thoſe which happen without any Tumour and Ulceration, and only deform it with ſpotted appearances, we will now in order treat of the more grievous Affections, and thoſe which diſſolve the Unity, and eſpecially of the Pſora or Scab, which in ſundry and frequent places of the whole Body doth much infeſt the skin with a painful Itch, and with ſmall puſtles and breakings out, being ſometimes dry and often ſcaly, and another while moiſt and diſpoſed to ulceration; and a malady of this ſort is moſt properly the Diſeaſe of that part, conſidering it frequently begins in the very skin by reaſon of ſome outward Contagion, and often receives Cure by certain Remedies applyed to the skin only, at leaſt the reaſon of both holds ſo far, that it is ſeldom otherwiſe undertook or perfectly cured.

Pſora a diſeaſe properly cutaneous.

The Pſora or Scab is vulgarly deſcribed to be a breaking out of Puſtules and wheals throughout the whole body, here and there, procured from a ſharp and ſalt humour heaped up in the Pores of the skin, and that it may be diſcuſſed from thence induces a notable Itch, and a neceſſity of ſcratching.

Its deſcription.

That we may ſearch duly into the cauſes of this Diſeaſe, and the reaſon of the ſymptoms, we will more deeply enquire concerning the matter effecting and the conjunct cauſe thereof, that it may certainly be known of what ſort that humour is which is heaped up within the skin, by what means it is either generated there, or comes from ſome other parts, afterwards in what pores or little places it is contained, and how endeavouring to break out, it doth create ſo troubleſom an Itch.

Wherefore about the origine of this Diſeaſe, that we may not impute the fault with the Ancients to the Liver or Spleen, the matter thereof is not any particular humour of the four commonly ſuppoſed ones, not Phlegme, nor yellow Choler, nor black, neither only the blood apt of it ſelf to be extravaſated; moreover neither doth it ſeem to conſiſt of two or more of theſe humours mixt together. For though ſuch humours be granted, notwithſtanding if this Diſeaſe always conſiſts of them, it would not ſo eaſily be catch'd by a meer and light contagion, or receive Cure by an Oyntment alone. Wherefore it is rather to be ſuppoſed, that the morbific matter is the humour of the Lympha conſtantly reſting in the glandules of the skin; notwithſtanding

What humour its matter is of.

Not any of the four common humours.

But a humour plac'd in the Glandules of the skin.

PHAR. Part. II.

degenerating from its genuine diſpoſition, that is to ſay, its volatile ſalt, into an acid or otherwiſe offending diſpoſition. For when the continual Supplements from the blood come to this ſo depraved, and unceſſantly evaporating, theſe Juices new and old do not eaſily agree, or are united, but boyling together after the mutual cuſtom of diſſimilar Salts, they are coagulated into a recrementitious matter, which filling and diſtending the pores of the skin, every where raiſes it into Tumours; Moreover it ſomething hinders the Blood in its paſſage, and conſtrains it to be extravaſated. From hence thick Puſtules are raiſed, and becauſe that matter paſſing into an Ichor is compelled by the Serum and Blood purſuing it ſtill forward, they riſe up into little heaps; afterwards the Animal Spirits entring inordinately into the nervous Fibres, that they may promote the throwing off that Ichor, do cauſe the ſenſe of that troubleſome itch.

The deſcription of that Juice or Humour.

Indeed an inſpection with a Microſcope doth moſt clearly diſcover that there is a lymphous humour in the glandules of the skin which lye under all the ſweating pores, treaſured up for ſome uſes, ſo that according to the plenty and diverſe ſtay thereof, theſe Glandules exiſt more or leſs turgid. This Juice is laid aſide by the Blood, through the Arteries, in theſe Glandules, that this little burthen being caſt off, it might return more eaſily through the veins; in the mean time being repoſed there, it hath its uſes, *viz.* In the firſt place continually moiſtening the miliarie Teats, which lying under the nervous little Fibres, are the proper Senſory of Touching, it preſerves them from dryneſs, which would hinder the Senſe; alſo it imbues the aduſt effluvia's paſſing unceſſantly from the blood being kindled, in their paſſage near the skin, with a certain moiſture, and renders them fit to be voided by the pores; and whileſt part of this humour doth ſo continually evaporate with the Effluviums of the blood, thoſe expenſes are repaired by the Lympha continually freſh, being depoſited by the Arterial blood as is aboveſaid.

How it degenerates.

Notwithſtanding this œconomy of the Region of the skin is not always ſo regularly kept, but that the glandulous humour falling from its own diſpoſition and function, not only will provoke in the skin, but ſometimes in the whole body, preternatural affections of divers ſorts. This growing clammy, and cleaving more obſtinately in the little Cells obſtructs tranſpiration; and immoderate ſweating proceeds from its too plentifully flowing out, and from the ſame reſtagnating inwards, a more than uſual Diureſis. Moreover, as to what belongs to the Scab and puſtulous eruptions, that humour as it is wont to be depraved many ways, ſo chiefly theſe three, and is wont to enter into a coagulative diſpoſition with the Serum, being freſh poured out from the blood, *viz.* Firſt the Blood it ſelf being very impure, and alſo diſſolved, it leaves its corruptions and ſuperfluous droſs in the cutaneous Glandules, which in the ſame place putting on the nature of more corrupted ferment, they boyl up with other adventitious Juices, or paſſing by theſe, and are diverſly thickened, and ſo they beget not only puſtulous affections, but alſo leprous of divers kinds. From hence the daily and often eating of Shell-fiſh, and alſo of others; and of ſalted meats that have been hung in the Sun or Smoak; alſo the taking diſagreeing Drinks, and venemous Medicines, do cauſe cutaneous and frequently dreadful eruptions.

This is done three wayes.

1. By reaſon of impure Blood.

2. By mere ſtagnation.

Secondly, The humour being heaped within the cutaneous Glandules, ſometimes doth not only become puſtulous by a mere ſtagnation, but alſo frequently Louſie. Wherefore, not only they that have been long in priſon, but alſo thoſe who being of a ſedentary life, are uſed to naſtineſs and ſluttiſhneſs, do live obnoxious to the abovementioned maladies; inaſmuch as the cutaneous humour being not at all eventilated, is corrupted by mere ſtanding, after the manner of putrefying water, and ſo it puts on the diſpoſition of a corrupting ferment; to which moreover Supplements of putrefaction come from the blood in the like manner depraved.

3. By Contagion received from without.

Thirdly, If perhaps theſe Cauſes are wanting, that the glandulous humour of the skin, neither contracts any ſtain from fault of the blood, nor its own proper ſtagnation, notwithſtanding virulent ſteams communicated from without, render it no leſs prolific as to thoſe diſeaſes. This is manifeſt by common obſervation eſpecially, forasmuch as they that have health moſt, and are endowed with the beſt Conſtitutions, ſcarce ever eſcape free from the ſame, if they lye in the ſame Bed either with a ſcabby perſon, or where he hath lately lain: and not only ſo, but moreover the Linnen of the Scabby, oftentimes waſhed with other Linnen have beſtowed the contagion upon others. Surely, the taint of no diſeaſe (the Plague only excepted) is more eaſily or certainly propagated than this of the Mange.

The reaſon of its moſt ſudden contagion is unfolded.

If the reaſon of this be enquired into, we preſently ſay that the liquor ſuſceptive of the ſcabby taint is mightily expoſed, and moſt eaſily diſpoſed unto it; and indeed much more ready to either, than the Blood or Nervous Juice. For the glandulous humour

humour of the skin abounding in the outer ſuperficies of the body, firſt imbibes every Atome let in by holes and pores every where open, and anticipates them from the blood. Moreover, that this is ſo ſoon infected with a ſcabby Contagion, both the activity of the ferment communicated cauſes it, and alſo the proneneſs of the glandulous liquor to degenerate. For indeed the effluvia's falling from the breaking out of the ſcabby skin, are aptly enough compared to the Yeſt of Ale, remaining on the top as it were its outmoſt Coat; of which if the leaſt portion be taken from thence, and mixed with other new Ale unfermented, preſently it ferments the whole maſs how great ſoever, and changes it into the diſpoſition of the liquor from whence it was taken. Certainly there is a very conſiderable energy, which the particles however ſo ſmall and little, carryed to the higheſt activity, are able to perform; but eſpecially if they fall into a liquor (of which ſort is the cutaneous) made up together of ſubtile particles of the ſeveral ſorts, as well partaking of the blood, as of the nervous Juice, and for that cauſe moſt readily apt to be fermented. Whereſoever therefore theſe effluvia's of the Contagion aboveſaid hit againſt any outward part of a healthful body, firſt they will infect the cutaneous humour only planted in that place, but then the particles of this ſo corrupted, being received by the venous blood, and preſently delivered to the Arteries, are diffuſed through the entire habit of the body, and in a ſhort time defile the whole maſs of this Humour and make it ſcabby.

The Contagion when any where received, preſently ſpreads over the whole skin.

From theſe Cauſes of a Pſora as well adjunct as procuring being unfolded, the reaſon of the firſt ſymptoms, or breaking out in Puſtules, is manifeſt enough; but as to the other, *viz.* the Itch, as it is troubleſome to Senſe, that the formal reaſon thereof may be known, we ought to conſider to what Senſory or Organ of ſenſe it properly belongs, and of what ſort its paſſion or affection ſhould be.

Of the Itch.

Concerning theſe things, firſt it is ſure it belongs to the ſenſe of touching, and that the firſt Inſtruments hereof are Teats faſhioned like a Millet, and their little Fibres diſperſed through the whole skin, as we have before declared. Moreover with this ſenſe all the nervous fibres are endowed, being diffuſed throughout the whole body. Notwithſtanding, whereas there are two ſupream paſſions of Touching, and as it were generical, *viz. Pain* and *Pleaſure*, it is deſervedly doubted to which of theſe Itching ought to be related. For the ſolution of which, we ought to ſhew by what means the Animal Spirits, being inmates to the organ of Touch, are affected in Pain, and alſo after what manner in Pleaſure; then their demeanour alſo as to the Itching being deſign'd, it will eaſily be manifeſt of what Province this Paſſion is, and in what things the nature of it, and the manner of its acting do conſiſt. Let the Reader pardon me, if I ſhould by way of digreſſion expound this more at large, and even to tedioufneſs, becauſe this Ætiology ſeems very neceſſary both to the underſtanding and curing of moſt outward diſtempers. Pain being diſtinct from Sadneſs and belonging to the Touch, is uſed to be defined, *A troubleſome feeling proceeding from the diſſolution of Unity.* And indeed it takes its origine as often, and in as much as any ſenſible thing, diſagreeable or improportionate, being applyed to that Organ of ſenſe, divides and ſeparates the fibres one from the other; and for that cauſe repelling the animal ſpirits inhabiting in them, from their wonted and quiet emanation diſtracts them from one another, and as it were puts them to flight; then preſently foraſmuch as that outward repulſe of the ſpirits, is communicated by a continued order of other ſpirits, to the firſt Organ of Senſe, it ſtirrs up the Spirits dwelling there into the like confuſions, ſo a perception is cauſed of grief or pain inflicted outwardly. In truth the whole ſeries of animal ſpirits which are affected with pain, as it were ſome ſingular member of the ſenſitive Soul, conceiving trouble, as it were from the impreſſion of the object, is forced to be wrinkled with pain, and to contract it ſelf into a leſſer dimenſion.

It belongs to the Senſe of Feeling.

Of what ſort its Affection is.

The chief Affections of feeling are Pain and Pleaſure.

The formal reaſon of Pain.

When a diſſolution of Unity is ſaid to be the cauſe of pain, we muſt not underſtand it ſo as if this affection only were cauſed from a wound or blow inflicted upon the body, for the ſame thing is uſed to be induced from cold, heat, wind, from the extravaſating of the blood and of other humours, or their being heaped up together in ſeveral places, oftentimes the faſhioning of the member remaining as yet intire; in which caſes, although the continued parts, and chiefly the fibres and filaments, are not at all cut off, notwithſtanding they are in every Affection of grief pulled from their uſual poſition, either by the oppreſſion of the object, or by ſtrange particles forced like wedges, and are compelled into too much tenſion or diſtorſion, or divulſion; and for that cauſe the inmate ſpirits being pulled from their mutual embraces, and diſſipated, are ill at eaſe, and incur the paſſion of pain or grief.

The Solution of the Unity always the cauſe of it.

Pleaſure

PHAR. Part. II.

Pleaſure is oppoſed to Pain, and is a manner of Feeling clearly contrary thereunto; which takes its origine, inaſmuch as a pleaſant ſtroaking being made upon the Organ of Senſe, the Spirits flock thither, and preſently being thickly gathered together, and overſpread with a certain delight, they do as it were exult and rejoyce together in the Organ: afterwards, inaſmuch as the ſpirits enter into the like triumph or rejoycing within the *Corpus ſtriatum*, a perception of pleaſure is ſtirred up.

What Pleaſure is.

Its formal Reaſon.

It chiefly conſiſts in removing of Pain.

The greateſt pleaſure which is offered to the Touch, conſiſts in this, that the cauſe of Pain being removed, the parts formerly affected by it, may recover their wonted temper and frame; for ſo the animal ſpirits being before put to flight, and diſperſed from one another, they recollect themſelves, and ruſhing into the places from which they were baniſhed with reinforced ſtrength, they prepare themſelves to rejoyce. From hence the Peripateticks placed the formal reaſon of Pleaſure only in the removal of ſomething that was troubleſome, as when the exceſs of cold or heat is received by an oppoſite and more agreeable ſtate. Indeed the tangible object (becauſe it is alwayes thick and dull) doth ſcarce any way elſe (excepting Venery) allure the animal ſpirits into heaps to the Organ of Senſe, unleſs for that it removes their former confuſion.

What the Itch is.

How the Spirits are moved in it.

From theſe things ſo deſcribed concerning thoſe paſſions, it is eaſily manifeſt, that the Itch according to the formal account thereof, is neither perfectly nor fully either Pain or Pleaſure, but imperfectly and as beginning, partakes of both. For really the ſcabby matter being heaped up within the pores of the skin, and making the ſolution of Unity in many places, enclines towards pain: yet as it is volatile, moving, and haſtens towards vent, for that cauſe the Animal ſpirits are not put to flight from the Fibres although pulled aſunder, neither are they driven back with ſenſe of pain; but the contrary, as if being ſtronger than the humour infeſting, they were able to caſt it forth, they being wrapp'd up more thick, but irregularly within the cutaneous fibres, do twitch them together variouſly, and draw them on, that they may the ſooner diſcharge the morbific matter, and expell it forth. Wherefore inaſmuch as the Animal Spirits being neither put to flight, nor repulſed, but flowing together in crouds into the organs of Touching, they manage themſelves there tumultuouſly, and diſorderly, and as it were by tickling the ſenſible fibres do provoke them into ſmall Convulſions, no pleaſure, but a troubleſome feeling, nor alſo is it Pain, but a Paſſion clearly diverſe ariſes from it. But as ſoon as by rubbing or ſcratching, the plenty of Spirits aſſembled about the Organ of Senſe, begin to be better diſpoſed, and as it were reduced into order, from thence a thorough feeling of Pleaſure is introduced.

A certain medium between Pain and Pleaſure.

Wherefore the Itching ſeems to be a middle-ſtate between the beginning of Pain and Pleaſure, or a paſſage of the Spirits from the rudiments of that, towards the full compleating of this. But from this Phyſical diſcourſe by the by, let us return to our Pathologie or diſcourſe of the diſtemper. From what is above ſaid it is eaſie to collect the differences of this diſeaſe.

The difference of the Pſora as to its origine.

In the firſt place therefore the Pſora as to its origine either is got by Contagion, or by reaſon of an ill Courſe of Diet, the fierceneſs and ſupply thereof is communicated by the Chyle and Blood being vitiated, or it is generated in the skin it ſelf, by reaſon of filth, and the defect of Tranſpiration: Whereto we may add, that ſometimes Infants acquire this taint hereditarily contracted from their Parents.

2. As to its form.

Secondly, Theſe cutaneous Eruptions as to their form, vary according to the diverſe Conſtitutions of the perſons affected: for in ſome perſons of a cholerick dryer Temperament, or Melancholy, only a dry Scab is ſtirred up, and inaſmuch as it evaporates leſs by reaſon of the defect of the Serum, with an Itching not altogether ſo troubleſome; but in others of a moiſter Temperament, and of more unclean blood, very many wheals and puſtules imbued with Ichor, and moſt of all itching, do very much provoke to ſcratching, and by reaſon of the Ulcers ſtirred up therewith, the Itch is immediately altered into pain.

The Prognoſticks of it.

As to the Prognoſticks, although this Diſeaſe is never of it ſelf mortal or very dangerous, and always eaſie of Cure: yet frequently it contains an evil event; inaſmuch as being long continued, it utterly depraves the blood and nervous Juice, and from it haſtily cured, by reaſon of the matter received within, while it is diſcuſs'd from the Pores, a pernicious taint is brought upon the Præcordia, and Brain, and other noble parts.

Moſt dangerous to Children and ill juiced or chacheſtick perſons.

The greateſt hazard from a Scab, threatens Children and Cachectick perſons; as in both of which the taint is more eaſily impreſſed from this Cutaneous humour upon the nobler parts, which afterwards when the outward malady is removed, remaining within cannot be vanquiſhed entirely, but a very long Courſe of Phyſick, of which neither is capable nor patient; wherefore, ſuch perſons, all care and diligence being

being adminiſtred, ought to be preſerved from the infection of the Scab as from the Plague. PHAR. Part. II.

Concerning the Cure of a Scab or Pſora, two chief Indications preſent themſelves and each of them two-fold, *viz.* The firſt intention Curatory reſpects theſe two things, Firſt, that the glandulous Humour (its corruptive ferment being wholly extinct) may be reduced to a due temper. Secondly, afterwards that the pores and paſſages of the skin being freed from thoſe Ichorous congealings, may recover their priſtine frame or good temper. *Its cure.* *The firſt Indication curatory.*

The Second Indication Preſervatory takes care to prevent thoſe two things, *viz.* Firſt, leſt the impurity of the Pſora, or corrupting Miaſma's of the skin being diſcuſs'd from the skin (while the ferment is expugned) turn back again into the blood and nervous liquor, and bring upon them not only ill temperaments, but alſo (as frequently it uſes to do) a more conſiderable prejudice upon the Brain or Præcordia. Secondly, alſo let it be endeavoured that the taint of the Humours, and of the noble parts contracted from the Itchy matter, may be eradicated while the faults of the skin are repaired. *The ſecond Indication preſervatory.*

All theſe intentions of Curing, by remedies internal as well as external together being much and often uſed, ought to be joyn'd together, or at leaſt-wiſe to be interus'd, *viz.* that the morbific matter being diſcuſſed from its receſſes, may not depart into and lye hid in any lurking-places any where elſe, but from every part, inwardly and outwardly, by remedies taken, may be wholly removed away; wherefore Purgatories ought alwayes to begin and end this method of Curing. Although *Helmont* with great pomp overthrows this Cathartick method of Phyſick, and as it were leads it in Triumph, becauſe it doth not cure the Scab by it ſelf, yet we may affirm this Diſeaſe without that remedy can ſcarce ever eaſily be cured, but never ſafely. Moreover Phlebotomy, unleſs ſomething contradict it, is preſently to be celebrated in the beginning; upon theſe, Alteratives that cleanſe the blood and ſtrengthen the bowels, and defend againſt the aſſaults of the morbific matter, challenge their turns; and in the mean time Liniments, or Baths, or topical remedies of another kind, and properly Cutaneous, are adminiſtred: As without which not only Purging and Bleeding, but alſo Diaphoreticks, Diureticks, yea whatſoever remedies evacuating blood or humours, or altering them, become uſeleſs. We will annex ſome more ſelect ſhort forms of Medicaments, of every one of theſe Kinds but now recited. And firſt for the due undertaking of the Purging part, let there be adminiſtred in the beginning a purging Medicine or a Vomit; alſo after Phlebotomy being uſed (if need require) an Apozeme or purging Ale may be adminiſtred for ſeven or eight dayes. *Both inward and outward Medicines are to be taken together.* *Purges, Bleeding and Alteratives, and afterwards Topicks are required.*

Take of Electuary Diacarthamus three drams, Spec. Diaturbith with Rhubarb one dram, Cream of Tartar, Salt of Wormwood an. half a ſcruple, ſyrup of purging Apples what ſuffices, make a Bolus to be taken with Government. Or, *Forms of Purgers.*

Take Sulphur of Antimony ſeven grains, Scammony ſulphurated eight grains, Cream of Tartar half a ſcruple, make a powder.

Take roots of Polypody of the Oak, ſharp pointed Docks prepared, an. one ounce, leaves of Senna ten drams, Turbith, Agarick, Epithymum, an. one ounce, Carthamus-ſeeds half an ounce, Citrine Sanders two drams, Anniſe, Carue-ſeeds, of each two drams, being ſliced, bruiſed, &c. digeſt them warm in four pound of White-wine twenty four hours, pour it clear off without ſtraining: the Doſe ſix ounces by it ſelf, or with a ſpoonful of ſyrup of Epithymum.

Or take the foreſaid Ingredients and boyl them in ſix pound of Spring-water to half, then add one pound of White-wine, and preſently ſtrain it for an Apozeme to be taken as the former. *Apozems.*

Take roots of Polypody of the Oak, ſharp-pointed Docks an. three ounces, Senna four ounces, Epithymum, Turbith, Mechoacan, of each two ounces, of yellow Sanders one ounce, Coriander-ſeeds ſix drams, prepare them according to art, make a bag for four gallons of Ale; draw it after five or ſix dayes, take twelve ounces more or leſs every morning, for eight or ten dayes. *Medicated Ale.*

For ordinary Drink let a little four-gallon Veſſel be filled with ſmall Ale, wherein may be put the following Bag.

Take the tops of Tamaris, dryed Fumitory an. four handfuls, roots of ſharp-pointed Docks dryed ſix ounces, the rind of woody Night-ſhade two ounces, ſlice and bruiſe them and mingle them. Or let them take a Bochet of the Decoction of Sarſaperilla, Saunders, with ſhavings of Ivory, Harts-horn, and Liquoriſh.

II. As

PHAR. Part. II.

Altering Remedies.

II. As to what belongs to altering Remedies, beſide the Phyſick-Ale for ordinary Drink, there ſeems not need of many others, but only, that a due government of Diet be obſerved, by declining Salt and ſpiced Food, Shell-fiſh, and others ſeaſoned with pickle; alſo abſtinence from Wine, Strong-waters, ſtronger Ale, and from all Liquors apt too much to ſtir and ferment the blood. In a contumacious Pſora, and ſeizing upon a Cachectick body, it will be expedient to adminiſter the following Electuary with a diſtilled water twice aday.

Electuary.

Take of Conſerve of Fumitory, roots of ſharp-pointed Docks, of each three ounces, Troches of Rhubarb, Species of Diatrion Santalon, of each one dram and a half, Salt of Wormwood one dram, Vitriolum Martis four ſcruples, with a ſufficient quantity of ſyrup of Cichory with Rhubarb, make an Electuary, the doſe from one dram to two, twice in a day, drinking upon it three ounces of the following water.

A diſtilled water.

Take of the tops of Fir-tree, ſix handfuls, of leaves of Fumitory, Agrimony, Fluellin, Liverwort, Brooklime, of each four handfuls, roots of ſharp-pointed Docks two pound, Bark of Elder two handfuls, the outward Rinds of ſix Oranges, cut them and bruiſe them, and then pour upon them eight pints of Poſſet-drink turn'd with middle-beer, diſtill them in a Roſe-Still; let the whole Liquor be mingled together.

Oyntments whereof the Baſis is chiefly Sulphur.

III. Oyntments for to anoint the Skin, are wont commonly and efficaciouſly to be preſcribed for the curing of the Scab; notwithſtanding thoſe which are adminiſtred to many other Tumours or Ulcers, do not help here at all; but Brimſtone and Preparations thereof ſeem to have a ſpecific vertue in this Diſeaſe, ſo that for the moſt part they are put into all Liniments for the Itch, and are the baſis of the whole Compoſition. The Receipt chiefly uſed by the Vulgar is this.

Forms of them.

Take Powder or flower of Brimſtone half an ounce, unſalted Butter four ounces, powder of Ginger half a dram, make an Oyntment.

A little more neat, though not much more efficacious is preſcribed thus.

Take Oyntment of Roſes four ounces, powder of Quick Brimſtone half an ounce, Oyl of Tartar per deliquium *what ſuffices, make an Oyntment: for ſcent ſake add one ſcruple of Oyl of Rhodium.*

Other ſtronger Medicines.

When the force of the Brimſtone is to be drawn forth or ſtrengthened by other things added,

Take Oyntment of Enula-campane without Mercury four ounces, powder of Sulphur half an ounce, Oyl of Tartar per deliquium *what ſuffices. For the ſame purpoſe the Oyntment of the roots of ſharp pointed Docks boyled in Butter, or Oyl, with White-wine, to the conſumption of the Wine, and made up with Sulphur and Oyl of Tartar.* Alſo thoſe Oyntments are uſed with ſucceſs by themſelves, the more curious abhorring the ſmell of Sulphur.

The moſt powerfull made of Mercury.

3. The third kind of Liniment againſt the Itch, is made of Mercury, wanting no guards of Sulphur, or any other Vegetables. But of it ſelf it is too powerful to be applyed all over the body, but only to the Joynts of the Arms and Thighs, or worn about the Loyns, made up in a Girdle, for ſo it ſeldom fails in curing the Itch. Notwithſtanding there is danger leſt this practice (as it often happens) produce evil and pernicious ſymptomes; for from the Mercurial Oyntment, frequently a ſalivation, alſo ſometimes dimneſs of the eyes, or drowſie or convulſive Affections do proceed: Alſo ſometimes the Poyſon of the medicine within the Præcordia or Bowels produces the dreadful Affections of ſhort breathing, Swounding, or bloody Fluxes.

But dangerous.

The form of it.

The vulgar form of a Mercurial Oyntment, and chiefly in uſe for the Itch, is this.

Take of Quick-ſilver reduced into ſmall particles with an acid, or (as they ſay) kill'd, an ounce and a half, freſh Hogs Lard ſix ounces, incorporate them well, ſtirring them long in a Stone or Glaſs-mortar.

A Mercurial Water for the Itch.

Neither only under the form of an Oyntment, but alſo after many other wayes the aforeſaid Medicines are wont to be often uſed. For the fume of Cinabar (which is prepared of Mercury with Sulphur) caſt upon Coals and taken in at the mouth, or ſtriking the ſuperficies of the Body, cures the Pſora. The Mercurial Coſmetick before deſcribed

ſcribed being weaker by two degrees, if it be applyed upon the Skin, chiefly on the ulcerated places, it kills the Scab. Notwithſtanding the uſe of theſe is not always ſo ſecure as to be adminiſtred every where to all perſons. PHAR. Part. II.

Baths. Baths are prepared of Sulphur and Vegetables, either apart or together, being boyled in water which heal this Diſeaſe not as a common Bath, by only waſhing off the filthineſs of the Skin, but alſo by deſtroying the ferment thereof. Moreover, beſide theſe there is another more eaſie and neater manner of healing the Itch, *viz.* Let a Shirt boyled with Powder of Brimſtone in Spring-water, and dryed by the Sun or Fire, be worn next the body for four or five dayes; for ſo that diſeaſe is wont to be cured without bathing, or naſtineſs of anointing, or evil ſmell. *A Sulphureous Shirt.*

Why Sulphur is the Antidote of The Pſora. If the Ætiologie of theſe be enquired into, and firſt why Brimſtone is ſuch a ſpecifick Antidote againſt the Itch, that poor and ordinary men (who have not wherewithal to uſe any other Medicine) do take againſt this Diſtemper inwardly only powder of Brimſtone with Milk, and adminiſter it outwardly with Butter, I have already in part given an account, where we have unfolded the balſamick vertue of Brimſtone towards the Lungs. Namely, it is a good expedient in either caſe, inaſmuch as it deſtroys the acidities of the Blood and Humours, and all the exotick and corrupting roughneſſes, and reſtores a benign diſpoſition to every Juice, *viz.* a mild and unctuous: and ſo the Particles of Brimſtone any way outwardly applyed, do eaſily enter into the pores of the skin, and being admitted inward, do forthwith work upon the ulcerous Ichor there abounding, kill the Salts there predominating, and procure a Balſamick nature to the cutaneous Juice, that it may afterwards agree with the Blood and Serum continually flowing to it. *The Reaſon of it.*

How Mercury cures this Diſeaſe. As to Mercury, it is no wonder if Medicines prepared hereof do throughly heal the places of the skin affected with the Pſora wherever applyed, for by the application hereof, wheals and puſhes, and all malignant ulcers, *viz.* Venereal and Scorbutick, are wont to be tamed. Neither is it a thing to be admired, that theſe Remedies adminiſtred in any private places, as long as they provoke ſalivation, are a Cure of an Univerſal Itch; but really that without ſpitting they can produce ſuch an effect, as that a Girdle wherein Quick-ſilver is ſowed and worn about the Loyns, ſhould aboliſh the Scab of the whole body, and that ſometimes without any ſenſible evacuation or harm cauſed thereby, I ſay the reaſon hereof is not ſo eaſily apparent.

The reaſon of its vertue. Yet for the ſolution hereof, we muſt ſay that the Particles of Mercury being able to extinguiſh the ſcabbineſs of every Itchy ferment, when they are applyed to any private part, do preſently take away the Scab of that place; and beſides being caught by the venous blood, and diffuſed through the whole maſs thereof, and a little after they are not only carried back by the Arterious blood to the ſame place where taken in, but being brought outward every where, they are depoſited in the Skin of the whole body, and in the ſame place deſtroy every Miaſma of the Scab: If it then ſhall happen that theſe Mercurial particles, after they have finiſhed the Cure, ſhould be all evaporated again out of the Skin, no ſalivation afterwards, or other prejudice will follow.

SECT. III. CHAP. VII.

Of the Impetigo, *or* Lepra *of the* Greeks.

Several names of the Impetigo. After the Scab with the Itch, it follows that we treat of another Diſtemper, a little a-kin to this by reaſon of the breakings out of little puſtules, which is commonly call'd *Impetigo*, by ſome a Tetter and Morphew, and by others the Leproſie of the *Greeks*. And as it gains ſeveral names, ſo they are variouſly applyed by Authors, and by theſe they deſign one kind of Diſeaſe, and by thoſe another kind. Wherefore, as the names of this Diſtemper are variouſly confounded, and perhaps that as to its nature and formal appearance it has been various in divers Regions, neither may it be altogether the ſame in our generation as in former times, for this cauſe my buſineſs here ſhall not be to deſcribe this diſeaſe according to Books, but from the proper obſervation of the Patients themſelves.

It is deſcribed according to its appearances. The Impetigo is wont to ariſe and affect after this manner; to wit, little wheals or red puſtules, ſometimes ſingle, and ſometimes many together, are raiſed in divers parts

PHAR. Part. II.

parts of the body, but chiefly in the Arms or Thighs; to each of which, new ones every where are adjoyned, (the Diſeaſe augmenting) and in a ſhort ſpace of time there become many heaps of riſings of that kind, like cluſters. For the little pimples breaking out daily near to their ſtemme, and ſpreading ſtill larger, diffuſe themſelves into a Circle, and ſo cauſe every heap of Eruptions to be enlarged. The rough ſuperficies of each appears ſomething white and ſcaly, ſo that upon ſcratching the ſcales fall off, and often a thin Ichor ſweats out, which being preſently dryed up again, hardens into a ſhelly ſcale.

Theſe Cluſters of little Pimples being firſt ſmall and fewer, appear perhaps three or four in the Arm or Thigh, or other particular member, about the bigneſs of a Penny or half a dram: but afterwards, if the diſeaſe be ſuffered to augment, they break out every where more frequent, which being leiſurely encreaſed in their ground, afterwards appear to equal or exceed the bigneſs of a Silver Crown, but not always round or of a regular Figure, but diverſly formed. Moreover there is no ſtop in this condition, but the diſtemper, unleſs it be reſtrained with Medicine, breaking out ſtill in more places, and creeping on every where in broadneſs, at length not only covers over the whole member but alſo the whole body with a leprous dry ſcurf; and this kind of Impetigo the Ancients call'd by reaſon of its outrage Ἄγριαν, and for the moſt part accounted it incurable.

The differences of this diſeaſe.

From hence the chief differences of this diſeaſe are made known; and in the firſt place as it is leſs or more malignant according to the faſhion thereof, it is diſtinguiſhed, as it comes nearer the nature of the Scab, or Leproſie, or as it is in a middle condition between both. We are alſo to note, this diſtemper ſometimes infeſts ſome particular members, as the Arms or Thighs, the reſt of the body being untoucht,; but ſometimes it begins together in all parts, and every where excites ſcatteringly little Pimples or Cluſters thereof. Alſo eruptions of this kind are in ſome for a ſeaſon, or periodical, and for the moſt part infeſt thoſe perſons during Winter only, vaniſhing away about Summer; likewiſe on the contrary, in others they abhorre Winter, and are wont to obſerve the ſeaſon of the Swallow going and coming, but in moſt others the Diſeaſe being continual grants no truce, yea it hath neither remiſſion nor mediocrity.

How it differs from the Pſora and Leproſie.

Moreover we muſt diſtinguiſh an Impetigo from other Diſeaſes a kin to it, and firſt from the Scab, and the Leproſie. It deffers from the former as to the form of the Puſtules; for every where in the Pſora they are ſingle and remote from one another, although by ſmall ſpaces; here moſt of them break out in Cluſters, concurrently, and as it were disjoyned by branches with great interſpaces. But between theſe diſtempers a notable difference yet ariſes, in that the Scab is wont eaſily or ſcarce otherwiſe to be propagated or ariſe, but by Contagion; but the infection of an Impetigo is ſo ſeldom or never, that the Miaſma from the Husband doth not paſs to the wife, or from her to him, though they lye together.

Alſo this Diſeaſe differs from the Leproſie, as well in reſpect of the form of its eruption, as of its contagion, which is likewiſe active in this, as in the Pſora; and the breaking out is much larger and more horrid, *viz.* it is every where ſhelly and ſcaly, without intermiſſion, and diffuſed through the whole body.

The material cauſe not a humour of the skin.

From hence it is manifeſt, that the material cauſe of an Impetigo, is not merely a cutaneous humour, by reaſon of effluvia's or a taint received from without, or depraved by reaſon of other accidents, and degenerated from its temperament; becauſe it is not eaſily communicated to others by Contagion, as in the Pſora, neither is it immediately diſperſed throughout the whole body. But indeed little Puſtules breaking out firſt about the initiations of the Diſeaſe ſeem therefore to proceed, for that certain acid ſalt Concretions happen to be in the maſs of Blood (like Tartar in Wine) which when they can neither be concocted or again diſſolved, are here thruſt out into the skin, as there into the ſides of the Veſſel. As long as theſe Concretions are ſmall and few, they are conveyed into the skin in this or that member, and by one or two branches of an Artery; then as Nature is wont to continue the ſame mannner of excretion as it began, the matter being carryed every where by the ſame veſſels, to the ſame neſts, near the firſt wheals it cauſes heaps of others round about them; but afterwards when the dyſcraſie of the blood is daily augmented, and that Tartarous matter is generated more plentifully in the maſs thereof, more portions are conveyed by other Arteries, and ſtill by more to the outward places: and for that cauſe alſo more pimples break out both in the ſame, and other members, which a new matter coming continually by the ſame Arteries, and being placed cloſe to the former, enlarges them every day, and every where dilates them by the addition of other puſtules; and at length if this ſort of Tartar of the blood augment hugely, being

But tartarous Concretions begot in the blood.

carryed

carryed out by more or all the Arteries together, it is fastened in the skin, and in process of time covers over all the superficies thereof with a scaly or downright leprous shell: And then that cutaneous humour being wholly corrupted, promotes the disease it self; for it causes the stock of the morbific matter to be encreased, by polluting more, or rather poysoning the blood and humours, whilest they pass in Circulation; moreover dismissing the corruptive steams from it self, it renders the Contagion of the same disease unto others.

The next cause of it.

Wherefore, both the procuring and conjunct causes of this Disease consist in this, for that without any fault of the skin, it happens that the blood is filled with salt Particles of a various disposition and condition; (into the preceding cause of which disposition we will anon inquire) and where those fixt and acid Salts are especially predominant (as the manner is) they mutually embrace one another, and so grow together into Tartarous Concretions; which being thrust forth into the blood, cause eruptions of wheals, as it were nests of the Disease; then they being daily and leisurely encreased both in number and largeness, according to the supply of matter, they produce the beginning, augmentation, and state of this disease.

The evident causes.

As to what relates to the antecedent and evident causes, there are two chief kinds of occasions from which this distemper for the most part derives its origine; to wit, an evil manner of Diet, or a taint of the Scurvy, or Pox, or other Diseases left in the body, being ill, or not at all cured. We will weigh a little the reasons of each of these.

Irregularities in Diet.

As to the former, besides the common irregularities in Diet, wherein some being too much addicted to eating of flesh salted and afterwards dryed in the Sun or Smoak, and the drinking of acid Wines, do easily contract this malady; Also it is a vulgar observation, that very many are disposed thereunto by the too frequent or daily feeding on Pork, and Fish, and especially Shell-fish. There is a notable instance of the former, which is, that the food was chiefly forbidden the *Jews* for prevention of this disease. Also there is an example of the other, that in time past the Inhabitants of *Cornwal* for the most part dwelling on the Sea-coast, inasmuch as the poorer sort were fed with Fish, became very obnoxious to Leprous Distempers; insomuch that for their relief many Hospitals were erected in that country. That I may hint in a few words the reason hereof, I am apt to think whether that food is rancid, or otherwise improportionate, that it conveys particles not rightly mixed, not easily to be subdued to our blood, which being so heterogeneous and largely heapt up by a long use of such Diet, the saline particles of which kind do easily associate themselves, and so do constitute Tartarous Coagulations to be exterminated in the skin, and the seeds of the Leprosie or of the Impetiginous Evil.

The daily eating of Pork or Fish.

The reason thereof inquired into.

It often follows the Pox and Scurvy.

But yet a plentiful Crop is begot from the taint of the Scurvy and pox left in the body, and afterwards by the combination of Salts and Sulphur exalted to extremity. We have elsewhere discovered the reasons of the former disease, and especially of the foresaid symptome coming after it, which being accomodated to our present Hypothesis do make it more clear. And it so often happens, that pustulous eruptions of this sort do follow an inveterate Pox, although it seem to be cured, that none distempered almost with these, wants the suspicion of that shameful Disease; so that the first Question of a Physician in such a case being consulted, is, Whether the Patient, have not at some time formerly contracted that Distemper? For surely the Corruptions of the blood, after they are by a long stay become altogether heterogeneous and indomitable, at length acquire to themselves salt Particles, wherewith growing into such like Tartarous Concretes, and being thrust forth into the skin, produce those Impetiginous Pustles.

Its Prognosticks.

As to the Prognostick part of this Disease, although it seldom threatens death or imminent danger, yet after it hath taken deep root, the Cure is very difficult, if at all: The Impetigo first beginning, and exciting a few Pustules, and knots of them, perhaps in one or two members, sometimes admits of Cure, but hardly without a most efficacious remedy. But if the Disease proceed so far, that the frequent and broad clusters of wheals appear dispers'd throughout the body; then small remedies effect nothing, and the great ones howsoever diligently observed, will not easily perform a Cure. But if the Disease, maugre all remedies advance daily, and encrease at length into a Leprosie, *Celsus* judges it impossible to be cured. and therefore we must wholly abstain from it.

The Cure.

Two chief Indications.

There are two chief Indications concerning the Cure of an impetigo, *viz.* Preservatory, which respects the cause of this Disease, and the Curatory, which relates to the symptomes, *viz.* the pustulous Eruptions. The vital Indication hath seldom place here, unless in a desperate condition, where sleep and strength fail. The Method of

PHAR. Part. II.

Curing ought to begin with the Preſervatory Indication, which takes away the Cauſes of the Diſeaſe by inward remedies, for otherwiſe external (as in the Pſora) are never adminiſtred with ſucceſs; but the roots of the diſeaſe in the blood being cut off, the cutaneous ſproutings quickly conſume away: for the taking them away, we muſt proceed in one manner when the Impetigo begins by it ſelf, and in ſomewhat a different manner when it follows an inveterate Scurvy or Pox, being ill or not at all cured. We will conſider each caſe througly by it ſelf, and diſtinctly.

How to be cured, the Diſeaſe beginning of it ſelf.

Therefore whenſoever this Diſeaſe is ſimple, and primary, and being yet New, let the evident and extern Cauſes be removed; let the manner of Diet, and unwholſomneſs of Air be corrected; therefore thoſe that have been lately too much accuſtomed to ſalt Diet, and the fleſh of Pork and Fiſh, let them change to Diet of good Juice and eaſie of digeſtion. They that inhabit the Sea-coaſt, or Fenny places, let them remove to a dry and clear Air; in the mean while let no leſs care be had to their Drink, by declining thick and foggy Ale, and ſmall acid and Wines too much abounding with Tartar: at length let care be taken leſt their Drink or Food be dreſſed with any Mineral waters that are apt to petrifie.

The evident cauſes to be firſt removed.

The conjunct Cauſes how taken away.

Secondly, In reſpect of the conjunct and procuring Cauſe, there are two chief Intentions of Cure, *viz.* that the impurities of the bowels and humours be quickly purged out; alſo that the acid ſaline diſtemperatures of the blood and nervous Juice be altered (whereby the Tartarous matter may be the leſs engendred in them;) for theſe purpoſes Medicines both evacuating and altering are preſcribed of ſeveral kinds. Notwithſtanding, becauſe not all, but the greateſt remedies are here convenient, thoſe which are moſt chiefly of uſe and available, are Catharticks, Phlebotomy, Whey, Chalybeate Waters, Jucy expreſſions of Herbs, Decoctions of Woods, ſteel'd Medicines and Salivation. Some certain Models of each of theſe, and the manner of uſing them, we will annex.

The chief Remedies made known.

1. *A Purge.*

Wherefore in the firſt place, univerſal purging and bleeding being celebrated (as in the cure of the Pſora) we appoint the following Tincture or purging Infuſion, whoſe doſe is from ſix to eight ounces, to be repeated in ſix or ſeven dayes.

A purging Infuſion.

Take of the roots of ſharp-pointed Docks dryed, Polypodie of the Oak, of each half an ounce, Senna ten drams, Epithymum ſix drams, Rhubarb, Mechoacan of each half an ounce, yellow Sanders two drams, Celtick Nard half a dram, Salt of Tartar one dram and a half, put them in a glaſs with three pints of White-wine, water of Elder-flowers one pound, let them ſtand ſtopt in a cold place three dayes, pour off daily as much of the clear liquor as is ſufficient.

2. *Whey.*

Secondly, For ſweetning of the Blood, and waſhing of the Salts thereof, let ſimple Whey, two or three pints, or with the infuſion of Fumitory, Chicory, and ſharp-pointed Docks, be drunk every morning, for twenty or thirty dayes, if the Stomach will bear it, and likewiſe evening and early in the morning, let a doſe of the enſuing Electuary be ſwallowed.

An Electuary.

Take Conſerve of the roots of ſharp-pointed Dock ſix ounces, Crabs-eyes, Coral prepared, of each two drams, Ivory one dram, Powder of Lignum Aloes, yellow Sanders, of each a dram and a half, Sal Prunella two drams, Vitriol of Mars a dram and a half, Syrup of juice of Wood-ſorrel what ſuffices to make an Electuary, the doſe two drams.

3. *Steel'd Waters.*

Thirdly, For the ſame reaſon that Whey, your Iron Mineral waters are preſcribed for this Diſeaſe, and do oft notably help: for when all the other remedies have been in vain, I have with thoſe alone cured a painfull and almoſt leprous Impetigo. Moreover, for more efficacy ſake, let the uſe of Sal Prunella or Vitriol of *Mars*, or of the Electuary but now mentioned, be dexterouſly adjoyned.

4. *Decoctions of Woods.*

Fourthly, In ſome indued with too much Serum, and a watery Conſtitution, where the drinking Whey are Mineral waters or leſs requiſite, it is ſometimes expedient that a Decoction of the Woods be aſſumed at Phyſical hours, and alſo conſtantly inſtead of ordinary drink:

Take the Shavings of Willow half a pound, of Sarſaperilla eight ounces, white Sanders, Lignum Lentiſcinum, of each two ounces, Shavings of Ivory and Harts-horn, of each ſix drams, Filings of Tin, crude Antimony, of each four ounces tyed in a rag, of Liquoriſh one ounce, infuſe them in ſixteen pound of Spring-water, and boyl them to half, keep it ſtrained for uſe.

Fifthly,

PHAR. Part. II.

Fifthly, Medicines of *Steel*, in that they are every where accounted among the more excellent Remedies, are wont ſeldom to be omitted in this Diſeaſe, although not frequently given with ſucceſs: for moſt Preparations of Steel, wherein the Sulphureous Particles predominate, inaſmuch as they ferment the blood, and irritate it into Critical Effervescences, do cauſe theſe impetiginous eruptions to augment rather than diminiſh; notwithſtanding the Salt, Syrup, Tinctures, and infuſions of Vitriol, inaſmuch as they fix the Blood, and ſomething reſtrain the raging of the Salts, do fitly enough agree with the Intention of Cure now propoſed; but being weak in efficacy, they do not prevail againſt ſo Herculean a Diſeaſe.

5. *Medicines of Steel.*

Wherefore Sixthly, theſe and many other Remedies nothing availing, many commend *Salivation*, as the ſtouteſt Wreſtler and only match for ſuch an Enemy. Yet the event doth not alwayes anſwer this great expectation; for I have experimented this remedy without ſucceſs in four Patients labouring under a painfull Impetigo, which had reſiſted other Medicines. Some of theſe were provok'd to abundant Spitting by Unction with Quick-ſilver, others by doſes of Solar Precipitate; which they have endured for the ſpace of twenty dayes; which time being elapſed all the ſcaly eruptions and cluſters of wheals have vaniſhed; notwithſtanding, to confirm the Cure, a Diet-drink of the Decoction of Sarſa was appointed, and frequent ſweating under a Cradle, and due purgation between, was continued for a month: Notwithſtanding, this Courſe being finiſhed, when no footſteps of the diſtemper ſeemed to be left, within another month a new ſtock of the ſame Diſeaſe beginning to break out, it encreaſed quickly to its uſual maturity. Moreover when one of them would repeat this courſe, and another after two relapſes would experiment it the third time, both of them at length after great ſufferings of Pain diſpaired of Cure: whence it is manifeſt that the Venereal Diſtemper, although highly malignant, and raiſing moſt filthy Ulcers conſuming the fleſh and bones, is more eaſily and certainly cured than the Impetigo.

6. *Salivation.*

Salivation does not always cure this Diſeaſe.

The reaſon whereof if we enquire, may plainly be conceived, for that the cauſe of the latter Diſeaſe conſiſts in a malignant and altogether heterogeneous pollution, infecting and poyſoning the blood and nervous Liquor for a certain time, but not altogether overthrowing, or for ever depraving its temperament; wherefore the Cure is performed by Salivation, or a ſudorifick Diet, eradicating all that venom, and then the natural diſpoſition of the blood and humours remains entire: But in a more difficult Impetigo, the Elemental particles and firſt Conſtitutives of the blood are corrupted, inſomuch that unleſs the natural Diſpoſition and Conſtitution of theſe are reſtored, all Evacuations and expurgations of any venemous, malignant and heterogeneous matter, however plentiful and eradicative, do little or nothing prevail. Wherefore, many famous Phyſicians not undeſervedly judg'd this Diſeaſe being confirmed and raiſed to the borders of a Leproſie, to be hardly or never cured.

Why the Impetigo is more difficult of Cure than the Pox.

Secondly, No better event attends this malady enſuing upon an inveterate Scurvy; perhaps hence the intentions of healing are a little more certain when this diſtemper is placed as the Baſis or root of that; to wit, that the chief curing Indication being taken from thence, we muſt chiefly inſiſt upon Antiſcorbutical remedies; but the more ſharp and hot of this kind, as the Garden Scurvy-graſs, Water-creſſes, the Horſe-rhadiſh, Pepperwort, and others too much irritating the blood, inaſmuch as they diſſolve the temperament thereof more, and drive out more plentifully the Tartarous Coagulum to the skin, are always diſcovered to be more prejudicial then advantagious; and for this reaſon, the uſe of Baths, or bathing in hot waters, which namely evacuate the humours of the whole body by an abundant Evaporation, and cleanſe the pores of the skin, and ſeem very available in this malady, often-times are ſo far from helping, that thoſe Eruptions are wont to be exaſperated from thence and very much encreaſed: for I have known many not extreamly Impetiginous, to have gone to our Baths, to bathe in the hot waters, that have returned altogether Leprous. Wherefore, when the Symptoms of this diſtemper ariſe from a ſcorbutick evil, all elaſtick things are to be avoided, and only the more temperate, endued with a Nitrous, Vitriolic or volatile Salt, are to be adminiſtred. We will lay down ſome Models of each ſort; As firſt Cryſtal Mineral, Juices of ſome Herbs and Decoctions, Salt and Mineral purging Waters, are moſt predominant with a Nitrous Salt.

Impetigo ſucceeding a Scurvy, how to be cured.

Hot antiſcorbuticks do not agree.

Nor Baths.

But only the more temperate Remedies endued with a nitrous, vitriolick or volatile Salt.

Take of Cryſtal Mineral, or Nitre purified one ounce, Flowers of Sal Armoniack one dram, bruiſe them in a glaſs Mortar, give one dram three or four times in twenty four hours.

Forms of Nitrous Medicines.

Take

PHAR. Part. II.

Take of the leaves of Houſleek the greater two handfuls, bruiſe it and boyl it in two pound and a half of new Milk till it turn to Curds and Whey, ſtrain it, and take a pint of the clear liquor twice in a day.

Water of Sowthiſtles.

Take of the leaves of Dandelyon ſix handfuls, bruiſe them, and put them into a glazed earthen pot with a cover, which put in an Oven after the bread is drawn out, let it ſtand ſix or ſeven hours, then pour it through a Strainer, the doſe is four ounces to ſix of the clear liquor, thrice or oftner in a day.

Cucumbers.

Cucumbers being endowed with a Nitrous quality are advantagious by experience againſt this diſeaſe, wherefore in lieu of a Sallad let them be plentifully and often eaten; moreover three or four of them cut into ſlices, let them be infuſed, and ſtopt cloſe, in three pints of Spring-water all night; to the clear liquor poured out, add Sal Prunella two or three drams, the doſe is half a pint thrice or oftener in a day. For the ſame purpoſe Decoctions of the leaves in running water together with the fruit do profit.

Purging Mineral Waters.

1. Certain mineral purging waters, of which ſort are chiefly thoſe of *North-hall*, an Analyſis being made up by Evaporation, manifeſtly ſhew a Nitrous Salt with which they are imbued, and I have ſometimes found the daily drinking about four pints for many dayes, to help againſt a gentle Impetigo.

Vitriolick acidule waters.

2. But as I have before hinted, thoſe Mineral waters endued with a vitriolic Salt, of which kind are the *SPAW*, and *Tunbridge*, and *Aſtrope* Wells, do far excell thoſe Nitrous, and all other Remedies, and do more prevail in the Cure of an Impetigo. To thoſe Patients that have not the opportunity of uſing theſe waters, I uſed to give with good ſucceſs againſt this diſeaſe common water impregnated with our Steel, and ſo rendring moſt exactly the guſt of thoſe Mineral waters. By reaſon of Mineral Salts, or at leaſt the Mercurial Particles in them, Tin and Antimony are oft in uſe in the Cure of the Impetigo, and are uſually preſcribed with other remedies. Let the Filings of Tin, and Powder of crude Antimony, be infuſed in Ale for ordinary Drink: alſo Decoctions of *Sarſa* made with the woods, are found beneficial againſt this Diſtemper,

Medicines of Tin and Antimony.

3. Medicines endued with a volatile Salt.

3. The uſe of a Viper, and the Preparations thereof, doth enough commend the wonderful vertue of volatile Salts in a grievous Impetigo, and alſo in curing the Leproſie it ſelf. This Antidote of that Diſeaſe is reported to be found out firſt by a caſual experiment, inaſmuch (as *Galen* reports) that drink being pour'd out of a Bottle wherein a Viper was put to poyſon one labouring with an Elephantiaſis, and ſo given him to free him from his miſery, prov'd his remedy, and what was deſtined for his murder, diſpatched an incurable Diſeaſe. Hither relates the Analogy, taken from the nature of this Animal, whence they collect that it helps in this Diſeaſe; becauſe the Viper yearly ſhakes off his ſcaly Coat, therefore ſome thinks its particles prevalent to throw off the leprous skin of a diſeaſed man; but though we do not attribute much to theſe things, yet it is manifeſt by frequent obſervation, that remedies of a Viper do profit in the Impetigo and Leproſie; the true reaſon whereof ought to be aſcribed much to the volatile Salt wherewith this Animal is endued. For the particles hereof deſtroy the fixt and acid Salts predominating in the blood of the diſeaſed, and diſſolve their combinations; notwithſtanding, the Salt, Spirit, and Oyl chymically extracted out of Vipers, by reaſon of their elaſtick particles, contracting an Empyreuma from the fire, profit not in this diſeaſe; as alſo neither *Spirit* not volatile Salt of *Harts-horn*, *Soot*, *Blood*, and other the like *Armoniacks*; becauſe by violently ſtirring the Blood and Humours they rather diſſolve their temperament, and thruſt forth the Corruptions more plentifully into the Skin. Wherefore the more ſimple Preparations of Vipers, as broths from their fleſh boil'd in water, and Drinks impregnated by Infuſions, and Decoctions, and Powders being made of them dryed and beaten, are preſcribed more ſucceſsfully againſt this Diſeaſe. Moreover not only the boyl'd fleſh of Vipers, but of any other kind of Oviparous Snakes being taken in lieu of ordinary food do oft afford notable relief.

Chiefly prepared of Vipers.

But not chymically.

Broths and infuſions of Vipers.

4. How the Impetigo following the Pox is to be cured.

4. The Impetigo or ſcaly eruption of Pimples, and formed as it were into cluſters, is ſo frequent and familiar a ſymptome of an inveterate Venereal diſtemper, that we firſt ask the Patient whether ſomething of that malignity be not concealed of which they are conſcious; and if we perceive the matter ſuch, all Specificks againſt this Diſeaſe, and Antiſcorbuticks being omitted, we muſt come to the Decoctions of Woods, and thoſe little or nothing helping, we muſt deſcend to the uſe of Quick-ſilver. And truly by this method I have cured many that were accounted Impetiginous and Leprous, (who have been handled long in vain, and wretchedly vexed with other Remedies appropriate to theſe diſeaſes:) But we refer this ſort of

of Impetigo to the Pathology of the Venereal diſtemper, whereto it is an Appendix. PHAR. Part. II.

II. The ſecond Indication curatory relating to the Diſeaſe it ſelf, and the primary ſymptom, to wit, the ſcaly eruptions and cluſters of Puſtules, preſcribes Topical Remedies to be applyed to the outer Skin for the removing theſe effects; for which purpoſe in the firſt place Baths and Liniments are convenient: which yet rarely or never help of themſelves, unleſs the procuring cauſe, that is, the Tartarous diſpoſition of Blood be firſt purged out. *The ſecond Indication Curatory.*

There is a vaſt medley of Topicks of this ſort vulgarly vented, as well by Phyſicians as by Empiricks and Quacks; among all which notwithſtanding, Baths or Liniments compounded of Tar do far excell all other Remedies of either kind, inſomuch that we ſhould only uſe theſe but for their ill ſavour; wherefore we will annex ſome models of Compoſitions both with and without Tar. *Topicks of Tar are the beſt.*

Wherefore, for Baths it is common to take water out of Tubs wherein Tar hath long ſtood, and impregnated with the infuſion thereof: Or,

Take of Tarre two pound, and with white Aſhes ſifted incorporate it into a groſs maſs, which boyl in a ſufficient quantity of Spring-water, adding leaves of Ground-Ivy, Fumitory, white Horehound, the roots of ſharp-pointed Dock, Enula-campane, of each four handfuls, make a Bath to be uſed with government; Or let ſuch a Decoction be prepared without Tarre for Patients abhorring the ſmell.

Sulphureous Baths as well Natural as Artificial are found by experience leſs appropriate, yea for the moſt part the former do prejudice; Moreover, every bathing ought cautiouſly to be adminiſtred: for becauſe this adminiſtration exagitates the blood, and puts it into an Effervеſence, its Temperament is endangered (as has been ſaid) rather to be diſſolved, and the corruption to be ſpread more plentifully over the Skin. *Baths.*

2. *Liniments* whoſe uſe is more ſafe, and convenient, are of a Triple kind or degree, *viz.* Gentle, Indifferent, and moſt ſtrong; of each of theſe we will propound one or two patterns. *Liniments.*

1. Firſt therefore in a ſlighter Impetigo, when the Eruptions and Cluſters are ſmall, Faſting Spittle is commended; likewiſe the weeping of green Wood in the Fire, alſo mere rubbing them with roots of ſharp-pointed Docks bruiſed and macerated Vinegar: Or, 1. *Mild Liniments.*

Take of Oyl of Tartar per deliquium, *Oyl of Nuts or Almonds by expreſſion of each equal parts, make a Liniment to be uſed to the parts affected twice in a day.*

2. Liniments of the Second kind have Tarre for an Ingredient, which is eſteemed above all. 2. *Stronger, of Tar.*

Take of Oyntment of Roſes ſix ounces, of Tarre two ounces, melt them together: Or,
Take a fat piece of Weather-mutton, which ſtick with the roots of ſharp-pointed Docks, ſpit it and roaſt it, and in the mean while baſte it with Tarre dropt leiſurely upon it; the Dripping being received in a Veſſel under it, keep it for an Oyntment moſt excellent for an Impetigo.

3. The moſt prevalent Liniments are Mercurial, *viz.* thoſe made with Quick-ſilver or Precipitate. Let the model of the former be that preſcribed already againſt the Scab; for the other, 3. *The ſtrongeſt of Mercury.*

Take of white Precipitate three drams, Oyntment of Roſes three ounces, mix them, for to anoynt the parts chiefly affected.

The uſe of theſe ought chiefly to be ſuſpected in this Malady; for if ſpitting be raiſed, that great glutt of matter impacted in the pores of the Skin will be moved, which if the whole together ruſhing too much towards the *Ductus Salivales*, gather about the parts of the Throat, will endanger ſuffocation.

Some years ſince a Virgin of a Noble Family, being of a hot Temperament, and endowed naturally with a ſharp and ſalt blood, after being a long time obnoxious to an Impetigo, almoſt from her Cradle, about her riper years began to be afflicted more grievouſly; for the cluſters of ſcaly Puſtules covered not only her Arms and Thighs every where, and the other covered parts of her body, but Alſo her Hands and Face were ſo defiled, that ſhe was aſhamed to appear abroad or converſe with others of her rank. Leſſer remedies almoſt innumerable were exhibited without ſucceſs; *A notable Relation.*

PHAR. Part. II.

ceſs; by uſing Baths ſhe at firſt appeared releived, but at length grew worſe thereby. *Aſtrope* Wells which have cured ſome, afforded her little or no relief. Wherefore when all ordinary means would not effect any thing, I propounded Salivation, as a remedy more prevalent then all the reſt and (as it is accounted) the laſt. When the Parents and Patient readily conſented to this advice, preparing her body duely by Purgation and Phlebotomy, I gave her (after our manner) Pills of Solar Præcipitate two dayes, and after the interval of one day, the remedy being repeated the next, an abundant and laudable ſpitting began, and continued for a month without any ill ſymptome; to keep which in its due tenour, I applyed a Mercurial Oyntment to the bending of the Joynts and the places moſt affected, one while to one, another while to another. Before the finiſhing of this courſe, all the Eruptions vaniſhed; notwithſtanding to confirm the Cure, as alſo for the extirpation of the Mercury, ſhe remained another month in Purging, Sweating, and Diet of the Decoction of *Sarſa*, *China*, &c. in which time ſeeming perfectly cured, ſhe ſo remained for about forty dayes. But afterwards though ſhe obſerved an exact courſe of Diet, the ſame diſeaſe began to bud forth again, and leiſurely encreaſing, at length it advanced into its former ſtate. I being confounded with this event, perſwaded her to hope an alteration for the better after her Menſtrual Flux, which was ſuddenly expected. Notwithſtanding, after long delay that Criſis at length happening, and managing her ſelf regularly after it, brought no Cure or eaſe of that Diſeaſe, but rather a freſh aſſault. Wherefore recourſe was had again to Phyſick and divers Remedies aſſay'd, all which when they became fruſtrate, her friends importuned that ſhe might ſalivate again, to wit, allured by this hope, that that method which cured for a ſhort ſpace, being adminiſter'd again, would cure her either for a longer ſpace or altogether Wherefore according to their wiſhes, the ſame courſe of ſpitting and ſweating repeated for two months ſpace, and thereupon the Puſtules every where going off, the Noble Virgin ſeem'd again wholly to recover her health. But within a fortnight after the courſe finiſhed, the Puſtules, and their Cluſters again appeared, and leiſurely encreaſing daily in number and bulk at length grew fouler then before, inſomuch that like an *Hydra*, after the loſs of one head this diſeaſe received ſevenfold.

Salivation cures for a time the Impetigo, but with a relapſe.

That remedy repeated, did not thoroughly cure the Diſeaſe.

I knew another ſtrong man endowed with a luſty habit of Body, who after he had laboured with an Impetigo many years, the malady ſtill encreaſing, and being advanc'd to the higheſt, he was covered all over with a white Scurf, as it were leprous, that every night the Scales fell off like Bran in great plenty in his bed, and might be gathered up in heaps. This man for Cures ſake firſt tryed the ordinary Remedies of every kind, notwithſtanding without ſucceſs; and afterwards trying a lighter Salivation, found himſelf nothing better: but afterwards the ſame method being repeated, by a long and painful Spitting, he ſeemed to be reſtored to health; but within three months the ſame diſeaſe budding out, in a ſhort ſpace arrived to its former outragiouſneſs; Moreover, when he had undergone the third time that moſt painfull Remedy, that affect, which ſeemed expulſed for a certain time, returned again; and afterwards maugre this and all methods, it exercis'd its Tyranny during the Patients life. It will not be requiſite here to diſcourſe any thing of the *Lepra*, which being only a more intenſe degree of the former Malady, for the moſt part admits of no Cure. As to what relates to other Tumours, and their manifold kinds, and the Ætiologies or Reaſons of each, I confeſs I am ſcarce able to contain my ſelf, but that I ſhould enter upon that pleaſant Field of Speculation. But this ſeems as irrational and unuſual, as for one wearied with a long Courſe, and breathleſs at the end, running beyond his Poſts preſently to begin a new Race.

FINIS.

A TRACT OF THE SCURVY.

CHAP. I.

The Contents.

A Deſcription of the Scurvy. The Internal and neareſt Cauſe of it is chiefly in the Blood, and alſo in ſome part radicated in the Nervous Liquor.

THere is ſo rare Mention, and ſo ſlender Deſcription in the ancient Medicine of this Diſeaſe, which we call the Scurvy, that ſome have doubted, whether there were in the times of old any ſuch Sickneſs, though now epidemical in many places, and almoſt every where ordinary, and with which every one is troubled, or at leaſt thinks himſelf troubled with it; and which like the Pox and the Rickets, is derived a great way down to the Children: but certainly it is plain by the teſtimonies of *Hippocrates*, *Aretæus*, *Pliny*, and others, that this Affection though known by other Names, was taken notice of by the Ancients, and that its cure hath been treated of though after a ſlender manner. PHAR. Part. II.

Being not very ſolicitous concerning the appellations of this Diſeaſe, we will preſently proceed to the knowledge and application of its Nature: which as it is ſo diffuſe and extends its ſelf into ſo various and manifold Symptoms, that it can neither be comprehended by one definition, or ſcarce by a ſingular deſcription, it will ſeem beſt firſt of all to recite all the *Phænomena* of this Diſeaſe, or to relate the Hiſtory of the more notable accidents of it, and thence to accommodate a certain *Hypotheſis* for the right ſolving its appearances.

A recital of the chief ſymptoms of the Scurvy.

As to the firſt, there are reckoned up a great company of Symptoms in the Scurvy, and manifold Affections and of diverſe kinds; and which ſometimes are of an oppoſite or contrary nature to it: yea if any unuſual accident, never before heard of in an humane Body happen, when it cannot be referred to any other kind of Diſeaſe certainly, we preſently without doubting pronounce it the Scurvy: ſo that this Diſeaſe, like one condemned, and of an evil Name, ſuffers for others faults:

PHAR. Part. II.

faults: In the mean time it is wont to excite ſymptoms very many from its own power, which appear almoſt in every part of the Body, a recital of which will be beſt performed by a diſtribution of the parts of the Body. Therefore that we may thorowly handle the marks of the Scurvy, from the beginning to the end, we will

In the Head. begin firſt from the fountain of it in the Head: and to this belong great and habitual Headaches, and thoſe either by certain fits, or at certain times, ſometimes a numneſs or ſtupidneſs of Spirits, ſometimes pertinacious Wakings, frequent Giddineſſes, and Swimmings in the head, Convulſions, Palſies, plentiful Spittings, Ulcers in the Gums, a looſneſs of Teeth, a ſtinking in the Mouth. Secondly, ſometimes in the region of the Breaſt, pains in divers parts of its membranes, and chiefly about the *Sternum*,

In the Breaſt. which being often ſharp and piercing, do miſerably torment thoſe labouring with this Diſeaſe night and day, a frequent *Aſthma*, difficult and unequal breathing, a ſtraitneſs of the Breaſt, a ſtriving with an empty Cough and inordinate Pulſe, a trembling of the Heart, frequent Swoonings, and often faintneſs of Spirits, or a fear of it almoſt

In the lower Belly. continual. Thirdly, this Diſeaſe, as it were fixing its chief ſeat in the lower belly, produces an Iliad of Diſeaſes: for often they have Nauſeouſneſs, Vomitings, Belchings, gnawing at the Heart, Inflammations, and grumbling of the *Hypochondria*, often Colicks, and troubleſome Griefs running up and down here and there, almoſt a continual *Diarrhæa* or Looſneſs, ſometimes a Dyſentery or Flux, or a deſire of going to ſtool, a waſting away of the Fleſh, and ſometimes an *Aſcitis*.

The Urine, for the moſt part red and lixivial, with a cruſtineſs ſwimming in it, or elſe ſticking to the Urinal: ſometimes alſo by fits it is pale and wateriſh and in abun-

In the outward Parts. dance. Fourthly, beſides theſe Affects of the Belly, there are wandring pains and thoſe not ſeldom highly painful, and troubling chiefly at night in the external Members, yea thorow the whole habit of the Body they feel a heavineſs and ſpontaneous wearineſs, a waſting of the Fleſh, an ach about the Loyns, and a debility and enervation of other Members; in the Skin ſpots of ſeveral colours, Tumours, Pimples, and often venemous Ulcers ſhew themſelves about the Muſcles: a Numneſs, Stifneſs and pricking, and as it were the aſcenſion of a cold air, Alſo Contractions, and leapings of the Tendons: Beſides to ſcorbutical Perſons happen inordinations of the Blood, uncertain Effervеſcencies, wandring Intemperaments, erratick Fevers and great Hæmorrhagies. Beſides theſe more common and accuſtomed ſymptoms of the Scurvy, of which ſome have more ſome leſs, and which infeſt them now after one manner, and now after another manner, and in another kind, oftentimes there happen other unaccuſtomed and prodigious accidents to this Diſeaſe.

The evident cauſes of the Scurvy. For the more full knowledge of this Diſeaſe, it ſeems good that we here obſerve as it were lightly, what concerns the original, beginning or firſt invaſion of it. For we are to inform you, that the Scurvy may be produced by reaſon of ſeveral Cauſes and Occaſions: for although an ill courſe of Diet, a ſedentary life, the inordination of the Spleen, and the Crudities heaped up in the firſt paſſages are very much accuſed; yet there is wont to be a further cauſe, as the unwholſomneſs of the Air, and the evil *Craſis* of the blood, vitiated by former Diſeaſes: wherefore the Scurvy or Scorbute is often venacular or peculiar to mariſh places, and to the Sea Coaſts: and frequently falls on thoſe who much uſe the Sea, and feed much upon ſalt and ſmoak-dry'd Meats, and who are forced to drink putrified Water: and often ſucceeds to continual Fevers, and to other chronical Diſeaſes ill cured; alſo to great Hæmorrhagies and other evacuations; and to uſual excretions, as the Piles and monthly Courſes being ſuppreſſed: Moreover this Diſeaſe, without any great forerunning cauſe, is excited not ſeldom by contagion, and ſometimes is alſo hereditary.

The cauſe of the Diſeaſe diffuſed thorow the body ſticks either. It manifeſtly appears from what we have obſerved concerning this ſcorbutick Affection, that the material cauſe of this Diſeaſe is not contained in any private place or ſingular Mine, but is diffuſed thorow the whole body and every part of it, both within and without: from whence we gather that the ſcorbutick Miaſm or Contagion, is poured forth, either in the Blood or in the Nervous Juice or in both. And indeed, the eruptions of Spots, and little whelks, the redneſs, and as it were lixivate urine, or like lie, plainly teſtifie the Contagion to be placed in the effervency and inordinateneſs

To the Blood or to the nervous Juice or both. of the Blood; to which another like prognoſtick may be added, the divers production of this diſeaſe, which for the moſt part, ſucceeds the depravation of the Maſs of Blood: no leſs the troubleſome dolors, both within in the Membranes & without in the Muſcles, the debility of the Members or reſolutions, the *Vertigo*, Cramps, and frequent faintings of the Spirits declare the fault or vice to be in the nervous Juice. Therefore, when both the general Humours are in fault, we will ſee which is firſt and chiefly vitiated, and from whence it draws its Contagion, and by what means it communicates its harm to another humour, and to any other parts, that are wont to be affected.

As

PHAR. Part. II.

As to the Blood (in whose mass the Scurvy seems most of all to be rooted) we have elsewhere shown, that its disposition is even almost of the same temper, and of such like particles composed, as Wine: for that we have hinted, the Blood, even as Wine, to be sick, chiefly from two causes, to wit, either, because that there is something extraneous, and not to be truly mingled with it, poured into one or the other, or else because the disposition of the Liquor, or its temperament is perverted, that is, for as much as some things that are to be in Subjection, either to one Element or to another, and which ought to be subjugated, are exalted. *The Dyscrasie of Blood and Wine Compared.*

As to the first we have observ'd of some, that when the *faces*, are first secreted, and thrust up from the bottom, they are by being moved, lifted up; or if any exotick thing be cast into the Pipe, as Sewet or Sulphur, presently a notable perturbation is stirr'd up; by which, unless it be soon quieted, the whole *Crasis* of the Wine will be in danger to be subverted. In like manner there are many things not miscible, which disturb the Motion and Circulation of the Blood, by being poured into it, and hinder it, that it cannot perform its due œconomy, the nutritious Juice being full of the feculencies, does inordinately ferment the Blood, and as we have formerly shown, that Liquor becoming degenerate stirs up the paroxysms of intermitting feavers; the vaporous Recrements of the Blood, the serous, bilous, and melancholy being retained in the bosom of it, bring forth Catarrhs, Dropsies, Jaundice, Mellancholly, and many other Diseases: but if that extraneous thing be removed in time, it soon, even as VVine freed from its extraneous mixture, recovers its pristine Condition. But either Liquor, being for a long time infected with those heterogeneous contents, so that the due *Crasis* is at length degenerate, it is not then easily to be restored. *As to things not miscible poured into either.*

2. Besides, both Wine, and Blood, by reason of many other causes, depart from their right Temperament. As to Wine there are many ways and reasons whereby its Liquor is perverted from its legitimate disposition: which may also be parallel'd, by as many, if not more, in the dyscrasie of the Blood. (For this is often wont to be suddenly empoyson'd and broken, which does not easily happen to Wine) 1. Therefore, we may observe of Wines, that they do not sometimes attain to maturity, but for want of Spirit they remain crude, for as much as the Spirits, and the other active principles of Sulphur and Salt being overwhelmed with more thick and gross parts, cannot extricate themselves; wherefore they become without Spirit, but having a thick consistence, and ungrateful, taste degenerate into a tastless VVine: and almost after the same way it is, when the Blood, the Spirit, and Sulphur depressed becomes crude and watry, and without Vigor, and unable to be inkindled afresh in the Heart. And this kind of disposition of the Blood *Horstius* affirms to be the cause of the scorbutick affection; but this same disposition, seems rather to infer the *Pica*, or strange longings of women with child, as also the Dropsical disposition, than the Scurvy, as we shall shew more at large anon. 2. The sulphureous parts of Wine being exalted above the rest, cause an immoderate effervescency or ebullition in the Liquor, and is called in our idiom or proper Speech, *Fretting of Wine*: In like manner, the sulphureous parts of the Blood being too much provoked or carried forth, causes a feverish intemperance, and is apt to be inflamed in the Heart, and indeed is the cause of very many feavers together. 3. Not seldom the Spirit in Wines growing weak, and the Sulphur being bound up, the saline part being carried into a flux overcomes the rest; wherefore the Liquor becomes sour. The famous *Sennertus* thinks the Blood in the Scurvy to be altered as VVine degenerated into Vinegar, which we shall shew by and by, to be otherways. And we have formerly shewed, the dyscrasie of the Blood, being grown sour, causes Mellancholy. 4. There yet remains another ill disposition of Wines, to which we may very aptly compare the scorbutick Disposition of the Blood, to wit, when the Spirit being depressed, the sulphureous and the saline Particles being combined together, are exalted, and as this comes to pass in Wines, after a two fold manner, so also by the like affection of the Blood we may deduce from thence a two fold Kind of Scurvy, as we shall shew more clearly anon. It is then a common observation in VVines, that besides their degenerating into a tastless Liquor, and into sour Vinegar, they do sometimes, the Spirit being depressed, and the Sulphur and Salt being together exalted, become rancid, or ropy, or mucilaginous; in proper terms, *Wines that are fretted, or ropy*. In either mutation, the Spirit being subjugated, the sulphureous and the saline Particles being associated together, exceed the rest of the Elements, and cause the disposition of the Liquor, to become of their Nature. But yet the business is not performed, altogether after the same manner, in both: for that in the former dyscrasie of the Wine the Sulphur is something more potent, than the Salt, but in the latter the Salt exceeds the Sulphur: so that either of them being the stronger, their Lord, *As to the temper of either variously altered.* *The Scorbutick Dyscrasie of the Blood-like Wines when they become,* *Fretted or Ropy;*

PHAR. Part. II.

the Spirit, being caſt off; they agree one with the other, and ſurmount the due tencur. The reaſon of either, may ſeem to be unfolded after this manner.

When generous Wines have grown hot for a long while, the particles being much agitated and ſtriking one againſt another, the Spirit partly evaporates, and partly overwhelmed in the more thick Elements, is ſuppreſſed: In the mean time, the Sulphur (of which there is the greater plenty) being more carried forth by the agitation, and ſo caſting off the yoak of the Spirit, adheres to the Salt, and lifting up, alters the mixture of the Liquor, which by reaſon of the riſing up of the Sulphur combined with the Salt, becomes rancid, or fretted: In like manner, when thin Wines have been kept long, the Salt is carried forth, and depreſſes the Spirit, overcome by its *fluor*, and ſo ſubjected by its wat'riſhneſs, the Liquor becomes ſour or ſharp; after that the Salt growing eminent, the Sulphur (of which there is a leſs quantity) cleaving to it, and intimately uniting, converts the Conſiſtency of the Liquor from thin to thick, and as it were of an oily ſubſtance; and from an acid, ſour taſt to a very ingrateful and as it were muſty.

It is probable that after the ſame manner the B'ood is altered in the affection of the Scurvy, as Wines, as often as they become too hot, degenerate into fretted and ropy, for it is an argument, that this diſeaſe does not depend ſo much on the feculencies mixed with the Blood (though ſuch ſhould there be, they might be at laſt driven forth, and their ſupplies cut off) but on the habitual dyſcraſie of the Blood; becauſe the Scurvy being radicated, is ſo difficult and ſometimes not at all, to be cured. Moreover we may affirm, the dyſcraſie of the Blood which cauſes the Scurvy, to be two fold, as of the Wine, to wit, a ſulphureous-ſaline and a ſaline-ſuphureous diſpoſition. For as there are very great variety of affections, which are ſtirred up by the Scurvy; yet all of them may be aptly enough reduced to two principal Heads, or as it were two Fountains of evil, to wit firſt, that the blood being touched with the ſcorbutick Miaſm or Contagion, becomes either very fervid or hot, in which the Sulphur having dominion, aſſociates it ſelf powerfully with the Salt: wherefore it being made more rancid or fretting, grows inordinately hot in the veſſels, and perpetually ſends forth from it ſelf aduſt recrements, to wit, concretions of Sulphur and Salt, and diſperſes them here and there, which ſpreading outwardly, produce ſpots, pimples, whelks, or ulcers: but being inwardly laid up, bring forth a diſpoſition to Vomit, pains about the heart, Looſneſs, Fluxes and grievous pains. In this kind of Scorbutick rancidity or frettedneſs of the Blood temperate Remedies only are convenient, and often Blood-letting, Scurvigraſs, Horſe-radiſh, or other things endued with a ſharpneſs and incitation: even by the like means as fretted VVines are cur'd, by diſcharging them from their *faces*, and by pouring into them, Milk, Flower, or Starch, Glew, or other Demulſions or Sweetnings, this is helped. Or in the ſecond place, in blood nouriſhing the Scurvy, Salt has the chief dominion, and aſſociates Sulphur to it ſelf, wherefore it is not ſo fervid, but like ropy Wine becomes thick and mucilaginous, and is ſlowly circulated in the Veſſels, and is apt to ſtuff the *Viſcera* in its paſſage, and to affix there its feculencies as it were mud. Thoſe affected after this manner, for the moſt without any puſtulaes or eruptions of the skin, become ſluggiſh, breathleſs and feeble, and labour with ſpontaneous weakneſs and ſtraitneſs of the Breaſt; and are found to be obnoxious to the paſſions of the Heart, the *Vertigo*, and Convulſions: In the ſcorbutick diſpoſition of this kind, more hot Remedies, and ſuch as are indued with a volatile Salt, yea Chalybeates or ſteel Medicines, which may fuſe and agitate thorowly the Blood, are wont to be moſt uſed, and are to be handled even after the ſame way, as ropy Wines, to wit, to be ſoundly ſhaken and agit agitated; and alſo to them are put Lime, burnt Allum, *Gypſum* or Playſtering, Sea ſalt calcined, and the like, indued with an high acritude or ſharpneſs. So much for the beginnings of the Scurvy radicated in the Maſs of Blood: There yet remains to be unfolded, for what cauſes the Blood degenerating from its proper nature, conceives this or that morbifick diſpoſition, bringing forth the Scurvy. But it firſt behoves us to ſhew by what means the ſeeds of this Diſeaſe lye hid in the nervous Juice, the other general humour.

By what means the ſcorbutick Contagion is impreſſed on the nervous Juice.

We have elſewhere declared that from the Blood driven to the confines of the Brain, there doth diſtil a ſubtle Liquor, both for the matter and for the vehicle of the animal Spirits, and that it doth diſperſe it ſelf every where thorow the *Encephalon*, and the nervous Stock: This *Latex*, ſo long as it is right and good, conſiſts chiefly of Spirit and Salt combined or volatiliſed in it, and with theſe and the *modicum* of Water, wherewith they are waſhed, there ſeems to be little need of Sulphur and Earth: but yet this concretion of Spirit and volatile Salt doth indeed conſtitute the moſt pretious humour which penetrates, paſſes thorow, actuates, and irradiates all things, concerning which the Chymiſts have dreamt of their *Alchaeſt*. At the beginning of the Scurvy, whilſt

PHAR. Part. II.

whilſt the *Craſis* of the Blood and the tone of the Brain are not thorowly vitiated, this watring liquor of the Brain and Nerves, being as yet ſpirituous, ſweet, and not very unfit, performs all the functions to which it is deſtinated: but afterwards out of the bloody Maſs made poor and very much weakned, a much thinner *Latex* and inclining towards Vinegar drops forth: and further, from the fœculented Blood and as it were rancid or fretted or ropy, heterogeneous Particles and very much infeſted are carried to the animal Regiment, and that being made weak within the Brain, they are admitted without repulſe, and thence poured forth with the moiſtning Juice on its *Appendix*, both medullar and nervous: and from hence in ſeveral Regions of the flowing animal Spirits, ſometimes faintings and wantings of ſtrength, ſometimes painful and ſpaſmodick, or cramplike diſtractions, and exploſions do follow. Wherefore a *Paralyſis* or Palſy, Convulſions, *Vertigo* or turning round or giddineſs in the head, tremblings and other preternatural Affections of the Brain and nervous Stock, are wont to fall on thoſe who have the Scurvy deeply rooted: concerning which we will hereafter ſpeak more particularly. In the mean time we will take notice in general, that the ſcorbutick Contagion affixed in the nervous Juice, conſiſts in one of theſe three or in all of them together, *viz.* that the moiſtning of the Brain and Nerves becomes much thinner or poorer; or that it degenerates from its ſaline diſpoſition into ſourneſs; or that it is ſtuft with heterogeneous Particles.

Hitherto we have ſhown after what manner the firſt ſeeds as it were of the ſcorbutick Affection are ſown in the Blood, and from thence in the nervous Juice. Before we will conſider of the fruits or ſymptoms of the Diſeaſe, excited by reaſon of the evil diſpoſition of either of the humours and the reaſons of them, and their manner of becoming ſo; we muſt inquire into the more remote cauſes and differences of the Diſeaſe it ſelf: to wit, that it may appear from what cauſes or occaſions, and by what proviſion the ſcorbutick diſpoſition is impreſſed on the aforeſaid humours.

CHAP. II.

Of the more Remote Cauſes of the Scurvy, by which its Contagion is affixed on the Maſs of blood, and conſequently on the nervous Juice.

HAving ſhown in the former Chapter, what is the conjunct and neareſt cauſe of the Scurvy, *viz.* the evil diſpoſition impreſſed on the Blood and nervous Juice, it now remains, that we inquire into the more remote Cauſes, by which the Contagion of either humour, and chiefly of that which is chiefly and firſt in fault, is carried into the Blood: for the depravation of this being detected, it will eaſily appear, how the morbifick Miaſm or Contagion is derived to the other Juice. Therefore as we have determined, that the ſcorbutick Affection is chiefly founded in the vitiated Blood, and that the evil of it conſiſts, whilſt the Spirit is depreſſed, in that the Salt and Sulphur, as in Wines becoming fretting and ropy, is unduely exalted; we will ſeriouſly conſider, how this or that diſpoſition is impreſſed in the maſs of Blood.

The opinions of others concerning the original of the Scurvy recited.

But we ought not to paſs over what other Authors, diligently ſearching after the nature of the Scurvy, have determined concerning its Cauſes and Subject. As there are many opinions of this thing, almoſt all agree in this reſpect, that the fountain and origine of this Diſeaſe is derived from the fault of the *Viſcera*, and the ſeat of its product is placed in the bloody Maſs, to wit, that this being almoſt only infected with their vitiouſneſs, contracts the ſcorbutick Contagion. The more Antient did impute the chief cauſe of this Diſeaſe to the Spleen, not rightly performing its office: but as the office of the Spleen was conceived this thing by ſome, another thing by others, and a different thing by theſe; they ſhewed the production of this Diſeaſe after a ſeveral manner. *Wierius*, *Ecthius*, *Albertus*, *Ronſeus*, *Engalenus* with many others, ſuppoſing that the Spleen was the receptacle of the excrementitious melancholick Juice ſeparated from the Blood, have determined the internal and next cauſe of the Scurvy, to be a plenty of lutulent or muddy humour, and of melancholly only, or alſo of that mixed with others, framing a peculiar form of corruption, which abounds about the Spleen and Liver, and in the Veins themſelves. This opinion might deſervedly challenge our aſſent, if it had pronounced the ſecretion of the melancholick Juice from the Spleen being neglected or hindred, to be ſometimes and in part

PHAR. Part. II.

part the cauſe of the Scurvy; but that this Diſeaſe is held to ariſe always and altogether from the default of the *Viſcera*, is very highly improbable; as will hereafter be made plain, when we ſhall declare the far more potent cauſes of the Scurvy. Other Authors attributing the office of ſanguification to the Spleen, ſay that the Scurvy is produced, for that the Spleen does not turn that part of the Chyle deſtinated to its ſelf, into laudable Blood. But again others, as *Reuſnerus*, *&c.* have thought the more humid and watry parts of the Chyle to be prepared in the Spleen, and to be converted into Blood. Therefore they judged the next and internal cauſe of the Scurvy to be the watry and ſerous humours, which not being received by the Spleen, were poured on the Blood, and ſo produced the original of the Scurvy. In the mean time others, as *Platerus*, *Bauhinus*, *&c.* ſaid that the thicker part of the Chyle being drawn by the Spleen, was the cauſe of ſanguification, and by it too be prepared for it ſelf, and other parts convenient Blood. From this ſuppoſition *Gregory Horſtius* ſaid the cauſe of the Scurvy to be the crude and ichorous Blood in the whole Body, but yet chiefly in the *Hypochondria*, offending not only in quantity but with a kind of ſpecifick corruption, proceeding from the imbecillity of the Spleen, *viz.* becauſe thorow the preternatural Affection of the Spleen, the more crude parts of the Chyle, are not averted from the ſanguification of the Liver, from whence the blood in the veins of the Liver and Spleen is firſt depraved, and then by the Commixtion of ſtrange matter the Sanguification of the Liver is hindred, by reaſon of the object not rightly diſpoſed, for as much as the chyle, by reaſon of the hurt of the Spleen, was not depurated in its juſt meaſure. *Horſ. appen. ad. lib. 2 part. 2 Sect. 1 de Scorbuto.* This opinion eaſily falls to the Ground, becauſe he aſſerts contrary to the Laws of Sanguification, the Spleen to ſanguifie and to draw the more crude parts of the chyle to it ſelf; when 'tis well known, there is no paſſage for the Chyle to the Spleen. Alſo this miſtake is refelled by the opinion of *Reuſnerus* and others, which affirm the next and internal cauſe of the Scurvy to be the ſerous and watry humours which the Spleen ought to draw, and by its peculiar office of Sanguification, to convert into Blood.

The moſt learned *Sennertus*, although with the former he attributes alſo the office of Sanguification to the Spleen, *Inſtitut. lib. 1. cap. 9.* yet he derives the cauſe of the Scurvy otherways than from the fault of this *Viſcus*. For he affirms, that by reaſon of the evil Concoction of the Chyle in the firſt paſſages, and being deſtitute of Spirit, ſalt and tartareous Feculencies to be heaped up, about the Meſentery and Cawl, and theſe being continually augmented by the approach of new matter, and moiſtened by the *Serum*, to be at laſt transferred into the Spleen and Liver, and from thence into the Stock of the veins, and ſo in them to infect the whole bloody Maſs, and to render it crude and ſalt. He calls this firſt Mine of the Scurvy, gathered together in the firſt paſſages, a melancholly Humour; which beſides he ſays to be ſerous, ſtopped up with pituitous humours, and by reaſon of its ſtay in thoſe parts, corrupted after a peculiar manner: Then he adds, that this humour is generated by the fixion of the Spirit and volatile Salt, after the ſame manner, when as wine changes into Vinegar.

The Scurvy does not always ariſe by the fault of the Spleen or the firſt paſſages.

Several Reaſons of no ſmall moment do convince me, that I cannot in all things aſſent to this opinion; however probable it ſeems. For beſides, that this Doctrine does not exactly quadrate with the Circulation of the Blood, ſince by its Law the humours in the meſaraic veſſels are ſcarcely gathered together apart from the other kind of Veſſels, at leaſt there is not any paſſage for them from thence into the Spleen, moreover it is not rightly determined, that the Scurvy begins only in the firſt paſſages; for ſometimes it is contracted by mere Contagion. Neither alſo do we think that this Diſeaſe proceeds from the fixedneſs of the Salt, or from the Crudity of the Blood and humours: for oftentimes it ſucceeds to long continued Fevers, and that rather ſeems to proceed from aduſtion and too great deflagration of the Blood, than from any advention of the Chyle and other humours in the firſt paſſages: moreover ſometimes a Sea and mariſh air induces this Diſeaſe, though no Crudities are begotten about the *Viſcera*: and the ſick do not complain from the beginning, of their Appetite and Digeſtion. Indeed wee grant, as to what belongs to the Crudity and the fixity of the Salt, in the Chyme (or ſecond digeſtion) or the Blood, and defect of Spirit, that from theſe cauſes a ſickly Diſpoſition is oftentimes produced, but not therefore preſently the Scurvy, but rather the *Malacia* of longing women, *Pica* of Virgins, the phlegmatick Dropſie, or ſome other dropſical diſpoſition ſucceed. Therefore ſince the Scorbutick Ætiology hath been delivered by Authors, to whom the Circulation of the Blood was not known, and agrees leſs with the Truth, we will open the whole matter with that Key, and to the beſt of our Skill more accurately unfold the cauſes

ſes, both procatartick and evident, of this Diſeaſe, according to the Law of Sanguification. PHAR. Part. II.

We have already hinted that there are many occaſions and procatartick means from which the Scurvy ſeems to deduce its original. 1. In ſome places it becomes national or peculiar, ſo that the morbifick Contagion is drawn in together with the vital Spirit, by reaſon of the evil Influence of the Air, and of the vapours, wherewith it is ſtuffed. 2. Very often this Diſeaſe follows upon long continued fevers, and other Chronical Diſeaſes, and is very deſervedly accounted the effects or products of them. 3. Sometimes it is hereditary, and is propagated by traduction from Scorbutick Parents. 4. Sometimes again it is taken by mere Contagion. 5. An evil manner of living, inordinations as to the things non-natural, an innate or acquired Dyſcraſie of the *Viſcera* ſometimes induce a Scorbutick affection, more often contribute to its birth, or nouriſh the inkindling. We will conſider the reaſons of every one of theſe effects.

1. There is none of the ordinary ſort of People, but confeſſes that the Scurvy is very often contracted by the fault of the Air, and it is almoſt in every bodies mouth, that places neer the ſea ſide, mariſh lakes, and moiſt places, render the Dwellers obnoxious to intermitting Fevers, or the Scurvy: wherefore the ſickly, or ſuch who have any regard to their health, do chooſe their habitations far from ſuch kind of places. Indeed ſuch an humid Air, continually diffuſing filthy exhalations and infection, becomes unwholeſome in a double reſpect, and often brings forth the Scurvy, *viz.* by reaſon of Tranſpiration being hindred: and becauſe of the ſuſception of an incongruous Ferment. For in the firſt place, people dwelling in a thick and not purified Air, have the Paſſages and Pores of their skin much cloſer, or ſhut up: wherefore when the *Effluvia* of the Blood are not duly exhaled, but the ſame retained within, ferments the reſt of the bloody Maſs, and diſpoſes its active particles to various inordinations. Then in the ſecond place, for as much as at the ſame time filthy vapours, ſtinking, incongruous Salt and Sulphurs are ſucked in, by reaſon that the Spirits of the Blood are greatly depreſſed, and in the mean time its ſulphurous and ſaline particles are carried forth to the extremity, and from thence the *Craſis* of the ſanguineous Maſs being by degrees chang'd, it degenerates into an evil diſpoſition. And indeed, the ſulphureous part of which being exalted by it ſelf induces a notable rancour to the Blood; and there is wont to be excited, ſometimes continual, but often intermitting fevers ſo familiar, by the unwholſome air, for the reaſons elſewhere ſhewed. If from ſuch an occaſion (as it very often happens) the ſaline Principle is carried forth together with the Sulphur, ſuch a ſcorbutick diſpoſition as we have above deſcribed, like to fretted or ropy Wine is impreſſed on the Blood. Not only a great tract of humid and vaporous Air, is unwholſome after this manner, but alſo to dwell in houſes ſituate neer any mariſh, or encompaſſed about with a pond or moat, or in houſes new plaſtered with lime, renders perſons obnoxious to this Diſeaſe. *By what means unhealthful Air breeds the Scurvy.*

2. A Fever of long continuance, very often induces the Scurvy: the reaſon of which manifeſtly appears from our *hypotheſis*; for from the often, and too much deflagration of the Blood, the Spirits are very much waſted, and like liquor that becomes poor and liveleſs; by its burning, a great plenty of the more pure Sulphur evaporates, and in the mean time what is left of it, aſſociating to it ſelf the Salt, carrying it up, is wont to cauſe the *Craſis* of the Blood to become planely morbid and ſcorbutick. It is to be obſerved, after a long Fever, by reaſon of the Spirit and Sulphurs too much exhaling, and very much of the Salt being for a long time concocted with the remaining Sulphurs, that the Blood becomes very ſalt, and as it were lixivial, ſo indeed that from thence, it is ſcarcely enough inkindled in the heart to perform the circulation: ſuch a diſpoſition of the Blood is not to be reſtored, but by a long time, and is very difficultly hindred from running into the Scurvy. Not only after fevers, but alſo after other chronical diſeaſes, evilly cured, the Scurvy is induced, and that for a double reaſon or means of affecting, to wit, either becauſe the Blood is changed by the preſent diſeaſe towards a ſcorbutick diſpoſition, or becauſe the diſeaſe hinders the ſick for a great while, from any exerciſe, or motion, and from thence they are inclined, by a long Idleneſs and ſitting ſtill, to the Scurvy. The firſt is diſcerned in Melancholly, when by the depreſſion of the Spirit, and the Salt being carried out into a *fluor*, the Blood turns to a Sourneſs. This kind of *Craſis*, the Sulphur afterwards aſſociating with the Salt, and both of them being carried forth eaſily paſſes into the Scurvy. The Hypochondriack Affection is ſo much of kin to the Scurvy, that it very often takes it for a Companion: for the melancholly feculencies, which only after the nature of that affect pollutes the Blood, afterwards perverts its *Craſis*, and renders its ſcorbutick: in like manner the Jaundice and Dropſie which at firſt only infects the Blood by an impure and incongruous Mixture, after a long *2. Why it follows upon long fevers.*

ſtay

PHAR. Part II.

ſtay, quite changes its Temperament. 2. Many other Diſeaſes accidentally induce the Scurvy for as much as the ſick are hindred from any kind of Labour or Exerciſe; ſo that their blood is very little eventilated, but retained, like Wine a long time upon its lees, looſes its *Craſis* or Temperament, and is liable to the inordinations of the Salt, and Sulphur. After this manner the Palſie, *Lumbago*, or feebleneſs of the Loins, the fracture of Bones, Ulcers, Wounds long time in curing render Men obnoxious to the Scurvy.

3. How it is contracted by Succeſſion.

3. The Scurvy is ſometimes contracted by ſucceſſion, ſo as the contagion of the Diſeaſe being derived to Children from their Parents, without any other external or internal cauſes, produces infected fruits exactly like the nature of the ſcorbutick Affection: So have I known Children ſprung from ſickly Parents, to have been affected with wandring pains in their Limbs, an eruption of Spots, an eroſion and rottenneſs of the Gums and Teeth. Beſides it is obſerved, the Children of Parents touched with the venereal Diſeaſe, to be obnoxious to moſt grievous ſymptoms, like to ſcorbutick Affection. The reaſon of theſe ſorts of affections ſeems to conſiſt in this, for that the filthy taint being impreſſed on the genital humour, becomes like empoyſoned ferment, which although it for a long time lies hid, being involved with other Particles, at laſt exerts its power and raiſes up the ſymbolick Elements of Sulphur and Salt in the Blood or nervous Juice, and by carrying them above the reſt of the Particles, inclines to the ſcorbutick taint.

How by Contagion.

4. By the ſame reaſon and means of affecting, the Scurvy is propagated by contagion, *viz.* the Effluvia's proceeding from an infected Body, and entring into the Pores of one that is near or inſpired by the Breath, ferment either the Blood or the nervous Juice, or both of them together: and ſo by carrying up the ſpirituous-ſaline, and ſulphureous Particles, pervert the Temperament or *Craſis* of the Liquor, according to their nature.

How the Viſcera and the firſt ways are in fault.

5. The cauſes of the Scurvy hitherto cited, reſpect more immediately the bloody Maſs, and ſhew the diſeaſe to begin from its *latex*, without any great fault in the firſt paſſages. But leſt we ſhould think this Region, to which ſome attribute all the fault; to be wholly free; it ſeems to be determined according to the judgment of others, that the rudiments of the Scurvy is alſo ſometimes conceived within the *Viſcera* of Concoction, and from thence traduced into the Blood: For when it happens from the Chyle, being for a long time vitiated, that the nutricious Juice becomes incongruous, and is ſtuffed with Particles of enormous Salts and Sulphurs, which it carries to the bloody Maſs; there is a neceſſity that its *Craſis* will at length be changed, & perverted according to the nature of the matter, by which it is conſtantly & daily ſupplied. Wherefore it is obſerved, that thoſe who eat much of ſalt or ſmoke-dry'd Meats, and drink much Wine and ſtrong Waters, by which means Salt and ſulphureous Particles are violently carried into the Blood, are found to be very much obnoxious to the Scurvy: Beſides thoſe who feed much on Swines fleſh or Fiſh, although freſh, but eſpecially on Shell-fiſh, for that theſe Aliments have in them plenty of rank Sulphur and Salt (as may be gathered by the extreme ſtink of their putrefaction) are very apt to fall into the Scurvy, and which is more, ſometimes into the Leproſie. On the contrary, they are not ſo incident to this Diſeaſe, who eat milk meats, raw and unripe fruits, freſh Cheeſe and other abſurd things, which heap up in the Ventricle a great quantity of Phlegm; neither is the Juice nouriſhing the Scurvy, produced from depraved or ill digeſted meats; but ſometimes Aliments fit or convenient enough turn into a morbifick matter by the fault of the *Viſcera*; which indeed happens not always by the fault of the Liver or Spleen, as ſome have thought, for theſe have no buſineſs with the Chyle, but the Stomach it ſelf being endued with an extraneous ferment, perverts every thing that is put into it, and changes it ſometimes into a ſour, ſometimes into a Salt or vitriolick pulp, and it is very likely alſo that the incongruous Juice from the Pancrace, or the cholidical paſſage, may be mixed with the Chyle, and imbue it with an heterogeneous tincture. We do not deny but that the Spleen and the Liver do not ſeldom contribute to the production of the Scurvy, but yet not the Chyle but more immediately the Blood ſuffers for their faults when the Liver is obſtructed; ſo that the aduſt recrements of the Blood are but little or ſmally ſeparated, by reaſon that its Maſs being more feculent, becomes too luxuriant with the particles of Salt and Sulphur concocted together. As to what relates to the Spleen, it is not altogether undeſervedly, that ſo many complaints are exhibited againſt it, as to the production of the Scurvy: For as the office of this Bowel (as we have before ſhewn) conſiſts in this, that it doth receive and ſeparate both the atrabilary or melancholly feculencies of the Blood, which conſiſt in a fixed Salt and Earth, and alſo that it digeſts the ſame by a further concoction into a ferment, to be mingled again with the Blood: If then at any time the Spleen does not rightly perform

PHAR. Part. II.

form theſe its Offices, the maſs of Blood is wont to be infected in a double reſpect: to wit, either becauſe the atrabilary or melancholly fæculencies are not wholly received by the Spleen being obſtructed or debilitated; or becauſe being received, the ſame are perverted into an unfitting and corruptive ferment of the Blood: After this manner and ſometimes after that, the ſanguinious Maſs becomes evilly diſpoſed, and not rarely by this only occaſion, or by the acceſſion of other cauſes, degenerates into a ſcorbutick diſpoſition: And indeed from ſuch a foregoing cauſe, we have formerly declared the hypocondriack affection to ariſe, to which truly the Scurvy (as even now we hinted) is ſo near a kin, that it moſt often is a companion with it, or follows hard after it. But it plainly appears by the obſervation before cited, that the Scurvy does not always and only ariſe from the fault of the Spleen: For ſome time paſt there was a noble Gentleman, who for many years had laboured under a ſcorbutick affection, accompanied with very many and grievouſly horrid Symptoms; The Phyſitians whilſt they had this Gentleman in cure, concluded his ſickneſs to be contracted by the fault of the Spleen; and all thoſe heavy evils to come upon him for the ſake of that Bowel: At laſt after being afflicted almoſt with continual pains, for the ſpace of ten years, and alſo with the *Paralyſis* and miſerable Convulſions, waſting away, he died with a Conſumption. The Corps being opened, it appeared to the ſenſe, that the Spleen ſo evilly defamed was free from all fault; for this inward was very laudable in figure, magnitude, ſubſtance, and colour, and without any tumour or obſtruction: Beſides, the ſanguiferous Veſſels being opened and freed from their ſtuffings, the nervous Fibres appear'd firm enough, and the Blood contained within the pores of the Spleen, free from corruption.

wherefore ſadneſs and immoderate Studies beget the Scurvy.

Among the cauſes of the Scurvy, that are wont to be derived from the inordination of the *non*-naturals, we may here deſervedly place ſadneſs, for it is every where obſerved, that men, through ſome occaſion ſtruck with ſorrow, and ſo remaining for a long time ſad, do become ſcorbutick. The reaſon of which ſeems to be this, great ſadneſs immediately affecting the inferior or bodily Soul, compells inwardly both its parts, to wit, the ſenſitive and the vital, ſtraitens their *Syſtaſes* or conſtitutions, inhibiting their wonted expanſions, and draws them into a leſſer ſpace. Hence the Animal Spirits being hindred from their due expanſion, remit their Oeconomy, wherefore the Blood repeating its Circuits in a leſſer compaſs, is apt to be heaped up about the boſom of the heart, and there to ſtagnate for this reaſon, when the Spirits of either Government, *viz.* either animal or vital are depreſſed, and the Blood and nervous Juice begin to be altered in their complections, either of them by degrees loſing their vigor, turns from a generous Liquor to one ſour and liveleſs: Beſides, the *Viſcera* of Concoction being denyed the wonted influx of Spirits, perform very untowardly their Offices. Hence from the Chyle not rightly concocted, or being depraved in its coction, the nutricious Juice being ſtuffed with feculencies, becomes vitious; and is poured on the bloody Maſs, whereby it more perverts its *Craſis*, and cauſes it eaſily to paſs into a ſcorbutick diſpoſition. Moreover for this reaſon, immoderate and too ſerious ſtudies, and the continual intention of the mind, for as much as from hence the Spirits being depreſſed, and the offices of the *Viſcera* ſubverted, the chief *Craſis* of the humours altered for the worſe, they often acquire a ſcorbutick taint: To which we may add, that both ſad and ſtudious perſons, for the moſt part lead a ſolitary life; for which cauſe, both the Blood and nervous Juice, as water wanting motion contracts mud, is wont to be vitiated and ready to fall into a ſcorbutick corruption.

The ſcorbutick taint is derived from the Blood to the Brain and nervous ſtock.

Theſe are, if not all the procatartick or more remote cauſes of the Scurvy, yet at leaſt the chief of them which affix its taint on the Blood; there will not need any other Ætiologie, to ſhew how it is derived from the hurtful Blood into the nervous Juice, for the Blood by its accuſtomed rite and law of circulation, diſtills a portion of its ſpirituous Liquor into the Brain: But as we have before ſhewn, from the Blood depauperated a thin *latex*, and from that a ſharp liquor and ſalt withal, is drawn off after the manner of ſalts when they are diſtilled: Alſo beſides from the feculent Blood, and as it were, muddy heterogeneous Particles, infeſting the animal Kingdom, are brought forth; which notwithſtanding are not eaſily admitted into a firm and ſound Brain. Wherefore as ſuch Particles, being received within the *Encephalon*, do induce thereupon paralytic affections or Cramps; ſome cauſes precede, by which the conſtitution of the Brain is debilitated, of which ſort they uſe to be, 1. Its evil hereditary Diſpoſition. 2. Frequent Surfeits or eating too much, immoderate drinking of Wine, noon Sleeps, great Hæmorrhagies, and other occaſions, whereby either the animal Spirits are too much conſumed, or the pores and paſſages of the Brain, relaxed, and too much opened, that they admit of every thing brought from without.

PHAR. Part. II.

CHAP. III.

Of the differences of the Scurvy, also of the Signs, Symptoms, and Causes of this Disease; and chiefly of those which arise by reason of the taint being impressed on the Blood.

The differences of the Scurvy.

FRom the causes of the Scurvy hitherto described, it will be easie to assign the differences of this Disease: For in the first place, this affection may be distinguished according to the twofold Region of the conjunct Cause, *viz.* the Blood and the nervous Liquor, for that it is either of this or that Kingdom chiefly, and is more deeply rooted now in the Blood, now in the nervous Juice. Secondly, according to the double taint of the Blood affected, to wit, as that shall be either sulphureous-saline, or saline-sulphureous, it shall also signifie the Scurvy by divers Names, or it shall be called according to the vulgar appellations, either, bilous or hotter, shewing it self in spots or whelks, and other more apparent symptoms; or Melancholly, whose poyson lying hid, as it were covered with ashes; is known rather by the intrinsick hurt of the faculties, than by outward eruptions. Thirdly according to the Original & manner of invasion of the Disease, to wit, for as much as it is received either by contagion, or that it arises through an internal *procatarxis* or remote cause; also according to its various state, it is many ways distinguished, and is either beginning, more perfect, or desperate, and requires adivers manner of Indications as to the Cure, of which we shall treat more largely hereafter. In the mean time, it is our business to recite the signs and symptoms of the Scurvy, and to add the causes of them, and after what manner they happen.

Signs and Symptoms.

The Signs by which Prognosticks or *Indicia* of the Scurvy are taken, are either extrinsick, to wit, certain accidents and circumstances, which till the more certain notes of the Disease appear, give a suspition of it: So we may deservedly think, any one having a very sickly disposition, to have contracted some taint of the Scurvy, if he be sprung from scorbutick Parents, or if he have long conversed with a Wife, or Companions affected with it; or if he live near the Sea Coast or marshy or otherways unwholesom places, or if he should have had before a long Fever or other Chronical Diseases, or if he shall be sensible of help by anti-scorbutick Remedies, and that such ill disposition be without a Fever, or certain signs of any other Disease. Or Secondly, the signs of this Disease are present affects and symptoms, to wit, inherent to the sick body; which sort as they are manifold, are wont to be variously distributed, & reduced into certain Classes, that is to say, for as much as they are proper to the Scurvy, or common to it, with other diseases, also for that they are excited, either about the beginning or in the increase of the Disease, or in its worst state or condition. Further, they are distinguished according as they shall be excited in the various parts of the Body internal or external, also for as much as they may happen either in the Head, Breast, the *Abdomen*, or about the Members or habit of the Body: By this way we have already recounted the scorbutical symptoms. But they may be aptly enough distributed according as they arise, either by reason of their taint, being fixed chiefly in the Blood, or by reason of the faults of the nervous Juice, or by reason of the congression, or as it were conjunct influences of either humour becoming enormous. We shall as much as we can, insist on this method, in reciting and unfolding the signs and symptoms of the Scurvy, although in the mean time, very many affections which seem to proceed from the singular fault of this or that humour, procure some fault of the other humour, to be also a part of the cause: As to what relates to the preternatural affections of the first passages, and the *Viscera* in the Scurvy, although they sometimes proceed from errors in living, yet most often the sicknesses of these parts becoming indeed permanent arise by reason of the Blood or nervous Juice, as shall be declared hereafter in its proper place. In the mean time, we will shew at once how the chief symptoms of the Scurvy proceed from the fault of this or that humour, or conjunctly from both.

1. What kind of Affections arise by reason of the scorbutick Dyscrasie of the Blood.

1. When as the Blood is very much infected with a scorbutick taint, evil symptoms follow for three chief Reasons, *viz.* 1. Because its Liquor being depauperated, wants its wonted vigor; so that it can neither be inkindled in the heart freely, nor be circulated lively and equally: For which Reason, a dejection, and as it were a falling down of the whole Soul, Sadness, Anxiety, difficultness of Breathing, a straitness of the Breast, intermitting Pulse, frequent Swoonings, and inordinate suffusions of Heat and Cold follow. 2. The Blood abounding with feculencies, pours all about its Recrements on the parts which it washes; Wherefore Spots outwardly, Pimples, VVhelks, Pustles and Ulsters are excited.

excited. Hence alſo, Catarrhs, the Dropſie, a ſwelling of the Members, Ulcers of the Gums, Vomitings, Lasks, Fluxes, great Spittings, Sweats, a lixivial Urine, or filled with Contents, as alſo tumors of the *Viſcera*, or obſtructions do not ſeldom follow. 3. A poor and feculent Blood ſupplies the Brain and nervous ſtock with but a vicious Liquor, and ſo by the means of thoſe Parts it communicates its faults: Beſides a depraved Blood does not afford preſently a *Copula* or joynting to the Spirits, every where abounding within the Fibres, convenient enough explosive for the acts of the locomotive faculty, from whence a ſpontaneous laſſitude, or wearineſs, and impotency to the moving of the parts proceed.

2. In the Scurvy, the moiſtning juice of the Brain and nervous ſtock, after it is infected with the filthy taint, offends in a treble reſpect. 1. For as much as it declines from a noble and ſpirituous, into a poor and thin Juice, from whence a languor and enervation of the whole Body, and in ſome part alſo an Atrophy proceeds. 2. For as much as this Liquor is changed from a ſpirituous-ſaline, into a ſour, acetous Juice, from whence melancholly and fear, a failing of Spirits, and a ſuppreſſion from their wonted vigor, and alſo almoſt continual griefs and irritations of the nervous parts, and a crackling of the Bones are induced. 3. For that this Liquor is ſtuffed with heterogeneous Particles, and infeſting the animal Regimen; Convulſions, Spaſms, or Cramps, Palſies, Vertigo's, ſoporiferous Affections, or pertinacious Watchings, at laſt Fooliſhneſs, or Moping, or Madneſs ariſe. *2. How impreſſed on the Brain and nervous Juice by reaſon of the taint.*

3. In a more heavy and inveterate Scurvy, the recrements of the Blood and nervous juice, being depoſited together in divers parts, for as much as they are endued with ſaline Particles, which are of a divers nature, they encounter one with another; and by a mutual ſtriving and effervescency, produce moſt horrible Symptoms. From hence ariſe intollerable dolors, chiefly at night, waundring pains in the Joynts, Rheumatiſms, and other affections of this kind. After this manner, from the double fountain of the ſcorbutick taint, very many Rivulets of evil affections running every where in all parts of the whole Body, create griefs. *3. How by reaſon of the Conjunctevils of either humour.*

4. That yet a more full knowledge may appear, it will not be from the matter, to recount each of the aforeſaid Symptoms, and the reaſons of every one of them, and how they come to paſs particularly to deliver.

1. The firſt ſign of the Scurvy, by which oftentimes a ſuſpicion of the beginning of this Diſeaſe is given, is a ſpontaneous wearineſs, to which are added impotencies as to motion, alſo a debility of the Thighs, and as it were a ſenſe of weight or heavineſs. Theſe Symptoms are wont to ariſe about the beginning of this Diſeaſe, and are derived rather from the fault of the Blood, than of the nervous Liquor, which is as yet ſcarcely infected: But this may be done in a double reſpect, *viz.* in the firſt place, for as much as the Blood being made impure, flings out ſerous feculencies in its circulation, and inſinuates them into the pores and paſſages of the Muſcles, wherewith they are ſtuffed and loaden, ſo that the Spirits being hindred, and intercepted, they perform not freely enough nor lively their locomotive exploſions: Beſides, the parts being loaded as it were with a certain Burthen, they are not eaſily and readily moved as formerly. 2. From a vicious Blood, the exploſive *Copula* of the animal Spirit becomes degenerate and weak, wherefore they neither readily accompliſh, or nimbly perform the local motions: We believe in an inveterate Scurvy the impotency as to motion to ariſe alſo from depravation of the nervous juice, and from the want of Spirits. *The cauſe of the Sypmtoms unfolded. Spontaneous wearineſs.*

2. Difficult breathing and a ſhortneſs of breath upon any motion, is a familiar ſymptom of the Scurvy, of which as there are wont to be two cauſes, it depends now upon one now upon the other, and ſometimes on both together. The ſcorbutick *Dyſpnœa* or ſhortneſs of breath, if it be very frequent and almoſt conſtant, comes from the very poor, and as it were, liveleſs ſtate of the Blood, whereby it is indeed apt to ſtagnate, and not to be eaſily inkindled in the Heart: wherefore from any motion, as the Muſcles urge the ſanguiferous Veſſels, by compreſſing every where their contained liquor, the Blood ruſhes ſomewhat more plentifully into the boſom of the heart, which when it is not there preſently inkindled, and carried forth of doors, it lies heavy at the heart, and threatens a decay of the vital function: Therefore the Lungs that they may bring help, are moved more ſwiftly, that the Blood may be drawn forth quickly, and ſo for this end, to wit, the circulation of the liveleſs Blood, and of it ſelf almoſt immoveable, the often and ſhort breathing is cauſed. In this caſe, with laborious breathing there is alſo a quick and ſmall Pulſe. 2. Sometimes the ſcorbutick *Diſpnœa* or ſhort breathing proceeds from the fault of the nervous ſtock, for after the morbid or filthy taint has occupied the Brain and its appendices, the heterogeneous Particles ſent from the *Encephalon*, as they are of kin to other nerves; ſo alſo to other Spirits, to wit, thoſe ſerving to the motion of the *Diaphragma*, and the Muſcles of the Breaſt, come to the Brain; and ſo according as thoſe Nerves are either inhibited or perverted from performing rightly their offices, a difficult reſpira- *Difficult of Breathing.*

PHAR. Part. II.

is produced of a various kind, and is for the moſt part either Paralytick or Convulſive: For the morbifick Particles entring into the nervous ſtock, and about their foldings or extremities being more plentifully heaped up, are fixed with plenty of Spirits. Hence it ſometimes happens from ſuch a cohæſion of Particles, (if perhaps they be Narcotick) that the Spirits inhabiting thoſe Nerves, are every where bound and hindred from their deſigned actions: When reſpiration being hindred, other Spirits the gueſts of Nerves yet free, that they may perform the common task by their own ſtrength, are very much ſtirred up, and ſo as much as they may, they cauſe a more frequent and laborious reſpiration. But whenever the Spirits flowing within certain Nerves, for the office of reſpiration are affected with an heterogeneous, explosive, or ſpaſmodick *Copula* or joyntling of the ends of the Muſcles, for the ſake of whoſe preſſing out, when they are excited through plenitude or for other occaſions, they run into convulſive motions: And from thence the Lungs are detained with laborious and often repeated turns, now of *Syſtoles* now of *Diaſtoles*, like to aſthmatick Paroxyſms. In theſe caſes, ſometimes the Nerves of the *Diaphragma*, ſometimes the Pneumonick, and thoſe abſolving the motion of the Breaſt, alſo ſometimes perhaps thoſe embracing the *Bronchia*, ſometimes theſe, ſometimes thoſe apart from the reſt, are ſtupefied or obnoxious to cramplike affections, and for that reaſon the various differences and ways of the anomal or unequal reſpiration occur: Some kinds and examples of which we may add hereafter. I know ſome aſcribe the cauſes of the aforeſaid Symptoms to the Vapours elevated from the Ventricle and its Neighbourhood, whoſe opinion in another place we have deſervedly rejected, with reaſons ſhewn to the contrary. *Eugalenus*, *Horſtius*, and *Sennertus*, whom others follow, deduce the cauſe of the ſcorbutick *Dyſpnœa* or purſineſs, from the *Viſcera* of the lower belly, being inflated or tumefied, and by that means preſſing the Caul, as it uſes to come to paſs in Hydropicks, and women big with Child. But I cannot aſſent to this opinion, becauſe this ſymptom does not ſeldom happen to thoſe, whoſe Belly and *Hypocondria*, are ſoft enough, and who have the ſinking below the Ribs, and the ſpace for the motion of the *Diaphragma*, free enough, as I have often found upon examination. But, that difficult reſpiration falls upon Hypochondriacks, & ſometimes alſo upon Scorbuticks, upon the perturbation of the Spleen, the reaſon is, becauſe the ſplenick Nerves communicate with the pneumonick: Therefore indeed when either of them are beſet with the morbid, *viz.* the ſpaſmodick matter, and the ſame being moved in either of them, ſtirring up Cramps, draws the others into a conſent of affection, as I have already manifeſtly declared, diſcourſing of the hypochondriack paſſions: In all difficult reſpiration excited by reaſon of the fault of the nervous ſtock, the Pulſe though for the moſt part ſtrong enough, yet becomes quicker than it ought to be, and ſometimes intermitting.

A ſtraitneſs of the Breaſt.

A ſtraitneſs of the Breaſt heavily infeſts ſome ſcorbutick perſons, which kind of ſymptom hath joyned with it a difficult reſpiration, and commonly is aſcribed to the ſame Cauſe, to wit, from the compreſſion of the Caul by the elevated *Viſcera*: But yet though the Breaſt be ſometimes by that means ſtraitned, that thoſe purſily affected can hardly draw their breath, but that the taking in of the breath terminates in the midſt of the *Thorax*, yet ſometimes on the contrary they draw in the Breath too deeply, ſo that they breath it out again hardly and difficultly: which certainly by no means ought to be attributed to the inequalities of the inferior *Viſcera* in the *Diaphragma*; but either to the undue accenſion of the Blood in the Heart, or rather to the preternatural affection of the Nerves, ſerving for reſpiration: By the like reaſon alſo the cauſe of more difficult inſpiration or taking in the Breath, is deduced from the ſame fountain, *viz.* in either caſe the Nerves ſerving for the drawing in and thruſting out the Breath, for that they are poſſeſſed with a morbifick matter, and that either Narcotick or Spaſmodick, they perform in the executing their proper Offices either more or leſs than they need to do. But ſometimes ſcorbutick Perſons are troubled with a ſtraitneſs of Breaſt, without the breathing much hindred; ſo that they feel the compaſs of the *Thorax* to be more ſtrictly drawn together, and to be contracted into a narrower ſpace. In the mean time, thoſe ſo affected complain rather of the anxiety of the heart, than of any hindrance of the motion of the Lungs: The cauſe of this ſeems to be, that the Membranes inveſting the *Præcordia*, for as much as being too much irrigated with a ſerous humour, together with the nervous, become more contracted like wet Leather: So that their Fibres being irritated, wrinkle themſelves too much into ſhort Convulſions or Spaſms, and from thence they force the containing parts to be ſtraitned: Beſides, this kind of ſtraitning of the *Præcordia*, follows in ſome part the motion of the Heart it ſelf: For whilſt the Blood is made poorer, it does not leap forth ſtrongly enough from the boſom of the Heart, nor flames out openly into the Lungs. Wherefore theſe need the leſs to be dilated or expanded, but rather that they may anſwer to the circulation of the Blood, performed in a leſſer compaſs, and exactly quadrate to the inveſting Membranes, & to the nervous Fibres deſtinated to their motion they are regulated

red according to the weak limits of expansions: Wherefore this constriction of the *Praecordia*, as I have observed in very many, is wont to be suddenly remitted and intended, by reason of the occasions of Joy and Sadness, even as the Blood leaps out more plentifully, or more sparingly from the bosom of the Heart, the greater or the lesser space is proportionated to its Circulation.

4. An unequal and an intermitting Pulse, also frequent swoonings and fear of the same, very often happen in the more grievous Scurvy, the same reason of which as of unequal breathing, is ascribed deservedly, now to the undue accension of the blood in the Heart, and now to the inordination of the nervous stock. The Blood being made more saltish, and besides much stuffed with scorbutick feculencies, is but unequally and brokenly inkindled, like the oyl of a Lamp imbued with Salt and muddy filths: Wherefore from hence an irregular Pulse, with a wasting of the vital spirits in the Brain is stirred up. Moreover, when the cardiack Nerves are also beset round with a morbifick matter, so that the influx of the animal Spirits, by which the motion of the heart is continued, is not performed in a just dimension and equal manner, by that means it happens that the motion of the heart is somewhat hindred, and its reciprocations variously disturbed; an inequal or intermitting Pulse, and a small & weak seems to proceed from the dyscrasie of the Blood, but if it be great and strong enough, from the fault of the animal function. *Inordinate Pulse.*

5. The trembling palpitation and great leapings of the heart often happen to those scorbutically affected; these sort of passions are merely convulsive, and altogether depend on the cardiack Nerves, to wit, belonging to the heart it self or *Pericardium*, beset with a Spasmodick and explosive matter: For the animal Spirits, the inmates of the Nerves themselves and of the Fibres, and their appendices being inordinately explosive, compel the whole joynting of the heart to be cruelly shaken and moved. In the mean time, whilst the whole bulk of the heart is agitated by that means, it does often rightly perform the proper motions of *Systole* & *Diastole*, as I have observed in many, who with such a shaking of the heart have had an ordinary and laudable Pulse. *The Passions of the heart.*

6. Erratick Fevers, also sudden suffusions of heat & cold in several parts of the Body, use to come upon an inveterate Scurvy: The reason of the former is, because the extraneous matter being often carried to the Blood with the nutritious Juice, for that also the alible Juice it self is made degenerous, because it is not rightly mixed with the Blood, they stir up its extemporany effervescencies. In the mean time, a Fever observing a regular type, for that cause excited, rarely happens to Scorbuticks, because the salsuginous Blood, although it be taken with a feaverish burning, does not burn long nor much, at least not equally: As to the sudden suffusions of heat and cold, they indeed seem to be inferred somewhat by reason of the affection of the nervous stock, for that the Nerves and Branches and nervous succours, do diversly embrace & compass about the sanguiferous Vessels in most parts of the Body, perhaps for that use, that the course of the Blood might be urged & restrained, as it were with Goads and Bridles, according to the force of the passions, and other exigencies of Nature: it is very likely that when the œconomy of the animal Kingdom is perverted by the scorbutick taint, that most of the Nerves and Fibres and their Appendices, being stretched out here and there; do every where run into spasms or convulsive motions, and also by reason of their hurt, the irregularity of the Arteries and Veins are contracted: So that the Blood is compelled into these parts more than it ought, and is too much estranged from them, from whence these kind of inordinations of heat and cold proceed. *Wandring Fevirs.*

7. Plentiful Sweats chiefly at night, are wont to be very troublesome to some scorbuticks, the reason of which is, that as the nutritious Juice being daily brought into the mass of Blood, by reason of the dyscrasie or evil disposition of this, and the impurity and filth of that, is not assimilated; but being rejected of the Blood is sent away under the form of Sweat. But that the nutritious Juice in the time of its assimilating, becoming degenerate; does not produce an intermitting Fever after its manner, the cause is the salsuginous intemperature of the Blood, which therefore becomes less able for periodick deflagrations; this sort of immoderate sweating happens chiefly in the Scurvy, following upon a long Fever or other Chronical Dyscrasies, where the nutritious Liquor is perverted, rather by the default of the assimilating Blood, than of the concocting *Viscera*. *Nightly Sweats*

8. In a more certain Scurvy, as in other Diseases, we consult the Urinal: For if the Urine appears intensly red, and as it were lixivial without a Feaver or the Jaundise, we undoubtedly pronounce this a sign of that Disease: For whilst the serous *Latex* is circulated for some time with the soluted Salt, and Sulphur, the saline and sulphureous Particles being inconcocted in the same, bestow on it a very deep and as it were lixivial tincture: Also that such Urine abounds very much with contents, which, the stale being cold, precipitate to the bottom, it altogether owes it to the Particles of the degenerate nutritious Juice snatched away with the *Serum*. But yet the Urines of the scorbutick persons often *Lixivial urine.*

vary,

PHAR. Part. II.

vary, for ſometimes they appear of a Citron colour, with a Cream ſwimming in it or fixed to the ſides of the Glaſs, from whence an *indicium* is taken, that the Blood doth abound with ſaline rather than ſulphureous Particles: Indeed if ſuch an Urine be exhaled at the fire, the ſaline reſidence will remain in almoſt the double quantity of the Liquor. Moreover, ſometimes the Urines of the Sick are changed from this or that ſtate to the contrary, ſo that what was to day red or of a Citron colour, to morrow is made limpid, clear, and thin, and in abundance: Which kind of Piſs, as it appears, was not circulated long with the Blood (becauſe it hath received no tincture from it) we judge to come to paſs from the watry recrements of the Blood and nervous juice, contained partly within the Lymphæducts, and partly depoſited within the Pores and paſſages of the ſolid parts, which when they are gathered together to a fulneſs, every where run forth of their Receptacles with the riſing flood, and ruſhing into the bloody Maſs, are from thence ſent away preſently by the Reins.

A plentiful ſpitting and ulcerous Affections of the Mouth.

9. There follows upon this Diſeaſe being grown very grievous, a plentiful ſpitting, and for the moſt part a bloodineſs of the Gums, and then a looſeneſs of them, and at length a putrefaction, which is wont to be accompanied with an Eroſion, Looſeneſs, or falling out of the Teeth, and with a ſtinking Breath: That the reaſon of which may the better appear, in the firſt place, you are to be advertiſed, that there are ordained about the peculiar parts of the mouth, certain Pipes or paſſages, to wit, ſalival, by which the ſerous humours are plentifully ſent forth: Theſe ariſing from various Glandula's, to wit, the *Parotides* being in the Weſand or Throat, the Maxillar for thoſe belonging to the Jaws, and thoſe under the Tongue for the moſt part terminate about the Gums or near them: The conſtant and ordinary Office of theſe, is to lay up the Spittle for ſome neceſſary uſes in the Cavity of the mouth. Beſides, it is obſerved that the ſuperfluous humours, yea the more thick and vicious are perhaps ſent away forth adoors by this way, rather than ſeparated from the Blood as by Urine, Sweat, and otherways. Quickſilver prepared with Salts and taken inwardly, or the Body anointed with it, is minutely diſſolved by the ſaline Particles of our Body, and being with them involved, mixes it ſelf moſt deeply: Theſe kind of Concretions of Salts and Mercury, being diffuſed thorow all the humours, and into all the parts of the whole Body, as Nature endeavours to expel the trouble they afford; the beſt indeed and moſt eaſily performs their execution by theſe emunctories of the Mouth: For the Blood, and perhaps in ſome part the nervous Liquor being burthened with thoſe mercurial-ſaline Recrements, endeavour by every way to ſhake them off; which however, when they are more thick and fixed, than that they can be exhaled or diſtilled forth by ſweat, or ſent away, being precipitated by the ferment of the Reins through the Urine; they are ſometimes breaking thorow the little mouths of the Arteries, inſerted in the Inteſtines, in ſome part excluded by the Belly: But yet the particles of this Medicine being involved with the *Serum*, and moſt readily depoſited in the aforeſaid Glandula's, and in others belonging to the Mouth and Throat, flow out by ſalivation more plentifully excited; by which effluxion it happens that the Gums and other parts of the Mouth are ulcerated, and the Teeth are looſened with a ſtinking of the Mouth. But this kind of ſalivation ſometimes ſucceeds of its own accord, inſtead of a *Criſis* without *Mercury*, in the declination of ill judged Fevers, and the humour to be excerned, ſweating forth not only from the more open holes of the ſalival paſſages, but alſo from the little mouths of the Arteries every where thick planted, daub over the Cavity of the Mouth with a whitiſh ſcurf. The like reaſon of theſe accidents, may be rendred of theſe ſort of Symptoms in the Scurvy: For indeed when in a depraved Blood, more and thicker recrements of the enormous Salt and Sulphur are gathered together than can be excerned by evaporation or by Urine or Siege, they are carried to the emunctories of the Mouth; by which the more ſalt purgaments of the Blood are wont to go forth: theſe ſalt things being diluted with the *Serum*, ſweating not only from the ſalival Veſſels, create great ſpitting; but alſo being carried thorow the Arteries, enter into the ſoft and ſpungy fleſh of the Gums which firſt of all, their pores being filled with an ichorous Blood, ſwell up; but afterwards the ſalt Ichor going forth from the Blood, and being continually excreted, the fleſh of the Gums, by reaſon of the defect of laudable nutriment, grows flaggy, leaving the Teeth almoſt naked. Further, by a long afflux of matter plainly corroſive, the fleſh of the Gums is eaten away; ſo that the Teeth can hardly ſtand, but grow looſe or fall out of the corrupted Stalls: And by reaſon of the ſaline-ſulphureous Particles, partly of the excreted humour, and partly of the putrefying Gums, being continually breathed forth, the filthy ſtinking ſmell of the mouth is excited.

Various Spots and Whelks.

10. Spots breaking forth in the Thighs and in other parts of the Body, are accounted a pathognomick ſign of the Scurvy: Theſe are ſometimes about the bigneſs of a Penny, and often as big as a Shilling, ſometimes the Skin ſeems to be marked or ſpotted an hands breadth or more in ſome part: Beſides, theſe Spots are of divers colours, to wit, now

Citron

Citron Colour, now Dark, now Purple, and ſometimes appear livid, blewiſh or black: Beſides, ſome have whelks variouſly ſwelling, *viz.* now lightly, now with a hard, and as it were a cruſty skin, or they break out with ſcales here and there in all the members of the Body: Among the ſpots and breakings forth whether tumid, or equal, or rough, this difference is noted in general, *viz.* that theſe contain a matter not congruous with the Blood, wherefore being ſecreted from its Maſs in its circuit, they are fixed in the Skin; neither are they altogether forſaken by the Blood, but that the Blood paſſing by adds to them others & new Particles, whereby it comes to paſs that the extravaſated matter, by the continual approach of the Blood, is either at length ſupp'd back again, or being ſubtiliſed is breathed forth, (and ſometimes it is effected partly one way and partly the other) or laſtly that matter being ripened, runs into an Ulcer or Sore. Moreover, Whelks almoſt of every kind do generally happen not only in the Scurvy, but in many other Diſeaſes, yea if at any time the Blood does immoderately boyl up through any occaſions. But ſpots are portions ſecreted from the Blood, and every where forſaken by it; ſo that there is nothing of commerce between them & the circulated Blood, wherefore they increaſe not in bulk, nor ſuppurate, nor eaſily evaporate. The Citron or darkiſh Spots ſeem to be ſome portions of Choler or Melancholly, poured forth from the Blood into the Skin: But as to the black or Purple marks, it is to be known, that they are not excited in any other diſeaſes, beſides peſtilential Fevers, the venereal diſeaſe, and the Scurvy: In the Plague and malignant Fevers they ſeem to be certain rejected parts of the blaſted and deadly affected Blood, to which always a Malignity and Contagion are joyned, as we have elſe where ſhown more at large: In the Pox and Scurvy, though there is not ſo much malignity found, that the Spirits of the Blood are greatly mortified, or that its liquor becomes ſo greatly blaſted, yet we may well ſuſpect, that in either diſeaſe, growing grievous, the Blood being apt to be in ſome meaſure broken and coagulated, it grows together into leſſer Clotters; which ſort of Concretions of the Blood being extruded at the mouths of the Arteries, are fixed in the Skin, and according as theſe portions are greater or leſſer, and participate more or leſs of the corrupted Blood, the Spots alſo, as to their bigneſs, and colour, are fixed in the Skin.

The Flux of the Belly.

11. A Flux and looſneſs of the Belly happens frequent enough in the Scurvy, ſo that the *Faces* of the Belly, which are ſometimes liquid and ſometimes compacted, and of divers Colours, ſeem to exceed in quantity the aliment that is taken in, which ſort of Flux, although it appear immoderate if it be ſtayed by the uſe of Medicines, preſently the Sick are wont to find a ſwelling of the Ventricle and *Hypochondria*, a hardneſs of Breath, or a waſting of the Spirits. The cauſe of the ſcorbutick *Diarrhœa*, is partly, that the Chyle is not rightly cook'd, neither is it ſoon enough, or ſufficiently born through the milky Veſſels; hence ſtagnating in the Inteſtines and becoming degenerous, is caſt forth adoors, but this chiefly happens, for that the impurities admitted within, from the bloody Maſs, drop out from the little mouths of the Arteries, wherefore the things excreted are more copious ſometimes than thoſe put in.

Vomiting, nauſeouſneſs, &c.

12. By the like reaſon, Scorbutick and Hypocondriack perſons are found obnoxious to frequent Vomiting, nauſeous Belching, and heart pains: which Symptoms indeed do frequently happen in this Diſeaſe, partly becauſe the Tone of the Stomach is looſned, and its Ferment vitiated, whereby it comes to paſs, that the reliques of the Chyle evilly concocted, is turned into an auſtere Salt, Vitriolick, or otherways degenerate pulp, and beſides, though the Stomach be ill, becauſe the recrements of the Blood reſtagnating within, are poured into its Boſom.

Dyſenterie and Hæmorrhagies.

13 Sometimes a dyſenterick Affection, alſo frequent hæmorrhages or flowings of Blood at the Noſe, the Fundament, Reins, *Thorax*, Gums and other places, follow thoſe ſick of an inveterate Scurvy: The cauſe of which Symptomes is, for that the Blood being made more ſalt, and therefore more apt to grow hot, eaſily breaks forth at the mouths of the Veſſels; but chiefly, becauſe when the tone of the ſolid parts is weakned, and that the Fibres are made very lax, the mouths of the Veſſels become broader and diſcontinued, ſo that it does not rightly lead the paſſages from the extremities of the Arteries into the little mouths of the Veins, but that the Blood being intercepted between the openings of the Veſſels, and being there apt to ſtagnate and flow out, by what it can, it eaſily breaks forth, and ſlides it ſelf forth adoors.

Theſe are the chief Symptoms, which are wont to be inferred by the Scurvy, by reaſon of its taint; being impreſſed on the maſs of Blood, and from thence tranſlated immediately into other parts, ſome of which alſo happen to be cauſed, partly by the depravation of the nervous Liquor. Now we will next conſider of the Effects and Accidents of this Diſeaſe, which are wont to be excited, almoſt only or chiefly by the fault of the nervous Juice.

CHAP. IV.

PHAR. Part. II.

CHAP. IV.

The Symptoms and Accidents which are wont to arise in the Scurvy, by reason of the Taint impressed on the Brain and nervous Stock.

Fearfulness and languor of the whole Body.

1. WE have already intimated, that in the more grievous Scurvy, the moistning Liquor of the Brain and nervous appendix is wont to become thinner and poorer, whereby it comes to pass that most of the animal Functions are performed untowardly and slowly, hence, the locomotive power flaggs very much, so that the sick loving Idleness and ease, shun exercises and labors of the Body, go about unwillingly any Task, and presently being weary give it off. I have known in some the whole sensitive Soul to seem lessened, and as it were made unequel for the Body, so that the sick, believing themselves not able to walk, nor stand; have refused altogether to be raised, or to rise from their Beds; when as yet no evident cause did hinder, but that they were strong enough to do what was required: Besides such, however ingenious they were before, abhorred the Studies, and labours of the Mind, and plainly affected to wear out their Life by doing nothing.

Melancholly.

2. In an inveterate Scurvy the nervous Juice declines from a spirituous-saline disposition towards a sour one; hence, as we have elsewhere shown, Melancholly, a fluctuation of the mind, an often mutation, and inconstancy of purposes, proceed: moreover, as the nervous Fibres are perpetually watered by the influx of such an humor, from hence, in some part, come the more light Spasms or Twiches, cramp-like contractures, and wandring Pains. But indeed the chiefest vice of the nervous liquor, is wont to be, that being stuffed with filths and fæculencies, it contains heterogeneous particles, and divers ways hurtful to the animal regiment: wherefore happen very often to Scorbuticks horrid and grievous Affections, of which sort, are the following Symptoms.

Scorbutick Palsie.

3. Paralytick Affections, *viz.* Impotency, or the resolution of one or more of the Members, also stupor, or lack of feeling, and a sense of tingling, or pricking, often follow upon a deep and heavy Scurvy: which sort of Symptoms are not however, for the most part, very much fixed and permanent, but sometimes they cease or remit, and anon are repeated or increased. The scorbutick Palsie is wont to be excited chiefly from three sorts of causes, which now conjunctly now divisively produce this Disease. 1. For the Debility, or resolution of the Members, happens, because of the nervous Juice being departed, there wants a sufficient plenty or stock of the animal Spirits, whereby all the members should be actuated: Hence, the sick have the locomotive faculty flagging, or weak, as if infeebled by old age, about the thighs, and feet, and sometimes in other extream parts, to which the influx of the Spirit doth not plentifully reach: perhaps afterwards, as greater afflux of the Spirits is carried to the affected Member, and is in the mean time elsewhere deficient, the disease ceases, or is transferred to another place. 2. Sometimes the animal Spirits, although they are plentifully and sufficient enough, in the parts, yet they are infected with Heterogeneous, and as it were narcotick particles, brought along with the nervous Juice, so that being as it were bound, & almost overwhelmed, they are not able sufficiently & nimbly enough, to perform their explosive endeavours, or labors: hence arise not only the impotency of the motive faculty, but also a certain depravation of the sensitive, *viz.* a benummedness, and a sence of stinging, tingling or pricking, for that whilst the animal Spirits are loaded with an incongruous *Copula*, their irradiation, like the beams of the Sun, passing thorow a cloudy air, is performed, but refractedly, and disturbedly. 3. Although the animal Spirits are dispensed in a sufficient plenty, and are free and clear of any narcotick quality, yet oftentimes their passages are obstructed, so that the Commerce between the inflowing Spirits and those implanted within some members, cannot be performed conveniently; for it sometimes happens, that the more thick and earthy Particles do enter into the bodies of the Nerves with the moistning Juice; which so stuff the passages, about the enfoldings of the Nerves and other nervous windings, with their full burthen, that the irradiation of the Spirits in this or that member is wholly hindred. So I have known some, who have had a hand or foot wholly enfeebled or resolved, whilst the arm, or thigh, with the rest of the Body was well.

From 3 sorts of Causes.

4. From

PHAR. Part. II.

4. From the like cauſe, *viz.* ſcorbutick Fæculencies, fallen upon the Bodies of the Nerves, Griefs or Pains alſo, which are eſteemed the moſt frequent Symptomes of this Diſeaſe, do in ſome ſort proceed; But as they are of a divers kind, they alſo ariſe ſometimes from other Cauſes. For indeed, the ſcorbutick Pains are either more light, uncertain, and quickly paſſing away, which depend ſometimes upon a *Flatus*, or Wind diſtending the Membranes, and ſometimes on a ſharp or Salt matter, poured forth, now from the Blood, now from the nervous Juice, upon the nervous parts; which kind of matter, for that it is improportionate to the nervous Fibres, pulls or hawls them, and irritates them into corrugations or wrinklings and becomes painful: but, for as much as the ſame is quickly waſhed off by the flowing of the *Serum*, or diſſipated by heat, the troubleſom ſenſe brought in from ſuch a cauſe is more eaſily removed. Or in the ſecond place, the ſcorbutick Dolors, are more grievous, very acute and hard to be moved, which ſort alſo, are either fixed, or determinated to ſome particular place, or wandring transfer the Pain, and that moſt grievous, from one place to another, as may be perceived in a wandring and Scorbutick Gout, and Rheumatiſm, concerning which we ſhall diſcourſe hereafter: In the mean time, fixed Pains and a long time remaining, are wont to be excited in divers parts, but chiefly in the Belly, Loyns, Thighs, *Sternum* or Cheſt, and in the Head: It will be worth our labour, briefly to deſcribe the Pathologie belonging to every one of theſe places.

Pains of which there are ſeveral Species.

1. The pain of the belly is ſo familiar to the Scurvy, that according to the German *Idiom*, it ſhould take from thence its name. This Symptom, though in a lighter degree, almoſt continually afflicts ſome ſick perſons, to which is joyned now a looſneſs, and now a high binding up of the Belly: the reaſon of which ſeems to be, for that, when both the Blood and nervous Juice abound with impurities, both the Arteries and Nerves carry the plenty of excrementitious matter towards the ſink of the Belly, which being fixed about the Coats of the Meſentery, or the Inteſtines, ſtirr up conſtant Pains, by a perpetual pulling the nervous Fibres. But beſides there happen to ſome ſcorbutical perſons, Paroxyſms or fits of very acute Pains, as it were Colical, Affections which being protracted for many dayes, yea ſometimes weeks, miſerably torment the ſick: ſo that they think their Bowels to be pulled, and torn to pieces with the grievouſneſs of the Pain: theſe pains are wont hardly to be allaied with any remedies, unleſs with the more generous Opiates; and as ſoon as the virtue of the Hypnoticks is conſumed, they are repeated with their wonted Cruelty, but continuing with a longer fit, very often torments in the Loins and Back are propagated and at length are diffuſed on the members of the whole Body: to this ſort of affection a Palſie does not ſeldom ſucceed. But then in reſpect of the Cauſe of the Scorbutick Colick, it is not probable that it ſhould ariſe from a ſharp matter, depoſited within the Cavities of the Inteſtines, neither from any ſimple humor, however miſchievous it be impacted in their Coats: for this is quickly ſhaken off, or goes into an Ulcer, beſides that is eaſily exterminated by the uſe of Clyſters, or Purges: but indeed, theſe cruel torments of the Belly can come from no other cauſe, than the mutual ſtrivings and effervescencies of the Salts (which are of a divers Nature) fighting or ſtrugling together, whereby truly the Nervous Fibres are pulled, and as it were torn aſunder. For we may ſuppoſe, that certain ſour recrements of the nervous Juice, like to vitriolick *Stagmas*, being gathered together about the foldings of the Meſenterie, or other nervous parts of that region, to which comes a ſerous *Colluvies* from the arterious Blood growing hot, abundantly ſtuffed with the particles of a fixed, and as it were a lixivial Salt, and with thoſe ſwellings up produces as it were piercing Pains. From thence it may be argued that the mine of the former morbid Stock deſcends from the Head, by the paſſage of the Nerves, into the lower Belly, for that great headaches, alſo the Vertigo and Swimming, or turning round in the Head often præceed, and not rarely ſucceed this kind of Colick. Beſides, it appears that from the Bloody Maſs there is a large ſupply ſent of particles of fixed Salt, paſſing as it were by *Deliquium* or a ſtraining thorow; becauſe the fitt of this Diſeaſe being very urgent, the Urine of the ſick appears of a deep colour, and is very much ſtuffed with Salt, and as it were lixivial, and oftentimes its ſuperficies is variegated with divers Colours, like the train of a Peacock: But ſo ſoon as the Diſeaſe begins to decline, the Urine is better, and from hence they are wont to aſſume hope and ſigns of growing well. But that this affection of the Belly is often propagated into the Loins, the reaſon is becauſe the nerves of the Loyns and the meſenterery intimately communicate, and in very many places are mutually inoculated: wherefore when the dolorifick matter ſuperabounds in the paſſages of theſe, it eaſily paſſes into the neighbour proceſſes of thoſe: But then that the Diſeaſe encreaſing, the pains being diffuſed thorow the whole Body, almoſt every Joynt and Member are afflicted, the reaſon is, becauſe when a more plentiful proviſion of the morbid ſeed is begot-

1. *An Almoſt continual Pain of the Belly.*

2. *Pains as it were of the Colick.*

The cauſe of them.

PHAR. Part. II.

ten in the head, then can be derived to the whole ſtock of the firſt affected Nerves, *viz.* the moving and intercoſtal pair; part of it entering into the Bodies of the other Nerves, and alſo ſpinal Marrow, ſpread, abroad this morbifick mine, participating of acetous Salt into very many parts of the whole Body, which every where by the acceſſion of the fixed Salt, from the bloody Maſs becomes dolorifick: and laſtly, after that the plenty of Spirits is profligated by the incongruous matter, the reſidue after the mutual effervescencies of the Humours, being in very many of the Nerves together beſet, and mightily filled or ſtopped up, the waies of Emanation are obſtructed, and their mutual commerce is broken off, ſo that 'tis no wonder if thoſe long Pains end at laſt in a Palſie, not only in the middle of the Belly, where the morbifick cauſe ſeems to ſubſiſt, about the foldings of the Meſenterie, but in other places round about, Pains not inferior to the Colick, are wont to ariſe. I know a noble Maid that was obnoxious to moſt cruel Torments, near the *os Pubis*, during about the ſpace of a Month, and were wont to be repeated upon any occaſion, given without any ſuſpition of the Stone, or Ulcer in the urinary Paſſages: which kind of affection I judge to depend upon a morbid matter impacted in the nervous foldings, planted in the *Hypogaſtrium*. Further, it is familiar to ſcorbutical Perſons, to find fits of very cruel Pains, ſometimes in the right, ſometimes in the left *Hypochondria*, and ſometimes about the Region of the Ventricle: the cauſes of which we think to ly hid in the nervous foldings, belonging to the *Viſcera* planted in that place.

Pains in ſeveral parts of the Abdomen.

In the Loins and Back.

2. Scorbutick Pains, are wont ſometimes to infeſt the Loins, and alſo the Region of the Back, now above, now below, without any prævious Affection of the *Abdomen*, or of the Reins. I have known ſeveral keeping their Beds with ſuch a Diſtemper, perpetually crying out Day and Night, by reaſon of the intollerable torment: The cauſe of this kind of Paſſion may be aſcribed to the acetous Recrements of the nervous Juice poured on the Membranes, and Tendons of thoſe parts, and ſo ſtirred up into effervescency by the acceſſion of the Sanguinious ſaltiſhneſs.

In the Breaſt and Pleura.

3. By reaſon of the ſame conjoyning of Salts, affixed on the Membranes, Cloathing the *Præcordia* very troubleſom Pains about the region of the Breaſt, and not eaſily to be removed, are often induced; hence the Baſtard pleuriſie is ſo frequent a ſymptom of the Scurvy. I have known many ſcorbutical perſons very much troubled for a long while, with a moſt grievous Pain under the *Sternum*, ſo that in ſeveral ſo affected, I could not but think there was ſome Ulcer, abſceſs lying hid in the *Mediaſtinum*; when in truth this ſymptom did depend only upon the heterogeneous matter, brought thither, partly by the Nerves, and partly by the arteries, and there growing hot, being affixed to the Membranes; as the event often proved: for that the ſick were freed, by the long uſe of antiſcorbutick Remedies.

In the Head.

4. Hitherto we have recounted the chief kinds of Pains, infeſting the middle parts of the Body. But in the Scurvy there is felt thoſe no leſs troubleſom, in the extream parts, *viz.* the Head, Thighs and Leggs. As to the firſt, Headach is ſo rarely wanting to this Diſeaſe, that many by this effect are ſatisfied, chiefly that it is the ſcorbutick Venom; by which they become obnoxious to moſt grievous fits of this evil, and handled for a long time, and oftentimes repeated. The cauſe of this is obvious to every one, that it may be aſcribed to the humours poured on the *Meninx* or Films inwrapping the Brain, which alſo Anatomie hath proved. For the Skulls of ſome of the dead being opened, I perceived both the membranes grown together, and every where ſet thick with little Whelks, and ſcirrhous tumors, which kind of tumors and concretions, ſeem to have riſen from the mutual coagulations of the two-fold painful humour, after many effervescences.

In the Thighs.

5 Nor indeed is it any otherwiſe to be determined, as to the Pains moſt grievouſly afflicting the Thighs and Leggs of the ſick, chiefly in the night time: for many labouring with an inveterate Scurvy as ſoon as ever they are warm in their beds, are wont to endure intollerable torments, about the calves of the Leggs, Shins and Thighs and ſometimes about other parts, ſo that they cry out their fleſh is gnawn, or torn in pieces like the biting of Dogs: Theſe tortures if they leave their Bed, do ſomewhat abate; otherwiſe the afflicted are moſt miſerably tormented all Night long. In this caſe there can nothing be more aptly conceived, than the acetous recrements of the nervous Juice, to fall down on the Leggs, as into a place having a great declivity and to be copiouſly affixed to their Membranes, to which whilſt the rejected Salts do come from the Blood notably rarefied and agitated, thorough the heat of the Bed, & do ferment with theſe after the manner of Salts, therefore indeed from the mutual ſtriving and effervescency of the Particles of divers kinds, the nervous Fibres being pulled and hawled beyond meaſure, run into painful Corrugations, neither do indeed theſe dolorifick Pains ceaſe or remit, till the particles are gathered together, either evapo-

rate

rate or by their mutual wreſtling being brought under are worn out, are quiet from their effervescencie; but then within a little ſpace, freſh proviſion of either matter diſpoſes to a new paroxyſm, by reaſon of the mutual effervescencie, and coalition. Of theſe kind of Salts of a diverſe kind, proceeding from a twofold humour, the wandring Gout, the Rheumatiſm and cartain other affections are produced, which we deſervedly impute to the conjunct dyſcraſies, and as it were evil confederations of the Blood and nervous Juice. Moreover in the ſame Claſs certain ſpecies of ſcorbutick Pains but now handled, ought to be placed; but becauſe they are of kin to other Pain, ariſing from the Sole Vice of the nervous Juice, or of the Blood, therefore we have here joyned together the divers Theories of the dolorifick Affections.

As there is a conflux of Symptoms of a divers kind in the Scurvy, ſo there is begotten a manifold morbifick matter, and of a divers nature: *viz.* Heterogeneous particles coming into the Brain and nervous ſtock, with the moiſtning Juice, are ſometimes narcotick, bringing forth the Palſie, and ſometimes ſaline, cauſing Pains, (as we have ſaid) alſo ſometimes they are nitro-ſulphureous and exploſive, from which the ſpaſmodie or cramp-like affections ariſe: but by reaſon of particles of this ſort go together in the Brain, there happen to ſcorbutical perſons, Vertigos, ſwimmings in the head and outragious aſſaults, like the falling ſickneſs: From the like cauſe, poſſeſſing the nervous Stock, proceed convulſive motions, trembling, ſhakings and very often horrid contractions in the *Viſcera* and in the Members. We have already ſpoken largely enough of the nature, differences and cauſes of Convulſions. Beſides we have fully deſcribed certain admirable caſes of this affection, ariſing from the ſcorbutick infection, ſo that it ſeems needleſs to diſcourſe any more of this matter, for it may be eaſily accommodated by the hypotheſis before delivered, to all the ſpaſmodick ſymtoms of the Scurvy whatſoever.

6. Thoſe labouring with an inveterate Scurvy are very obnoxious to a Vertigo: Concerning this affection, and alſo of many other Cephalical, we have made ſpecial diſquiſitions, which may perhaps be ſometimes made publick. In the mean time we will in one word ſignifie that this Symptom ariſes, for that the animal ſpirits are in ſome meaſure perverted from the wonted ways of their expanſions, to wit, being either hindred on otherways driven from their ſeries, ſtate, and orders are compelled to break off: this happens to come to paſs as in other caſes, ſo chiefly in the Scurvie eſpecially for two cauſes, either for the one, or the other, or for both together; *viz.* either becauſe the commerce of the Spirits is obſtructed ſomewhere, in ſome paſſages and Pores of the brain, being poſſeſſed by ſome extraneous gueſt, or ſecondly, ſome companies of the Spirits, being burthened with an heterogeneous *Copula*, or joynting are compelled to ſtay behind the reſt, or to go out of their tracts: In this Diſeaſe the liquor indeed inſtilled to the brain from a very impure blood, brings with it very many Fæculencies, by which it can be no otherways, but that the heterogeneous particles ſhould every where ſtuff up the Pores of the Brain, and growing to the animal Spirits, oppoſe them or force them into exploſions. *The Vertigo.*

7. Almoſt for the like cauſe, ſleepineſs and torpor, or heavineſs frequently happens to Scorbutick, perſons, *viz.* for as much as the animal Spirits being burthened with watery or narcotick Particles, and very much oppreſſed, cannot perform readily their expeditious and quick motions within the Brain very much alſo obſtructed, neither continue long the acts and exerciſes of their functions, but love to ly down and to indulge themſelves with idleneſs and reſt. Moreover, this ſort of affection ſometimes is ſtirred up by the defect and want of the animal Spirits; for from the Blood very much vitiated and as it were dead, the Brain and nervous Stock is ſupplied but with a thin Liquor, and almoſt lacking of all *Vigor*: From ſuch a *Prophaſis* or occaſion, I have known a Lethargie excited in thoſe about to dy; by which the affected though they ſeemed to indulge themſelves with a continual ſleep, yet being called are wont to know thoſe ſtanding about them, and to anſwer thoſe who ſpeak to them; but the ſtore of the animal Spirits growing weary, they were neither able to wake long nor to attend to diſcourſe. When I have opened ſuch who were overwhelmed with perpetual ſleep, I have found the Brain dry enough and altogether free from a Dropſie, or ſerous *Colluvies*, with which lethargick perſons are wont for the moſt part to be affected. *Sleepineſs.*

But ſometimes on the contrary, ſome ſcorbutick perſons are moleſted with almoſt continual waking. Which kind of Symptom proceeds ſometimes from the affections of the mind, Grief, convulſive Paſſions, fear of Swooning, paſſions of the Heart, and alſo from the perturbations of the Stomach and of other *Viſcera*; for as much as the Spirits being vehemently moved in every part of the ſenſitive Soul, their whole Hypoſtaſis is detained from entering into reſt, or a tranquil condition. For I have known ſome touched with a ſcorbutical Taint, who though they were free from Pains *And waking.*

PHAR. Part. II.

or Spaſms, and alſo clear from any immoderate affection of the mind, have been induced to watchings day and night for many weeks, and oftentimes could get no ſleep, though they had taken ſtrong opiates: In the mean time they continued lively enough and ready to the performance of Labours, without any heavineſs of the Head, and without any torpor or ſluggiſhneſs of the mind or ſenſes, as if they had wanted no ſleep. The reaſon of this ſeems to be, that ſometimes together with the nervous Juice, certain nitro-ſaline Particles of a fierce and unquiet nature, (of which ſort are the Effluvia's falling from *Aqua fortis*, or the ſpirit of nitre) growing to the Spirits, compell them to be perpetually agitated and to be continually in motion; for even as Vapors breathing forth from ſtygian Waters, are never altogether fixed or at reſt, ſo the heterogeneous Particles which are of that ſort of Nature, adhering to the Spirits inhabiting the Brain, ſuffer them ſcarce ever to be idle or to indulge ſleep. Theſe are the chief ſymptoms that are wont to be ſtirred up in the animal regimen, by reaſon of the ſcorbutick taint being impreſſed on the moiſtning liquor of the Brain, and Nerves; which with thoſe before mentioned happen by fault of the Blood, degenerating from its right *Craſis*. But as to thoſe great & Herculian Diſeaſes, to wit, the aſſaults of the Apoplexie and the Epilepſie, which ſometimes happen to ſcorbutical Perſons: In theſe caſes the former affection, being as it were married to another more worthy, loſes its name, and paſſes into the Pathology of that, as it were into its Progeny; laſtly we will inquire what are the ſymptoms of the Scurvy by reaſon of the conjunct Dyſcraſis of the Blood and nervous Juice, as it were joyning their alliances in Evil.

CHAP. V.

Of the ſymptomes of the Scurvy which ariſe by reaſon of the Conjunct Dyſcraſies of the Blood and nervous Juice.

IN this rank, in the firſt place is ſet the ſcorbutick Atrophy or conſumption of the Fleſh: for who labour long with this Diſeaſe often fall into a *Maraſmus* without any ſignal fault of the Lungs, or ſuſpition of a Conſumption or *Phthiſis*, ſo that the Fleſh wholly falls away, and the Skin becoming very flaggy, ſcarce ſticks on the Bones. The cauſe of which ought not only to be attributed to the fault of the Blood degenerating from its right *Craſis* or diſpoſition; for this however depraved it be, for the moſt part aſſimilates ſome portion of the nutricious Juice, and beſtows it on the parts to be nouriſhed: but indeed when as the nervous Juice is alſo bad, the nutritive faculty is altogether inhibited; for that by the defect or fault of this, the nutriment elaborated by the Blood becomes altogether unprofitable and unfruitful: By what means, as to nutrition, either Liquor, to wit, the Sanguinious and nervous diſcharge themſelves, we have elſewhere ſhewn. From that hypotheſis, which ſeems to be built upon ſufficiently probable reaſons, it eaſily follows that the Atrophie, familiar to the Scurvy depends from the conjunct irregularities of either nutritive faculty. For as much as the Blood gives only vicious aliment, and that the nervous Liquor fails in the actuating & aſſimilating it, there is a neceſſity for the ſolid parts, being continually defrauded of their food, to wither away.

2. The ſcorbutick Gout, which is very much wandring, and affects now this Part now that ſucceſſively, now more parts together, and leaps about from one place to another, or from theſe places to thoſe, ſeems to depend upon a double Stock, even as the Colick above deſcribed, but the manner altogether inverted. For indeed it is to be ſuppoſed in this Diſeaſe, that very many heaps of the fixed Salt, from the bloody Maſs are diſpoſed here and there about the Members and Joynts as ſo many Neſts: which indeed being hid within ſo many diſtinct Cells, remain as the Eggs of Fiſhes, or as the feminine Seed, to which afterwards the acetous ſour recrements of the nervous Liquor come as the maſculine Seed, and renders them fertil, to wit, in as much as the Salts of a divers nature, being commixed, they greatly ferment or grow hot; and ſo by the mutual wreſtling and agitation of the particles, the Membranes and nervous Fibres being notably hauled, they are carried into dolorifick Corrugations. In truth, it from hence appears that the firſt Mine of this diſeaſe as alſo of the common Gout, is to be placed in the bloody Maſs, and to be actuated by the Recrements of the nervous Juice, becauſe when the aſſaults of the Pains ariſe in various parts together, or ſucceſſively, the Blood ſeems not to grow hot above the meaſure, nor its ſalſaments paſſing by *Deliquium* at that time flow out more plentifully; for that neither the Pulſe becomes quicker nor the Urine lixivial. But in an urgent fit, very often a foregoing Headach, an heavineſs of the Head or Vertigo, inquietude of the Members and often a leaping of the Tendons, which ſort of Symptoms often præcede or accom-

company the assaults of pains, argue the four recrements of the nervous Juice to suffer a flux. To this appertains that the acid liquors being drunk up, provoke the gouty Paroxysms. In the Scurvy indeed either Mine is more plentifully begotten, the nests of the Gout are longer published, and the pains in these do spring sooner by far: besides from a very impure Blood, a saline or tartarous matter is heaped up not only in the Joynts of the Feet or Thighs, but almost every where about the membranes and the interspaces of the Muscles, to which also an acetous *Copula* or joynting being poured out in many places from the nervous Juice, it becomes fruitful of Pains; then for as much as either Mine consists in a matter less thick, and is gathered in open places, it is either washed away in a little time by the *Serum* flowing to it, or it is dissipated by heat, or else being sucked again by the Blood, it is transferred to some other place.

3. The Rheumatism.

3. The Rheumatism, as it is described by modern Authors, often comes upon an inveterate Scurvy. Which sort of affection, exciting Pains almost in all parts of the Body, one after another, although it appears like to the wandring Gout, but now described, yet it differs from it both in respect of the pains, which in a Rheumatism quicklier pass over, and oftner change their seat, and that with them are very often joyned a small Fever, and the tumour of the affected parts, and a *phlegosis* or Inflammation; as also by reason of the conjunct Cause, which indeed being of Kin to that which brings forth the scorbutick Colick, is clean contrary to the cause of the wandring Gout: For it seems that in the first preparation of this Disease, an acetous Mine is deposited in very many places from the nervous Juice, as it were the female Seed; to which sort of Symbols left in divers places here and there, whilst that the blood growing hot, pours forth its plentifully rejected saline reliques, presently upon the wrestling and Congression of dissimilar Particles. Pains are caused moreover, because the recrements of the Blood being exposed in the middle of its Course, they something hinder its motion, therefore a tumour and Inflammation is brought upon the part affected then, because the Blood at last licks up again the Matter, but now rejected by it self, and transferrs it to some other place, those often shiftings and mutations of Pains happen. This Affection deserves a peculiar consideration; but this may suffice to have said these few things of it in general, to wit, as it is a symptom of the Scurvy.

Hitherto we have unfolded the Symptoms of the Scurvy, arising from a threefold kind of Cause, the Pathologie of which contains in it self other manifold Affections, and very different in themselves: of which it is worthy to be observed, that as many Diseases, belonging to the Brain and nervous Stock, which exist very often alone and of themselves, come also upon the Scurvy; yet as to their formal reasons and as to the method, to be observed in the curing of these or those, a very great difference occurs. But when a Palsie, Vertigo, Convulsion, Lethargy, and other Diseases, of that kind happen of themselves, they always depend upon a more fixed cause, and very much on some notable fault of the Head and nervous Appendix; and as Cephalick remedies and appropriate to those Diseases only, are convenient, yet the success does not easily nor alwaies answer to their Wishes. In the mean time either little care is taken for the Emendation of the Blood, or if it be, for the most part it is in vain: But when these affections are brought in by the Scurvy, there is less danger, and although they have oftner fits, yet they more easily pass away; but the cure of the Disease is performed more happily by Antiscorbutick Remedies then by Specificks & by reduction of the Blood to a due *Crasis* or Complexion, rather then by administring any thing to the evils of the Brain and nervous Stock. The same observation is to be had in Tumours, Ulcers, the Dropsie & many other Distempers brought in by the Scorbutick infection, which otherways when excited by themselves, are healed only with antiscorbutick Remedies. The reason of which is, that in the Scurvy, the conjunct cause of the Symptoms and of very many Affections, consists for the most part only in the humours, to wit, in the Blood and nervous Juice, and not in the solid parts, *viz.* the *Viscera*, *Præcordia* and Brain, wherefore when their Dyscrasies or evil dispositions may be more easily mended, then the evil formations of the other Diseases of this kind, are more certainly and easilier or with less trouble cured, when excited by reason of the Scurvy than when they come to themselves. But when the Disease is more deeply rooted, and that the principle solid parts are hurt, (as it many times happens) *viz.* when the recrements of the Blood and nervous Juice, being impacted for a long time in them hurt their Tone, stuff their Pores and Passages, and bring forth in them Scirrhous Tumours, very often, or Ulcers; the aforesaid Symptoms, although imputed only to the Scorbutick Taint, seldom or never admit of a Cure, and by reason of this invincible Cause, at last the Scurvy it self becomes desperate and deplorable.

How the Diseases differ being excited by themselves, and brought on by the Scurvy.

PHAR. Part. II.

CHAP. VI.

The Prognoſticks of the Scurvy.

The Prognoſis in the Scurvy ought not to be without conſideration.

When in the ſcorbutick affection very many and ſometimes very cruel and horrid ſymptoms together are wont to oppreſs, there is expected a *prognoſis* from the Phyſician: Yea he himſelf, that he may the better inſtitute the method of Curing, carefully weighs what may be the future event of the Diſeaſe: Notwithſtanding Judgments in this caſe ought to be cautious, a long while ſuſpended and not too raſh, for very many (as have fallen under our obſervation) eſteemed deſperate, have grown well. I have known ſome whom a frequent and horrid *Aſthma* had already ſeemed to have choaked, others continually dying with frequent ſwooning, and alſo others troubled either with the Palſie, or convulſive Paroxyſms, or with a moſt grievous Colick, to be wholly freed in a ſhort ſpace by the help of Medicines. I have again known ſome ſcorbuticks ſwelled with the Dropſie through their whole Body, others reduced by an Atrophy to an extreme leanneſs, at laſt reſtored to perfect health. Therefore although thoſe labouring with this Diſeaſe, are ſometimes urged with affections highly dangerous, yet if the *Viſcera* be ſtill indifferently whole or at leaſt not much vitiated, we ought not to deſpair of thoſe evils, excited through the mere taint of the Scurvy. But on the contrary, when ſymptoms leſs terrible appear, if the Contents of the *Hypochondria* and *Abdomen* become hard and as it were ſchirrous, or if the Lungs begin to be corrupted; there is no great matter or benefit to be promiſed as to the cure of the Diſeaſe: But in caſes not deſperate, where a hope of recovering health is left, or at leaſt the fear of ſudden death is far off, if perchance the queſtion be asked how ſoon or how long, how eaſily or difficultly the Cure may ſucceed, let the anſwer depend on theſe ſorts of judgments.

1. The Scurvy as it does not ſtrait kill thoſe affected with it, or precipitate them into an incurable ſtate, ſo neither is it ſoon or eaſily cured: For the chief cauſe of the Diſeaſe conſiſting in the dyſcraſie of the Blood, is not eaſier to be taken away, than Wines to be reſtored to their due complexion when they are made fretted or ropy: Wherefore thoſe corrupted with this taint, endure its hurt for many months, and ſometimes years, yea ſometimes through their whole life.

2. This Sickneſs depending on the ſulphureous-ſaline intemperateneſs of the Blood, or like to the mere hot fretted Wine is more hardly cured; than if the ſame proceeded from the ſaline-ſulphureous dyſcraſie, or leſs aduſt like to ropy Wine: For this evil conſtitution of the Blood or Wine, may be after a ſort brought again to the condition from whence it fell, but that is wont not eaſily to be reduced into the ſtate which it departed from.

3. The Scurvy coming upon long Fevers and other Chronical Diſeaſes, is cured, or coming upon an originally, or for ſome other occaſions, ſickly conſtitution, is eſteemed of a more difficult cure, becauſe indeed in theſe caſes both the *Craſis* of the Blood is more vitiated, and not ſeldom alſo ſome hurt is affixed to the *Viſcera*. Next to theſe they are hardly cured, who by reaſon of an evil manner of living, and chiefly by the aſſiduous drinking of the more generous Liquors, have contracted this taint with hurting the tone of the Ventricle and other *Viſcera*: But thoſe who are become ſcorbuticks by reaſon of Contagion, the unhealthfulneſs of the Air, going to Sea, or a ſedentary Life, are more often and with leſs trouble reſtored to health.

4. This Diſeaſe being yet freſh, ſo long as the taint being included only in the bloody Maſs, is not yet impreſſed on the Brain and nervous ſtock, nor hath excited durable ſymptoms in the ſolid parts, often admits of a perfect Cure: But if the affection being more deeply rooted, is propagated into the animal Kingdom, and there produces ſpaſmodick and dolorifick paſſions, and that its poyſon hath ſpread it ſelf more largely by the eruption of ſpots and breakings forth, and by the roſion or eating away of the Gums and Teeth, and by other pathognomick ſigns, it is ſcarce ever wholly extirpated; but the chief buſineſs of Medicine is imployed in giving help to the Symptoms moſt grievouſly urging, and in ſuppreſſing their encreaſe and extremities.

5. Thoſe who labour with an inveterate Scurvy, refuſe to live moderately, but indulge their ſickly appetite, readily deſiring what is nought: And beſides they are very moroſe and difficult to take Remedies, ſo that they very often delude the labour of the Phyſician that in truth it is better to leave them to their evil *genius*, than to deſame

ſame profitable Medicines preſcribed in this caſe altogether in vain.

6. Becauſe this affection growing grievous, the morbifick matter is manifold and of divers ſorts, ſo that the cauſe of the Symptoms of a various kind and nature, is engendred; therefore Remedies not only of one kind are adminiſtred, but when a certain method of Medicine, though preſcribed with the beſt judgment, profits little or nothing in the Cure, the ſick are not preſently to be left off, but other medicaments and then others are to be tryed: For indeed the ſame things are not convenient to all, nor always to the ſame perſon. In the ſick Body the powers and combinations of Salts and Sulphurs every where vary, ſo alſo Medicines not helping ſhould be as often changed, till ſomething congruous and helpful be light upon.

7. If that notwithſtanding or by the uſe of Remedies not rightly adminiſtred, the Scurvy by degrees growing grievous, is carried daily into a worſe condition, at length it induces a Dropſie or Conſumption, the next paſſage then is to Death, either from this or that Diſeaſe: For after that the Blood is very much depraved, it pours forth its recrements, being more plentifully heaped up either on the Lungs, or in the *Viſcera* of the lower Belly; and ſo cauſes an affection of this or that kind equally mortal.

CHAP. VII.

Of the Cure of the Scurvy.

As to what reſpects the Cure of the Scurvy, for that it is not one ſimple preternatural affection, but a whole Legion that is to be put to flight; therefore the method of Curing ought to comprehend manifold indications, and thoſe variouſly complicated and ſubordinate, which after the ordinary mode may be referred to theſe three heads: to wit, that they be preſervatory which reſpect and take away the cauſe of the Diſeaſe, and curatory which reſpect and take away the Diſeaſe it ſelf and its ſymptoms, and laſtly vital, which may defend or reſtore the power and ſtrength of the Patient. *The Indication three-fold.*

At the very beginning of the Cure we ought to aim at the cauſe of the Diſeaſe, for this like the Root being cut off or pulled away, preſently the Trunk, Branches, and Fruit wither: Therefore as we have ſhown the cauſe of the Scurvy to be founded in the dyſcraſie of the Blood, *viz.* being either ſulphureouſly-ſalt or ſaltiſhly-ſulphureous; the firſt work muſt be that it may be mended and made better, both of this or of that ſort or nature. To this end in the firſt place impediments are to be taken away, then the primary intention it ſelf is to be performed; for either ſcope or purpoſe Remedies are required, from Diet, Chirurgery, and Medicine: As to Diet, there ſhall be ſhewn hereafter a ſpecial method of living, in the mean time we will proceed to the reſt. 1 *Preſervative.*

The Reduction of the Blood to its due *Craſis* by appropriate Remedies, is chiefly hindred by theſe two ways, *viz.* In the firſt place, becauſe a proviſion of vitious nutritious Juice is continually inferred by it: Then Secondly, becauſe the Recrements brought into its boſom are not ſufficiently ſent away, through convenient ſinks: Therefore care muſt be taken that the buſineſs of the Chyle may be rightly performed in the firſt paſſages, both that the vaporous Recrements may be ſufficiently purged forth by Sweat, the ſerous by the Reins and Lymphæducts, the bilous, by the galliſh *Cyſtis*, the melancholy of the Spleen, and all the others of every kind by their proper emunctories; then theſe offices being rightly inſtituted we muſt endeavour to reduce by ſpecifick Medicines, and chiefly thoſe endued with a volatile Salt, the dyſcraſie of the Blood: Remedies reſpecting every one of theſe intentions, ought to be uſed and adminiſtred together, but by what means and by what manner of adminiſtrations, ſhall be yet more particularly deſigned.

1. That the Chyle may be perfectly concocted in the firſt paſſages, care muſt be taken that the load of excrementitious matter heaped up in them may be exterminated, that the ferment being loſt or depraved may be reſtored, that the paſſages and pores any ways ſtuft and obſtructed may be opened: To theſe ends, Cathartick, Digeſtive, and opening Medicines are deſtinated. *The Therapeutick Intentions.*

2. The Excrements gathered together in the bloody Maſs, when they are not ſufficiently ſent away by their proper emunctories, may be drawn forth by other convenient ways: For this purpoſe alſo Catharticks or Purgers, and beſides Diaphoreticks and Diureticks, or Medicines that evacuate by Sweat and Urine, are convenient.
